near upon; close to the edge or confines; close
to: also to surround with an edge or border.
Border is the outer part or edge of any thing;
the confines of a country; the outer part of a
garment; a bank raised round a garden and set
with flowers.

If a prince keep his residence on the *border* of his
dominions, the remote parts will rebel; but if he
make the centre his seat, he shall easily keep them in
obedience. *Spenser.*

All over her a cloth of state was spread,
Not of rich tissew, nor of cloth of gold,
Nor of ought else that may be richest red
But like a cloud, as likeliest may be told,
That her brode-spreading wings did wyde unfold;
Whose skirts were *bordered* with bright sunny beames.
Id.

I saw a thousand huntsmen, which descended
Downe from the mountaines *bordering* Lombardie,
That with an hundred speares her flanks wide rended.
Id.

They of those marches, gracious sovereign!
Shall be a wall sufficient to defend
Our island from the pilfering *borderers*. *Shakspeare.*

The king of Scots in person, with Perkin in his
company, entered with a great army, though it chiefly
consisted of *borderers*, being raised somewhat sud-
denly. *Bacon.*

Sheba and Raamah are those parts of Arabia,
which *border* the sea, called the Persian gulf. *Raleigh.*

Yet on she moves, now stands and cyes thee fixed,
About t' have spoke, but now with head declined,
Like a fair flower surcharged with dew she weeps,
And words address'd seem into tears dissolved,
Wetting the *borders* of her silken veil.

Milton's Samson Agonistes.

The light must strike on the middle, and extend its
greatest clearness on the principal figures; diminish-
ing by degrees, as it comes nearer and nearer to the
borders. *Dryden.*

All wit which *borders* upon profaneness, and
makes bold with those things to which the greatest
reverence is due, deserves to be branded with folly.

Tillotson.

Volga's stream
Sends opposite, in shaggy armour clad,
Her *borderers*; on mutual slaughter bent,
They rend their countries. *Philips.*

My spouse and boys dwell near thy hall,
Along the bordering lake,

And when they on their father call
What answer shall she make.

Byron.

BORDERS, among florists, the leaves which stand round the middle thrum of a flower.

BORDERS, in gardening, are made to enclose parterres, that they may not be injured by walking in them. Borders are made either circular, straight, or in cants; and are turned into knots, scrolls, volutes, and other compartments. They are rendered very ornamental by the flowers, shrubs, yews, &c. that are raised in them. They are always laid with a sharp rising in the middle; to render them more agreeable to the eye: the largest are allowed five or six feet, and the smallest commonly four.

BORDERS, or BORDURES, in heraldry, are either plain or indented as in fig. 1 vert; a bordure indented, argent. Borders are charged in the same manner as the field; thus a border

Fig. 1.

Fig. 2.

analuron consists of birds, as in fig. 2. He beareth, argent; a bordure, vert; enaluron of martlets, or; so borders enurecy composed of beasts; verdoy, of vegetables; entoyer, of inanimate things.

BORDRAGINGS. Probably ravages committed on the borders.

Long time in peace his realm established,

Yet oft annoy'd with sundry bordragings

Of neighbour Scots, and foreign scatterlings.

Spenser.

BORDUNI, or BORDONE (Paris), an excellent Italian painter, born at Venice about 1512. He was the disciple of Titian; but has been admired more for the delicacy of his pencil, than for the truth of his outlines. For Francis I. of France, he drew not only abundance of history pieces, but the portraits of several court ladies, in so fine a manner, that original nature was hardly more charming. He died in 1587, aged seventy-five.

BORE', *v. & n.* } Ang.-Sax. borian. Wach-
Bo'ER. } ter and Skinner think the
Greek, *περαν*, to pierce; whence the Lat. *forare*, to bore, is the parent of this word; to pierce; to penetrate through; to make a hollow, or a cavity through; to push forwards towards a certain point. Metaphorically, to tease by ceaseless repetition; like the unvarying continued action of a borer.

Those milk paps,

That through the window bars bore at men's eyes,

Are not within the fold of pity writ.

Shakspeare.

I read in his looks

Matter against me; and his eye reviled

Me as his abject object: at this instant

He bores me with some trick. He's gone to the king;
I'll follow and outstare him.

Id.

Mulberries will be fairer, if you bore the trunk of the tree through, and thrust, into the places bored, wedges of some hot trees.

Bacon.

It will best appear in the bores of wind instruments; therefore cause pipes to be made with a single, double, and so on, to a sextuple bore; and mark what tone every one giveth.

Id.

But Capys, and the graver sort, thought fit

The Greeks' suspected present to commit

To seas or flames; at least, to search and bore

The sides, and what that space contains to' explore.

Denham.

Into hollow engines long and round,

Thick rammed, at the' other bore with touch of fire

Dilated, and infuriate.

Milton.

Nor southward to the raining regions run;

But boring to the west, and hovering there,

With gaping mouths they draw prolific air.

Dryden.

We took a cylindrical pipe of glass, whose bore was about a quarter of an inch in diameter.

Boyle.

These diminutive caterpillars are able, by degrees, to pierce or bore their way into a tree, with very small holes; which, after they are fully entered, grow together.

Rey.

Consider, reader, what fatigues I've known,

What riots seen, what bustling crowds I bored,

How oft I crossed where carts and coaches roared.

Gay.

BORE', } The past tense, and past par-
BORN'. } ticiples of the verb to bear. See BEAR,

And on his arme a bunch of keyes he bore,

The which unused rust did overgrow;

Those were the keyes of every inner door,

But he could not them use, but kept them still in store.

Spenser.

Only a target light, upon his arm

He careless bore.

Fletcher's Purple Island.

Their charge was always born by the queen, and duly paid out of the exchequer.

Bacon.

The great men were enabled to oppress their inferiours; and their followers were born out and countenanced in wicked actions.

Davies.

But he his wonted pride

Soon recollecting, with high words, that bore

Semblance of worth, not substance, gently raised

Their fainting courage, and dispelled their fears.

Milton's Paradise Lost.

The father bore it with undaunted soul,

Like one who durst his destiny controul;

Yet with becoming grief he bore his part,

Resigned his son, but not resigned his heart.

Dryden.

'Twas my fate

To kill my father, and pollute his bed

By marrying her who bore me.

Id.

Upon some occasions, Clodius may be bold and insolent, born away by his passion.

Swift.

BORE (Catharine de), wife of Luther, the celebrated reformer, was the daughter of a private gentleman, and was born about A. D. 1499. Having been early immured in the monastery of Nimptschen, she left it, along with other eight nuns in 1523, during the bustle of the holy week, and was married to Luther in 1526. On these accounts the Catholic writers raised many calumnies against her, from which Mr. Bayle has very completely vindicated her; and points out numberless mistakes of Varillas and others concerning her. He gives her an excellent character, and mentions, that Luther was satisfied so with his choice, that he said, 'he would not change his condition for the wealth of Cæsus.' She bore him five children, and survived him a few years. She died at Torgau in 1552, aged fifty-three.

BO'REAL. Lat. *borealis*, from *boreas*, the name given to the north wind; *απὸ τῆς βόρῃς*, says Vossius, from its bellowing, roaring noise.

BOREALIS, in conchology, a species of venus; lenticiform, with very remote membranaceous transverse striae; color, dirty white. Inhabiting the north of Europe.

BOREALIS, in entomology, a species of tabanus, distinguished by having the eyes with three purplish bands; abdomen black; thorax brown; legs black. A rare species. Also a species of coccinella, of a reddish or yellowish color, with twelve black dots on the wing-cases, and four on the thorax. A native of the cape of Good Hope.

BOREALIS, in natural history, a species of clio, of a whitish color, the head terminated in a flesh-colored pointed papilla; tentacula three, fleshy, and thick at the mouth. Inhabiting the north seas. Also a species of echinorhynchus, found in the intestines of the Eider duck.

BOREALIS, in ornithology, a species of anas, with a narrow bill, green head, white throat and abdomen. This is the Gauland duck of Latham. A native of Iceland. Also a species of tringa, the belly and legs of which are fuscous; body cinereous above, white beneath; tail and wings dusky. This is the Boreal sand-piper of Latham. Also a species of motacilla, of a green color; yellow beneath; front, throat, and temples ferruginous; tail rotund, feathers on the sides and at the tips white. A native of Kamtschatka; the rusty-headed warbler of Latham.

BOREALIS, AURORA. See **AURORA**.

BO'REAS. The north wind.

But all this glee had no continuance;
For effsoones winter gan to approche;
The blustering *Boreus* did eneroche,
And beate upon the solitary Brere,
For nowe no succour was scene him neere. *Spenser.*

Beat on proud billows; *Boreas*, blow:
Swell curled waves high as Jove's roof;
Your incivility doth show
That innocence is tempest proof;
Though surly Nereus frown, my thoughts are calm;
Then strike, affliction, for thy wounds are balm.
Old Song.

* * If tradition may be credited, this excellent old song was written by Sir R. L'Estrange.

Now from the north
Of Norumbega, and the Samoed shore,
Bursting their brazen dungeon, armed with ice
And snow and hail, and stormy gust and flaw,
Boreas and *Cacias* and *Argestes* loud,
And *Thracios* rend the woods, and seas upturn.
Milton.

BOREAS is derived by Chambers from the Greek, *βορρα*, food; because the north wind creates an appetite. Anciently boreas signified the north-east wind blowing at the time of the summer solstice.

BOREAS, in ancient mythology, is represented as the son of the giant Astræus, by the goddess Aurora, and to have reigned in Thrace, because Thrace lay north of Greece. He ravished Orithya the daughter of Erechtheus, king of Athens, who bore him Zetus and Calais two of the Argonauts, and six daughters. He is also said to have carried off Chloris, the daughter

of Arcturus. The Greeks paid divine honors to Boreas. The Megalopolitans honored him as their chief deity; and the Athenians, considering him as their ally, by his marriage with their ancient king's daughter, implored his aid in their wars with the Persians. He is represented on the temple at Athens with his robe before his mouth, as if he felt the cold of the climate over which he presides; agreeably to which, Ovid calls him gelidus tyrannus, the shivering tyrant. He is usually described by the Roman poets as violent and impetuous.

BOREASMI, feasts instituted at Athens in honor of Boreas.

BOREL (Peter), M. D. was the son of James Borel, who published several poems, and was born at Castres in 1620. He applied himself to the study of physic, and practised with great success in the city of Castres; where he collected a fine museum of natural curiosities, of which he published a catalogue in 1645, in 4to. Towards the end of 1653, he went to Paris, and was soon after made king's physician; and, in 1674, was received into the Academy of Sciences. His works are *Historiarum et Observationum Medico-Physicarum, centura prima et secunda*, 8vo.; *Bibliotheca Chemica*, 12mo; *De Vero Telescopii Inventore*, 4to; *Tresor des Recherches et Antiquités Gauloises*, 4to.; *Poeme à la Louange de l'Imprimerie*; *Carmina in laudem Regis, Reginae, et Cardinalis Mazarini*, 4to.; *Auctarium ad vitam Peirescii*, 4to.; *Commentum in Antiquum Philosophum Syrum. Hortus seu Armarum Simplicium Plantarum et Animalium ad Artem Medicam Spectantium*, 8vo.; *De Curationibus Sympatheticis*, 4to.; *Discours Prouvant la Pluralité des Mondes*.

BORELLI (John Alphonsus), was born at Castel Nuovo, Naples, on the 28th of January 1608. He was educated at Rome, where he made such rapid progress under the care of Castelli, and acquired so great a reputation, that he was invited to teach mathematics at Messina in Sicily. In 1647 and 1648, a fever having broken out in that island, Borelli paid particular attention to the disease, and published a treatise upon it at Cosenza, entitled, *Delle Ragioni delle Febri Maligni di Sicilia*, 12mo, 1649. He now removed to Pisa, where he was appointed professor of philosophy and mathematics. He was also honored with a seat in the Academy del Cimento. He now applied his mathematical knowledge to explain the functions of the animal economy; and, between the years 1659 and 1664, wrote numerous letters to Malpighi upon that subject. But being engaged in the revolt of Messina, he was obliged to quit Sicily and retire to Rome, where he lived under the patronage of queen Christina. He was under the necessity, however, of teaching mathematics in the pious schools in the convent of St. Pantaleon, where he died of a pleurisy on the 31st December 1679, in the seventy-second year of his age. Borelli corresponded with the leading philosophers of his time, particularly with Mr. John Collins, Oldenburgh, Dr. Wallis, Mr. Boyle, and Malpighi. His principal writings are: 1. *Delle Ragioni delle Febri Maligni di Sicilia*, Cosenza, 1649, 12mo. 2. *Della Cause delle*

Febri Maligni. Pisa, 1658, 4to. 3. Apollonii Pergæi Conicorum, lib. v. vi. et vii, Florent. 1661, fol. 4. De Renum usu Judicium, accompanied by Bellini's treatise De Structura Renum. Strasburg, 1664, 8vo. 5. Theoriæ Medicorum Planetarum ex Causis Physicis Deductæ, Florent. 1666, 4to. 6. De vi Percussionis, Bologna, 1667, 4to. 7. Euclides Restitutus. Pisa, 1668, 4to. 8. Osservazione intorna alla vista in eguali degli Occi, published in the Journal of Rome for 1669. 9. De Motionibus Naturalibus de Gravitate Pendentibus. Regio Julio, 1670, 4to. 10. Meteorologia Ætnea, Regio Julio, 1670, 4to. 11. Osservazione dell' Ecclissi Lunari 11 Genaro 1675, published in the Journal of Rome for 1675, p. 34. 12. Elementa Conica Apollonii Pergæi, et Archimedis Opera, nova et breviori methodo demonstrata. This work was printed at Rome, in 1679, in 12mo., at the end of the third edition of his Euclides Restitutus. 13. De Motu Animalium, published after his death.

BORER, an instrument used to make holes in various substances with. There is a very curious and simple machine of this kind used in America, consisting of the common centre-bit of the carpenters, followed by a wide flat thread-screw, hammered up from a plate of iron, or steel: it is said that it is used to bore holes, several feet in length, and it does it with this peculiar advantage, that it clears out the cuttings, without being itself drawn out, as is done with the auger, the gimblet, and other similar tools. Whether this advantage would be as completely obtained in boring perpendicularly down, to considerable depths, is not so certain, but that it would be completely effected in horizontal, or slightly inclined holes, will appear beyond a doubt, by the following description of its mode of working: the cuttings or shavings formed by the tool, are partly by their own weight, and partly by friction against the internal cylindrical surface, prevented from revolving along with the screw, the consequence is, that they are pressed against its thread, and slide along it towards the handle; now as this motion, or shifting of the thread, is quicker than the progress of boring, by which the whole tool is carried forwards, the cuttings must come out with a speed nearly equal to the difference between these two motions. Mr. Eccleston produced to the Society of Arts, an instrument for boring peat, which consists of a cylindrical body, six inches in diameter, and about two feet long; one half of the mouth is sharpened like a carpenter's auger, and at the other end there is an aperture (through which the peat, introduced by the action of boring, is drawn out), over which are some slips of iron, joined at the top, and terminated by a screw, by which it is connected with the common boring-rod.

BORG-BREGE. See **BORGI FRACTURA**.

BORGE, or **BORGHIA**, in Saxon law, a pledge of security for another's keeping the peace, and conforming to the laws.

BORGE-FORDS, or **BORGAN-FIORDER**, in geography, a district of Iceland, once famous for its warm baths, erected by Snorra Sturleson, an historian of the thirteenth century. They were so

large and well planned, that a hundred persons could bathe in them at one time. Near them was a remarkable one which received the name or cross bath, from the inhabitants of the western part of the island being baptised in it, A. D. 1000.

BORGHETTO, a town of Italy, in the Veronese, near which Buonaparte obtained a victory over the Austrians, in June 1796.

BORGIA (Cardinal), See **ALEXANDER VI**.

BORGIA (Cæsar), natural son of pope Alexander IV. was a brave general, but a most abandoned villain. See **ITALY**. It is incredible what numbers he caused to be taken off by poison, or by the sword. Assassins were constantly kept in pay by him at Rome, for removing all who were obnoxious or inconvenient to him. He experienced various turns of fortune, being sometimes very prosperous, sometimes the reverse. He narrowly escaped dying by poison in 1503; for having concerted with his father a design of poisoning nine newly created cardinals at once, for the sake of possessing their property, the poisoned wine, destined for the purpose, was by mistake brought to and drank by themselves. The pope died of it, but Cæsar, by the vigor of his youth, and the force of antidotes, after many struggles, recovered. This, however, was only to outlive his fortune and grandeur, to see himself depressed, and his enemies exalted; for he was soon after divested of all his acquisitions, and sent a prisoner to Spain. He escaped, however, and got safe to king John of Navarre, his brother-in-law, who was then at war with his subjects. Cæsar served as a volunteer, and was killed in 1507. Machiavel, in his celebrated book, entitled *The Prince*, proposes this villain as a pattern to all princes, who would act the part of wise and politic tyrants.

BORGI FRACTURA, **BORG BREGE**, or **BORGMBREACH**, in ancient law writers, denotes a breaking of the pledge or security given by the members of tithings for the behaviour of each other.

BORGO DI SAN SEPOLCRO, a town of Italy, in Urbino, on the borders of Tuscany. It is seated near the source of the Tiber, fifty miles east of Florence. On the 30th of Sept. 1789, this town was much damaged by an earthquake, which destroyed many houses and palaces, with part of the cathedral, some churches, and a village five miles distant. About 1000 persons perished.

BORGOGNONE II, a celebrated painter, whose real name was Giacomo Cortese, but he is commonly called Borgognone, from the country where he was born, about 1605. He was much admired for his grand manner of painting battles. He had been an officer of rank in the army. Towards the close of his life he retired to the Jesuits' convent in Rome, where he is said to have taken sanctuary to get rid of a bad wife, but happily surviving her, he lived in great esteem and honor till 1675.

BORING, in practical mechanics, may describe a variety of operations by which either the earth, solid bodies, or blocks, have a given portion excavated, or by which the internal surfaces of cylindrical vessels are made true and smooth. The common functions of the carpenter's gimblet,

drill, or bow, might therefore be expressed by this term; but it has been more particularly applied of late to the action of those machines which have been invented for finishing the cylinders of steam-engines, blowing-machines, pump-barrels, &c., and for boring the earth.

For BORING OF CANNON, see CANNON.

BORING OF CYLINDERS for steam-engines, blowing-machines, the barrels of large pumps, &c. is generally performed by steel-cutters, which describe a cylindrical course on the inside surface of the cylinder already cast, while it remains fixed. Steam-engine cylinders were first made of brass, or copper and tin mixed; but cast-iron has of late become the universal material. The cutters are fixed in what is called the cutter-head, which turns with the boring bar, while it is impelled round the interior surface of the cylinder by a rack, with a pinion moved by a lever and weight. A hollow tube of cast-iron is generally the axis or boring-bar employed, having a groove through it, the length of which is proportioned to the length of the cylinder. The cutter-head is composed of two cast-iron rings, the first of which is accurately fitted on the bar, which is made truly cylindrical, so that this ring may slide along it; the second ring is fixed round the first by wedges; and on its circumference are eight notches to receive the steel-cutters, also fixed in by wedges. The first ring is fixed on the bar, so as to make the whole cutter-head move round with it by means of two smaller bars, which go through notches in that ring, and pass through the groove of the boring-bar. These small bars have each a round hole in the part which passes through the geometrical axis of the boring-bar; through these holes there passes a bolt, which forms the end of the rack; a key is put through the end of the bolt, which prevents the rack from being drawn back by the lever and weight; and by this means the rack, impelled by the lever and weight, pushes forward the cutter-head, which is at the same time revolving with the boring-bar: the connexion of the rack and cutter-head being round, and in the axis of motion, the rack is thereby free from the circular motion of the cutter-head. This boring-bar was invented in the works of Mr. Wilkinson, at the time when accurately bored cylinders came to be required in consequence of Mr. Watt's improvements in the steam-engine. In the following machines the cutters advance by a train of wheels deriving their motion from the power that turns the boring-bar.

A patent was granted in 1799 to Mr. Murdoch of Redruth for an improved method of constructing steam-engines. He proposes to employ an endless screw for boring, turned by the moving power; this screw to work into a toothed wheel, whose axis carries the cutter-head. This method, he says, produces a more smooth and steady motion than the usual mode of fixing the boring-bar immediately on the axis turned by the moving power. Mr. Murdoch forms the cylinder and steam-case by casting them of one solid piece, and then boring a cylindrical interstice, by means of a tool made of a hollow cylinder of iron, with steel-cutters fixed to its edge, and acting like a trepan. The chambers of brass

pumps, whose diameter is small, are fixed within iron rings, by means of screws, in the same manner as described below in Mr. Murray's apparatus. The rings are made accurately cylindrical by turning; as is also the boring-bar. The boring-bar has four cross arms on its outer extremity, to one of which a handle is fixed, whereby a workman makes the boring-bar revolve. The cutter-head is made to advance along the boring-bar by a screw. See *Repertory of Arts*, Vol. XIII.

In 1802 Mr. Billingsley, of the Bowling Iron-works, near Bradford, constructed an apparatus in which the boring is performed perpendicularly. See *Repertory of Arts*, second series, Vol. II. p. 322. One object is, that the boring-dust may fall out, and not remain on one side of the cylinder, wearing the cutters; and in this way the cylinder may be bored through without changing the cutters. Another advantage proposed is, that the cylinder may be made more true, and not deviate from its cylindrical form by its own weight, a circumstance which is found to take place in large and slender cylinders when laid on their side. In this method the cylinder is fixed with screws by the flanges, where it is most capable of resistance, and the screws are disposed so as to press the cylinder equally all round. The operation, it is also contended, may be thus sooner performed, in consequence of less time being required to fix the cylinders, and no attendance being necessary to change the position of the bar on the axis of the pinion. The mechanism for propelling the cutters is as follows:—A leather strap passing over the boring-bar, communicates the revolving motion of the boring-bar to a wheel, which gives a slow motion by a train of wheels and pinions to an axis, bearing two pinions which work into two racks; these racks push the boring-head and cutters slowly forward on the boring-bar, at the same time that the boring-head is revolving with the boring-bar. The velocity with which it is required that the cutters shall advance, varies as the diameter of the cylinder varies, the moving power remaining the same; and, by altering the train of wheel-work, the cutters may be made to advance with any given velocity.

Our plate BORING, figs. 1, 2, 3, and 4, exhibits different views of a machine for boring cylinders, invented by Mr. Murray of Leeds. Fig. 1 is an elevation, and fig. 2 a plan, of the machine. W, fig. 1 and 2, is the spur wheel, deriving its motion from water or steam, and communicating a revolving motion to the boring-bar. The toothed wheel A, fig. 1, moves round with the boring bar, B, on which it is fixed; it gives motion through the wheels D and E, and to the screw S, whose threads act on the two racks, which racks are fixed to the cutter-head H, and revolve with it. The velocity with which the cutter-head is impelled along the cylinder, depends upon the number of threads of the screw in a given length, and on the proportions of the wheels A, C, D, and E, to each other. By varying the velocity of the screw, the cutter-head may be made to move in either direction, up or down the cylinder. F is a pinion, whose axis ends in a square, which may be wrought by a key so as to bring the cutter-head out of the

Fig. 1.

Fig. 2.

Fig. 3.

Fig. 4.

cylinder, or push it home by the hand when that is required. Screws, passing through two iron rings, fix the cylinder in its bed, as represented in fig. 4. Fig. 3. is a transverse elevation of the collar, in which the end of the bar at A, fig. 1., turns; X is the gudgeon in which the spindle X, fig. 1., turns. In fig. 3. are also seen the two apertures through which the two racks pass. By this machine the flanges are turned truly plane, so that the lid of the cylinder may fit on exactly.

BORING THE BARRELS OF MUSKETS AND SMALL ARMS is generally conducted by means of a boring bar, turned by the same mill that turns the grinding stones for polishing the outside; square pieces of iron being first forged of a proper length and breadth; and the two long edges, which had been previously thinned off, welded together on a mandril. The barrel thus formed, is fixed by a screw on a carriage that moves in iron grooves, and is carried towards the boring-bar by a rope which passes over pulleys, and has a weight hanging from its end. The barrels are cooled while boring by means of water from a trough. After the barrel is bored, the interior surface of the bore is polished by the action of the boring-bar. During the operation, an iron gauge of an inch and a half in length, and of a diameter equal to the proposed diameter of the musket, is made frequent use of to ascertain the progress made; and the barrel is occasionally held to the light and looked through. If it contains a flaw, the place of the flaw is marked on the outside, and the barrel is put on the mandril again, for the defective place to be heated and hammered over again; a gauge is also used to see whether the barrel be crooked or straight. When it has no flaws, and the boring has proceeded satisfactorily, the barrel is taken to the grinding mill, and undergoes the operation of outside polishing. Rifle-barrels are placed on a bench twelve feet long. The boring-bar is guided by a matrix or female-screw, whose spiral curve is similar to the spiral of the rifles intended to be made; the boring-bar being fixed to a male-screw, which passes through the female, and fits it exactly. The female-screw, having four threads and as many furrows, is also fixed to the bench. These threads, in general, return to the point of the circumference from which they set out, or make a revolution in the length of about two feet. The male-screw has at one end an iron bar attached to it, by which it is put in motion; at the other extremity is fixed the boring-bar, which passes through the barrel to be rifled; the boring-bar has a cutter fixed in it, which forms a spiral furrow in the barrel when the screw is turned by the handle. The number of spiral threads in rifle-barrels is from three to twelve. When the threads and furrows are required to be in straight lines, a straight lined matrix is of course used. In order that the threads may be placed at an equal number of degrees of the circumference from each other, the bench is furnished with a brass plate, divided in the same way as the plate of the machine for cutting the teeth of clock-wheels.

BORING OF PORTLAND STONE, so as to form pipes, was proposed by Sir George Wright in 1805. His method is as follows:—A hole is drilled through the block of stone, in which a

long iron bolt is inserted for the saw to work round as a centre; this bolt forms the axis of the cylinder which is to be taken out, and projects considerably beyond the block at both ends. Another hole is drilled in the intended circumference; into this the blade of the saw is introduced. The frame of the saw is so disposed, that, when it is wrought to and fro, the blade is guided by means of the centre bolt so as to describe the intended cylindrical circumference. In this way a solid cylindrical core of stone is detached, and a cylindrical cavity or pipe left in the block. Or the saw may be made to describe a circle without drilling a hole in the centre, by drilling a hole in the circumference, and fixing on the surface of the stone two metallic concentric rings, so that the hole shall be included in the interstice between the rings. The saw is then introduced into the hole, and, being worked, it cuts in the circular path formed by the interstice of the rings. See *Repertory of Arts*, second series, Vol. VIII.

Mr. Murdoch's method, for which he obtained a patent in 1810, is perhaps preferable. He employs a cylindrical saw to form the pipe. A plug of wood is inserted in the centre of the intended pipe; this receives the lower end of a vertical spindle, longer than the intended pipe: the spindle is square, and has sockets sliding on it. On the upper part of the spindle is a pulley or toothed-wheel, by which the spindle is made to revolve. Near the lower end of the spindle is a wheel, having a circumference like a hoop, three inches broad. The diameter of this wheel is somewhat less than that of the pipe to be bored. It regulates the motion, and fits in the inside of a tube of metal attached to the spindle. The diameter of the tube is nearly equal to that of the intended pipe; its length is greater by two feet. On the lower edge of the tube is a rim of metal, so much thicker than the tube, that the groove cut in the stone by the rim may admit the tube to move freely in it. This rim has an edge like that of a stone-cutter's saw, and performs here the office of a saw. The tube is caused to make a reciprocating circular motion round the spindle. There is a cistern placed above the tube, for the purpose of conveying a mixture of sand and water into the cylindrical groove formed in the stone, whilst the machine is working. Pipes, made of stone in the above way, have been tried for conveying water in and about the streets of London. They were joined by means of Parker's cement, as the best material for forming the joints; but were generally cracked by the motion of carriages above, and allowed the water to escape.

BORING FOR WATER has been lately introduced, in and near the metropolis, for the purpose of obtaining large supplies of water without the sinking of a well. We have witnessed its success with great satisfaction, and suppose that our readers will be gratified with the following description of the process from the *London Journal of Science*, No. xxxiii.

The first operation is to dig a circular hole, about six or eight feet deep, and five or six feet wide, in the centre of which the boring is to be conducted, as shown in our plate BORING FOR WATER. The handle, fig. 2, having a female

screw in the bottom of its iron shank, a wooden bar or rail passing through the socket of the shank, and a ring at top, is the instrument to which all the boring implements are to be attached. A chisel, fig. 3, is first employed, and connected to this handle by its screw at top. If the ground is tolerably soft, the weight of the two workmen, bearing upon the cross-bar and occasionally forcing it round, will soon cause the chisel to penetrate; but if the ground is hard or strong, the workmen strike the chisel down with repeated blows, so as to peck their way. The labor is often considerably reduced, by means of an elastic wooden pole, placed horizontally over the scene of their operations, from which a chain is brought down, and attached to the ring of the handle. This pole is usually made fast at one end as a fulcrum, by being set into a heap of heavy loose stones; at the other end the laborer gives it a slight up and down vibrating motion, corresponding to the beating motion of the workmen below, by which means the elasticity of the pole in rising lifts the handle and pecker. When the hole has been opened by a chisel, as far as its length will permit, that instrument is withdrawn, and a sort of cylindrical auger, fig. 4, attached to the handle, fig. 2, for the purpose of drawing up the dirt or broken stones which have been disturbed by the chisel. A section of this auger is shown in fig. 5, by which the internal valve will be seen. The auger being introduced into the hole, and turned round by the workmen, the dirt or broken stones will pass through the aperture at bottom, shown at fig. 6, and fill the cylinder, which is then drawn up and discharged at the top of the auger, the valve preventing its escape at bottom.

To penetrate deeper into the ground, an iron rod, fig. 7, is now to be attached to the chisel, fig. 3, by screwing on to its upper end, and the rod is also fastened to the handle, fig. 2, by screwing into its socket. The chisel having thus become lengthened, by the addition of the rod, it is again introduced into the hole, and the operation of pecking, or forcing it down, is carried on by the workmen as before. When the ground has been thus perforated, as far as the chisel and its rod will reach, they must be withdrawn, in order again to introduce the auger, fig. 4, to collect and bring up the rubbish, which is done by attaching it to the iron rod in place of the chisel. Thus, as the hole becomes deepened, other lengths of iron rods are added, by connecting them together, as figs. 7, 8. The necessity of thus frequently withdrawing the rods from the hole, renders it extremely inconvenient, if not impossible, to raise them by hand. A tripodal standard is therefore generally constructed, by three scaffolding poles tied together, over the hole, as shown in the plate, from the centre of which a wheel and axle, or a pair of pulley blocks, are suspended, for the purpose of hauling up the rods, and from which hangs the fork, fig. 10. This fork is to be brought down under the shoulder, near the top of each rod, and made fast to it by passing a pin through two little holes in the claws. The rods are thus drawn up, about seven feet at a time, which is the usual distance between each joint, and at every haul a

fork, fig. 11, is laid horizontally over the hole, with the shoulders of the lower rod resting between its claws, by which means the rods are prevented from sinking down into the bore again, while the upper length is unscrewed and removed. In attaching and detaching these lengths of rod, a wrench, fig. 12, is employed, by which they are turned round, and the screws forced up to their bearing. The boring is sometimes performed for the first sixty or a hundred feet, by a chisel of two inches and a half wide, and cleared out by a gouge of two and a quarter diameter, and then the hole is widened by a tool, such as shown at fig. 13. This is merely a chisel, as fig. 3, four inches wide, but with a guide, *a*, put on at its lower part, for the purpose of keeping it in a perpendicular direction; the lower part is not intended to peck, but to pass down the hole previously made, while the sides of the chisel operate in enlarging the hole to four inches. The process, however, is generally performed at one operation, by a chisel of four inches wide, as fig. 3, and a gouge of three inches and three quarters, as fig. 4. The most unpleasant circumstance attendant upon this business is the occasional breaking of a rod into the hole, which sometimes creates a delay of many days, and an incalculable labor in drawing up the lower portion.

Having obtained water in the quantity desired, the hole is dressed or finished in this operation, by passing down it the diamond chisel, fig. 14; this is to make the sides smooth previously to putting in the pipe. This chisel is attached to rods and to the handle, as before described, and in its descent the workmen continually walk round, by which the hole is made smooth and cylindrical. And now, in order to keep it pure and uncontaminated with mineral springs, loose earth, &c. the hole is cased for a considerable depth with a metallic pipe of tin or copper, about a quarter of an inch smaller than the bore; each length being let down, is held by a shoulder resting in a fork, while another length is soldered to it, and so on. We have seen a beautiful stream of water thus obtained from a depth of 320 feet, and rise above the ground constantly to a height of forty feet. It then formed a first moving power in the machinery of a brewery. From the depth of 280 feet was brought up the tooth of an unknown animal, between the size of that of the largest ass and that of a horse.

BORING OF WOODEN PIPES is performed by means of spoon-formed augers, beginning with one of small diameter, and proceeding to employ successively others of larger diameter. Those used for conveying water in London are generally made of elm, and bored out of one trunk. When a tree is to be bored, it is fixed on a carriage, with a rack on the under part. This fits into a pinion, whose axis passes through gudgeons on a fixed frame. On the axis of the pinion is a ratchet wheel, moved by two catches, which derive their motion from the wind or water power that turns the auger; and the pinion is moved in a direction that brings the tree towards the auger. The apparatus is the same as the one employed in saw-mills. The tree is made to advance by ropes, which pass over a windlass wrought by men, whilst the auger is turned by a horse-mill.

Wooden pipes are also frequently bored by an auger having at its outer end a wooden drift or handle, which is put in motion by the workman. The trees are placed on tressels, and there are also tressels of a convenient height that support the auger; there is also a lathe to turn one end of the tree conical, so as to fit into a conical cavity in the end of the adjoining tree, and thus form a joint water-tight. The end of the tree, which receives the adjoining pipe within it, has a surface at right angles to the axis of the pipe. Into this surface is driven an iron hoop, whose diameter is some inches greater than the diameter of the aperture of the pipe. This prevents the tree from splitting when the conical end of the next tree is driven home. When the tree is crooked, a bore is driven in from each end, and the two bores meet, forming an angle. An auger, whose stalk is formed spirally for some way up, is figured in Bailey's *Machines of the Society of Arts*. The object of this is that the chips may be delivered without taking the auger out of the hole. A patent was granted in 1796 to Mr. Howell of Oswestry, for boring wooden pipes by a hollow cylinder, made of thin plates of iron, about an inch less in diameter than the hole to be bored. To one end of this cylinder is fixed a flange about a quarter of an inch in breadth, and one part of this flange is to be divided, so that, being of steel, a cutter is formed thereby. The object of this is to bore out a solid cylinder of wood, capable of being converted into a smaller pipe, or of being applied to some other use in carpentry. This kind of borer is like the trepan, which is a hollow cylinder of steel, saw-toothed on the edge, and, when made to revolve rapidly on its axis, in the hand of the surgeon, it saws or bores out circular pieces of the flat bones of the head. See *Repertory of Arts*, vol. IX.

BORING, in mineralogy, a method of piercing the earth with scooping irons, which, being drawn back at proper times, bring up with them samples of the different strata through which they have passed; by the examination of which the skilful mineralogist will be able to guess whereabouts a vein of ore may be, or whether it will be worth while to open a mine. It is also a practice employed by the mineralogist to discover the different strata which lie beneath the surface of the earth, by sinkers to form wells and pits, or to tap springs, so as to draw off the water that lodges in their neighbourhood; in the last case, it is performed in the bottom of ditches, or drains previously made.

BORIQUEN, or **CRAB-ISLAND**, one of the Carribee islands, in North America, five miles south-west of Porto Rico. The English formerly had a settlement there, but were driven away by the Spaniards. Long. 66° W., lat. 18° N.

BORISTHENES, in ancient geography, the largest river of Sarmatia Europea, described by Mela and Herodotus, as the most pleasant of all the rivers of Scythia, calmer than all of them in its course, and very agreeable to drink: it fed very rich pastures, it is added, and produced large fish of the best flavor, and without bones; rising from springs unknown, it comes a great way, its course is a distance of forty days, and so far it is navigable. It is now called the Dnieper or Nieper.

BORITII, in botany, an herb thought to be the kali or saltwort. In Jer. ii. 22, it is translated nitre.

BORJA, a town of Arragon, in Spain, with three parish churches, five convents, and an hospital. It lies near Monte Cayo, and in one of the most agreeable spots of the province. Here sprung the family of Borja or Borgia, and the notorious pope Alexander VI. It is the capital of a district of the same name, which contains twenty-seven villages and hamlets, with a population of 3000. The environs of the town abound in wine, flax, and wool. Twenty-four miles north of Calatayud, and thirty-four W. N. W. of Saragossa. Long. $1^{\circ} 34'$ W., lat. $41^{\circ} 50'$ N.

BORJA, **SAN FRANCISCO DE**, the capital city of the province of Mainas, the kingdom of Quito, in South America. It is situated on the Pastaza, which falls into the Amazons, in long. $76^{\circ} 24'$ W., lat. $4^{\circ} 28'$ S.

BORJA (St.), a missionary settlement of South America, in the province of Moxos, 100 miles north-west of Trinidad. There are two other missionary settlements of the same name, one on the river Uruguay, in lat. $28^{\circ} 39'$ $51''$ S., long. $57^{\circ} 56'$ W.

BORKUM, an island on the coast of East Friesland, in the kingdom of Hanover, situated between the mouths of the East and West Ems. It is included in the bailiwick of Greetz, and so low in the middle, that at high water it is separated into two. The whole island is in circuit about twelve miles. It has a governor, a minister of the Calvinistic faith, and a school-master. The inhabitants are for the most part sea-faring people. The rest of the population rear cattle, and make considerable gains from shipwrecks.

BORLASE (Edmund), M. D. an English writer of the seventeenth century, was the son of Sir John Borlase, one of the Lords Justices of Ireland in 1643. He studied at Dublin, and afterwards at Leyden, where he took his degree of M. D. He afterwards practised physic with great success in Chester. He wrote, 1. *Latham Spaw in Lancashire*, 8vo. 2. *The reduction of Ireland to the Crown of England*. 3. *The History of the Irish Rebellion*. 4. *Brief Reflections on the Earl of Castlehaven's Memoirs*, &c. He died in 1682.

BORLASE (William), a very learned antiquarian, of an ancient family in Cornwall, was born at Pendeen, in 1695-6. He studied at Oxford, and in 1718 took his degree of M. A. In 1720 he was ordained a priest, and in 1722 made rector of Ludgvan in Cornwall. In 1732 lord chancellor King presented him to the vicarage of St. Just, his native parish. Finding that the copper works of Ludgvan abounded with mineral and metallic fossils, he collected them from time to time, and thence was led to study at large the natural history of his native country. Being also struck with the numerous monuments of antiquity that are to be met with in Cornwall, he determined to gain as accurate an acquaintance as possible with Druidical learning, and with the religion and customs of the ancient Britons. In 1750 he was admitted F. R. S. and, in 1753, published in folio, at Oxford, his *Antiquities of Cornwall*, a second edition of which was published at Lon-

don, in 1769. His next publication was, *Observations on the Ancient and Present State of the Islands of Scilly, and their Importance to the Trade of Great Britain*; Oxf. 1756, 4to. In 1758 came out his *Natural History of Cornwall*, Oxford, folio. He sent a variety of fossils and remains of antiquity, to be deposited in the Ashmolean museum, for which he received the thanks of the university in 1758, and in March 1766 the degree of LL. D. He married in 1724, and died in 1772, aged seventy-seven, leaving two sons. Among his other literary connexions, was Mr. Pope; and there is still existing a large collection of letters written by that poet to Dr. Borlase. He furnished Pope with many of the fossils, which adorned his grotto at Twickenham, where his name, in capitals, was long seen. On receipt of his present, Pope wrote to him, 'I am much obliged to you for your valuable collection of Cornish diamonds; I have placed them where they may best represent yourself, in a shade but shining.'

BORN, *pass.*, derived from the word To bear, in the sense of bringing forth; as, my mother bore me twenty years ago; or, I was born twenty years ago. It is usually employed in relation to circumstances: as, he was born a prince; he was born to greatness.

Amongst those knights there were three brethren bold,

Three bolder brethren never were *yborne*;
Borne of one mother in one happy mould,
Borne at one burden in one happy morn;
 Thrice happie mother! and thrice happie morn!
 That bore three such, three such not to be fond.

Spenser.

Be bloody, bold, and resolute; laugh to scorn
 The power of man; for none of woman *born*
 Shall harm Macbeth. *Shakspeare.*

When we are *born*, we cry, that we are come
 To this great stage of fools. *Id.*

For nature's law with fruitless sorrow mourn,
 But die, O mortal man! for thou wast *born*. *Prior.*

Two rising crests his royal head adorn;
Born from a god, himself to godhead *born*. *Dryden.*

I was *born* to a good estate, although it now turn-
 eth to little account. *Swift.*

In stress of weather most, some sink outright;
 O'er them, and o'er their names, the billows close,
 To-morrow knows not they were ever *born*.

Young's Night Thoughts.

To what gulphs
 A single deviation from the track
 Of human duties leads even those who claim
 The homage of mankind as their *born* due,
 And find it, till they forfeit it themselves. *Byron.*

What is here
 Which look like death in life, and speak like things
Born ere this dying world? They come like clouds.

Id. Heaven and Earth.

BORN (Inigo, baron), the German mineralogist, was born of a noble family at Carlsburg, in Transylvania on the 26th of December 1742. He studied at an early age in the college of the Jesuits, Vienna, who, perceiving his talents, prevailed with him to enter into the order. From Vienna he went to Prague to study the law. Having completed his education, he set out on a tour through Hungary, part of Germany, Holland, the Netherlands, and France, and upon his re-

turn to Prague devoted himself to sciences connected with natural history and mining. He was received in 1770 into the department of the mines and mint. In June 1770 he set out on a mineralogical tour through Transylvania, and Hungary, of which he gave an account in a series of letters addressed to the celebrated Ferber, who published them in 1774. He here complains of his ignorance of botany. This work was translated from the German by R. E. Raspe, and published at London, in 1777. In the beginning of August 1770 Born had nearly lost his life, by descending into a mine, and brought upon him a disease that embittered the remainder of his days. 'To explain the common firing of *Felso-Banya*,' says he, 'and the great effects produced by so small an expense of wood, I visited the great mine when the fire was hardly burnt down, and when the mine was still filled with smoke. An accident made me tarry somewhat longer in the shaft, by which the smoke went off. In short, I lost my senses, and fifteen hours after I was restored to myself by blisters and other applications. My lips were swoln, my eyes ran with blood, and my limbs in general lamed. Without the assistance of a skilful young physician at Nagy-Banya, and the great care of the upper administration inspector, Baron Gerham, in whose house I lodge, you would have been deprived of your friend; and the question is still whether he is to be saved. A violent coughing, and acute pains in the loins, which alternately put me on the rack, are, I fear, more than sufficient to destroy this thinly framed machine. If that should be the case, then my friend, I desire you to have my name at least inserted in the martyrology of naturalists.' He now travelled in a bad state of health from Nagy-Banya to Schemnitz, where he arrived in the beginning of September; and in October set out for Vienna, for the purpose of obtaining medical advice. In 1771 he went to Prague, and was appointed counsellor of the royal mines in Bohemia. Here he published, *A Treatise Written by the Jesuit Poda on Mining Machinery*; and in 1772 his *Lithophylacium Borneanum*, or a catalogue of a collection of fossils, which he afterwards sold to the honorable Mr. Greville for £1000. In 1774 he was chosen a fellow of the Royal Society of London. In 1776 he was finally called to Vienna, by the empress Maria Theresa, to arrange and describe the Imperial cabinet of natural history; in consequence of which he published a magnificent work describing the shells in that cabinet; but the death of the empress prevented the progress of the undertaking. Joseph II. however, patronised our author, made him counsellor of the mines, and employed his talents in improving the processes for the extraction of metals. In 1786 he published his *Treatise on the Process of Amalgamation*. His next work was *An Arranged Catalogue of Mad, Raab's Collection of Fossils*, published in 1790. At the time of his death, he was engaged in writing *A History of the Reign of the Emperor Leopold II.*, and a *Treatise on Mineralogy*. This took place in August 1791. Baron Born was the founder in 1775 of a literary society at Prague, which has produced several volumes of memoirs. He was a member of the

society of illuminati, and zealous against the encroachments of the clergy and the monastic orders. He wrote a satirical work entitled *Monachologia*, in which he has parodied the classification and language of natural history, in a descriptive catalogue of the different orders of Monks. But his genius was ill adapted for satire, and some of his friends disclaim this work as his own composition.

BORNA, a town in the circle of Leipzig, and kingdom of Saxony, situated between two arms of the Wiehra, on the road from Leipzig to Altenburg. It contains 3200 inhabitants, who manufacture baracan, plush, woollen stuffs, and earthenware. In the neighbourhood is a marble quarry. Borna, being nearly burnt to the ground in 1750, has been since rebuilt in a much neater style. It is ten miles N.N.E. of Altenburg, and twelve S. S. E. of Leipzig.

BORNEO, **BONA FORTUNA**, or **PULA KALAMANIAM**, as it is called by the Malays, is the greatest and most important of the Sunda islands, and was supposed, before the discovery of New Holland, to be the largest island in the world. On the north it has the Philippine islands; Java on the south; Sumatra on the west; and Celebes on the east. It extends from the fourth degree of south latitude to the eighth degree of north latitude, and from 109° to 119° E. longitude. It is about 780 miles in average length, and its breadth, which is nearly equal throughout, except towards the north, is about 720 miles. Its extreme length is 900 miles, and its circumference 3000 miles. It is formed by a central range of mountains declining towards the sea, and its extensive forests, and the deep verdure of its fields, preserve a perpetual freshness in the atmosphere. So that it is not exposed either to hot land winds, as the coast of Coromandel, nor to the violent heats which prevail in Calcutta and Bengal. The climate is indeed said to be unusually temperate for the latitude, but the island is, from its marshes and other causes, unhealthy for Europeans.

At the foot of the Crystal Mountains is a large lake, which gives rise to all the rivers of the island. Of these the principal are the Banjar-massin, Succatana, Lava, Sambas, and Borneo. The last is navigable far above the town of that name, for vessels of considerable burthen; the only difficulty is at the mouth, where the channel is narrow, and not above seventeen feet broad at high water.

The soil is fertile in a high degree, yet such is the indolence of the inhabitants, that they live in the most abject poverty. All the tropical fruits grow in perfection, besides several other species scarcely known anywhere else, particularly the madang, which resembles a large apple, and the balono, not unlike a large mango. We may also notice the kanari, a handsome tree bearing an oblong nut, the kernel of which, besides being extremely palatable, abounds in an excellent culinary oil. The sago palm (*metroxylon sagu*) is not extensively cultivated in this island, although it is indigenous; and appears to require all the violence of an eastern monsoon to bring it to perfection. A tree which yields the best camphor, is also peculiar to this island and Sumatra. Mr. Colebrooke gave in the Asiatic

Researches, vol. xii. the first scientific description of it, and has named it *dryobalanops camphora*. It belongs to a different family from the laurel tribe, to which it was formerly ascribed, and is a native of plains not far distant from the coast. The camphor is found in a concrete state in the veins and fissures of the wood; so that the tree must be cut down in order to procure it. It sells for four times as much as camphora, the produce of the *laurus*, from Japan, i. e. about £4. 4s. per pound avoidupois. The forests furnish the finest building timber; a black wood, the root of which is very precious; a fragrant eagle-wood, ebony, and sandal-wood; besides trees which yield a great quantity of pitch and resin. Pepper of various kinds has been reared in this island, chiefly by the Chinese; the most remarkable of which is the *vatica*. They fix in the ground a large stake, which supports the plant, and keeps the ground between the rows extremely clear; often thinning the leaves, that the clusters of pepper may be the more exposed to the sun. A single plant sometimes bears seventy, or even seventy-five clusters. Borneo produces likewise abundance of aromatic plants, cassia, camphires, benjamin, and wax. It is thought that spiceries would succeed well.

There are several peculiar animal productions here, particularly the *oncas*, a species of apes, whose body is white and black, and from whose entrails is extracted the most perfect bezoar. The *ourang-outang* is common in the forests; and in some of them there are whole families, or rather flocks, of red apes. An animal is likewise sometimes to be seen here, the fur of which is like that of the beaver. With the exception of the sparrow hawk, there is no bird in Borneo which resembles those of Europe. The plumage of many is beautiful beyond description; its parroquets, in particular, have attracted the admiration of travellers. Goats, swine, cows, horse, and buffaloes, are common.

Borneo is also rich in its mineral productions. The diamonds of this island have been thought preferable even to those of Hindostan; the most productive mines are those at Ambauwang, beyond Mouluca, in the district of Banjar-massin, and at Landac and Pontiana. Diamonds are likewise fished up by divers in several of the rivers. The fishery is carried on chiefly in the months of January, April, July, and October. Four kinds are distinguished by the natives; the white, which they call *verna ambon*, or white water; the green, which are called *verna loud*; the yellow, named *verna sakkar*; and a kind between the yellow and the green, which bear the name of *verna bassi*. Many of them are found from four to twenty-four carats, and sometimes even thirty or forty carats. The total amount of diamonds found in a year seldom exceeds 600 carats.

Gold is nowhere in this neighbourhood so abundant as at Borneo. The greater part is an alluvial deposit, obtained by washing and sifting the sand or mud of rivers. The chief mining operations are carried on by the Chinese colonists, in the high lands between the rivers Pontiana and Sambas, and at Montradak, a village two days journey from the coast. It is an allu-

vial tract, occupied by a population of 36,000 Chinese, and intersected by numerous streams. They pay an annual tribute of about £900, and are nearly independent. They pay their laborers by monthly wages and their board. An experienced miner receives about twenty-four Spanish dollars a year. They labor very nearly twelve hours in the twenty-four. 'The mines,' as Mr. Crawford was informed, 'are longitudinal excavations, following the course of the mineral stratum; the ore being seldom more than five or six feet below the surface, and the veins usually ten feet and forty feet wide, making fifteen or sixteen feet a common depth for the whole mine.' The access is by means of wooden steps, and the ore is extracted and brought up by manual labour with spades and baskets. The largest mines are cleared by the Chinese water-wheel, and the ore is washed in a trough lined with bark. The produce of a mine worked by 200 laborers for thirty-five days, is about 320 bungkals, = 555½ oz. troy; the smallest amounts to 140 bungkals, = 243 oz. troy. The charges on such a mine for that time amount to 210.478 Spanish dollars, and its produce may be estimated at 2000 bungkals of gold dust, worth 4848.00 Spanish dollars; the gross profit for the same time will be about 2743.22, = £1090. 16s. The annual produce of the mines of Sambas is about 88.342 oz. of pure gold.

Borneans rely on the Telinga settlers from Coromandel for assaying the precious metals, of which they are entirely ignorant.

Rich copper mines and plenty of load-stone are found at Mampava, at Pulo Bongorong, near Borneo Proper. In Sarawan, a country about sixty miles to the north of Sambas, veins of tin abound, as rich as those of Banca; but the works have been abandoned in consequence of the oppression of the government: there is also a valuable iron-mine in Matan, the metal of which is said to be equal to any in Sweden.

Boats of about five or six tons are employed on the coasts of this island with whole families on board, in fishing for the swallo, a sea slug, in seven and eight fathoms water. They also dive for it; the best, which is the black, being procured in deep water, and some of them being of the weight of half a pound. They are sold to the Chinese at four and five dollars per pecul (133½ pounds).

The native inhabitants occupy the interior, and are divided into tribes, speaking different dialects, and markedly distinguished by manners, customs, and religion, from the colonies of Malays and other conquerors of these tribes, who possess the coast. In the neighbourhood of Pontiana and Sambas they are called Dayers; at Benjar-masing, Biajus; at Burni, Moruts; and on the northern side of the island, Orang Idan. Their history it is impossible to trace. The last named tribes are fair and robust, the Dayer darker than the Malays. The whole are sunk in barbarism, and much afflicted with entaneous disorders. They are said to acknowledge a Supreme Being, whom they worship under the name of Dewatta; and to whom, as the creator, preserver, and ruler of the universe, they utter prayers for prosperity in this world, and

happiness in the next. It is one of their religious tenets, we are told, that their fate in a future life depends on the number of human beings whom they shall have slain in their combats, or in their ordinary quarrels, and that their happiness or respectability will then be proportioned to the number of human skulls which they have in their possession. They are very courageous, but dangerous enemies; using poisoned arrows, which they shoot through a hollow tube. The skulls of their foes they preserve as trophies: they live by the chace, and despise agriculture or commerce. Some are said to wear gold front teeth, having pulled out the natural ones. According to the Malays, their ferocity is extreme, but the Portuguese missionaries give a very different character of them. The fact is, we are ignorant of them altogether, except through the suspicious channel of information conveyed by their oppressors.

The Malaysans of the coast are said to have migrated from Malacca, Johor, &c. in the fourteenth century, and certainly have exhibited no very virtuous political character for the imitation of their neighbours.

Borneo has been long divided into three distinct kingdoms: 1. Burni or Borneo Proper, from Tanjong Dato in lat. 3° 15' N. to Kanukungan in the Straits of Macassar, 1° 15' N. 2. Sukadana (Sukadunya, an earthly paradise), from Tanjong Dato to Tanjong Sambar, formerly belonging to the sultan of Bantam: and 3. Benjar-masing, from Bendar-masing, the usual port.

Borneo Proper, one of the most ancient states, includes a considerable portion of the western coast, and is bounded on the north by Maludu, and on the south by Pontiana. Its eastern limits are unknown. The soil here is fertile, and the inhabitants are principally a colony of Malays: the government is a feudal despotism, of which the seat is Burnai or Borneo, the capital of the island, built on a swamp. The houses are built on stages, fixed on piles, and accessible only by ladders: canals watering every street. The river is navigable above the town; but its entrance is obstructed as we have seen. Here the commerce is almost entirely in the hands of the Chinese. But the English have a factory, and carry on a small trade in piece-goods. The public markets are held sometimes in one place, and sometimes in another; and consist of a number of boats loaded with the necessaries of life, and the various articles of merchandise, and crowds of purchasers rowing up and down the river.

Along this coast we find the states belonging to Sukadana, of which the first is Sambas, having a capital of the same name thirty miles inland, and on a navigable river. It is built on a similar foundation and soil to the town of Borneo. The rajah of Pontiana, in the neighbourhood, applied not long since to the English, then in possession of Batavia, for assistance against the piracies of the Sambaese, and in 1813 the rajah was driven into the interior, and his capital taken by storm. Mampava, a little to the south of Sambas, is the principal opium market on the coast. The mouth of the river is here also obstructed by a bar and some small islands.

Pontiana or Pontianak, is a powerful state on this side of Borneo, and the sovereign a prince who has of late much studied the welfare of his subjects. The capital stands on the river Lava. Landac, on the northern side of this river, has a town on the projecting brow of a hill, which is only accessible by a long flight of steps, and nearly enclosed by two rivers. This kingdom and Sukadana were ceded by the king of Bantam to the Dutch in 1778, and they kept possession of these districts till the middle of the late war.

Sukadana, the next territory on the western coast, was anciently the most powerful district in this part of Borneo. In 1786 it was attacked and destroyed by the Dutch, but has since been rebuilt. It does not appear to have been frequented by any modern Europeans; and an interval of more than two degrees of latitude and five of longitude, between Sukadana and the next state, appears a complete blank in the maps attached to Mr. Crawford's late work.

Banjar-masing, near the southernmost point of Borneo, is also placed upon a large and deep river, and, like most of the other streams of Borneo, obstructed at the mouth by a bar of sand. The population in 1780 was estimated at nearly 9000; many of the inhabitants are foreigners, particularly Chinese, who carry on a considerable trade. The residence of the sultan is at Martapura or Bumi-kin-chana, fifty or sixty miles up the river, and was built in 1771. This part of Borneo was often frequented by the Dutch for its pepper and valuable minerals. In the beginning of the last century the English also had a flourishing establishment at Banjar-masing; but the natives compelled the Company to abandon it. They attempted in 1766 to form a settlement at the northern extremity of Borneo, on the island of Balambangan, which was ceded to them by the king of Soloo, and stationed here a few Europeans, and a garrison of 300 soldiers, Europeans and blacks. In 1772 this garrison was greatly reduced by contagious diseases, and the fort which they had constructed, being badly fortified, was suddenly attacked, and the whole establishment destroyed. The English may now be said to be masters of all the northern coast of the island, which was delivered up to them by the Soloos. The places ceded are, Pandassan, Tampassook, Abia, Amboug, Salaman, Tawarran, Juannan, and Palatan, as far as Keemanees. In this extent of coast there are some good harbours; and it is much more populous than the country north of Pirate's Point, which extends a little beyond the spacious harbour of Sandakan, as far as Towson Abia.

BORNEUS, in ornithology, the long-tailed scarlet lory. Color red, quills and tail-feathers at the tips green, a blue spot on the wings, orbits fuscous. Inhabits India. Its bill is orange, orbits of the eyes bare of feathers, lower tail coverts red, bordered with blue.

BORNHOLM, an island in the Baltic sea, south-east of Schonen in Sweden, the most eastern of the Danish isles. It is 100 miles from the nearest part of Zealand, and forty from the coast of Sweden; thirty miles in length, and above eighteen in breadth. There is but one

considerable town, Rounne or Ronnelly, with a great number of villages scattered over its surface. It is fertile and populous, and exports grain, sheep, and great quantities of salted salmon, to Copenhagen. The inhabitants near the coast are chiefly employed in fishery, while many of those in the interior are engaged in the marble and stone quarries, coal pits, and vitriol works. Bornholm was conquered by the Swedes in 1566; but, soon after, the inhabitants, under the conduct of Jens Roefords, voluntarily surrendered themselves to the king of Denmark. In 1678 a body of 5000 Swedish troops, in their passage from Pomerania to Sweden, being shipwrecked on this island, such of them as remained were made prisoners of war. The inhabitants defend the island by their own militia. The governor resides at Rounne. This island was held by the British for a short time in 1809.

BORNII, in conchology, a species of tellina, transversely striated, bent on one side, with red rays.

BORNOU, or BERNU, called by the Arabs Berr Nuh, i.e. the land of Noah, a powerful and extensive interior kingdom of Africa, is bounded on the north by Canem, on the east by Bagirmi, on the south by Lekvang, Tzelkba, Kalo and Szikkeh, and on the west by Canó or Cannó. It lies between the parallels of 10° and 20° north latitude, and 12° and 22° east longitude, as far as at present known. The Mussulman negroes consider it as one of the four great monarchies of the world; an opinion mentioned both to Mr. Lucas at Tripoli, and to Mr. Bowditch at Ashantee. The country consists of mountainous ranges, separated by plains of sand, amidst which but one stream of any magnitude seems to flow, the Ilalemm Chád or Tsád, whose course is, according to the best accounts, from south-west to north-east, and which is probably the Jád of Burckhardt. It is called in Bagirmi Gambarro, according to Captain Lyon. A beautiful virgin was formerly thrown into it once a year. It overflows its banks in the rainy season, and a canal between it and the capital, to which it approaches within about four miles, conveys part of its waters into public reservoirs; it then assumes the appearance of a large lake, and hence perhaps the discordant accounts given by different travellers. The houses are supplied from wells. The soil near this stream is said to be a rich black mould highly fertile. Clay is found in other districts, and iron ore, and the mountains abound in stone. Two kinds of natron, white and red, are found in a remote desert. The climate is divided into the rainy season, which commences about the middle of April, with strong southerly and south-easterly winds, and continues till the latter end of October; the dry season then commences, and the heat is moderate with some degree of cold, mornings and evenings. Some parts of the country are covered with wood. Date palms, *phœnix dactylifera*, and *dümo cucifera thebaïca*, are found in abundance. The Suldi is a large tree, the fruit of which yields an oil useful for curing rheumatism; the Englim, *zutám*, *alfi*, *mitzki*, *mendádèh* and *kerrágeh* are also large trees of which only the names are known. The *kedeinalh* bears an eatable fruit,

from the kernel of which an oil is extracted, commonly used by the natives as a substitute for olive oil. Many trees produce an edible gum. The *hen-nā lawsonia inermis*, is also common, and its leaves are used as in Egypt and Arabia, for the purpose of giving a scarlet dye to the hair, nails, &c.

Kasab and kamfili, two species of sorghum, are the grain produced. Writing reeds grow wild; and several sorts of beans, as well as tobacco, are cultivated. Slow spreading shrubs called *Landú* have an edible root much used. It is dried in slices, and may then be kept from year to year. Another root of a tree, with whose name we are unacquainted, is prepared for use by boiling without any further process.

In the woods the monkey tribe abounds (*lli*), particularly the *simia hamadryas*, and another of a dusky red. It is called in the *Bernáwa* language *lli sumu*, the red monkey, and is very mischievous. There are also many camelpards (*zi-ráfah*) in the woods, browsing on the young shoots. There are also lions, foxes, wild dogs (sometimes eaten), buffaloes, some fine hippopotami and several kinds of antelopes. In the pastures, large flocks of sheep and goats are found. Birds of great beauty in point of plumage are also common, amongst which the *matzakeech*, a species of flamingo is distinguished. Ostriches are also hunted for their feathers. Bornou is much infested with dangerous loathsome reptiles, especially snakes and scorpions, centipedes and toads. The guinea worm is likewise common, and swarms of wild bees.

Bornou: the capital of the empire, is situated about 600 miles south-east of Morzouk, and 420 miles west of Senaar. It is said to be a town of greater extent than Tripoli; but the houses are very irregularly placed, so that the spaces between them have no appearance of streets. Throughout the empire the same mode of building prevails. Four walls, enclosing a square, are first erected; within these, and parallel to them, are built four other walls; the intervening space is then divided into different apartments, and covered with a roof. Thus the space within the interior walls determines the size of the court; the space between the walls determines the width of the apartments; and the rooms are of the same height as the walls. On the outside of the house there is usually a second square or large yard, surrounded by a wall, for the accommodation of the cattle. In the construction of the walls, the following method is said to be invariably adopted: A trench being made for the foundation, is filled with dry and solid materials, rammed in with force, and levelled; over these is placed a layer of tempered mud or clay, in which are regularly fixed a proper number of stones. Thus, with alternate layers of clay and stones the wall is raised to the height of six or seven feet, when the workmen suspend its progress for a week, that it may have time to settle, and become compact; for which purpose they water it every day. The roofs are formed of branches of the palm tree, intermixed with brushwood, and covered with layers of earth, in such a manner as at first to be water proof, though the violence of the wind and rain generally destroys them before the end of the second year.

The whole building is white-washed with a species of chalk. The only articles of household furniture among the lower classes are mats covered with a sheep skin, upon which they sleep, an earthen pot, a pan of the same kind, two or three wooden dishes, two wooden bowls, an old carpet, a lamp for oil, and sometimes a copper kettle. Besides these, the richer inhabitants possess leathern cushions stuffed with wool, several brass and copper vessels, a handsome carpet, and a sort of candlestick; for instead of vegetable oil, which is used by the common people, they occasionally employ the light of candles. The capital is surrounded by a wall of fourteen feet in height, the foundations of which are from eight to ten feet deep, and which seems to be very firmly built. A ditch surrounds the whole; and in the wall there are four gates, opening to the east, west, north, and south, which are carefully shut every evening at sunset.

The palace is also surrounded with high walls, which form a kind of citadel, and is built in a corner of the town. Provisions are sold in public markets within the city; but for other articles a weekly market is held, as in Barbary, without the walls. There is a great mosque to which the sultan goes every Friday to prayers, and distributes larges ums in alms to the poor; provisions are also distributed to them: and strangers, who present themselves to his majesty on that occasion, are treated with the greatest condescension. He rides out once a year through a part of the city into the open country, arrayed in all his pomp and accompanied by his courtiers gorgeously attired. The multitudes that attend on this occasion, are such it is said as to grind to powder the trunks of trees over which they pass! The name of the prince who reigned here about twenty years ago, was Ahmed, ibn Hasan, ibn Mahmud, ibn Abd-er-rah Man ibn Taher. We know, from Leo Africanus, that this empire was existing at least four hundred years ago. The monarchy is elective but not hereditary: though the election is confined to the royal family. On the death of a sovereign, the privilege of choosing a successor among his sons, is conferred by the nation on three of the most distinguished men, or elders, and, during their deliberations, the princes are confined in separate chambers of the palace. When their choice is made, they proceed to the apartment of the sovereign elect, and conduct him in silence to the corpse of his father, which cannot be interred till this ceremony is passed, there they expatiate freely on the character of the departed, and conclude with this awful warning, 'you see before you the end of your mortal career: the eternal which succeeds to it will be miserable or happy, in proportion as your reign shall have proved a curse or a blessing to your people.' The new sovereign is then brought back to the palace, amidst the loud acclamations of the multitude, and is invested by the electors with all the slaves, and two-thirds of all the lands and cattle of his father; the remaining third being kept as a provision for the other children. But fatal dissensions in the royal family, are said to be the consequences of this mode of election. It often happens that the most popular or the most ambitious of the rejected princes, creates a

powerful party, and assured of foreign aid, prepares in secret the means of revolt. 'But stained with such kindred blood,' says the writer who has drawn up the account of Bornou from Mr. Lucas's communications, 'the sceptre of the victorious rebel is not lastingly secure—one revolution invites and facilitates another; and till the slaughter of the field, the sword of the executioner, or the knife of the assassin, has left him without a brother, the throne of the sovereign is seldom firmly established.'

The military force consists chiefly of cavalry, armed with the sabre, lance, pike, and bow, and defended by shields of hides. Fire-arms, though not entirely unknown to them, are too difficult to be procured for common use. When the sultan levies an army for the purpose of taking the field, he is said to have a custom of causing a date tree to be placed as a threshold to one of the gates of his capital, and commanding his horsemen to enter the town one by one, that the parting of the tree in the middle, when worn through by the trampling of the horses, may serve as a signal that the levy is complete. The taxes are paid by the poor in kind, by the rich in gold, or in male and female slaves. The ministers of religion, the learned and pilgrims, are exempt from taxation. A contribution for the maintenance of the poor is paid in the month of Ramadan, called Siceah coin by the Arabs, and Ungumszekà, by the Bernawa. The inhabitants are chiefly Mahomedans, who circumcise both sexes, and who have many Abyssinian negro slaves. Some French slaves were formerly possessed by the Sultan, who were allowed to dress as Europeans, and who were employed by him in the establishment of a cannon foundry. Gold and silver is coined by the Sultan, and Spanish and imperial dollars, as well as Venetian zecchins, are current.

Salt, of a superior kind, is an extensive manufacture here, and is obtained from the ashes of a thorny plant, boiled and purified. The natives also cultivate tobacco, though they never smoke its leaves, but use them for chewing, and manufacture them into snuff. It is remarkable that none but the Christians, Moghrebines, and other foreigners, are in the habit of smoking.

Whips are made out of the hide of the ox and hippopotamus, and wax and tallow into candles. Two kinds of fermented liquor are in use: the one called Amderkù, is made from dates steeped in water, then adding meal, and squeezing the whole through a cloth. The liquor is used after it has stood two or three days. The second called sza, is made from durrah or meyz, and is extremely intoxicating.

The inhabitants likewise manufacture coarse linen, blue, cotton, and calicoes, and are not unacquainted with the art of making musical instruments; having lutes with five horse-hair strings, and wooden trumpets. The use of flint and steel is known, but they usually kindle a flame, by rubbing one stick held perpendicularly upon another placed in a horizontal position. Sewing and packing needles, rings of silver, gold and brass, and embroidered quilts, are also among their manufactures. The inhabitants, though composing so many different nations, are said to

be alike in their appearance, having a black complexion, but features different from those of the negroes. Their dress usually consists of a girdle for the waist, a turban consisting of a red woolen cap, surrounded by folds of cotton; together with a loose robe of coarse colored cotton.

BORODINO, a small town of Russia, near the Moskwa, and about ninety miles west of Moscow, is remarkable for the great battle fought in its neighbourhood, 7th of September, 1812, between the French and Russians. The latter having collected a force of 120,000 near this place, determined to make a stand here in favor of the ancient capital. On the right was the river Moskwa, on their left a thick coppice of underwood, enclosing a battery, and the whole length of their line, about four miles, was protected at intervals by batteries, particularly towards the river. The country however was flat; and his left being particularly vulnerable, Kutusoff, the Russian general, threw up a redoubt about half a mile in its front. Of this redoubt the French van, however, gained possession on the 5th. On the 7th, the French being commanded by Buonaparte in person, both armies were drawn up by sunrise, and the batteries on each side manned with several hundred field pieces: the firing began at six o'clock, and soon became general in the centre and Russian left. The French, after making some impression with their artillery and musketry, marched forward to attack particular points in the Russian position, not successively, but simultaneously; and the too great length of the line afforded an advantage to an enemy habituated to advance in masses. Accustomed to avail himself of the slightest mistake of an enemy, Buonaparte now directed an attack on the Russian left, in front, along the coppice, instead of taking the extremity of the flank, where Kutusoff expected it, and where he had stationed a protecting corps. The French pushed forward, and carried several batteries; and though the Russians were reinforced, and returned to the charge with great intrepidity, their recovery was attempted in vain. The enemy were strong, and their force well distributed. Success fluctuated awhile in the centre, where the Russians at one time retook a great battery, and drove the French back with dreadful carnage; but the failure on their left enabling the enemy to throw a mass of force into this quarter, the result was an irruption which nothing could withstand, and the final loss of the position. About eight o'clock in the morning the French first got possession of the Russian batteries; the reiterated attacks of the latter prolonged the engagement till noon, and even till two o'clock, after which the fighting became partial, and soon ceased. Eugene Beauharnois, Murat, and Ney, greatly distinguished themselves in this battle. On the side of the Russians fell prince Bagration, a general of considerable courage and talent. The loss of the Russians was about 30,000, and that of the French nearly equal. There was no pursuit, but in the course of the following night the Russians evacuated their remaining batteries on the right.

BOROLYBICUS, the north-west wind.

BOROMÆUS (St.) See **BORROMÆUS**.

BORON, the combustible basis of boracic

acid. Boron is solid, tasteless, inodorous, and of a greenish-brown color. Its specific gravity is somewhat greater than water.

BORONIA, in botany, a genus of the class octandria, order monogynia: CAL. four-parted; petals four, ANTH. pedicelled: STYLE short: STIG. capitate: CAPS. four, united: SEEDS coated. Four species, all natives of New South Wales.

BOR'OT'GH, } Goth. *byrgan*; Ang-

BOROUGH-MONGER, } Sax. *beorgan*, *brigan*, *byrgan*, to bar; to defend; to fortify. It signified anciently a surety, or a man bound for others; a fortified town; now it means a town with a corporation, possessing the privilege of the elective franchise. *Rotten-boroughs*. See **CORNWALL**, **OLD SARUM**. Borough-monger is a political nuisance, dealing unlawfully in the purchase or sale of the elective franchise; almost as respectable as a common informer.

A *borough*, as I here use it, and as the old laws still use, is not a *borough* town, that is, a franchised town; but a main pledge of an hundred free persons, therefore called a free *borough*, or, as you say, *francplegium*. For *borh*, in old Saxon, signifieth a pledge or surety; and yet it is so used with us in some speeches, as Chaucer saith, *St. John to boroh*; that is, for assurance and warranty. *Spenser*.

And, if a *borough* chuse him not, undone. *Pope*.

No office clerks, with busy face,

To make fools wonder as they pass,

Whisper dull nothings in his ear

'Bout some rogue *borough-monger* there. *Cowper*.

Hence chartered *boroughs* are such public plagues,

And burglars, men immaculate perhaps

And their private functions, once combined,

Become a loathsome body, only fit

For dissolution, hurtful to the main. *Id. Task*.

BOROUGH, English, is a customary descent of lands or tenements, whereby in all places where this custom holds, lands and tenements descend to the youngest son; or, if the owners have no issue, to his youngest brother. *Cowell*.

BOROUGH. The learned author of the *Institutes* observes, that 'of *Boroughs*, some be walled, and some not;' and that the word *borhoe* signified a pledge, and was 'taken, in former times, for those companies of ten families, which were one another's pledge. According to *Spelman*, the ancient Saxons gave the name *burgh* to those called, in other countries, cities. But divers canons being made for removing the episcopal sees from villages and small towns to the chief cities, the name city became attributed to episcopal towns, and that of *borough* to all the rest; though these too had the appearance of cities, as being governed by their mayors, and having laws of their own making, and sending representatives to parliament, and being fortified with a wall and castle, and the like. We read in the old authorities, that 'every city is a *borough*, but every *borough* is not a city.' 'It is to wit,' says *Littleton*, sect. 164, 'that the ancient towns called *boroughs*, be the most ancient towns that be within England; for the towns that now be cities or counties, in old times were *boroughs*, and called *boroughs*, for of such old towns called *boroughs*, came the *burgesses* of the parliament, &c.'

BOROTON, or **BURGH**, is now particularly appropriated to such towns and villages as send

burgesses or representatives to parliament. *Boroughs* are equally such, whether they be incorporated or not; there being great numbers of our English *boroughs* not incorporated; and, on the contrary, several corporations that are not *boroughs*; e. g. *Kingston*, *Deal*, *Kendal*, &c. *Boroughs* are distinguished into those by charter or statute, and those by prescription or custom. The number of *boroughs* in England and Wales, including cities and cinque ports, which elect members, is 215; some of which send one, some two representatives.

It has been a question disputed with great zeal among antiquaries, at what period the representatives of *boroughs* were first called to take a share in the national councils. Some have traced their origin to the Saxon *Wittenagemote*: others, on the contrary, have maintained, that the Commons formed no part of the great council, till some time after the conquest.

The advocates of the high antiquity of the Commons maintain, that they are to be traced even in the original customs of the ancient German nations, among whom, according to *Tacitus* (*de Mor. Germ.* c. 25.), all freeholders enjoyed an equal right with the nobles to assist in important councils. This right they exercised, upon their first settlement in foreign countries, by assembling together in open plains; and this is asserted to have been the practice among the Anglo-Saxons, the meadow near *Staines*, in which king *John* granted the great charter, being called *Runnemed*, or the meadow of council, because in ancient times it had been usual to meet there on the business of the nation. This custom, it is said, had gone into disuse previously to the Norman government; and the meeting in the reign of king *John* is the only instance of its having been revived. The words of an act of the 4th *Edw. III.* say, 'it is accorded, that a parliament shall be holden every year once, and more often, if need be,' it may hence, easily be inferred, that it was rather regarded as a privilege of which they earnestly desired the frequent enjoyment, than as a burden, as some have asserted, from which they wished to be exempt. There were some *boroughs*, indeed, which, on account of their poverty, were unable to bear the expense of sending members to parliament, and therefore declined the exercise of that privilege; but it were unfair to form any general conclusion from these particular cases. Besides, there are examples of *boroughs* petitioning to be restored to the use of the privilege of sending members to parliament, after a very long interruption.

It seems incredible, it is added, that, if the whole legislative power had before the reign of *Henry III.* been always in the hands of the nobility and the king, they should not have opposed the extension of it to so many persons of inferior rank; nor is it probable, that any new measure of such magnitude and importance, introduced by the earl of *Leicester*, while acting at the head of the nobles and the people in a very dangerous contest against the crown, should have been confirmed and perpetuated by *Edward I.* But among the close rolls of the twenty-fourth of that king, there is a writ of summons

to parliament, in which it is asserted, not as an innovation introduced by the earl of Leicester, 'but as a maxim grounded on a most equitable law, established by the foresight and wisdom of sacred princes, that what concerns all, should be done with the approbation of all; and that dangers to the whole community should be obviated by remedies provided by the whole community;' a species of language which could not, with propriety, have been used by Edward I. if the practice of summoning the commons to parliament had been a measure of recent introduction. It is, moreover, observed, that there is not the slightest intimation, in any of the oldest writs for sending up representatives from cities or boroughs, that such elections were a novelty. Two claims are still extant, made in the reigns of Edward II. and III. which have been held forth as decisive of the antiquity of the custom of sending citizens and burgesses to parliament, even from towns that were held under subjects, and not immediately of the crown. These are the claims of the towns of St. Albans and Barnstable. In the petition of the borough of St. Albans, presented to parliament in the reign of Edward II., the petitioners assert, that though they held in capite of the crown, and owed only for all other service their attendance in parliament, yet the sheriff had omitted them in his writs; whereas, both in the reign of the king's father, and all his predecessors, they had always sent members. Reference is also made to a statute of the fifth year of Richard II. sect. 2, which enacts, 'that all and singular persons and commonalties, which from henceforth shall have the summons of the parliament, shall come from henceforth to the parliaments in the manner as they are bound to do, and have been accustomed within the realm of England, of old times. And if any person of the same realm, which from henceforth shall have the said summons (be he archbishop, bishop, abbot, prior, duke, earl, baron, banneret, knight of the shire, citizen of city, burgess of borough, or other singular person or commonalty), do absent himself, &c. he shall be amerced and otherwise punished, according as of old times hath been used to be done within the said realm in the said case.' There is likewise a petition of the Commons in the second parliament of Henry V. which sets forth, 'that as it hath ever been their libertie and freedom, that there should no statute nor law be made, unless they passed thereto their assent, considering that the commune of your land, the which is and ever hath been a member of your parliament, be as well assenters as petitioners,' &c. Those on the other hand, who deny the high antiquity of the Commons' house of parliament observe, that, in those periods to which its origin is referred, no such class of men as are denominated citizens and burgesses had any political existence. Although Tacitus affirms, that, among the ancient Germans, the consent of all the members of the community was required in every important deliberation; yet he speaks not of representatives; and this ancient practice, mentioned by the Roman historian, could only have place among tribes where every citizen might, without inconvenience, be assembled upon any

extraordinary emergency. With regard to the Saxon Wittenagemote, it is said, the members are almost always called the principes, satrapæ, optimates, magnates, procures; terms which seem to suppose an aristocracy, and exclude the Commons. The boroughs also, from the low state of commerce, were so small and so poor, and the inhabitants lived in such dependence on the great men, that it does not seem probable they would be admitted as a part of the national councils. It appears from Domesday that the greatest boroughs were, at the time of the conquest, scarcely more than country villages; and that the inhabitants were of a station little better than servile. If it be unreasonable to think that the vassals of a barony, though their tenure was military and noble, and honorable, were ever summoned to give their opinion in national councils, much less can it be supposed, that the tradesmen or inhabitants of boroughs, whose condition was so much inferior, would be admitted to that privilege. These boroughs were not then so much as incorporated; they formed no community; they were not regarded as a body politic; and being merely formed of a number of low dependent tradesmen, living without any particular civil tie, in neighbourhood together, they were incapable of being represented in the states of the kingdom. The first corporation, even in France, which made more early advances in arts and civilisation than England, is sixty years posterior to the conquest under the duke of Normandy, and in Normandy, the constitution of which was most likely to be William's model in raising his new fabric of English government, the states were entirely composed of the clergy and nobility; and the first incorporated boroughs, or communities of that duchy, were Roüen and Falaise, which enjoyed their privileges by a grant of Philip Augustus, in the year 1207. All the ancient English historians, when they mention the great council of the nation, call it an assembly of the baronage, nobility, or great men; and none of their expressions, says Mr. Hume (*ubi infra*), though several hundred passages might be produced, can, without the utmost violence, be tortured to a meaning, which will admit the Commons to be constituent members of that body. When historians mention the people, *populus*, as a part of the parliament, they simply mean the laity, in opposition to the clergy. If, in the long period of 200 years, which elapsed between the conquest and the latter end of Henry III., and which abounded in factions, revolutions, and convulsions of all kinds, the House of Commons never performed one single legislative act, so considerable as to be once mentioned by any of the numerous historians of that age, they must have been totally insignificant; and in that case, what reason can be assigned for their ever being assembled? The magna charta of king John provides, that no scutage or aid should be imposed, either on the land or towns, but by consent of the great council; and, for more security, it enumerates the persons entitled to a seat in that assembly, the prelates and immediate tenants of the crown, without any mention of the Commons: An au-

thority (says Hume) so full, certain, and explicit, that nothing but the zeal of party could ever have procured credit to any contrary hypothesis. The first unequivocal notice which is given by historians of any representatives being sent to parliament by the boroughs, occurs during the reign of Henry III. in the year 1265;—at a period when the earl of Leicester had usurped the royal authority, and summoned a new parliament to London: an assembly he fixed upon a more democratical basis, than any which had been called together, since the foundation of the monarchy. Besides the barons of his own party, and several ecclesiastics, who were not immediate tenants of the crown, he ordered returns to be made of two knights from each shire, and, deputies from the boroughs. The precedent, however, appears to have been regarded as the act of an usurpation, and to have been discontinued in subsequent parliaments, until the 23d year of Edward I., who, in consequence of his pecuniary embarrassments, occasioned by his foreign and domestic military expeditions, again had recourse to the measure of summoning the representatives of the boroughs to parliament; and this period seems to be the real and true epoch of the House of Commons, and the dawn of popular government.

At first, these representatives of boroughs did not, properly speaking, compose any essential part of the parliament: they sat apart both from the barons and knights, who appear to have regarded them as personages of a very inferior rank. Having given their consent to the taxes required of them, their business was considered as finished, and they separated, even although the parliament still continued to sit, and to canvass the national business. By this union, however, they gradually acquired more weight; and it became customary for them, in return for the supplies which they granted, to prefer petitions to the king for redress of any grievances of which they found reason to complain. Still the Commons do not yet appear to have assumed the character of legislators. Throughout the reign of Edward I., their assent is not once expressed in any of the enacting clauses, nor in the ensuing reigns, until the 9th of Edw. III. nor in any of the enacting clauses of 16th Richard II. Nay, even so late as Henry VI., from the beginning till the 8th of his reign, the assent of the Commons is not once expressed in any enacting clause. (See Ruffhead's Statutes, preface, p. 7.) So little were they accustomed to transact public business, that they had no speaker till after the parliament 6th Edward III., and, in the opinion of most antiquaries, not till the first of Richard II. The burgesses did not even form the same House with the knights of shires. But as their wealth and consideration increased, so did also their public importance; and, in the reign of Henry V., the commons required, that no laws should be framed merely upon their petitions, unless the statutes were worded by themselves, and had passed their House in the form of a bill. They were, at length, united in the same house with the knights of shires. This, however, according to Mr. Carte (*Hist. v. ii. p. 451*), did not take place until the 16th Edward

III. and instances afterwards occur of the burghs and burgesses acting separately.

Burgesses were first admitted into the Scottish parliaments by Robert Bruce, A.D. 1326; in the preamble to the laws of Robert III. they are ranked among the constituent members of that assembly.—Brady on Boroughs. By the articles of union the Scotch boroughs send fifteen members to the British parliament.

Boroughs, in the law of Scotland, are corporate bodies, erected by the king's charter; and consisting of the inhabitants of a certain district, and its jurisdiction. They hold either of the crown, or of a subject: hence they are distinguished into boroughs royal, and boroughs of regality or barony. All royal boroughs have power, by their charters, to choose annually such office-bearers or magistrates as are specified in the grant; generally a provost, bailies, dean of guild, treasurer, and common council, who are elected in terms of the set or constitution of the borough. The magistrates of royal boroughs have the same civil jurisdiction within the borough, as the sheriff in his territory. They are also empowered by special statute, 1644, c. 35, revived by 1663, c. 6, to value and sell ruinous houses, when the proprietors refuse to rebuild or repair them. Their criminal jurisdiction is now confined to petty riots. By the charters of some royal Scottish boroughs, the magistrates are constituted justices of the peace within the bounds of their erection; and, since the union, the eldest magistrate of every royal borough is named, as a matter of course, in all the commissions of the peace. In all matters of police, the magistrates and town council must concur, as the full representatives of the community. In this capacity they enact bye-laws, choose persons into offices which are in their gift, &c.; and they may not only proportion the public taxes among the inhabitants, but also impose taxations, for the utility of the borough, by their own authority, provided they have not only the consent of the magistrates and council, but of the special corporations burdened.

In boroughs of barony and regality, the right of electing magistrates is, by the charter, vested sometimes in the inhabitants themselves, and sometimes in the baron or superior. Their jurisdiction extends to the cognisance of debts, and questions of possession between the inhabitants; and the superior's jurisdiction is always cumulative with that of the magistrates.

The convention of royal boroughs is composed of deputies or commissioners, one from each borough, who were as early as 1487, c. 3, authorised to meet yearly, to consider of the 'welfare of merchandise, the gude rule and statutes for the common profite of burrowes, and to provide for remeid upon the skaith and injuries sustained within the burrowes.' Their powers were confirmed and enlarged by many subsequent acts; and accordingly that body have been in the practice of meeting annually in Edinburgh, for the purpose of regulating the matters committed to their charge.

Borough English, in English law, is a custom in certain manors and boroughs, respecting the descent of lands, whereby they are inherited

by the youngest, instead of the eldest son. According to Glanville (lib. 7. cap. 3. to 9, cited by Co. Litt. 110), this name was given because the custom originated in England. Like that of 'Gavelkind,' however, it was of Saxon birth, but was recognised and retained under the Norman law. Different reasons have been assigned for this singular custom. Littleton says, because the youngest son, by reason of his tender age, is presumed to be more helpless than the rest of his brethren. Other authors have given a much stranger reason to the custom, and say, that the lords of certain lands having anciently the privilege of breaking the seventh commandment with their tenants' wives, on their wedding night, their tenement descended not to the eldest son, but to the youngest son, because he was more certainly the offspring of the tenant! The last custom alluded to, however, never prevailed in England, although it obtained in Scotland, under the name of *mercheta*, or *marcheta*, until it was abolished by Malcolm III. Blackstone endeavours to trace the origin of this species of descent in a more rational way, by deducing it from the practice of the Tartars, and other pastoral tribes; among whom, according to Father Du Halde, this mode of descent to the youngest son also prevails. The reason assigned for it is this, that among nations composed totally of shepherds and herdsmen, the elder sons, as soon as they are capable of leading a pastoral life, migrate from their father with a certain allotment of cattle, and go to seek a new habitation; while the youngest, who remains last at home with his father, is naturally the heir of his house, the rest being already provided for. This custom, of the elder son's separating from the father, is also to be found among other northern nations. In our law it is one of those customs of which it is technically said 'the law takes notice,'—that is, when proof shall have been adduced that certain lands are subject to the custom of borough English, the law will adjudge the right therein accordingly, without calling on the youngest son to prove what that custom is.

If a copyhold in borough-english be surrendered to the use of a person and his heirs, the right will descend to the youngest son according to the custom. And a youngest son shall inherit an estate in tail in borough-english. But an heir at common law shall take advantage of a condition annexed to borough-english land; though the youngest son shall be entitled to all actions in right of the land, &c. And the eldest son shall have tithes arising out of land borough-english: for tithes of common right are not inheritances descendible to an heir, but come in succession from one clergyman to another.

Borough-english land being descendible to the youngest son, if a younger son dies without issue male, leaving a daughter, such daughter shall inherit *jure representationis*. It has been adjudged where a man hath several brothers, the youngest may inherit lands in borough-English: yet it is said where a custom is, that land shall go to the youngest son, it doth not give it to the youngest uncle, for customs shall be taken strictly; and those which fix and order the descents of inheritance, can be altered only by parliament.

BOROUGHs, in Scotland. See LAW.

BOROUGHs (Royal), in Scotland, are corporations made for the advantage of trade by charters granted by several of their kings; having the privilege of sending commissioners to represent them in parliament, besides other peculiar privileges. The royal Boroughs are not only so many distinct corporations, but also constitute one entire body, governed by, and accountable to, one general court, anciently called the court of four boroughs, held yearly to treat and determine concerning matters relating to the common advantage of all boroughs. The four boroughs which composed this court were Edinburgh, Stirling, Roxburgh, and Berwick; which two last falling into the hands of the English, Linlithgow and Lanerk were put in their places; with a saving to the former, whenever they should return to their allegiance. But this court not being sufficient to answer the necessities of the royal boroughs, they were all empowered, under James III. in 1487, to send commissioners to a yearly convention of their own, which was then appointed to be held at Inverkeithing but is now held at Edinburgh, under the denomination of the convention of boroughs, vested with great power, and having for their object the benefit of trade, &c. See BOROUGH, p. 344.

BOROUGHBRIDGE, a market town in the west riding of Yorkshire, seated on the river Ure, over which there is a handsome stone bridge. It is a place of little trade, but many Roman coins have been found in the vicinity; and a sanguinary battle was fought near this place by the earls of Hertford and Lancaster, against the troops of Edward II. in 1322, wherein they were defeated, and the latter taken prisoner and executed. It sends two members to parliament, and lies seventeen miles north-west of York, and 218 miles north by west of London.

BOROUGH-COURTS are certain courts held in boroughs by prescription, charter, or act of parliament: such are the sheriff's court, and court of Hustings in London.

BOROUGH-HEAD, or HEAD-BOROUGH, one of the lowest magistrates among the Anglo-Saxons, and the chief man of the decenary, tithing, or free-burg, consisting of ten families. He was also called the tithing-man, and, in some countries, the borough-holder, bors-holder, or borough's-elder. Alfred made every householder answerable for the behaviour of his family, slaves, and guests, if they lived three days in his house; and ten neighbouring householders formed themselves into a corporation, under the name of a decenary, or tithing, of which the head-borough was the president. Every man was punished as an outlaw, who did not register himself in some tithing; nor could any one change his habitation, without a warrant or certificate from the head-borough of the tithing to which he formerly belonged. When any person in any tithing was guilty of a crime, this officer was summoned to answer for him; and if he were not willing to be surety for his appearance and his clearing himself, the criminal was committed to prison for trial. If he fled, the bors-holder and decenary became liable to inquiry, and were exposed to the penalties of the law.

Thirty one days were allowed them for producing the criminal: and if they did not find him within that time, the bors-holder, with two other members of the decennary, was obliged to appear, and, together with three chief members of the three neighbouring decennaries (making twelve in all), either to swear that his decennary was free from all privy both of the crime committed, and of the escape of the criminal, by fine make satisfaction to the king. The severity of this regulation was afterwards a little mitigated, and the oaths of all the members of the tithing to which the criminal belonged, to the above effect, were admitted as a sufficient exculpation, provided that, at the same time they promised to present him to justice, as soon as they could apprehend him. By this every man was obliged to keep a watchful eye over the conduct of his neighbours: and was in a manner surety for the behaviour of those of his division; hence these decennaries received the name of frank-pledges. See TITHING.

BOROZAIL, a disease, epidemic in the countries about the river Senegal; similar to the lues venerea.

BORRA, or **BORRADH**, in Gaelic antiquity, a pile of stones, but differing both from a cairn and a dun, in external figure, as well as in size and design. Outwardly these borras were covered with heath or grass so as to appear natural protuberances, and surrounded with wood. In their internal construction, they were oblong, and divided into small apartments. They were generally built on an eminence. Mr. McFarlane of Kilsinan, describes one of them in his parish, 'forty yards long, of considerable breadth, and amazing depth. At the bottom, from one end to the other, there was a number of small cells, end to end, each made up of five to seven large flags. Each cell was about five feet long, four broad, and five high. One large flag made up each side, and another of a curved figure, to throw off the water, covered them for a roof; the end was made up of two, and an opening between them, wide enough for a man to squeeze himself through.' He thinks they were intended as places of concealment for the plunder, which the ancient clans, in the ages of irregular government, carried off from each other. *Stat. Acc.* XIV. 127.

BOR'RI, *n. s.* It is explained by Junius without etymology. A mean fellow; one who wears coarse and shabby garments, and therefore considered low and vulgar. Mr. Tyrwhit derives it from bureau, which signifies a coarse cloth of a brown russet.

That is to say, if I begay, sire shrew!
I wol renne out my borel for to shewe.

Chaucer. Cant. Tales.

Siker thou speakest like a lewd sorrel,

Of heaven to deemen so:

Howbe I am rude and borel,

Yet nearer ways I know.

Spenser.

BORRELLISTS, in church history, a Christian sect in Holland, so named from their founder Borrel, a man of good learning in the Hebrew, Greek, and Latin tongues. They reject the use of the sacraments, public prayer, and all other external acts of worship. They assert, that all

the Christian churches of the world have degenerated from the pure apostolic doctrines, because they have suffered the word of God, which is infallible, to be expounded, or rather corrupted, by doctors who are not infallible. They lead a very austere life, and employ a great part of their goods in alms.

BORRHAUS (Martin), professor of divinity at Basil, first named Cellarius. He was born at Stutgard in 1499, and acquired the friendship of Melancthon, at Wirtemberg, where he had many scholars, and made much money. But afterwards falling in with Stubner, the anabaptist, he adopted his fanaticism, and in a conference with Luther in 1522, showed an extravagant degree of zeal. In 1525 being in Prussia, he was imprisoned on account of his principles, which, however, he still defended, and wrote several books to support them. Opinions, true or false, are not to be altered by compulsion. The failure of the prophecies of his brethren fanatics, representing the immediate renovation of all things, at length converted him, and made him not only change his profession but even his name. He retired to Basil in 1536, turned glazier for a livelihood, married, and at last was admitted professor of rhetoric and divinity in that university. He wrote, 1. Notes on Aristotle's Politics, in 1545. 2. A Commentary on Aristotle's Rhetoric, in 1551. 3. Another on the Pentateuch, in 1557. 4. One on Isaiah, and the Revelations, in 1561. 5. One on Job and Ecclesiastes, in 1564. He died at Basil, in 1564, of the plague.

BORRI, or **BURRIUS** (Joseph Francis), a famous chemist and quack of the seventeenth century, was a Milanese, and a most consummate villain. In his youth, he was quite debauched, but afterwards set up for a very religious man, and pretended to inspiration. He engaged his deluded followers in vows of poverty, while he had the address to draw from them all their money. His design was to bring about a revolution in Milan, but some of his disciples being apprehended, he fled to Strasburgh, and afterwards to Amsterdam; whence, after figuring some time with eclat as a great chemist, he decamped in the night, with much money and many jewels, which he had swindled from the public. He next imposed upon the simplicity of Q. Christina, of Sweden, and led her to bestow a great sum in search of the philosopher's stone; and soon after put Frederick III. king of Denmark, upon the same vain and expensive search. On that monarch's death he fled to Turkey, but was apprehended on the frontiers and sent to Rome, where he was condemned to perpetual imprisonment. In 1672 he abjured his errors, and was allowed to attend the duke of Estres, when the physicians had given him over. The extraordinary cure he performed, astonished all good Catholics. He died in the castle of St. Angelo, in 1695, aged seventy-nine.

BORRI, or **BOBERRI**; the Indian name for turmeric; also an Indian ointment, in which the roots of turmeric are a chief ingredient.

BORRICHUS (Olaus), one of the most learned men of his age, the son of a Lutheran minister in Denmark, was born in 1626. He studied

physic in the university of Copenhagen, and began to practise during a most terrible plague that made great havoc in that city. He travelled, but before his departure in 1660, was appointed professor in poetry, botany, and chemistry; and at his return discharged his duties with great assiduity. He was raised to the office of counsellor in the supreme council of justice in 1686; to that of counsellor of the Royal Chancery in 1689; and died of an operation for the stone in 1690. He published, 1. *Docimasia Metallica*. 2. *Hermētis Egyptiorum et chemicorum Sapientia*. 3. *Conspectus chemicorum*. 4. *Lingua Pharmacopœorum*. 5. *Dissertatione de poetis Græcis et Latinis*. 6. *De Ortu et Progressu Chemiæ*; and several other works.

BORRISOKEN, a village in Tipperary.

BORROROMEAN ISLANDS, in geography, two islands situated in the bay of the lake, called Lago di Maggiore, or Lago di Locarno, in the Milanese, and so denominated from their having belonged to the Borromeo family. One of the islands is called Isola Bella, and the other Isola Madre. They are a league distant from each other, and derive the various beautiful scenes and objects which they present, from the taste and liberality of the Counts Renatus and Vitalian Borromeo. Originally barren rocks, these noblemen, with immense labor and expense, furnished them with numerous terraces, grottoes, gardens, fountains, groves of cedars, cypress, citron trees, orange trees, laurel, &c. which render them scenes of enchantment, and a kind of terrestrial paradise. Bishop Burnet and Keyser speak of them as the finest places in the world in their time. They 'can be compared to nothing more properly,' says the latter, 'than to pyramids of sweetmeats ornamented with green festoons and flowers.'

'As the taste of mankind alters with a succession of years, I consider them,' observes Mr. Archdeacon Cox, at a later period, 'only as a monument of expense and folly. Terrace rises above terrace in regular gradations, bordered with flower-pots, or gigantic statues of horses, gods, and goddesses. The whole is raised upon arches, and the soil has been brought from the shore to cover them.' He adds, however, 'the palace is magnificent, and contains a profusion of marbles and paintings. The lower part of the house overhangs the lake on one side, where several apartments are furnished in the style of grottoes; the floors, pillars, and walls, are inlaid with various colored stones, marbles, and shells; the view and coolness united make this part a delicious summer retreat. If any thing justly gives this island the appellation of enchanted, it is the prospect from the terrace. The gradual diminution of the mountains from the regions of eternal snow to the rich plain; the sinuosity of the lake; its varied banks; the bay of Marzozzo bounded by vast hills; the neighbouring burgh of Palanza, and more distant view of Laveno; the numerous villages; the Isola Madre, on which is a palace of the Borromeo family; and another island sprinkled with fishermen's huts, form a delightful assemblage. These islands, and the whole western coast of the lake to the village of Locarno, were ceded to the king of

Sardinia by the late empress queen at the treaty of Worms, in consideration of the assistance which she received from that monarch.' See *Coxe's Travels in Switzerland*, v. iii.

BORROROMEO, or **BORROROMEUS** (St. Charles), cardinal and archbishop of Milan; a personage of great note in the Romish kalendar, and whose sincere piety, simplicity of manners, and zeal for reformation, render him indeed a character equally interesting and instructive to the members of any church. He was the son of Gilbert Borromeo, count of Arona, and Mary of Medici, and was born at the castle of Arona upon Lake Maggiore in the Milanese in 1538. When he was about twelve years old, Julius Cæsar Borromeo resigned an abbacy to him of a considerable revenue, which was considered as an hereditary possession of the family. Charles accepted of it, but applied the revenues wholly in charity. Having acquired a sufficient knowledge of the languages at Milan, he studied the civil and canon law at Pavia. He received great advantage from the conversation of Francis Alciat, one of the most learned men of the age, for whom he afterwards procured the purple. He would accept no benefice but upon condition that he should be at liberty to apply the revenue to public uses. In 1554 his father died, an event which brought him back to the castle of Arona; where, though he had an elder brother, Count Frederick, he was requested by the family to take upon him the domestic affairs, to which he at length consented. In 1559 he finished his studies, and took his degree of D. D. The promotion of his uncle Pius IV. to the pontificate in 1560, seemed to have very little effect upon him; but he was soon made protonotary, entrusted with the seals of the ecclesiastical state; and created cardinal-deacon, and soon after archbishop of Milan. In obedience to his uncle, he lived in great splendor, yet retained his own temperance and humility. He now established an academy, the works of which have been published in many volumes, intitled *Noctes Vaticanæ*. About this time he also formed a design of founding a college at Pavia, which should be both a school of science, and an asylum from vice. He accordingly raised a large edifice upon ground which belonged to the family of Borromeo in that city; he obtained from the pope several benefices, which he attached to his building; and he provided it with all things necessary out of his own revenue. Upon the death of his only brother Frederick, his relations, his friends, and even the pope himself, advised him to quit the church and marry, that his family might not become extinct. Charles, however, contrary to the expectations of the world, received the priesthood, and addressed the pope in these terms: 'Do not complain of me, Holy Father, for I have taken a spouse whom I love, and on whom my wishes have been long fixed.' There was a very intimate friendship between Borromeo and Don Barthelemy des Martyres, archbishop of Prague, and author of the work entitled *Stimulus Pastorum*. This work falling into Borromeo's hands, gave him an earnest desire to become a preacher. Having obtained permission to visit his church, he set out for Milan, where he was received with the most dis-

tinguished honors. He was, however, soon recalled to Rome; the pope was dying; and Charles arrived just in time to administer to him the last sacraments, on the 7th January, 1566, and, by his influence, to moderate the cabals of the conclave, in the election of his successor, Pius V. Borromeo then gave himself up to the reformation of his diocese, where the most flagitious irregularities were openly practised; and though he met with much opposition, prevailed by an inflexible constancy, tempered with great sweetness of manners. The most formidable opposition he had to struggle with was that of the Brothers of Humility. Three provosts of this order entered into a conspiracy to cut him off; and one of their confederates called Jerom Donat, surnamed Farina, took upon himself to execute the bloody design. For this purpose he mixed with the crowd that went into the archiepiscopal chapel, where the cardinal spent an hour every evening in prayer; and fired a harquebuss at him, loaded with ball and a considerable quantity of shot. It is said that the ball struck him on the spinal bone, but fell down at his feet without doing any other damage than soiling his rochet, and that the shot tore away part of a wall and went through a table. This was reckoned a miracle, but what was more to his honor, than if it had been one, he made every exertion to procure a pardon for the assassin. But the pope was inflexible; the monk was executed, and the order suppressed. In 1576 Milan was visited by the plague, which swept away incredible numbers; and the behaviour of Borromeo on this occasion was truly Christian and heroic. He went about giving directions for accommodating the sick, and burying the dead, with a zeal and attention that were at once ardent and deliberate, minute and comprehensive; and his example stimulated others to join in the good work. The continual labors and austerities of Borromeo shortened his life, and he died at Milan, the 4th of Nov. 1584, lamented by the whole province. Borromeo was canonised the 1st of Nov. 1610. Many churches and chapels, and religious societies, have since been erected to his honor.

BOR'ROW, *v. & n.* } Dutch, *borgen*; Ang-
BOR'ROWER, } Sax. *beorgian*; of the
BOR'ROWING, } same origin with bo-
BOR'ROWER, } rough. In Chaucer and the old writers, borrow or borowe is used in the sense of a security; a pledge. To borrow, in modern usage, is to take up money or other property of another upon a promise, pledge, or security given, to repay or return it: opposed to lending. It is also occasionally employed to signify what in common parlance would be called stealing; taking without leave; using another's property as if it were our own.

This Palamon answered; 'I grant it thee;
And, thus, they ben departed til a morwe,
Whan ech of hem hath laid his faith to borwe.'

Chaucer's Cant. Tales.

Fye! Fye! deformed wight,
Whose borrowed beantie now appeareth plaine
To have before bewitched all men's sight;
O leave her soone or let her soone be blame! *Spenser.*

Yet of your royal presence I'll adventure
The borrow of a week. *Shakespeare.*

Neither a borrower nor a lender be;
For loan oft loses both itself and friend,
And borrowing dulls the edge of husbandry. *Id.*

Go not my horse the better,
I must become a borrower of the night
For a dark hour or twain. *Id.*

He borrowed a box of the ear of the Englishman,
and swore he would pay him again when he was
able. *Id.*

Upon his shield the silver moon did bend
Her horned bow, and round her arrows spend:
This word in silver wrote, 'I borrow what I lend.'

Fletcher's Purple Island.

Night would invade: but there the neighbouring
moon

(So call that opposite fair star) her aid
Timely interposes, and her monthly round
Still ending, still renewing, through mid heaven,
With borrowed light, her countenance trim,
Hence fills and empties to enlighten the earth,
And in her pale dominion checks the night. *Milton.*

Where darkness and surprize made conquest
cheap!

Where virtue borrowed the arms of chance,
And struck a random blow! *Dryden.*

Some say that I am a great borrower; however,
none of my creditors have challenged me for it. *Pope.*

Mark me, Clotilda,

And mark me well,—I am no desperate wretch,
Who borrows an excuse from shameful passion
To make its shame more vile;—
I am a wretched but a spotless wife.

Maturin's Bertram.

BORROWING and HIRING, in law, are contracts by which a qualified property may be transferred to the hirer or borrower; in which there is only this difference, that hiring is always for a price or stipend, or additional recompense: borrowing is merely gratuitous. But the law in both cases is the same. They are both contracts, whereby the possession and transient property is transferred for a particular time or use, on condition and agreement to restore the goods so hired or borrowed, as soon as the time is expired, or the use performed, together with the price or stipend (in case of hiring) either expressly agreed upon by the parties, or left to be implied by law, according to the value of the service. By this mutual contract, the hirer or borrower gains a temporary property in the thing hired, accompanied with an implied condition to use it with moderation, and not to abuse it; and the owner or lender retains a reversionary interest in the same, and acquires a new property in the price or reward. Thus, if a man hires or borrows a horse for a month, he has the possession and qualified property therein during that period; on the expiration of which his qualified property terminates, and the owner becomes, in case of hiring, intitled also to the premium or price for which the horse was hired. There is one species of this reward the most useful of any, but concerning which many good and learned men have much perplexed themselves and others, by doubts about its legality in foro conscientie. That is, when money is lent on a contract to receive not only the principal sum again, but also an increase by way of compensation for the use, which is generally called interest by those who think it

lawful, and usury by those who do not. See INTEREST.

BORROWSTOWNNESS, a sea-port town of Scotland, in the county of Linlithgow, on the south side of the Forth, two miles north of Linlithgow, and nineteen west from Edinburgh. It has a good harbour, and is surrounded with collieries and salt works; its chief trade consisting in salt and coals. It has a fair and races on the 16th of November. Borrowstownness has a custom-house, and formerly traded to a considerable extent with different parts of the kingdom, as well as foreign ports. At present the whole exports do not exceed 10,000 tons annually, and the tonnage of the shipping belonging to the port is much reduced. Five whale ships, however, still belong to the port. The trade of Borrowstownness has declined in consequence of the navigable canal between the Clyde and Forth, and most of its trade has been transferred to Grangemouth, standing at the termination of this canal. There are two weekly markets, Monday and Friday.

BORSCHOD, a county of Hungary, bounded on the north by those of Gomor and Torn, on the east by Ujvar, Semplin and Saboltsch, and on the south and west by Hewisch and Meograd. It possesses a highly favored climate, and is one of the most fruitful districts in the kingdom. Abundance of corn, excellent wine, and forest timber, are its valuable products; and most of the rivers are stocked with excellent fish. The rearing of cattle is also conducted with activity, and many thousand head of oxen are annually exported. The inhabitants are for the most part native Hungarians, but mixed with Bohemians, Slavonians, and Germans. The total number is above 93,000, of whom about 1000 are Jews. It is divided into the circles of Mischkolz, Erlau, Sendro, and St. Peter, in which there are ten market towns and 159 villages, with 84 Calvinist parishes, 52 Catholic, ten Greek, and one Lutheran.

BORSE HOLDER, among the Anglo-Saxons, one of the lowest magistrates, whose authority extended only over one free burgh, tithing or decennary, consisting of ten families. See Borough.

BORSELLA, in the glass-works, an instrument wherewith glasses are extended or contracted at pleasure; also smoothed and levigated.

BORTAN, a river of North America, in Vermont, which rises in Westmore township, Orange county, and after running north-west unites with the river Black.

BORTHWICK CASTLE, a magnificent ruin, originally of astonishing strength. It was built by William, the first Lord Borthwick, about A. D. 1430. It measures about seventy-four feet by sixty-eight without the walls, which are of hewn stone firmly cemented, thirteen feet thick near the bottom, and gradually contracted to about six near the top; and, besides the sunk story, ninety feet in height to the battlement, but including the roof, which is arched and covered with flags, 110 feet high. The great hall is forty feet long, and had been elegantly adorned with lustres, paintings, tapestry, &c. On the first floor are state rooms, formerly accessible by

a draw-bridge. Notwithstanding its strength, it was taken by Oliver Cromwell in 1650.

BORYPTES, in natural history, a gem of a black color with red and white spots.

BOS (John Baptist, Du), a celebrated author and member of the French Academy, was born at Beauvais in 1670, and finished his studies at the Sorbonne. In 1695 he was made one of the committee for foreign affairs, and was afterwards charged with some important transactions in England, Germany, Holland, and Italy. At his return to Paris he was made an abbé, and chosen perpetual secretary of the French Academy. He was the author of several excellent works; the principal of which are, 1. Critical Reflections upon Poetry and Painting, 3 vols. 12mo. 2. The History of the four Gordians, confirmed and illustrated by medals. 3. A Critical History of the Establishment of the French Monarchy among the Gauls, 2 vols. 4to, 4 vols. 12mo. He died at Paris in 1742.

Bos (Jerome), born at Bois-le-Duc about 1470, had a peculiar pleasure in painting devils, spectres, and enchantment; though, therefore, he possessed considerable powers as a painter, his pictures rather excite horror mixed with surprise than real delight. The most remarkable painting of this master's hand, now in the Escorial, is an Allegory of the Pleasure of the Flesh, in which he represents the principal figure in a carriage drawn by monstrous forms, preceded by demons, and followed by death. His manner was less stiff than that of most of the painters of his time, and his draperies in better taste. His pictures have always been much esteemed, and yield considerable prices. At Bois-le-Duc is a picture of the flight into Egypt by him, which is well executed. He also engraved a number of plates, all which exhibit his fanciful humor. He died about 1530.

Bos (Lambert), an eminent critic, son of the rector of the college at Worum in Holland, born in 1670. He completed his education under the celebrated Vitringa, at Franeker, where he became Greek professor in 1704, and continued in that situation till his death in 1717, much accelerated by his intense application to study. His edition of the Septuagint with Prolegomena, and various readings, printed in 1709 at Franeker, in 2 vols. 4to. is greatly admired. Among his other works are, Exercitationes Philologicæ, &c. 8vo. 1700, reprinted in 1713; Antiquitatum Græcarum Descriptio; Animadversiones ad Scriptores quosdam Græcos; Thomæ Magistri Eclogæ cum Notis; an improved edition of Vilerius' Greek Grammar; and a treatise in great estimation with grammarians, entitled *Mysterii Ellipseos Græcæ expositi Specime*, a Variorum edition of which appeared at Leipsic in 1809.

Bos, in antiquity, was used for an ancient Greek silver coin: called, also, didrachmus, being equivalent to two drachms. It was called bos as having on it the impression of an ox, and chiefly obtained among the Athenians and Delians; being sometimes also struck of gold. From this arose the phrase *bos in lingua*, applied to those who had taken bribes to hold their tongue.

Bos, the ox, in zoology, a genus of quadrupeds belonging to the order of pecora. The cha-

acters of this genus are taken from the horns and teeth. The horns are hollow within, and extended in the form of crescents: there are eight fore teeth in the under jaw, and none in the upper, their place being supplied by a hard membrane; and there are no dog teeth in either jaw. Linnaeus enumerates six species, but Mr. Robert Kerr, in his *Animal Kingdom*, or *Zoological System* of Linnaeus, describes nine species and seventeen varieties. As he is one of the best writers on the subject, and has added every thing important from Gmelin, Mr. Pennant, and other eminent writers on zoology, we have adopted his classification, with the exception only of the *bonasus* and the *Indicus*, which he ranks as varieties of the *bos taurus*, but which we cannot help considering as distinct species, as indeed most other authors have ranked them: upon this account, therefore, the species we have to describe are eleven in number, viz.

I. *Bos AMERICANUS*, the American bison, with short black rounded horns, and a great interval between their bases. On the shoulders is a vast hunch, consisting of a fleshy substance, much elevated. The fore parts of the body are thick and strong; the hinder parts slender and weak. The hunch and head are covered with a very long undulated fleece, divided into locks, of a dull rust color: this is at times so long, as to make the fore part of the animal look shapeless, and to obscure its seeing. During winter, the whole body is clothed in the same manner. In summer the hind part is naked, wrinkled, and dusky. The tail is about a foot long; at the end is a tuft of black hairs, the rest naked. It inhabits Mexico, the interior parts of North America, and in the Savannas; and is fond of marshy places, where it lodges amidst the high reeds. In Louisiana they feed in herds innumerable, promiscuously with multitudes of stags and deer, retiring in the sultry heats into the shade of tall reeds, which border the rivers. They are exceedingly shy; and very fearful of man, unless they are wounded, when they pursue their enemy, and become very dangerous. The chase of these animals is a favorite diversion of the Indians. The uses of these animals are various. Powder-flasks are made of their horns. The skins are very valuable; formerly the Indians made of them the best targets. When dressed they form an excellent buff; the Indians dress them with the hair on, and clothe themselves with them; the Europeans of America use them for blankets, and find them light, warm and soft. The flesh is a considerable article of food, and the hunch on the back is esteemed a very great delicacy. The Indians prefer the flesh of the cows. The hair or wool is spun into cloth, gloves, stockings, and garters, which are very strong, and look as well as those made of the best sheeps' wool; Pownall assures us, that the most luxurious fabric might be made of it. The fleece of one of these animals has been found to weigh eight pounds. Their sagacity in defending themselves against the attacks of wolves is admirable. When they scent the approach of a drove of those ravenous creatures, the herd casts itself into the form of a circle; the weakest keep in the middle; the strongest are ranged on the outside, presenting

to the enemy an impregnable front of horns: when taken by surprise, numbers are sure to perish. Attempts have been in vain made to domesticate them. They weigh from 1600 to near 3000 pounds.

II. '*Bos ARNELI*,' says Mr. Kerr, 'has long erected semilunar horns, which are flattened, annularly wrinkled, with smooth, round, approaching points; and inhabits India, north from Bengal. This animal is of vast size, and is hitherto non-descript. A skeleton of the head with the horns is in the Edinburgh College Museum.' 'A British officer, who met with one in the woods above Bengal, says, it is about fourteen feet high, that it partakes of the form of the horse, bull, and deer, and is very bold and daring. This establishes its genus, as all the other horned animals, of the ruminant or cloven-footed tribe, are shy and timid.'

III. *Bos BARBATUS*, the bearded ox, or Cape auroch, 'has short horns; a beard on the chin, whence the name, and curly hair on the breast. It inhabits the country north of the Cape. The Namaquas call it baas, or the master courier, on account of its vast swiftness. It is like the common ox, but larger and of a gray color. The head is small.'

IV. *Bos BONASUS* has a long mane: its horns are bent round towards the cheek, and not above a span long. It is about the size of a large bull, and is a native of Africa and Asia. See *BONASUS*.

V. 1. *Bos BUBALUS*, the common buffalo, has large black horns, first extended outwards, then bent backward and inward, and plain before. The hair on the back is very hard, but thinly scattered over the body. It is a native of Asia; but they are tamed in Italy, and used for the same purposes as black cattle in other countries. They draw carriages, and are guided by a rope tied to a string thrust through their noses. This buffalo is larger than an ox, has a thicker body, and a very hard hide. His pace is slow, but he will carry a great burden. They feed in herds: the cows go twelve months with young, and yield plenty of milk, of which very good butter and cheese is made. Their flesh is pretty good, but not to be compared to beef. The wild buffalo is a very fierce and dangerous animal; he often attacks travellers, and tears them in pieces. However, they are not so much to be feared in woods as in the plains, as their horns, which are sometimes ten feet long, are apt to be entangled in the branches of trees, which gives those who are surprised by them time to escape. They are excellent swimmers, and will cross the largest rivers without any difficulty. They run wild in great troops on the coast of Malabar. Strangers are allowed to hunt and kill them at pleasure. The following varieties are mentioned by Messrs. Pennant and Kerr:—

2. *Bos BUBALUS ANOA* is a native of the island Celebes, and is not bigger than a middle sized sheep, very fierce and wild, of a dark ash color, inhabiting the rocks. Mr. Loten, when in India, put some of them into a paddock, and in one night's time they killed fourteen or fifteen of his deer by ripping up their bellies. No particular description has yet been given of it.

3. *Bos BUBALUS GUAVERA* has a hunch on

the back, which stands up in a sharp ridge; the lower halves of the legs are white. It inhabits Ceylon.

4. *BOS BUBALUS SEMINUDUS* has small horns, compressed sideways, taper, sharp pointed, and standing backwards. The rump and thighs are naked, whence the epithet *seminudus*, half-naked. It is small, of the size of a Welsh runt. The hair on the fore part of the body is bristly, and so thin, that the skin appears. On the rump are two dusky perpendicular stripes, and on the thighs, two transverse.

VI. *BOS CAFER*, the Cape buffalo, inhabits the interior part of Africa, north of the Cape of Good Hope, but does not extend to the north of the Tropic. They are said to be greatly superior in size to the largest English ox: they hang their heads down, and have a most ferocious and malevolent appearance. They will lie quietly in wait in the woods, and rush suddenly on passengers, and trample them, their horses, and even oxen of draught, under their feet. They are also found in the interior parts of Guinea. Sparman, describing one that was shot, says, 'the entrails perfectly resembled those of an ox; but were much larger, and indeed gave us no little trouble in clearing them away; for the diameter of this creature's body was full three feet: the length eight feet, the height five and a half, and the fore legs two and a half long; the larger hoofs were five inches over; from the tip of the muzzle to the horns was twenty-two inches. This animal in shape, very much resembled the common ox; but the buffalo has much stouter limbs, in proportion to its height and length. Their fetlocks hang likewise nearer to the ground. The horns are singular, both in their form and position: the bases are thirteen inches broad and only an inch distant from each other; by which there is formed between them a narrow channel, in a great measure bare of hair. Measuring them from this, the horns rise up in a spherical form, with an elevation of three inches at most. In this way they extend over a great part of the head, viz. from the nape of the neck to the distance of three inches and a half from the eyes; so that the part from which they grow out, does not occupy a space of less than seventeen or twenty inches in circumference. From hence bending down on each side of the neck, and becoming more cylindrical by degrees, they form a curve, the convex part of which is turned towards the ground, and the point up in the air; which, however, at the same time is generally inclined backwards. The distance between the points of the horns is frequently above five feet; the color is black; and the surface, to within about a third part, measured from the base, is very rough and craggy, with cavities sometimes an inch deep. The eyes are somewhat sunk within their prominent orbits. This, together with their near situation to the bases of the horns, which hang somewhat over its pendant dangling ears, and its usual method of holding its head inclined to one side, gives the buffalo a fierce and treacherous aspect. His disposition corresponds with his countenance. He hides himself among the trees, and skulks there till somebody comes very near him, when he rushes out at once and attacks him. Not con-

tent with killing the person whom he attacks, he afterwards tramples upon him with his hoofs and heels, and with his horns and teeth tears to pieces and mangles the whole body, stripping off the skin by licking it with his tongue. Notwithstanding this, the buffalo will bear to be hunted; though sometimes he will turn and pursue his hunter, whose only dependence in that case is upon the swiftness of his steed. The surest way to escape is to ride up a hill, as the great bulk of the buffalo's body prevents him from being able to vie with the fine limbed horse in swiftness; though, on the other hand, the buffalo, in going down hill, gets on much faster than the horse. The flesh of the buffalo is coarse and not very fat, but full of juice, and of a high and not disagreeable flavor. The hide is thick and tough, and is in great request with the farmers for thongs and harness; being the only halters that can be depended upon for securing horses and oxen; so that they cannot get loose by snapping them asunder, which they are otherwise apt to do when the lions and wolves make their appearance in the neighbourhood.'

VII. *BOS GRUNNIENS*, or hog cow, has short, erect, sharp pointed, cylindrical horns, bent outwards. The body is so hairy, that the hair hangs down upon its knees like a goat. The color of the body is black, but the front is white. It has bristles on its back and hind-legs, and it grunts like a hog. The tail resembles that of a horse, and is covered with very long flowing silky hairs. It is an inhabitant of the north of Asia. Mr. Kerr enumerates four varieties of this species, viz. 1. *B. grunniens ecornis*: 2. *B. grunniens ferus*, the wild grunting ox: 3. *B. grunniens ghainouk*, a domesticated variety of the wild breed: 4. *B. grunniens sarlyx*, a degenerated race, not particularly described.

VIII. *BOS INDICUS*, the Indian ox, with all its varieties, are considered by Gmelin, as varieties of the *bos taurus*; but, as Mr. Kerr observes, 'many of them have such remarkable differences as would constitute, in other genera, sufficient marks for specific distinction.' They have a large fatty lump on the shoulders. They differ much in size and in the form of their horns. Some are very large, and of a reddish color; with horns short, and bending close to the neck, others very small, with horns almost upright, bending a little forward. The following are the chief varieties: 1. *B. Indicus major*, with short horns bending backward, inhabits India, Africa, and Madagascar: 2. *B. Indicus minimus*; it inhabits Surat, and is used to draw children in small carts: 3. *B. Indicus minor*, the zebu, or little Indian buffalo, with short erect horns turned a little forwards, and a lump on the shoulders. It is the common beast of burden in India.

IX. *BOS MOSCHATVS*, the musk ox of Hudson's bay, is about the size of a Scotch bullock; has a thick body and short legs. The horns are large, and are united at their origin in the skull; but immediately after, they fall down on each side of the crown of the head, then taper away small, the points turning up, and out. The horns of an old bull are about two feet in length, as well as in circumference, and weigh about thirty pounds each. The hair is black, and

grows to a great length; underneath which is a very fine ash-colored wool. The male only has the curious scalp; the female is covered with hair. They live in herds from thirty to eighty or a hundred. The bulls are very few in proportion to the cows. It is rare to see more than two or three full grown bulls with the largest herd; and from the number of males which at times are found dead, the Indians are of opinion that they kill each other in contending for the females at the rutting season.

X. *Bos PUMILUS*, the dwarf ox, has horns almost erect, which close at the base, recede in the middle, and approach at the points. It inhabits Africa, and was seen at Cairo by Belon, who says it came from Morocco. It is larger than a roe but less than a stag; has a thick neck, elevated shoulders, and short legs; the hair is brown and shining, and the tail is terminated by long and coarse hairs.

XI. *Bos TAURUS*, the domestic bull and cow, has cylindrical horns bent downwards, and loose dewlaps. The bull, or male, is naturally a fierce and terrible animal. When chafed, he has an air of sullen majesty, and often tears up the ground with his feet and horns. The principal use of the bull is to propagate the species; although he might be trained to labor, his obedience cannot be depended on. A bull, like a stallion, should be the most handsome of his species. He should be large, well made, and in good heart; he should have a black eye, and a fierce aspect; but an open front, a short head, thick, short, and blackish horns, and long shaggy ears; a short and straight nose, large and full breast and shoulders, thick and fleshy neck, firm reins, a straight back, thick fleshy legs, and a long tail well covered with hair. Castration remarkably softens the nature of this animal; it destroys all his fire and impetuosity, and renders him mild and tractable, without diminishing his strength; on the contrary, after this operation, his weight is increased, and he becomes fitter for the purposes of ploughing, &c. See Ox. The females of all those species of animals which we keep in flocks, and where increase is the principal object, are much more useful than the males. The cow produces milk, butter, cheese, &c. which are principal articles in our food, and besides answer many useful purposes in various arts. Cows are generally in season, and receive the bull from the beginning of May to the middle of July. Their time of gestation is nine months, which naturally brings the veal to our markets from the beginning of January to the end of April. However luxury has fallen upon methods of interrupting this natural course, and veal may be had almost every month in the year. Cows, when improperly managed, are very subject to abortion. In the time of gestation, therefore, they ought to be observed with more than ordinary care, lest they should leap ditches, &c. Neither should they be suffered to draw in the plough or other carriage. They should be put into the best pasture, and should not be milked for six weeks or two months before they bring forth their young. The cow comes to the age of puberty in eighteen months, but the bull requires two years; and it is better to restrain them till they

be full three years. From three to nine years these animals are in full vigor; but when older, they are fit for nothing but to be fed for the butcher. A milch cow, ought to be chosen young, fleshy, and with a brisk eye.

The criteria of a beautiful cow has been thus expressed.

She's long in her face, she's fine in her horn,
She'll quickly get fat, without cake or corn,
She's clear in her jaws, and full in her chine,
She's heavy in flank, and wide in her loin.

She's broad in her ribs, and long in her rump,
A straight and flat back, with never a hump;
She's wide in her hips, and calm in her eyes,
She's fine in her shoulders, and thin in her thighs.

She's light in her neck, and small in her tail,
She's wide in her breast, and good at the pail,
She's fine in her bone, and silky of skin,
She's a Grazer's without and a Butcher's within.

There is a great variety in the color of oxen. A reddish or black color is most esteemed. The hair should be glossy, thick, and soft; when otherwise, the animal is either not in health, or has a weakly constitution. The ox eats very quick, and soon fills his first stomach; after which he lies down to ruminate, or chew the cud. The first and second stomachs are continuations of the same bag, and very capacious. After the grass has been chewed over again, it is reduced to a kind of mash not unlike boiled spinnage; and under this form it is sent down to the third stomach, where it remains and digests for some time; but the digestion is not fully completed till it comes to the fourth stomach, from which it is thrown down to the guts. The contents of the first and second stomachs are a collection of grass and other vegetables roughly macerated; a fermentation, however, soon commences, which makes the grass swell. The communication between the second and third stomach is by an opening much smaller than the gullet, and not sufficient for the passage of the food in this state. Whenever then the two first stomachs are distended with food, they begin to contract, or rather perform a kind of reaction. This reaction compresses the food, and makes it endeavour to get out: now the gullet being larger than the passage between the second and third stomachs, the pressure of the stomach necessarily forces it up the gullet. The action of ruminating, however, appears to be in a great measure voluntary; as animals of this kind have a power of increasing the reaction of their stomachs. After the food undergoes a second mastication, it is then reduced into a thin pulp, which easily passes from the second to the third stomach, where it is still further macerated; from thence it passes to the fourth, where it is reduced to a perfect mucilage, every way prepared for being taken up by the lacteals, and converted into nourishment. What confirms this account of chewing the cud is, that as long as these animals suck, or feed upon liquid aliment, they never ruminate; and in the winter, when they are obliged to feed upon hay and other dry victuals, they ruminate more than when they feed upon fresh grass. Bulls, cows, and oxen, are fond of licking themselves, especially when lying at rest. But this practice

should be prevented as much as possible; for as the hair is an indigestible substance, it lies in the stomach or guts, and is gradually coated by a glutinous substance, which in time hardens into round stones of a considerable bulk, which sometimes kills them, but always prevents their fattening, as the stomach is rendered incapable of digesting the food so well as it ought. The age of these animals may be distinguished by the teeth and horns. The first fore-teeth fall out at the age of six months, and are succeeded by others of a darker color, and broader. At the end of sixteen months, the next milk teeth likewise fall out; and at the beginning of the fourth year all the fore teeth are renewed, and then they are long, pretty white, and equal: however, as the animal advances in years, they become unequal and blackish. The horns of oxen four years of age, are small, pointed, neat, and smooth, but thickest near the head: this thick part next season is pushed further from the head by a horny cylinder, which is also terminated by another swelling part, and so on (for as long as the ox lives, the horns continue to grow); and these swellings become so many annular knots, by which the age may easily be reckoned: but from the point to the first knot must be counted three years, and every succeeding knot only one year. The bull, cow, and ox, generally live about fourteen or fifteen years. Ox beef is very nourishing, and yields a strong aliment; the flesh of a cow when well fattened and young is not much inferior. Bull beef is hard, tough, and dry; for which reason it is not much used for food. Veal is well tasted, easy of digestion, and rather keeps the body open than otherwise. For the uses of the various parts of these animals, see Ox. The northern countries of Europe produce the best cattle of this kind. In general they bear cold better than heat; for this reason they are not so numerous in the southern countries. There are but few in Asia to the south of Armenia, or in Africa beyond Egypt and Barbary. America produced none of this species till they were carried there by the Europeans. But the largest are to be met with in Denmark, Podolia, the Ukraine, and among the Calmuc Tartars; likewise those of England, Ireland, Holland, and Hungary, are much larger than those of Persia, Turkey, Greece, Italy, and Spain; but those of Barbary are least of all. In all mountainous countries, as Wales, the Highlands of Scotland, &c. the black cattle are small, but hardy; and when fattened make excellent beef. In Lapland they are mostly white, and many of them want horns. The British breed of cattle, Mr. Pennant observes, has in general been so much improved by foreign mixture, that is difficult to point out the original kind of these islands. Those which may be supposed to have been originally British are far inferior in size to those on the northern part of the European continent; the cattle of the Highlands of Scotland are exceedingly small, and many of them, males as well as females, are hornless: the Welsh runts are much larger; the black cattle of Cornwall are of the same size with the last. The large breeds now cultivated through most parts of Great Britain, are either entirely of foreign extraction, or our own im-

proved by a cross with the foreign kind. The Lincolnshire kind derive their size from the Holstein breed; and the large hornless cattle that are bred in some parts of England, come originally from Poland. There are many varieties of this species: among which the following are mentioned by Mr. Kerr and Professor Gmelin. 2. *B. Taurus Abyssinicus*, the Abyssinian ox, has a hunch on its back, and the horns adhere to the skin only, and hang pendulous. It inhabits Abyssinia and other parts of Africa. 3. *B. Taurus Africanus*, the lant, is white and has elegant horns, slender legs and black hoofs. It inhabits Africa, and is swifter than most horses. The hide is said to be impenetrable by a bullet. Some reckon it a species of antelope. 4. *B. Taurus bison*, has horns reflected forwards, a hunched back and a long mane. It is white, and is supposed by Buffon to be the same with the bonasus and the ferus: but Gmelin ranks them as distinct. It is quite a different animal from the American bison. 5. *B. Taurus ferus*, the wild ox, inhabits the marshy woods of Poland, Prussia, and Lithuania. It is supposed to be the original stock of all the European domestic breeds. It has thick short horns, reflected forward, and a curly forehead. About 250 years ago there was found in Scotland a wild race of cattle, which were of a pure white color, and had, if we may believe Boethius, manes like lions. Mr. Pennant says, he cannot but give credit to the relation; having seen in the woods of Drumlanrig in North Britain, and in the park belonging to Chillingham castle in Northumberland, herds of cattle probably derived from the savage breed. The former appear to have been exterminated by the late duke of Queensberry. They had lost their manes, but retained their color and fierceness; they were of a middle size, long legged, and had black muzzles and ears; their horns fine, with a bold and elegant bend. They were wild as any deer; on being approached they would instantly take to flight, and gallop away at full speed; never mix with the tame species, nor come near the house, unless constrained to it by hunger in very severe weather. Frequent mention is made of our savage cattle by historians. One relates that king Robert Bruce was (in chasing one of these animals), preserved from the rage of a wild bull, by the intrepidity of one of his courtiers, from which he and his lineage acquired the name of Turnbull. Fitz-Stephen names these animals *uri sylvestres*, among those that harboured in the great forest, that in his time lay adjacent to London. Another enumerates among the provisions at the great feast of Nevil, archbishop of York, six wild bulls; and Sibbald assures us that in his days a wild and white species was found in the mountains of Scotland, but agreeing in form with the common sort. These were probably the same with the *bisontes jubati* of Pliny, found then in Germany, and might have been common to the continent and our island; the loss of their savage vigor by confinement might occasion some change in the external appearance, as is frequent with wild animals deprived of liberty; and to that we may ascribe their loss of mane. The urus of the Hercynian forest, described by

Cæsar (lib. vi.) was of this kind; the same which is called by the modern Germans, aurochs, i. e. bos sylvestris. 6. B. Taurus Madagascariensis, the boursy, or Madagascar ox, is of a large size, and white color, with pendulous ears, and a hunched back. It inhabits Adel and Madagascar.

BOSC (John du, lord of Esmandreville), president of the Court of Aids at Rouen, was one of the many martyrs to the protestant religion in France, during the bloody reign of Charles IX. Bayle gives him an excellent character. He was made counsellor and commissary of requests in 1554, and was promoted to the second presidency, January 26th, 1562; but was beheaded the 1st of November following, as one of the authors of the resistance of Rouen to the arms of the king. Le Laboureur says 'he was worthy of a better fate, having all the great qualities that are to be desired in an accomplished magistrate.' He wrote 1. Joannis Boschai Neustrii περί Δικαιογυμίας, De Legitimis Nuptiis; 2. A Treatise of the Number Seven; 3. De Numæ Pompilii Sacris, a work which gave great offence to the Catholics.

Bosc (Peter du), the greatest protestant preacher of his age, was the son of W. Du Bosc, advocate of Rouen, and born at Bayeux in 1623. He studied at Montauban and Saumur, and made such rapid progress, that in 1645 he was chosen minister at Caen. He was soon considered as a perfect orator, and was repeatedly pressed to accept of the church of Charenton, but he and the people of Caen were so fond of each other, that nothing but persecution could part them. This began in 1664, when he was confined to Chalons by a lettre de cachet, but was liberated soon after, and the joy of the people of all persuasions was so great upon his return, that even the Catholics rejoiced; and one gentleman made two Franciscan friars so drunk upon the occasion, that one of them died on the spot. The bishop of Chalons was particularly kind to him. In 1665 he began to signalise his prudence as well as his eloquence, in defending the protestant churches against persecutions. In 1666, the king having published a declaration against them, all the churches sent deputies to Paris; but the drawing up their memorials was committed by the rest to M. du Bosc, who was deputed from those of Normandy. In 1668 he alone had an audience of the king, wherein he succeeded so well, that some melioration was obtained. And Bayle observes, if it had been possible to save the reformed churches by negotiation he would have done it. But in 1685 he himself was interdicted; whereupon he went to Rotterdam, where he was minister till his death in 1692. He published several volumes of sermons; and after his death, his son-in-law, M. le Gendre published a valuable collection of his memoirs, requests, petitions, &c. relating to the churches, with his speeches, letters, and poems, in Greek, Latin, and French.

BOSCAGE, *n. s.* *Boscage*, Fr., wood or woodlands. The representation of woods.

We bent our course thither, where we saw the appearance of land; and, the next day, we might plainly discern that it was a land flat to our sight,

and full of *boscage*, which made it shew the more dark.

Bacon.
Cheerful paintings in feasting and banqueting-rooms; graver stories in galleries; landscapes and *boscage*, and such wild works, in open terraces, or summer-houses.

Wotton.

BOSCAGE, among painters, a landscape representing much wood and trees.

BOSCAGE, or BOSCAGIUM, in law, 1. food which trees yield to cattle; as mast, &c. Manwood says, to be quit of boscage is to be discharged of paying any duty for windfall wood in the forest. 2. A tax on wood.

BOSCAN (John), a Spanish poet of the sixteenth century, born at Barcelona. He was the friend of Garcilasso de la Vega, another Spanish poet. They were the first who made any great improvement in the poetry of their nation, and their pieces were printed together. Boscan, who died about A. D. 1542, principally succeeded in sonnets.

BOSCAWEN (Edward), a brave British Admiral, was the second son of Hugh, lord viscount Falmouth. Having early entered into the navy, he was, in 1740, captain of the Shoreham; and behaved with great intrepidity as a volunteer under admiral Vernon, at the taking of Porto Bello. At the siege of Cartagena, in March 1740-1, he had the command of a party of seamen, who attacked and took a battery of fifteen twenty-four pounders, though exposed to the fire of another fort of five guns; and was appointed to the command of the Prince Frederic of seventy guns. In May 1742 he returned to England, and married Frances, daughter of William Glanville, Esq. and the same year was elected representative for Truro. In 1744 he was made captain of the Dreadnought of sixty guns; and soon after took the Medea, a French man of war, the first king's ship taken in that war. May 3d 1747 he signalized himself under admirals Anson and Warren, in an engagement with the French fleet off Cape Finisterre, and was wounded in the shoulder with a musket-ball; the whole ten French ships of war were taken. On the 15th July he was made rear-admiral of the blue, and commander in chief of the land and sea forces employed on an expedition to the East Indies; and on the 4th of November sailed from St. Helen's, with six ships of the line, five frigates, and 2000 soldiers. On the 29th July, 1748, he arrived at St. David's, and soon after laid siege to Pondicherry; but the men growing sickly, and the monsoons being expected, the siege was raised, and he showed himself as much the general as the admiral in his retreat. Soon after, he received news of the peace, and Madras was delivered up to him by the French. In April 1750 he arrived at St. Helen's in the Exeter, and found that in his absence he had been appointed rear admiral of the white. He was the next year appointed one of the lords commissioners of the admiralty, and chosen an elder brother of the Trinity house. In February 1755 he was appointed vice-admiral of the blue. On the 19th April he fell in with and took the Alcide and Lys, of sixty-four guns each. In 1756 he was appointed vice admiral of the white; and in 1758 admiral of the blue, and

commander in chief of the expedition to Cape Breton; when, in conjunction with general Amherst, and a body of troops from New England, the important fortress of Louisbourg, and the whole island of Cape Breton, were taken, for which he afterwards received the thanks of the House of Commons. In 1759, being appointed to the command in the Mediterranean, he arrived at Gibraltar, where, hearing that the Toulon fleet, under M. de la Clue, had passed the Straits, to join that at Brest, he got under sail, and on the 18th of August engaged the enemy. His ship, the *Namur* of ninety guns, losing her mainmast, he shifted his flag to the *Newark*; and, after a sharp engagement, took three large ships, and burned two in Lagos Bay, and the same year arrived at Spithead with his prizes, and 2000 prisoners. On December 8th, 1760, he was appointed general of the marines, with a salary of £3000 per annum, and was also sworn one of the privy council. He died in 1761.

BOSCH (Jacob Vanden), a painter of still life, was born at Amsterdam in 1636. He painted summer fruits of various kinds, with such natural and transparent color, that they appeared delicious, and almost real. He died in 1676.

BOSCHAERTS (Thomas Willeborts), a celebrated painter, was born at Bergen-op-zoom; and when very young, exhibited decuried proofs of genius. He proved, under Gerard Segers, a most ingenious artist. Antwerp being at that time the seat of arts, he there executed such a number of noble pieces as added greatly to the splendor of that city. In 1642 Henry Frederic prince of Orange, and his son prince William, employed him in their service; and he painted portraits for most of the persons of quality then living. He died in 1670.

BOSCIAS, in ornithology, the common mallard, or wild duck, the specific distinction of which consists in the plumage being of a cinereous color; the tail-feathers recurved; bill strait; collar white.

Gmelin mentions several distinct varieties of this bird, in the *Syst. Nat.* the characters of which are described as follows:—*Cirrhata*, above gray, beneath white, crest cinereous; *Persica*, head and upper parts of the neck cinereous, beneath yellowish; major, back sooty. This is larger than the others, measuring two feet and a half in length; grisea, entirely cinereous, with the legs and bill black; *navia*, with the back black, spotted with yellowish; *nigra*, having the head and collar black.

In England only a small number of wild ducks are found in the summer; because, at that time, they remain in the more northern parts of Europe, and only return to us towards the winter. In France this species is not often seen till the winter; appearing in October, and again departing northward in the spring.

BOSCOVICH (Roger Joseph), a distinguished natural philosopher, was born at Ragusa, on the Adriatic, the 11th of May, 1711. Of the rank and circumstances of his parents, nothing has come down to us; and we are left to conjecture their condition in life from the education they gave to their son, which was both liberal and well directed. Boscovich, like many

others who have risen to eminence, did not display very marked tokens of ability at school; and even when he was sent to study philosophy under the Jesuits, who were, at that period, the principal guides of education in Italy, he seems to have attracted notice rather as a docile and regular youth, than as one from whom the sciences were destined to receive either cultivation or extension. In his fifteenth year he was admitted into that celebrated order, and was immediately sent to Rome, where he enjoyed great advantages as to the means of acquiring knowledge. Upon entering on the studies which were prescribed by the rulers of his fraternity, his mind received a new direction, but his assiduity and perseverance continued unabated; and after devoting two years to Christian ethics, and to the constitutions and rules of his order, he returned with avidity to extend his knowledge of the classics, and particularly of the structure and laws of Latin verse; an accomplishment which, at that time, was deemed essential to a perfect and elegant education. Having completed his novitiate, he was sent to the Roman college to study mathematics and physical science; and it was in these pursuits that his great talents first became conspicuous, and secured for him the admiration of his contemporaries. As a reward for his uncommon diligence and success, he was exempted from the operations of a statute by which novices were bound to teach Latin and the principles of composition, five years before entering upon the study of theology. In the theory of religion, however, he seems to have made very little progress. His mind was captivated with those researches only which led to the discovery of physical and mathematical truth; on which account, it is not surprising that his favorite authors belonged to the school of Newton, rather than those of Thomas Aquinas. His eminence, as a mathematical scholar, very soon pointed him out as the fittest person to fill the office of mathematical professor, in the Jesuit college at Rome. For this appointment he was, indeed, particularly well qualified, both by his knowledge of everything that modern science had effected, and also by his intimate acquaintance with the works of the ancient geometers. But his attention was not confined to the instruction of youth: he was already revolving in his mind some of those sublime and original conceptions which afterwards astonished the scientific world, and laid the foundation of his peculiar system of Natural Philosophy. In the public disputations, which were then practised in the schools, he advanced his opinions, with the view of ascertaining to what objections they were exposed, and also of deriving from the collision of kindred minds, whatever light could be thrown upon enquiries so far removed from the ordinary walks of human thought. While he performed the arduous duties of his professorship, he published tracts upon the following very important and difficult subjects:—*The Transit of Mercury*; *The Spots in the Sun*; *The Aurora Borealis*; *The Construction of Spherical Trigonometry*; *The Figure of the Earth*; *The Ancient Arguments for the Rotundity of the Earth*; *A New Telescope to Determine Celestial Objects*; *Oscilla-*

ting circles; on Infinites, and Infinitely little Quantities; the Motion of Bodies in Unresisting Spaces; the Aberration of the Fixed Stars; the Inequalities in Terrestrial Gravity, in Astronomy; on the Limits of Certainty in Astronomical Observations; on the Solid of Greatest Attraction; the Cycloid; the Logistic Curve-lines; the Vires Vivæ; the Comets; Light; Tides; the Rainbow; the Calculation of Fractions, the Moon's Atmosphere; the Centre of Gravity; the Law of Continuity; Lenses and Dioptrical Telescopes; the Objective Micrometer; and the Divisibility of Matter. The variety and depth of the investigations constitute the strongest evidence that could possibly be advanced, in proof of the great industry and transcendent acquirements of Boscovich. Nor did his reputation fail to keep pace with his learning; for he was already known and admired over the greater part of Europe. Universities and other learned bodies conferred on him the highest marks of their esteem; and his presence was deemed an honor at the courts of princes. Pope Benedict XIV. and John V. king of Portugal, consulted him on architecture, hydrodynamics, and similar subjects; and he was employed to correct the topography of the papal states, and to measure a degree of the meridian there. But it was not only as a man of science that Boscovich stood high in the estimation of the world; he was also consulted and employed in a diplomatical capacity. He was commissioned by the senate of Ragusa to repair to London, to remove certain suspicions on the part of the British government, relative to some ships of war which were said to be fitting out in their port for the service of France, and was received by the learned in this country with a respect becoming his well-earned fame. In return for the attention shown to him by the Royal Society, he addressed to them an elegant Latin poem on the solar and lunar eclipses. He could not, however, comply with their invitation to join the members of that learned body who went to America in 1762, to observe the transit of Venus over the sun's disk. Upon his return to his native country he was appointed to be mathematical professor in the university of Pavia, and to superintend the astronomical observatory in the Royal College of Brera. After six years residence in this situation, he was preferred, by the empress queen, to the chair of astronomy and optics in the palatine schools of Milan: and here he might have ended his days in affluence and tranquillity, but for that signal and striking visitation which soon after befel the order of which he had taken the vows.

The extensive influence of the Jesuits had long rendered them objects both of suspicion and fear, even among the best consolidated states of Europe. During the early part of the last century, their power was gradually undermined, and their members were treated with hostility, even by those who professed the warmest attachment for the Romish communion, and supported the other monastic societies. In 1773, accordingly, an edict was procured for demolishing the society of Jesuits; and, so strictly was it executed, that no exemption was afforded to the most eminent or respected of that celebrated brotherhood: all were proscribed, and stripped

of office and emolument; and Boscovich himself was obliged to seek refuge in the city of Paris. He was, indeed, appointed by the French government to be one of their directors of optics for the sea service, and received a pension; but he does not seem to have enjoyed much happiness in that country, or to have regarded his situation in any other light than that of a wretched dependence upon the generosity of rulers, who had been very active in creating the distress which compelled him to accept of it. His manners were naturally grave, and his temper somewhat irritable; while the painful reflection, that the Jesuits were no more, and that his own consequence was involved in their ruin, contributed not a little to embitter his life, and to render his society less agreeable to the gay and volatile people among whom he sojourned. After a residence of ten years, accordingly, he solicited leave to return to his native country; and, arriving at the city of Bassano, he published, in five vols. 4to, a collection of the Works which he had written at Paris. Upon leaving Bassano, he directed his course to Rome, to visit several distinguished persons who had been the companions of his youth, and were now the sharers of that contempt and suspicion which were everywhere pointed against their fallen order. He then proceeded to Milan, where he revised some of his own works, and also prepared for the press the poems of the celebrated Benedict Stay, who had written several volumes in Latin verse on the philosophy of Descartes. While thus employed, however, and enjoying the society of those friends to whom early affection and a common grief had engaged his heart, his leave of absence from Paris, which was limited to two years, drew to a close; and it thus became necessary either to return to the duties of his office, or to give in his resignation. He preferred the latter. He could not tear himself from the bosom of those who alone were able to amuse the languor of advancing age; and, although he was not insensible to the kindness of the French government, he came to a firm determination to withdraw himself from their patronage, and to relinquish every claim upon their attention. His life was now rapidly approaching its end. He had been some time subject to attacks of the gout; and other infirmities now pressing upon him, completely overcame his constitution, both in body and mind; and this distinguished and illustrious philosopher sunk into hopeless fatuity. After lingering five months in this melancholy condition, death terminated his existence, on the 13th of February, 1787, in the seventy-sixth year of his age. We would willingly, did our limits permit, exhibit an outline of the *Theoria Philosophiæ Naturalis* of Boscovich, but we must rest satisfied with a few general observations on its leading principles and object. It holds so much of the Leibnitzian hypothesis, as to teach, that the elements of matter are simple and unextended; but it departs from it, in denying the continued extension of these elements, and in asserting that they are perfectly homogeneous. With Newton, Boscovich maintained the existence of mutual forces or powers, which vary, according to the distance, by certain laws; but

he went further, in asserting that these powers are both repulsive and attractive, and that when either of these terminates the other begins. The theory of the *Philosophia Naturalis* seems to embrace, as its first principles, the following views—that the primary elements, or atoms of matter, are indivisible, unextended, simple, homogeneous, and finite in number; that they are dispersed in an immense space, in such a manner that their distance from each other may extend to any assignable interval; that this interval may be indefinitely enlarged or diminished, but cannot entirely vanish. From this doctrine it follows, that the contact of one atom with another is utterly impossible, because the greatest force with which the one could approach the other, could not overcome that repulsive power which prevents the vanishing of the interval which subsists between all individual elements of matter. This is indeed tantamount to the assertion, that the attractive power can never overcome the repulsive; but as it is impossible to explain this doctrine without the aid of diagrams, we shall not enter into it. On the subject of light, Boscovich adheres to the opinions of Newton, that it is an efflux or radiation of matter from the sun, propagated with immense celerity, and entering into certain bodies, from which it may be extricated by chemical analysis. Agreeably to this general doctrine, he maintains, that although the atoms of light are inconceivably numerous, they are still finite in number; and in explaining the wonderful properties with which the matter of light is connected, he calls in, with considerable success, the application of his principle relative to repulsion. His notions of electricity coincided with those of Franklin, which he reduces very ingeniously to the fundamental principles of his theory; and we are not certain but some of the late discoveries, by means of electrical energies, lend a considerable degree of support to the speculations of Boscovich. We may mention, in concluding, that our author also attempted to explain sensation on the principles of his philosophy, and arrived at conclusions similar to those of the Hartleian hypothesis, with respect to the vibrating motion of the nervous and cerebral matter as the organ of sense. It is enough, however, to have mentioned it; for every new attempt of this kind has only proved more convincingly, that the subject is placed at an immeasurable distance beyond the reach of human investigation.

BOSEA, Golden-rod Tree: a genus of the digynia order, and pentandria class of plants: *CAL.* is pentaphyllous; there is no corolla, the berry monospermous. Of this genus there is but one species, viz.: *B. yervamora*. It is a native of the Canary and Caribbee islands. It has been long an inhabitant of the British botanic gardens, but has never been observed to flower in this country. A strong woody shrub, the branches come out very irregular, and make considerable shoots every summer, which should be shortened in spring.

BOSIMEN, **BOSHUANAS**, **BOSJESMANS**, or **BUSHMEN**, a species of Hottentots, so called, according to Sparman, from their dwelling in woody or mountainous places. They were compa-

ratively unknown to Europeans till visited by Mr. Trutter and Mr. Somerville, whose observations were given to the public by Mr. Barrow, in the appendix to his voyage to Cochinchina. Since that time several narratives of journeys amongst them have been published. Their territory is stated by Lichtenstein to extend from the twenty-fifth to the twentieth degree of south latitude, thirty or forty days journey north from the river Kuruhman. They are evidently of the same original stock with the Caffres, but somewhat altered; inferior in bodily strength and stature, they surpass them in civilisation and in the arts of life. Their towns are of considerable magnitude. Leetakoo was estimated by its first visitors to contain from 10,000 to 15,000 inhabitants; and though it has suffered by intestine broils, it seems still to contain 7000 or 8000. This city is the capital of the Matchappin tribe, the only one among the Boshuanas yet visited by Europeans. Beyond them are the Wanketzens, said to be more numerous, and their agriculture more improved, but they seem to be ferocious and treacherous. The Chojas, the Marootzees, and the Morolongs, are also mentioned as powerful and numerous tribes. The race seems to improve as it extends northwards, since the Macquanas, the most remote, are also the most numerous and most advanced in the arts. Mr. Salt supposes them to be the same who are called by the Portuguese, Makooanas, and who inhabit immediately in the interior from Mosambique. It was through them accordingly that the inhabitants of Leetakoo had first heard of white men.

The Bosjesmans are a species of Hottentots, who, although they do not live within the colony of the Cape, have been, and appear but too likely to be, long connected with its history and interests. Their name is connected with their habits, and derived, according to some writers, from their usual mode of attack, that is, from behind the thickets or bushes of the country: a great part of their lives is certainly occupied in predatory excursions. Mr. Campbell having asked one of a remote tribe 'for what end man was made!' the answer was, 'for plundering expeditions.' They neither rear cattle nor cultivate the ground; but subsist, when at home, on the larvæ of ants and locusts, which they are very dexterous in securing, the bulbs of the iris, and a few graminaceous roots.

They speak a dialect of the same language as the common Hottentot, but are singularly opposed to him in the general vigor of their character. No human being can be more active and cheerful than the Bosjesmans; they emulate the antelope of their favorite fastnesses in agility, and a horse is not able to keep up with them over hilly, or even rough ground. In the day-time they confine themselves to the huts of their kraals, lest the boors should surprise them, and from 180 to 200 will thus herd together in the remote districts of the colony; but they will often dance the night entirely away, especially at the approach of summer.

Their kraals are composed of distinct huts, about three feet high and four wide, made of two mats, one of which is bent semicircularly

between two sticks, and left open before, the other closes the hut behind. In the centre the Bosjesman hollows a little circle to hold a whip of straw, on which he sleeps, coiled round some favorite domestic or hunting animal. When on their expeditions, however, the loftiest chasms of the mountains are their chosen retreats. Mr. Barrow observed the sides of some of these caverns to be ornamented with various sketches of animals, drawn with great truth and spirit. The upper part of the cave was completely covered with a black paint of a pitchy, bituminous character, supposed to be the poison used by the tribe. The weapons which they carry are a small hassagai, uniformly dipped in poison, and a bow and arrows of inferior size. From childhood they are inured to these weapons; and the boys of a kraal have their bows and well-furnished quivers. In these the men carry from seventy to eighty arrows at a time, with sticks to procure a fire by friction; their poison and poison brush; pieces of red ochre and iron; and shafts to repair their stock of arrows.

In stature the Bosjesmans are exceedingly diminutive; the men measuring only from four feet six, to four feet nine inches in height; and the women not more than four feet four inches. Their personal appearance is extremely forbidding. The high cheek-bones, rounded eye-lids, and flat nose, of the Hottentots are thrown into a hollow visage, in which the chin is very prominent, and a sharp rolling eye, gives a sort of ferocious intelligence to the whole. The men have no dress whatever, and the women only a Hottentot belt round the waist, of which the apron is cut in front into threads; they wear caps on their heads, and all the trinkets they can procure suspended from their tufts of hair about the neck. The men ornament themselves with a piece of wood or porcupine's quill suspended to the nose.

They practice bigamy; the elder men generally having one young wife, and another who is past child-bearing. The projection of the posterior part of the female in these tribes is still more monstrous than in the Hottentot women. If the letter S, it has been wittily observed, be considered as the one expressive of the line of beauty, to which degrees of approximation are admissible, the Bosjesman women are entitled to the first rank in point of form. A section of the body, from the breast to the knee, seems, in fact, the very shape of that letter. It is not to be forgotten, however, that the women of neither of these races are in any situation to check such a singular mode of growth, or to feel its awkwardness; and it may be questioned whether many of the laboring females in this country, are not as widely different in the general shape of their persons, from the higher ranks, who dress tighter and more carefully, as these women are from them. They also possess the other sexual peculiarity of the Hottentot female, which wholly disappears in both cases, on their marriage with an European.

In their dispositions, seen under every circumstance of provocation, and for ages goaded by the bad treatment of the Dutch, the Bosjesmans are sanguinary and wantonly destructive.

'Should they seize a Hottentot,' says Mr. Barrow, 'guarding his master's cattle, not contented with putting him to immediate death, they torture him by every means of cruelty that their invention can frame; as drawing out his bowels, tearing off his nails, scalping, and other acts equally savage. Even the poor animals they steal are treated in a most barbarous and unfeeling manner; driven up the steep sides of mountains, they remain there without any food or water, till they are either killed for use, or drop for want of the means of supporting nature.'

When a horde is surrounded by the farmers, and little chance is perceived by them of effecting their escape, they will fight it out most furiously, as long as a man shall be left alive. It frequently happens, on such occasions, that a party will volunteer the forlorn hope, by throwing themselves in the midst of the colonists, in order to create confusion, and to give to their countrymen, concealed among the rocks, or in the long grass, at the expense of their lives, an opportunity of exercising more effectually their mortal weapons upon their enemies, and at the same time to facilitate the escape of their wives and children. Their plundering expeditions are conducted not without system. If in carrying off their booty they should chance to be pursued, they always divide; one party to drive away the cattle, while the other continues to harass the pursuers; and when the peasantry prove too many for them, they stab and maim the whole herd with poisoned weapons. On all such plundering expeditions, they carry, in addition to their bows and arrows, lances that resemble the Kaffre's hassagai, but of a much smaller size, and always dipped in poison. Their bows are remarkably small, and, in the hands of any one but a Bosjesman, would be entirely useless. From their earliest infancy they accustom themselves to the use of the bow; all the little boys who came to us at the kraal, carried their bows and small quivers of arrows. A complete quiver contains about seventy or eighty, made like those of the Hottentots; and, in addition to these, a few small brushes to lay on the poison; pieces of iron, red ochre, leg bones of ostriches cut in lengths and rounded, and two little sticks of hard wood to produce fire. This is done by placing one horizontally on a piece of withered grass, and whirling the other vertically between the hands, with the point acting in a hollow place, made in the surface of the former. In a few seconds of time, the velocity and friction set the grass in a blaze.' See *An Account of the Cape of Good Hope*, 8vo.

BOS'KY, *adj.* Fr. *bosquet*, woody.

And with each end of thy blue bow dost crown
My *bosky* acres, and my unshrubb'd down. *Shakspeare.*

I know each lane, and every valley green,
Dingle, or busby dell, of this wild wood,
And every *bosky* bourn from side to side. *Milton.*

BOSMAIFE, an island of Russia, in the province of Astracan, ten miles below the city. See ASTRACAN.

BOSNA SERACNO, BOSNA SERAI, or SERAI, a large town of Turkey, the capital of Bosnia, 110 miles south-west of Belgrade. It is generally garrisoned by Janissaries, and is surrounded by thick

turretted walls connected by an old citadel. Altogether they mount eighty pieces of cannon. Here are manufactures of lances, daggers, and other arms, in which is the chief trade. There are perhaps 500 Catholic and 100 Greek families interspersed among a population of 12,000. The town is an appanage to the mother of the sultan. Eastward are extensive fertile plains.

BOSNIA, a province of Turkey in Europe, bounded on the north by Slavonia, on the east by Servia, on the south by Albania, and on the west by Croatia and Dalmatia. It belongs entirely to the Turks: but they were on the point of being expelled from it by the Christians, when the Spaniards invaded Sicily, and obliged the emperor to conclude the peace of Passarowitz in 1718, by which he gave up Bosnia to the Turks. It is 200 miles long and 75 broad, containing about 13,200 square miles. Though mountainous, it contains fruitful spots, especially in the north. The breed of cattle is excellent, and the wool little inferior to that of Spain. Many of the sheep are sent to fatten on the banks of the Adige in Italy. Here are considerable iron mines, and some few of gold and silver. The inhabitants (Bosniacks) are of Slavonian origin, and use the purest dialect of the Slavonian language. They are generally of the Greek religion, but Mahommedanism is not uncommon, the towns being mostly inhabited by Turks. The total number of native inhabitants does not exceed 80,000; that of the Turkish militia is estimated at 50,000.

In ancient times the name of Bosnia was Pannonia Inferior; in the middle ages it had its own governors, who were vassals of the sovereign of Hungary; but in the wars between that power and the Turks, the latter succeeded in rendering Bosnia tributary. It continued so till 1463, when Stephen V. the last king of the country, was taken by Mahomet II. and flayed alive, after which his dominions were incorporated with the Turkish empire. The modern province is of greater extent than the ancient kingdom, and is divided into Upper and Lower; the whole forms the government of a pacha, under whom are eight deputy governors called sandgiaks. Lower Bosnia is made up of the above kingdom, and is divided into the three sandgiaks of Banjaluka, Orach, and Bosna-Serajo, so called from their chief towns. The last is the capital of the country, although the pacha has his seat at Travnik. Upper Bosnia (otherwise called from the river of that name the kingdom of Rama) consists of portions of Croatia and Dalmatia, with the province of Herzogovina, or duchy of St. Saba.

BO'SOM, <i>v. & n.</i>	Ang.-Sax. <i>bosome</i> ;
BO'SOM-FRIEND,	Dutch, <i>boesem</i> ; Germ.
BO'SOM-PARTNER,	<i>busem</i> ; Junius derives
BO'SOM-INTEREST,	it from <i>bow</i> , <i>boekw</i> , I
BO'SOM-LOVER,	feed; I nourish. Skin-
BO'SOM-SECRET,	ner and Wachter from
BO'SOM-VICE,	the French <i>poser</i> , for
BO'SOM-CHEAT,	reposer, to rest; to
BO'SOM-SLAVE,	lean upon; because
BO'SOM-BARRIER.	infants rest and repose

upon the bosom. These appear, however, unsatisfactory to the etymologist in the *Ency. Met.*, and, with his usual research and acumen, he

has suggested what is ingenious, if not conclusive: as we already owe him so much, we shall, without scruple, lay him under further contributions. 'Those,' says he, 'whose ears are accustomed to the change of letters, will easily understand that *bosm* may arise from *fæthm*, and this *fæthm* from *fassen*, *fatten*, to seize; to embrace. In this uncertainty a new attempt to trace the word may be allowed. In Ang.-Sax. we have *bu-gan*, to bow; *bugsum*, *buhsum*. Hence, perhaps, *bosome*. In Dutch, *booghen*, to bow; *boogsæm*. Hence, perhaps, *boesem*. In German, *beugen*, to bow; *beugsam*; and hence, perhaps, *busem*. In confirmation it may be remarked, that the Latin *sinus*, and the Greek *κολπος*, are the bosom, and also a bay or bow. Bosom then may be so called from its form or shape; bowing; bending; curving; arching. It is also applied to that within, or beneath the bosom; as the heart; the feelings or passions; the affections; the desires of the heart: to bosom; to store; to treasure up in the bosom; to seat or fix deeply. The bosom of the deep, the bending surface of the deep; a bosom-friend, a friend of our affections; a friend affectionately beloved; entrusted with all the secrets of our bosom; the depository of our feelings and affections, and so of the other compounds.' *Ency. Met. Art. Bosom*.

And this chanon toke out a crosselet
Of his *bosome* and shewed it to the preest.

Chaucer's Cant. Tales.

Soone her garments loose
Upgathering, in her *bosome* she comprized,
Well as she might, and to the goddesse rose;
Whiles all her nymphes did like a girlond her enclose.

Spenser.

There with thy daughter Pleasure they doe play
Their hurtlesse sports, without rebuke or blame,
And in her snowy *bosome* boldly lay
Their quiet heads, devoid of guilty shame.

Id.

Unto laws thus received by a whole church, they which live within the *bosom* of that church, must not think it a matter indifferent, either to yield, or not to yield, obedience.

Hooker.

Bosom up my counsel,
You'll find it wholesome.

Shakspeare.

Our good old friend,
Lay comforts to your *bosom*; and bestow
Your needful counsel to our businesses.

Id.

If you can pace your wisdom
In that good path that I could wish it go,
You shall have your *bosom* on this wretch.

Id.

This Antonio,
Being the *bosom-lover* of my lord,
Must needs be like my lord.

Id.

Whose age has charms in it, whose title more,
To pluck the common *bosoms* on his side.

Id.

No more that Thane of Cawdor shall deceive
Our *bosom-interest*; go, pronounce his death.

Id.

Those domestic traitors, *bosom-thieves*,
Whom custom hath called wives, the readiest helps
To betray the heady husbands, rob the easy.

Ben Jonson.

So have I often seen a purple flower,
Fainting through heat, hang down her drooping head,
But soon refreshed with a welcome shower,
Begins again her lively beauties spread,
And with new pride her silken leaves display;
And while the sun doth now more gently play,
Lays out her swelling *bosom* to the smiling day.

Fletcher's Purple Island.

I do not think my sister so to seek,
Or so unprincipled in virtue's book,
And the sweet peace that *bosoms* goodness ever.

Milton.

Towers and battlements it sees,
Bosomed high in tufted trees,
Where perhaps some beauty lies,
The cynosure of neighbouring eyes.
To whom the great Creator thus replied :
O son, in whom my soul hath chief delight,
Son of my *bosom*, Son who art alone
My word, my wisdom, and effectual might !

Id.

Id. *Paradise Lost*.

The fourth privilege of friendship is that which is here specified in the text, a communication of secrets. A *bosom-secret*, and a *bosom-friend*, are usually put together.

South.

I feel death rising higher still and higher
Within my *bosom* ; every breath I fetch
Shuts up my life within a shorter compass.

Dryden's Rival Ladies.

He sent for his *bosom-friends*, with whom he most confidently consulted, and shewed the paper to them ; the contents whereof he could not conceive.

Clarendon.

From jealousy's tormenting strife
For ever be thy *bosom* freed.
She, who was a *bosom-friend* of her royal mistress, he calls an insolent woman, the worst of her sex.

Prior.

Addison.

To happy convents, *bosomed* deep in vines,
Where slumber abbots, purple as their wines.

Pope.

No further seek his virtues to disclose,
Or draw his frailties from their dread abode ;
There they alike in trembling hope repose,
The *bosom* of his father and his God.

Gray.

The only art her guilt to cover,
To hide her shame from every eye,
To give repentance to her lover,
And wearing his *bosom* is—to die.

Goldsmith.

Not the soft sighs of vernal gales,
The fragrance of the flowery vales,
The murmurs of the crystal rill,
The vocal grove, the verdant hill,
Not all their charms, though all unite
Can touch my *bosom* with delight.

S. Johnson.

Reply not—tell not now thy tale again ;
Thou lov'st another—and I love in vain ;
Though fond as mine her *bosom*, form, more fair,
I rush through peril which she would not dare.

Byron's *Corsair*.

BO'SON, *n. s.* corrupted from boatswain.

The barks upon the billows ride,
The master will not stay ;
The merry *boson* from his side
His whistle takes, to check and chide
The lingering lads' delay.

Pope.

BOSPHORICUM MARMOR, a name given by the ancients to a species of marble, of a yellowish white colour, with beautiful veins of a somewhat darker hue ; called also, from its transparency, phengites.

BOSPHORUS, or BOSPORUS, from *βους*, a bullock, and *πορος*, passage ; in ancient geography, a long and narrow sea, which it is supposed a bullock may swim over. In a more general sense, it is a long narrow sea running in between two lands, or separating two continents, and is chiefly confined to two straits in the Mediterranean sea, viz. 1. Bosphorus Cimmericus, or the Scythian Bosphorus, so named from its resemblance to the Thracian ; and, 2. Bos-

phorus Thracius, the Thracian Bosphorus, now commonly called the Straits of Constantinople, or the Channel of the Black Sea, the strait through which the Black Sea pours its waters into the Propontis, or Sea of Marmora. It is called Bogaz by the Turks, and divides Europe from Asia. It is about a mile broad, between Constantinople on the European side, and Scutari on the Asiatic. Tournefort supposes the name to have arisen from the ox market being held near this strait.

BOSQUET (Francis), a learned prelate of France in the seventeenth century, was born at Narbonne, and studied at Toulouse. Before he took orders he had been intendant of Guienne and Languedoc, attorney-general of Normandy, and counsellor of state. In 1648 his friend John de Plantavit resigned his bishopric of Lodeve to him. In 1655 he was made bishop of Montpelier, and continued so till his death, in his sixty-third year, A. D. 1676. His works were, 1. A History of the Gallican Church ; 2. History of the Eight Popes who resided at Avignon ; from 1300 to 1394 : 3. The Liberties of the Gallican Church : and, 4. Notes on the Canon Law.

BOSQUETS, in gardening, from *boschetto*, Ital. a little wood ; groves or compartments in gardens, formed by branches of trees disposed either regularly in rows, or wildly and irregularly, according to the fancy of the owner.

BOSS, *v. & n.* ' *Bosse*, Fr. from *pusa*, Bos'SED, } which is formed from *φύσα*, Bos'SY. } *φύσσω*, *inflo* ; *φύσα*, *pusa*, *busa*, *bussa*, *bosse*. From *pusa* the Latins formed *pusula*, *pustula* (a *pustule*). *Menage*. ' *Bosse*, *bokeler*, shield, or the knoll of a hill.' *Kilian*, *Bosseln*, to push out ; to force ; to protrude.—*Wachter*. ' *Boss*, res quasi extumescens ; any thing rising up.—*Skinner*. A *boss* is, therefore, any thing rising or raised up ; swollen ; projecting ; thrusting ; or pushing forth.' *Ency. Met*. ' An ornament raised above the rest of the work ; a shining prominence ; protuberances on ancient bucklers or bridles.

Johnson.

He runneth upon him, even on his neck, upon the thick *bosses* of his bucklers.

Job xv. 26.

A *broche* she bare upon hire low colere,
As brode as is the *bosse* of a bokelere.

Chaucer. *Canterbury Tales*.

And on her shoulder hung her shield, bedeckt
Upon the *bosse* with stones that shined wide,
As the faire moone in her most full aspect ;
That to the moone it mote be like in each respect.

Spenser.

True is that I at first was dubbed knight
By a good knight,—the knight of the red-crosse ;
Who, when he gave me armes in field to fight,
Gave me a shield, in which he did endosse
His deare Redeemer's badge upon the *bosse*.

Id.

What signifies beauty, strength, youth, fortune, embroidered furniture, or gaudy *bosses* ?

L'Estrange.

This ivory, intended for the *bosses* of a bridle, was laid up for a prince, and a woman of Caria or Mæonia dyed it.

Pope.

A *boss*, made of wood, with an iron hook, to hang on the laths, or on a ladder, in which the labourer puts the mortar at the hitches of the tiles.

Moxon.

If a close appulse be made by the lips, then is framed M ; if by the *boss* of the tongue to the palate, near the throat, then K.

Holder.

There they formed

Their ardent virtues: in the bossy piles,
The proud triumphal arches; all their wars,
Their conquests, honours, in the sculptures live.
Dyer's Ruins of Rome.

BOS'SAGE, *n. s.*, in architecture, any stone that has a projecture, and is laid in a place in a building to be afterwards carved. Rustic work, which consists of stones, which seem to advance beyond the naked of a building, by reason of indentures or channels left in the joinings: these are chiefly in the corners of edifices, and called rustic quoins.

BOSSE, a glass bottle, used in the French artillery, very thin, and containing four or five pounds of powder. Round the neck four or five matches are hung, after it has been well corked; a cord, two or three feet in length, is tied to the bottle, which serves to throw it. The instant the bottle breaks, the powder catches fire, and everything within the immediate effects of the explosion is destroyed or injured.

Bosse (Abraham), an able engraver, born at Tours, well skilled in perspective and architecture. He wrote two treatises, which are esteemed: the one on the manner of designing, and the other upon engraving.

BOSSEIA. In botany, a genus of plants, class diadelphia, order decandria; *cal.* two-lipped, the upper lip heart-shaped; legume pedicelled, compressed, many-seeded. One species only, *B. petrophylla*; a New Holland shrub.

BOSSU (René le), born at Paris in 1631, was admitted a canon regular in the abbey of St. Genevieve in 1649; and, after a year's probation, took the habit. He taught literature with great success in several religious houses for twelve years. He then published a parallel betwixt the principles of Aristotle's natural philosophy, and those of Des Cartes, with a view to reconcile them; which was but indifferently received. His next treatise was on epic poetry; which Boileau declared one of the best compositions on that subject in the French language, and which produced a friendship between them. He died in 1680, and left a great number of MSS.

BOSSUET (James Benigne), bishop of Meaux, was born of an ancient family at Dijon, in 1627. He was placed, while young, under the care of the Jesuits, who, on the discovery of his abilities, sought to gain him for their order; he was removed to Paris, and entered at the college of Navarre; and in 1652 took his degrees in divinity. He afterwards went to Mentz, where he was made a canon. Here he applied himself to the study of the Scriptures and the fathers, especially of St. Augustin; until, becoming a celebrated preacher, he was invited to Paris, and appointed to preach before the king. He was particularly celebrated for his funeral orations. At court he maintained an unusual dignity and independency of character; and, without any solicitation on his part, was created bishop of Condom, a dignity which he resigned in 1670, on being appointed preceptor to the dauphin. In this situation he wrote for his pupil his celebrated Discourse on Universal History. When the prince's education was completed, Louis XIV. raised him to the see of Meaux, and appointed him counsellor of state,

and almoner to the dauphiness and duchess of Burgundy. He was also made a member of the French Academy and superior of the Royal College of Navarre. The leisure which he now enjoyed, was devoted to the defence of the Catholic church, both against infidels and Protestants; and some years before his death he retired to his diocese, and devoted himself to the duties of his functions there. While thus engaged he died in 1704, at the age of seventy-seven. His Exposition of the Roman Catholic Faith, addressed principally to Protestants, was nine years waiting the approbation of the pope. The points on which he chiefly lays stress, are the antiquity and unity of the churches, and the accumulated authorities of fathers, councils, and popes. He was ably answered by Claude and other ministers of the French Calvinists, as also by archbishop Wake, who, in his Exposition of the Doctrine of the Church of England, exposes the management and artifice used in the suppression and alteration of Bossuet's first edition. This great ornament of the French church was zealous for the re-union of the churches, but nothing was to be yielded as a matter of right. He was not an advocate for the infallibility of the pope, or for his assumed right of deposing kings. On the contrary, he resisted these doctrines with energy, and lost a cardinal's hat by opposing Innocent XI. in claims contrary to the independence of the crown and clergy of France. But though a profound enemy to persecution, he raised no remonstrances against the cruel treatment of the Hugonots by Louis XIV.

BOSTANGI BASCHI, or chief gardener, in the Turkish affairs, an officer who has the superintendence of the gardens, water-works, and houses of pleasure, with the workmen employed therein, one of the most considerable posts in the Turkish court.

BOSTON, a corporation and market town of Lincolnshire, which sends two members to parliament, is commodiously seated on both sides of the Witham, over which it has a cast-iron bridge, newly erected, and, being near the sea, enjoys a good trade. Its name is an abbreviation of Botolph's town, from Botolph, a Saxon, who had a monastery here, and is supposed to have been its founder. It had formerly, besides St. Botolph's monastery, a priory, four friaries, and three colleges, whose lands Henry VIII. gave to the town. It had likewise two churches, St. John's and St. Botolph's; the former of which has long since gone to decay, and not the least remains of it are now visible; the church-yard is however used as a burying-ground. St. Botolph's church is a handsome structure of the ornamented, pointed architecture, and is the largest parochial church known without cross aisles, being 300 feet long within the walls, and 100 feet wide. It is ceiled with English oak, supported by tall slender pillars; it has 365 steps, fifty-two windows, and twelve pillars, answerable to the days, weeks, and months of the year. Its tower, the highest in Britain, was begun to be built in the year 1309, and is 232 feet from the level of the river, having a beautiful octagon lantern on the top, which is a guide to mariners as they enter the dangerous channels of Lynn and Boston Deepes;

and may be seen forty miles round the country. The architecture of the whole is light, yet magnificent. The interior is furnished with a good organ, a clock with chimes, and eight bells.

The market-place is spacious, and is ornamented by a handsome market cross, in which is a good chamber appropriated to the purposes of corporation meetings, card assemblies, &c. Here is also a handsome theatre, with generally a good company of actors. Among the charitable foundations are, a free grammar-school, two charity schools, a general dispensary, and two national schools on Bell and Lancaster's plan. It has also a neat theatre. Here are, besides, several places of religious worship for dissenters; the town, of late, has been much extended, and considerably improved by lighting, paving, and cleansing the streets, deepening the river, and enlarging the harbour. The public libraries and news-rooms are well supported and furnished; the market-place is spacious, and is ornamented with a handsome cross, and commodious assembly-room. In the reign of Henry I. a gang of desperadoes, who came to the fair in the disguise of monks and priests, set fire to Boston; but by its thriving trade it soon recovered the damage sustained. The Hans-Towns established a guild for wool here, but when the prohibition on the importation of wool was passed, the trade gradually declined: however, the enclosures of late years, and its navigation, have again revived its consequence. In 1772 the corporation built a good fish-market, by which the town is well supplied with both sea and river fish. Besides a considerable export of oats and other grain, it has a growing trade to the Baltic for hemp, tar, timber, &c. The neighbouring country being rich marsh land, it feeds vast numbers of sheep and oxen, remarkable for their size and fatness: and the fens have been largely enclosed of late, and yield noble crops of oats. The town was first incorporated by Henry VIII.; and Elizabeth gave the corporation a court of admiralty over all the neighbouring sea-coasts. It is governed by a mayor, recorder, twelve aldermen, and eighteen common council, with a judge-advocate, town-clerk, &c. The members are elected by the resident freemen, who pay scot and lot. Boston was the birth-place of John Fox the martyrologist. It is thirty-six miles S.S.E. of Lincoln, and 116 N. of London.

Boston, the metropolis of Massachusetts, and one of the most flourishing of the Eastern States of North America, was founded in 1630, and is situated in Suffolk county, in a peninsula of about four miles in circumference, at the head of Massachusetts Bay. Here originated that resistance to the British authorities which terminated in the independence of the United States. The isthmus which connects this peninsula to the main land is at the S.S.W. end of the town. It is not very regularly built, but lies in the form of an amphitheatre on a rising ground, around the head of the bay, which gives it an agreeable appearance in sailing up the harbour. This is one of the best in the United States, safe from every wind, and accessible at all seasons for vessels of the greatest burden. Five hundred vessels may ride at anchor here; yet the entrance, defended by two

forts, is so narrow, that but two ships can get in a-breast. About eighty wharfs face the harbour; the amount of shipping arrived here in 1815, was 143,420 tons, the greatest amount belonging to any part of the Union, except New York.

The neighbourhood is fertile and populous, connected with the capital by noble roads, while the Middlesex canal opens a wide communication with the interior. Charlestown, but one mile to the north, is connected with this canal, by a bridge over the river Charles. The public buildings of Boston are a state-house, court-house, work-house, a council-chamber, a treasurer and secretary's office, a bridewell, and a powder magazine, besides seven public schools, and eleven churches for congregationalists, episcopalians, baptists, quakers, and Roman catholics. Several humane and literary societies are also incorporated, for benevolent purposes, and supported with great liberality. On the west side of the town lies the Mall, a handsome public walk, ornamented with several rows of trees. Beacon Hill has an elegant monument erected in commemoration of some of the most important events in the Revolution. Although now so flourishing, no town in the United States has been more retarded in its progress than Boston. In 1676 a fire consumed forty-five houses, a church, and several storehouses. In 1697 another fire destroyed eighty houses, seventy warehouses, and several ships. In 1727 it was much damaged by an earthquake. In 1747 the court-house and public records were burnt. In 1760 houses and property to the amount of 444,000 dollars were destroyed by fire, which also did much damage in 1761 and 1764. During the siege of 1775 upwards of 400 houses were destroyed by the British troops. In 1787 above 100 houses were burnt; and July 30th, 1794, forty houses, seven rope-works, and several storehouses, were entirely consumed, to the amount of 200,000 dollars. In consequence of these disasters, an order was at this time made by the town authorities, that no houses should hereafter be built of wood to the height of more than two stories.

Boston, East, or what may be called the Old Town, consists of numerous streets, lanes, and alleys, having little regularity or convenience; but they are clean, and for the population contained, and the business conducted here, preserved in good order. There are, however, some spacious streets, such as State and Common Streets, and a few others. The former being on a line with Long-wharf, where strangers usually land, exhibits a flattering idea of the town. Several new streets, consisting of large stores and warehouses, connect it with India wharf.

Franklin Place, adjoining Federal Street theatre, is a great ornament to the town. It contains a monument of Dr. Franklin, who was a native of this town, and is encompassed on two sides with buildings, which, in point of elegance, are not exceeded in the United States. Here are kept, in capacious rooms, given and fitted up for the purpose, the Boston library, and the valuable collections of the historical society. Most of the public buildings are handsome, and some of them are elegant. A magnificent new state-house, of which the foundation stone was laid in 1795, has

been built upon the south side of Beacon Hill. The lower part is constructed in a plain and simple style of architecture, with red brick. The extent of the front is 173 feet, and over the centre rises a spacious dome, terminated by a circular lantern, 100 feet above the foundation. The prospect from this is magnificent, surpassing everything else of the kind perhaps in the United States. The town, with its numerous buildings, the harbour, islands, shipping, a fine country interspersed with villas, and about twenty flourishing towns, are to be seen here. Other important improvements have also been executed. On the south side of State Street, stands a very lofty and extensive hotel, under the direction of one of the principal merchants in the town. The house is seven stories high, and occupies a large extent of ground.

An extensive range of lofty warehouses has been erected upon India wharf: they are built of red brick, with much neatness and uniformity. Offices for the merchants are below, and the upper part of the building is appropriated to the reception of goods. A short distance from these warehouses, to the northward, is Long Wharf, or Boston Pier, which extends from the bottom of State Street, upwards of 1750 feet into the harbour. Its breadth is above 104 feet. On the north side of this wharf is a range of large warehouses, extending the whole length of the pier. Most of the old buildings have been pulled down, and handsome warehouses, similar to those on India Wharf, erected on their sites. The ground floors of these warehouses are occupied by wholesale or retail stores, merchants' offices, &c. The upper parts are appropriated to the warehousing of goods. At the end of this pier there are upwards of seventeen feet of water at ebb tide.

BOSTON, WEST, contains the dwelling houses of the principal merchants. A number of elegant buildings have been erected here within these few years, and wide spacious streets, consisting of handsome private houses, are still forming throughout that end of the town. Boston is well paved, and has excellent foot-paths of flag-stones. The markets are situated near each other, close to the water side, and are supplied with every description of provisions in the greatest plenty. Besides its connexion with Charlestown, it is also united by a bridge 3,840 feet long, with the town of Cambridge; both bridges are kept in good order by the produce of a cent. toll. The population, in 1800, was 24,937; in 1820, 43,000. It is 252 miles north-east of New York; 347 north-east of Philadelphia, and 500 north-east of Washington.

BOSTON (Thomas), a pious divine of the church of Scotland, who flourished about the end of the seventeenth century. He wrote many books on divinity, which were long extremely popular. Among these, his illustration of the Assembly's Catechism, his Treatise on the Covenant, his Human Nature in its fourfold State, and his Crook in the Lot, have gone through a vast number of editions.

BOSTRICHUS, in entomology, a genus of colcopterous insects, whose distinguishing cha-

acters are the antenna clavated, the club solid; thorax convex, with a slight margin; head inflected, and concealed under the thorax.

BOSWELL (James, Esq.) of Auchinleck, the son of the Hon. Alexander Boswell, lord Auchinleck, was born at Auchinleck in 1740, and studied the civil law at Edinburgh. In 1760 he visited London, for which place he ever retained a partiality; and was desirous, at this period, of a commission in the guards; but was withheld by parental authority. In 1763 he went to Utrecht, and proceeded through Switzerland to Italy, where he contracted an intimacy with Paoli of Corsica. He returned to Scotland in 1766, and, being admitted an advocate, was employed in the celebrated Douglas cause, the particulars of which he published in a pamphlet. In 1768 he printed *An Account of Corsica*, of which Dr. Johnson spoke in high terms. The year following he married Miss Mary Montgomery, his cousin, who, at her death in 1790, left him two sons and three daughters. In 1782 he lost his father, on which he removed to London, with a view to professional practice, but never succeeded; the only appointment he obtained was that of recorder of Carlisle. In 1785 he published *A Journal of a Tour to the Hebrides*, which met with a favorable reception; as likewise did his more important work, *The Life of Samuel Johnson, LL.D.* which appeared in 1790, in 2 vols. 4to, and forms one of the most exquisite and amusing delineations of character in our language. Mr. Boswell was also the author of *Two Letters to the People of Scotland*, printed in 1783; the *Hypochondriac*, a series of papers in the *London Magazine*, and several *Miscellaneous Pieces* in various periodical publications. He died in London in 1795.

BOSWORTH, a market town of Leicestershire, on a high hill, memorable for the decisive battle fought near it between Richard III. and the earl of Richmond, afterwards Henry VII. The church is spacious, with a very beautiful spire. Various fragments of sundry lances, &c. are shown as having been ploughed up at Redmore or Bosworth Field. It has a market on Wednesday, and fairs May 8th, and June 10th. It is 13 miles north-east of Leicester, and 106 N.N.W. of London. Long. 1° 18' W., lat. 52° 40' N.

BOTAGIUM, in middle age writers, a fee paid for wine sold in butts.

BOTALE FORAMEN, in anatomy, an aperture in the heart of a fœtus, whereby the blood circulates, without going into the lungs, or the left ventricle of the heart.

BOTALLUS (Leonard), physician to the duke of Alençon, and to Henry III. was born at Asti in Piedmont. He introduced at Paris the practice of blood-letting, which was condemned by the faculty; though soon after his death it came into rather too general practice. He wrote, 1. *De Curandis Vulneribus Sclopetorum*, 1560, 8vo. 2. *Commentarioli duo, alter de Medici, alter de Ægroti*, Munere, 8vo. 3. *De Curatione per Sanguinis Missionem*, 1583, 8vo. His works were collected and published at Leyden in the year 1660.

BOT'ANY, { Gr. *βοτάνη*, a herb, herb-
BOT'ANIST, { age; relating to herbs; skilled
BOTANICAL, { in herbs; a part of natural
BOTANICK, { history which relates to vege-
BOTANOL'OGY. { tables; the science of plants.

Botanist, one who studies the various species of plants. **Botanology**, an oration or discourse upon plants.

Some *botanical* critics tell us, the poets have not rightly followed the traditions of antiquity, in metamorphosing the sisters of Phaeton into poplars.

Addison.

The uliginous lacteous matter, taken notice of by that diligent *botanist*, was only a collection of corals.

Woodward.

Then spring the living herbs, beyond the power Of *botanist* to number up their tribes. *Thomson.*

While *botanists*, all cold to smiles and dimpling, Forsake the fair, and patiently—go simpling.

Goldsmith.

1. **BOTANY**, considered in its details, treats of the elements, of the immediate principles, of the internal and external structure, of the functions, of the organs, and of the similitudes and dissimilitudes of the almost infinite multitude of beings of which the vegetable world is composed.

2. Chemistry explains the constituent elements and the immediate principles of vegetables; anatomy and physiology indicate the structure of their system and the uses of their parts; botany, properly so called, teaches us to compare, to describe, and to name plants, and to class them according to the mutual affinities which are indicated by their external characters.

3. In this article it is not proposed to enter into any investigation of chemical botany, which has no practical relation to the study of the science, and which more properly forms a part of the science of chemistry. The heads into which the following remarks will be divided are, 1. The analogy of the science; or of the differences which exist between vegetables and other animated beings, and of their resemblances. 2. The history of the science. 3. The anatomy and physiology of plants. 4. Pure botany, comprehending the theory and principles of the science, its terminology, and its classifications.

I. OF THE ANALOGY OF THE SCIENCE.

4. Among the multitude of beings which cover the surface of our planet, man only is possessed of the intellect which raises him above other animals. The latter are the mere slaves of their feelings, or of instinct; but man, whose only laws act upon his own free will, by the operations of the mind, is divested of the mere sense of necessity or of want, and directs his intelligence to the examination and knowledge of the other beings which constitute that glorious nature which has been formed for his advantage. The infinite variety of forms, and the imposing appearance of those objects which surround him, not only offer him matter for admiration, but carry him yet further; he is induced to study the laws

by which they act or live, the qualities, whether useful or injurious, which they possess, and the affinities which they bear to himself and to each other. God, mind, and matter, are the subjects of the meditation of man. But if he would devote himself to all the departments of knowledge, which are included under these three great names, his natural weakness would compel his mind to sink under the exertion.

5. Hence the origin of sciences, into which all nature is divided by certain limits. By the aid of analysis, the fruit of intellectual observation, all knowledge is separated into different branches; and though the boundaries of the sciences are confined in appearance, that limitation has been the means by which each has been brought to its present state of perfection, and by which the knowledge of one science has been made to bear upon that of another.

6. On the one hand, intellect has given rise to what are called the intellectual or moral sciences; on the other hand, observation has created the natural or physical sciences; and these are divisible under three heads, that is to say, **PHYSICS**, medically considered, **CHEMISTRY**, and **NATURAL HISTORY**. The physician directs his attention to the properties and maladies of matter in general; the chemist considers the action of its elements; and the naturalist studies the phenomena of particular parts.

7. The district of the naturalist is confined to what are called the three kingdoms of nature; and no limits can appear more certain or decided than those within which these kingdoms are confined. The *mineral* kingdom is composed of brute matter, and is only susceptible of increase, by the juxta-position of the substances which combine in its formation. *Vegetables* are furnished with organs, by means of which they assimilate and adapt to their purposes the elements which surround them; but, fixed by the hand of nature to one spot, they are incapable of other movements than those which are peculiar to their organisation, or than those which are communicated by neighbouring bodies. But *animals* which are endued with similar properties in many respects, and which are propagated in like manner by peculiar organs, are also furnished with instinct, which teaches them how to distinguish their aliment, and to move from place to place. But do these limits absolutely exist in nature, or are they the imperfect creatures of the mind of man? And is not all nature connected by an inconceivable and inextricable multitude of affinities, crossing and interlacing each other in all directions, in such a manner as to render it impossible for us to circumscribe any one of her works within bounds so absolute that she will not be found overleaping them in some corner or another? It will probably be found that the affirmative is the answer to these suggestions, and that the deeper becomes our knowledge of the productions which occupy our minds, the more numerous the exceptions will be found to every law by which man in his ingenuity has

fancied that he has fettered those operations of nature from which his own existence has been derived.

8. What, for example, is a vegetable? This word is in every body's mouth, and yet no one has hitherto been able to define it in so exact a way as to fix the certain line by which the vegetable is to be distinguished from the animal. In this respect men of science are not to be separated from the multitude, except that they have acquired the habit of doubting, to which they have been conducted by study and meditation.

9. The division of minerals, vegetables, and animals, already spoken of, has been long admitted; and if we judge only by our first impressions, the distinction is not to be shaken. There is certainly something imposing in that simple manner of regarding the works of the creation; but, if we think upon it scrupulously, we shall be at no loss to perceive that it cannot be applied with precision, as we have no means of ascertaining at what particular point either sensation or sensibility cease to exist.

10. For this reason many modern philosophers reject the division of the three kingdoms, and admit only two great classes, of organic and inorganic substances. The latter class embraces all brute matter; fluids, gas, minerals. The molecule of which these are composed are subject to the laws of chemistry, physics, and mechanics. The other class includes animals and vegetables; their constituent molecule are in a perpetual state of motion. The organised particles of which these molecule are constituted are irritable, that is to say, susceptible of contraction, upon the application of particular stimulants; a wonderful power, the effects of which we are daily called upon to admire, but the first cause of which, like all other first causes, is beyond the perception of the human mind, and is designated by the appellation of the vital principle.

11. Endowed with this power, an organic body is able to offer resistance to such external causes as are prejudicial to it, to reject such substances as are useless or hurtful, to select those which are best adapted to its nature, to associate and dispose them according to the laws of its peculiar organisation, to communicate to them the motion which animates its molecule, to increase in volume, and finally to reproduce other beings of the same nature as itself. In the opinion of an ingenious Frenchman, the process of generation and nutrition, rightly considered, are two modifications of one and the same phenomenon. It is, therefore, irritability which distinguishes to our perception animals and vegetables from brute matter. But if irritability is absent, no fixed line of demarcation can be assigned.

12. Brute matter is formed by the attractive power of its elements. Organic bodies owe their existence to beings of their own kind. The first ceases to exist whenever the powers of chemistry or mechanics become greater than those by which the aggregation of the molecule of matter is maintained. The second perish when the organs necessary to their existence lose their irritability.

13. The limits of organic and inorganic bodies may, therefore, be considered to be ascertained with tolerable, if not with rigid, precision. The differences between vegetables and animals must now occupy our attention. A glance at the peculiarities of each will show in what these differences consist.

14. If we cast our eyes only upon the higher orders of plants and animals, in which organisation is in its highest state of perfection and development, no difficulty will be found in perceiving how wide a difference reigns between them. But in the lower orders of each, these differences vanish away. We will consider the connexion of animals and vegetables, both in their most perfect and most imperfect state.

15. And, firstly, their most perfect state of organisation. Carbon, oxygen, hydrogen, and occasionally azote, constitute the basis of vegetables. Occasionally metallic oxides, and some alkalies and earths are found also, but they exist in very minute quantities, and cannot be said to form any part of the peculiar character of vegetables. Animal matter offers the same compound; but differs remarkably in this, that while carbon is in excess in vegetables, azote is in excess in animals. A vegetable is wholly composed of an homogeneous, transparent, flexible, colorless substance, forming a mass, in which, by the aid of powerful microscopes, we are able to detect no other organisation than what is caused by the cohesion of an infinite multitude of tubes or cells, of various conformation. In animals, the structure is far more complex. Three organic elements enter into their composition. The first is the cellular tissue, which is a mass of membranous and continuous cellulæ, the cavities of which communicate with each other through pits or perforations in their sides; the second is the irritable fibre, consisting of long filaments, evidently possessing a power of contraction, composing the muscles by their union, and lining the arterial tubes and the intestinal canal; the third is the medullary substance; an homogeneous pulp, which presents to the eye, when examined through a microscope, a conglomeration of minute globules. The brain, the spinal marrow, and the nerves, are composed of this substance. Animals are furnished with an intestinal canal, usually open at each extremity. One orifice is for receiving aliment, the other for voiding that part of the food which is useless for nutrition. The intestinal canal is furnished, for a part of its length, with pores, which absorb the nutritive molecule, and throw them into 'the torrent of circulation.' Plants have no intestinal canal, and their absorbent pores are diffused over all parts of their surface. For this reason, Aristotle and Boerhaave designated plants by the title of animals turned inside out.

16. But, if we consider the distinctions between those animals and vegetable substances which are imperfect in the greatest degree, we shall find that nearly all these discrepancies are non-existent. The infusorial animalculæ are, for the most part, formed with nothing more than an intestinal canal, with two foramina; or, as a well-known writer has observed, they are all stomach. Among plants, the genera *Palmella*, *Echimella*,

Protococcus, and many others, possess the same simplicity of anatomical structure. The power of motion, which is believed to be the peculiar attribute of animals, equally exists in the genus *Oscillatoria* of vegetables. The propagation of the polype, by separation into many parts, is precisely the mode of increase which takes place in many *Confervee*. As to the distinction of irritability in animals, and non-irritability in vegetable bodies, it is one of those problems which, perhaps, will never be solved. That the presence of nervous and muscular fibre is not essential to even animal irritability, as some have supposed, is obvious from the infusoria, in which neither muscle nor nerve exist, and which are, notwithstanding, endowed with irritability. It is probable that every organic body, which possesses the capability of development, is, from that circumstance alone, irritable, although the power of contraction may not be always manifest; for nutrition, or the power of assimilating foreign substances, and incorporating new molecules with themselves, which living beings possess, and of subjecting them to the laws of organisation, of necessity supposes a force of suction which attracts the nutritious juices. But how is suction to take place otherwise than by the alternate contraction and expansion of the absorbent vessels? The phenomena of nutrition are, therefore, a proof of irritability; and since plants increase, it is clear that they possess powers of nutrition, and consequently are irritable. Besides which, many exhibit motions, as in the *Oscillatoria*, above alluded to, and in the common sensitive plant, which cannot be explained upon the ordinary laws of physics, and which may be supposed to result from a power of contraction, of what may be called the muscular fibre.

17. Plants are operated upon in the same way as animals, by the application of poisonous or corrosive substances.

18. M. F. Marcelet, of Geneva, has lately published the result of some curious experiments respecting the effect of both mineral and vegetable poisons upon the system of vegetables. His observations were chiefly made upon the common kidney bean (*Phaseolus vulgaris*), and a comparison was always made with a plant watered with spring water. 'Until now,' the author observes, 'plants have been supposed to be distinguished from animals by the absence of organs corresponding to the nerves of the latter class; but the results of my experiments tend to prove that they are capable of being affected by such poisons, in a manner analogous to that in which animals are affected by them.' His experiments may be divided into those in which metallic poisons were employed, and those in which vegetable poisons were the agents. *Metallic poisons*.—A vessel, containing two or three bean plants, each with five or six leaves, was watered with two ounces of water, containing twelve grains of oxide of arsenic in solution. At the end of from twenty-four to thirty-six hours, the plants had faded, the leaves drooped, and had even begun to turn yellow. Attempts were afterwards made to recover the plants, but without success. A branch of a rose tree was placed in a solution of arsenic, and in twenty-four hours, ten grains

of water, and 0.12 of a grain of arsenic had been absorbed. The branch exhibited all the symptoms of unnatural decay. In six weeks a lilac tree was killed, in consequence of fifteen or twenty grains of moistened oxide of arsenic having been introduced into a slit in one of the branches. Mercury, under the form of corrosive sublimate, was found to produce effects similar to those of arsenic. But no effect was produced upon a cherry tree, by boring a hole in its stem, and introducing a few globules of liquid mercury. Tin, copper, lead, muriate of barytes, a solution of sulphuric acid, and a solution of potash were, found to be all equally destructive of vegetable life. But it was ascertained, by means of sulphate of magnesia, that those mineral substances which are innocuous to animals, are harmless to vegetables also. *Vegetable poisons*. In the experiments with vegetable poisons, the bean plants were carefully taken from the earth, and their roots were immersed in the solutions used. It had been previously ascertained, that a plant so transplanted and placed in water, under ordinary circumstances, would remain in excellent health for six or eight days, and continue to vegetate as if in earth. A plant was put into a solution of nux vomica, at nine in the morning. At ten o'clock the plant seemed unhealthy, at one the petioles were all bent in the middle, and in the evening the plant was dead. Ten grains of an extract of *Cocculus mernispermum*, dissolved in two ounces of water, destroyed a bean plant in twenty-four hours. Prussic acid produced death in eighteen hours; laurel water in six or seven hours; a solution of *Belladonna* in four days; alcohol in twelve hours. From the whole of this experiment, M. Marcelet concludes, 1st. That metallic poisons act upon vegetables nearly as they do upon animals. They appear to be absorbed and carried into different parts of the plant, altering and destroying the vessels by their corrosive powers. 2nd. That vegetable poisons, especially those which have been proved to destroy animals by their action upon their nervous system, also cause the death of plants. Whence he infers that there exists in the latter a system of organs which is affected by poisons nearly as the nervous system of animals.

19. From these experiments it is impossible not to perceive that the fibrous tissue of plants and of animals, as well as their absorbent vessels, are acted upon in the same way by the application of injurious matter, whence it must be concluded, that a strict similarity exists between the two kingdoms in that particular.

20. In sensibility, as distinguished from irritability, or in the possession of a nervous system, there is now scarcely room for doubting that plants agree with animals. The discoveries of Dutrochet show that in the system of vegetables a matter exists which is altogether analogous to the nerves of animals. The latter are composed of an agglomeration of an infinite number of minute globular particles, which are conrescible by the action of acids, and resolvable by the application of alkalis. In the sensitive plant, Dutrochet has ascertained that sensibility depends upon the presence of a vast number of

particles, which are affected by chemical agents in the same way as the nerves of animals. They line the cellular tissue, and are plentifully distributed over the tubular and spiral vessels, or tracheæ.

21. Neither can the power of perception be denied to exist in some plants, in as distinct a state as in many animals. We see that the former move, that they seize little insects, that they retreat from the approach of danger, and that they appear to possess a faculty of selecting that nourishment which is best adapted to the peculiarities of their structure. Can any one attribute the power of sense to zoöphytes, to corallines, and deny its existence in the *Dionæa*, or the sensitive plant? is it possible to ascribe it to the *Infusoria*, and to refuse it to *Oscillatorias*? surely, no argument can be employed in justification of such an opinion, except such as may be deduced from analogy. And let us see to what such an argument may be imagined to amount.

22. On one hand, considering that zoöphytes perform motions precisely similar to those which are peculiar to animals visibly provided with nerves and muscles, we should conclude that the motions of zoöphytes have a similar origin; and on the other hand, bearing in mind that the small number of plants which perform what appear to be voluntary motions are, in all apparent respects, organised in just the same way as other plants which have no such motion, we are equally justified in inferring that those plants in which no motion is observable have the same power of contraction as the others, but in an insensible degree.

23. In their different modes of generation, animals and plants are remarkably similar. Envelopes more or less hard and numerous; an embryo concealed within these envelopes; a small quantity of nutrition ready prepared for the early use of the young being; these are common both to the seed and the egg. A double foramen exists in the ova of many of the lower animals, as in frogs; it is equally present in the seed, or ovula, of nearly all plants. If almost all animals have eggs, so have almost all plants seeds.

24. Many vegetables have no seed; many animals have no eggs. Both are multiplied by the extension and natural separation of their peculiar substance. On the surface of many polypes are found little tubercles, which generally enlarge, become detached, and form, at a greater or shorter distance from the parent stock, other polypes, which soon become capable of increasing by the same means. *Confervæ* are known, in several cases, to increase in precisely the same way. Of what degree of precision then is the most perfect of the following definitions of a plant; proposed by observers who are placed at the head of their science? Stones grow; vegetables grow and live; animals grow, live, and have perception. *Linnaeus*. A plant is a compound organic body, deriving nourishment from the soil in which it grows. *Link*.

II. HISTORY OF THE SCIENCE.

25. The physical sciences are generally supposed to depend almost entirely upon the powers of human observation for their perfection and

final development; and it was formerly admitted as an incontrovertible axiom, that philosophical induction, or metaphysical classification, had little or no effect upon the actual amount of ascertained facts; or, which is the same thing, upon the elements of science. It has been a common belief, that the classification of natural objects, has no other end than that of forming a sort of index to the science of natural history, and that systems bear the same relation to sciences as alphabets to languages. With regard to botany, the description of a plant, with a detail of its qualities in medicine or art, actual or supposed, was the utmost which was formerly attempted by the most celebrated writers; and it certainly was never by such persons for a moment supposed, that an acquaintance with the mutual relations and affinities of the vegetable kingdom, would in any degree influence the discovery of new objects. But the experience of modern times has shown, that directly the reverse of this opinion is consonant with facts, and that so long as the mind remained occupied in no other manner than in the acquisition of new plants, without knowing in what way to appreciate their respective peculiarities, discoveries continued to be made slowly, and to be of little value when made. As soon, however, as botanists arrived at the art of arranging, upon philosophical principles, the materials which they possessed, their attention was strongly directed towards supporting their respective systems by the addition of new objects and new facts. Their minds were excited by the hope of undiscovered forms enabling them to fill up chasms, which, they could not fail to perceive, existed in the most perfect methods known to them; and the strenuous investigations instituted on this account, naturally brought them acquainted with an abundance of subjects, the existence of which the imperfection of their previous knowledge could not have led them to suspect. Thus we perceive, that during the space of more than 5500 years, from the creation of the world to the time of Cæsalpinus, a period during the greater part of which botany was an humble art, necessarily, from its intimate connexion with the wants of mankind, the study of physicians, the whole number of recorded plants of all descriptions scarcely equalled the quantity now produced, under the auspices of science, by the investigations of a twelvemonth.

26. In the east, at first the only seat of erudition, the greatest care was taken to acquire a knowledge of the beneficial or noxious qualities of different natural productions. The Chaldeans communicated their knowledge to the Egyptians, and these to the Greeks. In Greece, where, indeed, real science first originated, Æsculapius attempted, by means derived from the vegetable kingdom, to cure some diseases. Medicine soon became intimately connected with religion. In the temples dedicated to the worship of the gods, the prescriptions of Æsculapius were publicly hung up, and the priest alone undertook the examination and the search of officinal plants, and the treatment of different diseases. They were, as followers of Æsculapius, called *Æsclepiades*.

27. The father of medicine, Hippocrates, added to the observations of Æsculapius a great many of his own, and first published several works on medicine. In his writings, the diseased and healthy state of man are fully treated of, and in speaking of the methods of cure, he has mentioned about 234 plants. But these are only names. Hippocrates was born about 459 years before Christ, at the Island of Cos. He lived to a very old age, though on that point authors differ, some saying he lived to be 89 years old, some 90, others 104, and a few indeed 109. The plants he mentions can scarcely be guessed at; for though great natural philosophers and linguists have attempted, long ago, to fix them properly, notwithstanding all their endeavours they still remain very doubtful.

28. Among the ancients, Thales, the Milesian, holds the earliest station as a philosopher. He perceived in the whole range of natural bodies nothing but mind, damons, and a divine nature. As the ocean was the parent of his gods and goddesses, so was water the primitive origin of all created things. Aristotle conceives that the humid state of all nutriments, and the aqueous nature of all seeds in the beginning, gives a plausibility to this hypothesis. *Metaph.* i. 3.

29. Pliny testifies to the deep knowledge of Orpheus in the properties of plants, but Pythagoras the Samian is the first who is known to have written any treatise upon botany. This philosopher procured his information from the Egyptian Magi. He first taught the miraculous uses of the *Scilla maritima*, in prolonging life; the bulb pickled in vinegar was affirmed to gift the vinegar with the power of extending the period of human existence to the hundred and seventeenth year. He declared the virtues of Anise against the bite of scorpions, the power of *Brassica*, and of *Sinapis*.

30. Empedocles, of Agrigentum, one of the disciples of Pythagoras, wrote a poem on the agency of the four elements. He conceived that plants were formed from the united agency of fire and earth, that they grew upwards through the influence of the former element, and downwards by the action of the latter, that air was diffused through their branches, earth through their roots.

31. This opinion may, however, be rather considered as part of the doctrines of the exoteric philosophers, who adopted the notions of the poets about the origin of things, and supported them by the subtlety of materialism. That plants are animated beings they held to be proved by the motions of which they are susceptible, and by the elasticity of their branches, which, when bent, resume their natural position, as soon as the external power is removed. They believed that plants were all subject to a metamorphosis into animals, or the contrary; and that no man could be sure that he had not, at some period of his existence, been a plant, a bird, or a fish. For this reason the laurel was held to be the noblest of trees, as being that into which man is translated after death. They admitted that the sexes were united in plants: but they supposed that they became separated upon the change into animals.

They were moreover believers in the presence of a soul in plants; of a peculiar nature, indeed, but endued with intelligence and *γνώσις*, appetites and sensations. Even reason was ascribed to them by Sextus Empiricus. He declared that they were propagated by eggs, in the way of animals, and that their leaves were analogous to the hairs of animals, and the scales of fishes, that their root performed the functions of head and mouth, because it was through it that nutriment was introduced into the system.

32. Similar opinions were held by Anaxagoras, of Clazomene, who also thought that earth was the mother and the sun the father of vegetation. That their spiritus, or soul, was absorbed from the air by their leaves, and exhaled by the same organs.

33. Democritus the Abderite, who spent his early life in travelling through Persia and Egypt, adopted the notions of the Magi respecting the supernatural powers of herbs. He is said to have composed a work upon their hidden and miraculous virtues.

34. These and a few more are those who are supposed to have existed previously to the time of Aristotle. Among their opinions it is curious to observe how much of truth, even in their abstract speculations, is mixed with the fables of their poets. It is evident that they were acquainted with the sexes of plants, and with the principle that all vegetables proceed from ova. Some light was also possessed upon the functions of leaves.

35. But it was with Aristotle that the real origin of natural science must be said to have arisen. That extraordinary man embraced in his observations the whole circle of nature, from the structure and generation of the *Sepia*, the *Nautilus*, and other similar animals, to the elephant and to bipeds. That he paid extensive attention to plants is to be inferred from his own statement, that he had written two entire books upon the subject. He calls these books a *Theory of Vegetation*, and, in another place, he promises that he will enter at large upon the nature of vegetables. These books are even cited by Diogenes Laërtius, v. 25, Athenæus, xiv. xviii. p. 652, and by the scholiast Nicander, v. 645, p. 42. The books which have come down to our time are, however, believed to be forgeries. They correspond neither with the gravity, the dignity, nor the erudition of Aristotle. But much may be gathered from the genuine writings of this classic, as to the nature of the opinions which he held respecting plants, as forming a particular portion of animated nature; and most especially as to his ideas of their analogies with animals. He appears to have applied himself, with incredible industry, and most remarkable ingenuity, to the discovery of their relative degrees of organisation, and of those functions and phenomena which bore upon his own philosophical system. He was the first to conceive the speculative notion of a continuous chain of organisation, in which the most perfect beings gradually degenerate into an imperfect state. 'Nature,' he declares, 'is continually progressing from inanimate objects to animals, and this through beings which are animated, indeed, but which

are not animals; so small is the difference which exists in nature between proximate beings. As among marine animals many may be found whose dis severed limbs maintain a separate life, so among plants morsels of the epipetron (*Sedum acre*), suspended from a nail, will nevertheless retain their vitality for a long period. In another place, he repeats the same remarks, and adds a comparison between plants and his ostracodermata or shell-fish. He believes that the latter are, in fact, plants, if considered with respect to the gradations of other animals, for most marine animals manifest a power of sensation very obscurely, and others in no degree whatever. In a third place, he pronounces plants to be a sort of terrestrial ostracodermata, and the latter to be marine plants. In the same proportion as water is more prolific of life than land, in the same degree are ostracodermata more vivacious than plants. He conceives that the main difference between plants and animals consists in the absence of excrementitious matter from the former; whence the roots, which absorb only such nutriment, as is already prepared, may be said to make use of the earth and of its heat, as a stomach and intestine. The minute quantity of excrementitious matter which is parted with by plants has an agreeable odor, whilst that of animals is almost always the reverse. He believed with Anaxagoras, that the nature of plants was hot and dry, and that earth was the mother and the sun the father of vegetation. Whence he thought might be explained the greater richness and fragrance of fruits and flowers growing on a hot soil under a burning sun. Aristotle admitted only one end in vegetation, which was the generation of fruits. Whence, the more imperfect were animals, the more similar they became to plants in this respect. All the nutrition and increase of plants appeared to him to tend to this object. He thought that the power of absorbing nutriment, and the mere circumstance of food being necessary to plants, rendered it impossible to deny their sensation, and hence a vital principle. He denied the separation of sexes in plants by which he gained an additional argument as to their affinity with the imperfect animals; in which the union of sexes in the same individual had been observed. The mixture of sexes, which had been assumed by Empedocles, was received as an axiom by Aristotle. *Gener. Anim.* iii. 10. Aristotle was not, however, free from the errors of his age, or from the love of wonders and miracles. He asserted that the *Ruta* flourished best when grafted on the fig-tree.

36. This philosopher was succeeded by various writers, whose works are now almost wholly unknown, but who do not seem to have thrown any new light upon the philosophy of botany, but to have confined their observations to the properties of herbs and roots. They are now known only by the quotations of their works in the books of later botanists. Here it will be sufficient to enumerate their names. They are Thrasyas and his disciple, Alexius, whom Theophrastus judges to have been more skilful than his master. Eudemus, Aristophilus, Cleidemus, Menestor, who entertained the remarkable notion that aquatic plants are naturally warmer than ter-

restrial, because they are not killed by the winter's frost; Hippon, Diogenes, who taught that plants are the consequence of a mixture of earth and putrid water, Leophanes, and Androtion. Besides these, Eumachus, Anacreon, and Micton, are thought to have lived before the time of Theophrastus, but this is uncertain.

37. If Aristotle is to be considered the founder of the philosophy of botany, the adaptation of his opinions to practice is, as far as we now know, to be ascribed to his friend and disciple Theophrastus, born in the year 370 B. C. Such was the fame of this philosopher that, when his master retreated to Chalcis, he succeeded to his school, whither no less than 2000 disciples repaired. In his *Historia Plantarum*, he described all the plants which were known in his day, either by description or actual observation. The text of that part of his work which has descended to our days is remarkably corrupt, but much light has been thrown on it by the critical acumen of the learned Sprengel. No order is pursued in arranging his descriptions, the same name is often applied to extremely different plants, and his opinions upon abstract matters do not seem to have been different from those of Aristotle. He was a believer in the transmutation of species, and even genera, and treats at large upon the subject. His nomenclature of the parts of plants is the first upon record in which an attempt was made to attach precise ideas to particular terms; and in this he succeeded remarkably well. The physiology, or 'the physick' of trees was understood by him in a manner which necessarily gives us a high opinion of the state of philosophical knowledge at his day. He distinguished between the structure of the trunks of palms and other trees, or, in modern terms, between monocotyledones and dicotyledones. He discovered that nutrition was conveyed to plants through their leaves, but he attributed this power to both surfaces alike. The sexes of plants were not unknown to him, but his ideas on the subject were incorrect. In short, that part of his history which appertains to vegetable physiology offers a mass of observation and reasoning, which is well worth consideration even at the present day.

38. Little is known of the Alexandrian school, which succeeded Theophrastus. Diphilus, who lived in the time of Lysimachus, first discovered the use of asparagus as a pot herb; and described for the first time the *Persica coccumela* or peaches. A manuscript of the works of Cratæus is preserved in the library at Venice, but it contains no information of importance.

39. When the Romans became masters of Greece, they adopted the writings and opinions of the latter country so completely, that there is in natural history scarcely any additional information in the writings of all their naturalists. Some inconsiderable additions were made to the list of plants, but very little change took place in the opinions held of the nature and properties of beings.

40. To pass by the agricultural writers, Cato, Varro, Diophanes, Virgil, Columella, and others, who are by some moderns ranked in the list of Roman botanists, the first author whose writings are of present value is Pedacius Dioscorides, who flourished in the time of Nero. Attached

to the Roman army, he traversed Greece, Italy, and Asia Minor, in which countries he collected many new plants. But, in his history, he described by far the greater part of those he mentions, upon the authority of others. He was acquainted with no method of arranging his plants, which were frequently classed from some similarity in their names, rather than in their nature. His descriptions are so imperfect, that the name only is given of many plants. His catalogue, however, of the plants of Greece and Italy, was by far the most complete which had been compiled in his day.

41. He was followed by Caius Plinius Secundus, who was born in the twenty-third year of our era, under Tiberius Cæsar. The fame of this remarkable man has reached to all the corners of the civilised earth, and he is on all hands pronounced to have been the father of natural history. He was a person of great learning, considerable acuteness, and unwearied industry. His reading was more extensive than that of any of his predecessors or contemporaries, and his writings are reported to have been scarcely less voluminous. Judging from the books upon natural history, which have come down to our time, his high reputation may be stated to have been very little deserved, except on the score of industry. They chiefly consist of almost literal compilations from the works of his predecessors, especially of Dioscorides. The arrangement of the matter is uncertain and empirical; the descriptions of his subjects meagre, vague, and unsatisfactory; the qualities assigned to them fanciful, childish, and unphilosophical. The advantages he possessed of having visited the most remote of the Roman provinces, in the capacity of a general officer, were turned to small account by him in discovering new objects of natural history. In a word he must be pronounced to have been a mere compiler without observation, experience, or judgment.

42. Galen succeeded Pliny, and turned the great powers of his mind to the subject of botany, but in a medical view only. So that a few new plants were all which natural science derived from his labors.

43. Thus much has been said upon the state of botanical knowledge up to the time of Galen, in order to make it appear what was the actual amount of discoveries during the first epoch of natural science. It is worthy of remark, that the period was fraught with fanciful conjectures, and often ingenious hypotheses; but that philosophy was unaided by experience, and that metaphysical speculations usurped the place of accurate observations.

44. In the early ages of the world, the science therefore, which is now called botany, consisted of a collection of names, and exceedingly imperfect descriptions of plants; either entirely unarranged, or combined according to their supposed qualities in medicine, or in human economy.

45. The race of botanists who succeeded the classics, were physicians or mere simplers, who cared for no classification beyond that which enabled them to arrive at an imaginary knowledge of the powers and effects of the few herbs which

were imported for pharmacy, or which grew in their vicinity. Even after the revival of learning in Europe, the same ideas were entertained, and a proportional progress was made in the acquisition of knowledge. The second race of botanists, or those who existed after the dark ages of Europe had passed away, were the commentators upon the writings of the first race; men of some learning, indeed, but in the deepest ignorance of the subject they undertook to illustrate; monks, whose practical knowledge extended not beyond the walls of their monastery, and who depended for all the information they found necessary to their purposes, upon the assistance they could derive from the few copies of the Arabian physicians, which their own or their monastic libraries might chance to possess. Science in the hands of such men, would, it may be easily believed, retrograde rather than make advances towards improvement. So that, up to the time of Vincentius Bellovacensis, who has been called the Pliny of the middle ages, and whose *Speculum Quadrupartitum* was published in 1494, the second volume of which is devoted to the subject of natural history, it may be safely affirmed, that no progress whatever, in modern times, had been made in botany; the whole of this author's materials having been borrowed from Aristotle, Dioscorides, Isidorus Macer, Pliny, Avicenna, Platearius Actor, and Cassius Felix, an obscure writer, whose works are lost. But the practical ignorance of the monks was not the only evil which impeded the advance of physical knowledge. They were in many instances deplorably unlearned in the languages from which they borrowed their opinions. With Arabic, the only source to them of new ideas, they were in most instances imperfectly acquainted: and the degree of knowledge which they possessed, even in the Greek language, was so low, that they were led into the commission of continual errors, in translating the fables of classical writers into the dreams of themselves. Another and a more serious consequence than the decline of science, was the result of this deplorable state of botanical learning, which, as a modern writer has justly observed, was so desperate that it is not more surprising that it should have arrived at it, than that it should ever have been extricated from it. By a frequent misinterpretation of the Arabic writers, it not unfrequently came to pass, that properties were ascribed to plants which were directly the reverse of those which the original authors attributed to them; a curious instance of which occurred with respect to the cinnamon. This was for a long time considered a deadly poison, in consequence of Nicolaus Myrepsicus, a Greek physician, who flourished in the thirteenth century, having translated *dar-sini* the name given to the cinnamon by the Arabians, by the word *ἀπείρυνος*.

46. The time, however, arrived, when some truly learned men undertook the exposition, not only of the blunders of their contemporaries, but of the ignorance or corrupt text of those original authors in whom a blind confidence had for so many ages been reposed. The bold attack of Hieronymus Barbarus upon Pliny, and of Nicolaus Leoniceus upon Serapio, and the Arabian

writers, the one published at the end of the fifteenth century, the latter at the commencement of the sixteenth, put an end to the delusion under which the world had labored for so long a time. These men fearlessly tore the mask from before the face of the impostors of their day, and boldly succeeded in convincing the world that the ignorance of antiquity had been mistaken for the experience of ages; and a new impulse was given to the pursuits of naturalists, not only by these writers, but also by the declaration of Collenuti, an earnest defender, indeed, of the originality of Pliny, that 'non satis esse ad herbariam perdiscendam tradendamque, herbarios scriptores legere, plantarum videre picturas, Græca vocabula inspicere, magistri unius verbis addictum esse, sed rusticos montanosque homines interrogare oportere.'

47. To particularise all the obscure writers, who existed up to this period, would be an unprofitable waste of space and attention. All kinds of learning had been brought to so low a state of degradation, by the insane and stupid madness of the worthless men who sanctified their acts under the cloak of religion, and who, in their pretended zeal against paganism, destroyed all the fountains of knowledge, that there was scarcely an author upon botanical matters, during this long period, who deserves to be handed down to posterity. Between the first and the early part of the sixteenth century, natural history may be considered a blank, during which that description of learning was buried in a deep trance. In the strong language of one of the earliest revivers of botanical science: 'Those writers who did occupy themselves with the subject, especially Matthæus Sylvaticus, and Simon Januensis, deserve the execration of all posterity, for their worthless compilations and treacherous translations of the ancients.'

48. The second period presents us with more promising views. All science began to revive, and monasteries were no longer the exclusive seat of human knowledge. Brunfelsius, Gesner, Fuchsius, Dodonaus, the ever memorable Clusius, and the great Bauhin, opened the path to the present state of botanical science.

49. Otto Brunfelsius, son of a cooper, was born at Maynz, at the end of the fifteenth century. He was first a Carthusian friar, and became, soon after, cantor (precentor) in Strasburg. In his work he has given the first figures of plants, and he was also the first botanist in Germany. The drawings are not very good, and do not in the least correspond with his own descriptions.

50. Hieronymus Bock, was born at Heidesbach, in Deux Ponts, 1498. He died in the fifty-sixth year of his age, the 21st of June, 1554. He changed his name, according to the fashion of his age, to the Greek name Tragus. In three books of his work he treated pretty accurately of those plants which grow in Germany, and represented the described plants in 567 figures, which are not bad. It is an objection made to him, that he neglected the virtues of the plants, though he knew them perfectly well, and that he used the writings of the ancients too little. He wrote a history of plants, of which many

editions have appeared in German, French, and Latin. He likewise wrote notes to Dioscorides, Galen, and Hippocrates, on which account he entered into a long dispute with the famous physician and philologist, John Heynbut or Hagenbut, who likewise called himself Cornarus. Cornarus published a treatise against him, entitled *Vulpecula Excoriata*. The botanist, Fuchsius, answered in another, with the title, *Cornarus Furiens*; after which Cornarus finished the dispute with the publication of a work, which he termed *Mitra*, *S. Brabylla pro Vulpecula Excoriata Asservanda*.

51. Peter Andreas Matthiolus, a physician at Sienna, was born in the year 1500, and died at Trent, in 1577, of the plague. He had carefully studied the works of the ancients, especially of Dioscorides. His *Krauterbuch* (work on plants) was written originally in Italian, but we have French and German translations of it.

52. Matthias de Lobel, physician to king James I. of Great Britain, was born at Brussels, in Flanders, in 1538, and died in London, 1616. Together with Peter Pona, a physician in Provence, he wrote the *Adversaria*, part of his greater work. He says that this physician sent him many rare plants. Some assure us that he has in his works given many ideal figures of plants; and he has described several as growing wild in Britain, which after him nobody could ever find.

53. Charles Clusius, or Charles de l'Ecluse, was born at Arras, in the Netherlands, 1526. His parents wished him to become a lawyer, and he went with this design to Louvain. But he presently changed his mind, and, from his great love of botany, soon undertook the most tedious and troublesome journeys through Spain, Portugal, France, Great Britain, the Netherlands, Germany, and Hungary. In his twenty-fourth year he became dropsical, of which, however, he was cured by the use of succory, recommended to him by the famous physician, Rondeletius. In his thirty-ninth year, in Spain, he fractured his right arm close above the elbow, falling with his horse, and soon after he broke his right thigh. In his fifty-fifth year, at Vienna, he sprained his left foot, and eight years afterwards dislocated his hip. This last dislocation was neglected by his physician, and he had the misfortune to walk for the remainder of his life on crutches. The great pain and difficulty he had thus to suffer when walking, prevented him from taking the necessary exercise, in consequence of which he was affected with hernia, obstructions in his abdomen, and calculous complaints. Thus miserable and unhealthy, tired of the court of the emperor, where he had resided for fourteen years, and finding, besides, the superintendence over the gardens there too great a burden, he accepted, in the year 1593, an invitation as professor at Leyden, where he died, April 6th 1609. Clusius was the greatest genius of his age, and prosecuted the study of botany with an enthusiastic zeal, and a perseverance which was not equalled by any preceding philosophers, or by that of any of his followers. His works exhibit a great botanist, and they will always remain valuable and indispensably necessary. The figures annexed to

them are neat, the drawings correct, and his descriptions masterly. It was a pity that a man of such great merit should have suffered so much, and even become the first martyr to botany.

54. Andreas Cæsalspinus came from Arezzo, in Tuscany. He was called to Rome, as physician to Clement VIII., where he died, the 25th of June, 1602. Before him plants had been described without the least order, and nobody thought, by attending to the similarity of different parts, to render the study of botany more easy. His system will render him ever memorable. The writings of this botanist are so rare, that scarcely more than their titles are now known; but they are among the most valuable in the world.

55. Jacob Dalechamp, born at Caen, in Normandy, in the year 1513, spent most part of his life at Lyons, and died there in 1588, or according to some, 1597. He was the first who intended to write a general history of all known plants; but, by other occupations, he was prevented from continuing it. An accomplished physician at Lyons, of the name of John Molinæus, completed it, at the desire of the bookseller Rovilli.

56. Joachim Camerarius (son of the celebrated commentator), was born at Nuremberg, the sixth of November, 1534, and died October 11th 1598. He lived with Melancthon, at Wittenberg, when a boy, and afterwards studied medicine at Leipzig. Camerarius wrote several treatises on economical botany, and on the plants of the ancients. His principal work contains forty-seven figures, from Gesner's collection. For he purchased Gesner's whole collection of cuts, which amounted to about 2500. He made great use of them in his edition of Matthioli, and in another work, still of great value.

57. Jacob Theod. Tabernamontanus, a pupil of Tragus, took his name from his native place, Bergzabern, a small village in Deux P'onts. He was first an apothecary at Kronweissenburg, he went afterwards to France, returned as doctor of medicine, and at last died as physician to the elector palatine, at Heidelberg, 1590. He was generally esteemed for his great skill. His work was not finished by himself. The second and third volumes were written by another, and are inferior to the first.

58. Leonard Rauwolff, a German, undertook a troublesome journey throughout the Levant. He travelled in the years 1573—1575 through Syria, Arabia, Mesopotamia, Babylon, Assyria, and Armenia. After his return he settled as physician at Augsbourg. On account of his religious profession he was obliged to leave his native place, and died, 1596, as physician to the emperor's army. He has published a very complete account of his journey.

59. Prosper Alpinus, from Marostica near Venice, went, on account of his love for botany, to Egypt. After his return, he practised as physician in Venice, and then in Genoa; he went at last as professor to Padua, where he died, in 1617. He was universally regarded as a very able man. Botany is indebted to him for a few curious little works.

60. John Bauhin, was born at Lyons, in 1541. He was a pupil of Fuchs: and left his native

country, and remained for some time in Yverdon, a town in the canton of Bern. He then went to Muempelgard, where he died, as physician to the duke of Wirtemberg, in 1613. He travelled through the greatest part of Switzerland and Italy. When a youth he commenced his great work, which he only finished fifty-two years after. In this extraordinary performance, a history, extremely well arranged for the time, and admirably compiled, was given of all the plants which had up to that time been published. It was illustrated by a vast multitude of wood blocks, and is the first work of the nature of what are now called *Species plantarum*. The works of Bauhin will always stand as landmarks in science for the benefit of all succeeding ages. His younger brother, Gaspard Bauhin, who died at Basle, in 1624, trod closely in his footsteps, and deservedly ranks high among the botanists of that age.

61. From this memorable period of improvement, in which the Herculean labors of John Bauhin and his brother, as well as the arrangement of Cæsalspinus, had not only advanced the study of vegetables to an unprecedented height, but seemed also to have ensured its continued and unremitted progress; botany, as represented by botanical historians, appears notwithstanding to have languished for a period of nearly half a century; which might perhaps have been owing to the impossibility of outdoing the Bauhins in their own line of investigation, and upon their own principles. But if the progress of the study of vegetables was thus suspended, inasmuch as relates to the collecting, describing, and figuring of plants, there is at least one view of the subject in which it was most essentially advanced; and that is in the revival, if one may not absolutely say original introduction, of phytological investigation, which had been attempted by Theophrastus, and consigned to the most culpable neglect by succeeding botanists, for a period of nearly 2000 years.

62. The revival of this study was probably owing to the new impulse and new direction communicated to the spirit of philosophical enquiry by that great and illustrious luminary of science, Francis Bacon, Lord Verulam, who, having explored and developed the true foundations of human knowledge with a sagacity and penetration unparalleled in the history of mankind, and having dared to disengage himself from the fetters of academical authority, denounced as vain and idle the visionary speculations of the schools, and boldly pointed out the necessity of a complete and thorough revolution in all pre-established methods of study; recommending the more tedious, but yet more successful, method of analytical and inductive investigation, and proclaiming truth to be but the image of nature. But to whatever cause it may be attributed, the fact is, that two different sets of phytological experiments modelled upon the principles and methods pointed out by Bacon, and with a view to elucidate the phenomena of vegetation, were instituted about nearly the same time, by two celebrated anatomists, and accurate observers of nature, residing in different countries, and having no communication with one another. These

naturalists were Grew and Malpighi; the latter an Italian, the former an English physician. For as Gesner and Cæsalpinus had been led, as it were, instinctively to the study of methodical arrangement without any mutual intercourse, so were Grew and Malpighi to the pursuit of phyto-logical enquiry; a circumstance likely to happen, at a time when the spirit of true philosophy had begun to diffuse itself among men of speculative habits, of whom many, no doubt, would be led to view the same subject in the same light.

63. The result of the investigation of these illustrious phytologists was first communicated to the public towards the end of the seventeenth century; and it must be confessed that the success of their labors made amends, in a great measure, for the long neglect of preceding naturalists; for though they had no track to direct them in this obscure and intricate investigation, yet by joining patience to penetration, and experience to philosophy, and by adopting the only sure means of detecting the secrets of nature, the experimental mode of enquiry; exploring most scrupulously the internal and recondite structure of plants, and watching with unwearied application the functions of the different organs, they succeeded in removing much of that veil which had enveloped the phenomena of vegetation; and in opening up to the observation of man a new view of the works of God.

64. But the principles of the philosophy of Bacon, which were thus so successfully applied to phytology, were extended also to botany; particularly on the subject of arrangement, and ground of generic distinction—the necessity of which was now more than ever indispensable, for the purpose of reducing to order the immense mass of particular specimens, collected and described by the increasing multitude of adventurers in the field of botanical discovery. Accordingly, in pursuit of this important object, the talents and industry of the learned were now also more than ever exerted, and a variety of systems introduced, adopted, and abandoned, in their turns.

65. Of these the principal were the methods of Morison, Ray, Tournefort, Rivinus, Boerhaave, Herman, and Magnol, which appeared about the end of the seventeenth or the beginning of the eighteenth century; and which, whatever might have been their defects, had at least the merit of exhibiting botany under a new and systematic form. But the most celebrated as well as the most beautiful of them all was that of Tournefort, which was adopted in France with a kind of epidemic enthusiasm characteristic of the nation, and which has been admired by botanists of all countries. It had, indeed, much merit, at least as exhibiting the first model of generic discrimination, founded on principles truly philosophical. But it had also its defects; for, extremely beautiful in speculation, it was yet clogged with insurmountable difficulties in the practice.

66. No method of arrangement, therefore, had yet been discovered sufficiently suited to the exigency of the case; and a method founded on

principles more easily reduced to practice, was still the grand desideratum of botany.

67. In this peculiar crisis of botanical perplexity, when specimens were every day multiplying in the hands of collectors, when herbariums were devoid of arrangement, and the science was in danger of relapsing again into an absolute chaos; a great and elevated genius arose, destined to restore order, who surveying the immense mass of materials with a sagacity and penetration unparalleled in botanical research, and seizing, as if by intuition, the grand traits of character calculated to form the groundwork of a philosophical division, detected the clue by which he was to extricate himself from the intricacies of the labyrinth, and rear the superstructure of a legitimate method. This great and illustrious naturalist was the celebrated Linnæus, who deducing his rules of method from the most incontrovertible of all principles, and establishing the laws of generic and specific distinction, and even rules of legitimate definition, introduced into the study of botany a simplicity of system, a perspicuity of arrangement, and a precision of language, which have elevated it to the high rank it now holds in the scale of human knowledge, as well as allured to the study of the science men of the most distinguished abilities, and excited that ardor for botanical investigation which characterises the present age.

68. Now let us trace the progress by which this stock of knowledge was acquired. In the Holy Bible it has been ascertained, from the investigations of Sprengel, that there are seventy-one plants noticed by name; which, generally, are such only as were applicable to the purposes of man; and, viewed in this light, the number, as compared with those known to the early heathen writers, is far from inconsiderable. The Homeric Flora amounts to less than thirty species; that of Hippocrates, in the year of the world 3630, to 274 species; and of Theophrastus, who is supposed to have flourished about the same time, to something like 500 species. Dioscorides, who, it is most probable, lived in the time of Cleopatra, more than 300 years later than Theophrastus, notices 600 plants; and finally, Pliny, in the seventy-fourth year of the Christian era, compiled, from an examination of more than 2000 volumes of Greek and Roman writers, an account of nearly 1000 species, the result of the investigations of more than forty centuries. In the succeeding 1400 years, we have already seen that the progress of botany was so slow, that if an increase of 500 species is allowed to have taken place during that long period, it is as many as can possibly be made out to have been discovered. But the two next centuries, when the knowledge of plants was assuming a scientific form, produced, after making every allowance for repetitions and spurious species, upwards of 4500 new plants; a number more than three times greater than had been ascertained in all the ages of the world before.

69. But if we find the opinion expressed at the commencement of this chapter confirmed by the experience of the ages anterior to Tournefort, how much more strongly is it supported by

the evidence of modern times. In the first edition of the *Species Plantarum*, published fifty-three years later than the first edition of Tournefort's *Institutes*, the number of species amounts to 7300; but so extraordinary was the advance of botany under the auspices of philosophical classification and of Linnaeus, that in a few years more it was found that 1500 plants could be added to the list. Pulteney, indeed, makes only 7800 in all; but in this he must be mistaken.

70. The number, however, of species described by Linnaeus, even in his latest work, is by no means to be taken as the standard by which the actual state of knowledge at his time is to be measured. It is well known, that his notions respecting species were peculiar to himself, and it must also be supposed that the difficulty of adapting the half described species of his predecessors to his system, operated with him in some degree in inducing him to neglect their labors, in cases in which his own knowledge did not chance to be such as confirmed their opinions and descriptions. For this reason he often omitted the discoveries of Tournefort, whom he also viewed, and with justice, as his most powerful rival. But the most remarkable instance of his oversight is to be found in the lower orders of vegetables; an obvious example of which is afforded by fungi, of which he notices in the most perfect of his works only ninety-three species, at a time when Micheli had described nearly 800 species of *Agaricus*, or at least of pileate fungi, peculiar to Italy alone. Hence it follows, that a just criterion of the number of plants known in the days of Linnaeus can by no means be formed from consulting that writer's works alone; if, on the contrary, we take into account his omissions, and deduct from the *Institutes* of Tournefort one third for garden varieties, which are improperly ranked as species in that work, we shall be justified in fixing the number of species actually described in works of botany at the time of Linnaeus's death, in the year 1778, at the following numbers:

	Species.
Described in the second edition of the <i>Species Plantarum</i> , and the <i>Mantissas</i>	8800
Described in the <i>Institutes</i> of Tournefort (not noticed by Linnaeus)	1000
Described in Micheli, and other authors upon cryptogamous plants (not noticed by Linnaeus)	1000
Described in the works of Hernandez, Piso, Morison, Ray, Bauhin, &c. being either not taken up, or confounded with others by Linnaeus	800
making the whole number of plants of all kinds, actually described at that time, amount to 11,600, or, in round numbers, to 12,000 species.	

71. Notwithstanding the undoubted excellence of the principles and system of Linnaeus, it is not to be denied that, had he lived at a less corrupt period, or had he not possessed the singular power of precise language, at a time when he was surrounded by confusion and vague descriptions, his botanical system would have been as unsuccessful as those of his predecessors had been, in establishing itself in the good opinion

of the public. The errors of Linnaeus have been so glozed over in this country, that it is quite necessary, in a work intended for public benefit, to open the eyes of the public to the nature of his faults, which may be considered under two heads; the errors of his principles and the faults of his system.

72. Nothing could be more improper and injudicious than the arbitrary manner in which he rejected or altered, when unnecessary, the names given by individuals who preceded him; a practice by which the difficulty of bearing in mind the identity of Linnæan plants with those of antecedent authors has been increased to a most inconvenient degree. He was also in the practice of applying the names used by classical writers to modern plants, without any consideration, and often to such as were wholly dissimilar from those of the classics. His rules of nomenclature, as promulgated by himself, however excellent they may be in some parts, are to the last degree gratuitous, and inconvenient in others. He likewise had the glaring fault of not attaching precise ideas to the names of the organs of plants, but under a single name confounded entirely dissimilar parts; as, for example, in the case of his nectarium, which means almost any and all parts of the flower; this circumstance is very remarkable in a man who certainly possessed a very logical mind. His definitions, usually not accompanied by descriptions, are so imperfect and vague, that it would have been impossible to have determined his plants without the aid of his herbarium; a fault which ought to be considered as most grave; and yet his admirers bepraise him for these very definitions. His patience in overcoming the difficulties of condensing the information of his predecessors, and the novel and elegant manner in which he effected this, are however so striking, that one might almost allow that he merited his high fame upon these grounds alone. Nor would it have been requisite to point out faults, such as have been here noticed, had not the indiscriminate admiration of his friends attempted to make it appear that this certainly great man was something superhuman in all his works, while they are as much open to criticism as those of other authors.

73. The famous system of arrangement which was founded by Linnaeus, under the name of the sexual system, and which for more than half a century was exclusively employed by a large proportion of the most learned botanists, and which is even now made use of by some of the more venerable existing writers, may be said to have owed its celebrity more to its being the groundwork of the important labors of its inventor, than for any extraordinary inherent merits. A great recommendation with the world has also been its apparent facility and simplicity. The principles upon which this system was founded will be explained hereafter; its application and merits are all that demand attention in this place. As it is entirely and essentially artificial, it must be considered in that point of view only; for which reason all the inventions of modern botanists, which tend chiefly to render it less artificial, will be passed by, as well as be-

cause the innovations of his successors are not attributable to Linnæus.

74. It is obvious that the only merits which an artificial system of arrangement can possess, must be extreme facility and precision of application; and that it will be found defective in exactly the degree in which these qualities are absent. Now, notwithstanding the simplicity of the organs upon which the Linnæan arrangement depends, it is notorious, that it is continually necessary to leave them out of consideration in determining the locality of plants. The species, for example, of a genus vary or differ in the number of their stamens; that genus therefore ought to be found in as many different classes as there is variation or difference of this kind; the species differ or vary in the number of their styles; such a genus would be referrible to as many different orders as there are variations of that nature. These differences exist, not only among species of the same genus, but even in flowers of the same individual; whence cases might be found of particular plants, which belong at the same time to several classes and orders of the system. Can any thing be more objectionable to its use than this fact? and instances of such difficulties are neither few nor uncommon. Another objection to the sexual system is, that no information is gained by its use, and that after employing it for the whole of a life, not a single idea is acquired beyond the half dozen with which it was necessary to set out; the consequence of which has been a misconception of the nature and analogies of the organs of plants, and a general ignorance of the affinities by which individuals are related, a thorough knowledge of which is absolutely indispensable to any systematic writer. That this is the fact may be sufficiently shown, by an appeal to the writings of the very best of the exclusively Linnæan botanists. These points are abundantly sufficient to show the inferiority of Linnæus's celebrated system to the praises of his admirers, and to explain the cause of its almost universal disuse at the present day. As an artificial system, it is unquestionably inferior for ready use, and precision, to the artificial system of the French school. Any ingenious botanist, indeed, would contrive a better, if it were either necessary or useful.

75. The natural method, as it is called, has now, however, so entirely superseded the sexual system, and has become so much more facile than it formerly was, that the utility of any artificial system whatever may now be doubted. This celebrated system is generally said to have taken its rise in France, with Bernard de Jussieu, who in the year 1758 arranged the plants in the Royal Garden of Trianon upon a plan which may be considered the basis of the system in its present state. It is not here, however, an object to enter upon the history of the subject, nor to point out the improvements the method has successively received at the hands of Antoine Laurent de Jussieu, Ventenat, Brown, Mirbel, Richard, and De Candolle. It will be preferable to give a rapid glance at its actual state, principles, and objects.

76. The great principles upon which the na-

tural system depends, are, that plants ought to be considered with reference to all their organs, forms, and peculiarities, and not with reference to an arbitrary selection of any one of these; that a bond of union exists in all nature, by which individuals approximate to individuals by insensible gradations; and that the true mode of arriving at a knowledge of the real nature and station of a given object is, by considering it with reference to the points in which it most nearly resembles other objects, which points are called affinities. By this mode of looking at the science, while it becomes necessary to acquire a knowledge of a considerable number of individuals, in order to understand the nature of any single individual, it also follows that the acquisition of this knowledge facilitates in an obvious manner the subsequent investigation of any new subject. For example, a student who is entirely unacquainted with the science, takes up, for the first time in his life, a grass; he examines it, and discovers that it possesses the characters of the extensive natural assemblage called gramineæ, or grasses, and that it belongs to the section of that assemblage called the genus *poa*. From that time forward he will, from the investigation he must of necessity have instituted, possess an accurate notion of the properties and peculiarities of graminææ, and, whenever he again meets with a grass, he will know that it is one, and where in the system at once to refer for information respecting it. The same is consequent upon his studies to the end of his career; each new discovery necessarily increasing his knowledge in various directions, and facilitating the making of discoveries to come.

77. The modes of arrangement, and of analysis, of the natural method are these.

78. The vegetable kingdom is first divided into three portions, according to the structure of the embryo, and of vegetation, viz. 1. *Acotyledones*, which have no cotyledons, as other plants, but whose seeds or spores germinate from any indifferent point of their surface, and whose vegetation is constructed entirely of cellular tissue, without the intermixture of tubular or spiral vessels. 2. *Monocotyledones*, whose embryo has one cotyledon, rarely none, and which in that case germinates from a determinate point, and whose vegetation is formed by increase taking place at their centre, not at their circumference. 3. *Dicotyledones*, which are formed with two cotyledons, and whose vegetation is produced by the gradual superposition of internal layers beneath the bark. This order of arrangement of the three primary groups was used by Jussieu; it is now more frequently inverted, the *Acotyledones* terminating instead of beginning the series.

79. *Dicotyledones* constitute the most extensive part of the vegetable kingdom, and are considered to be in a more perfect state of development than the two others. They are subdivided, 1. According to the number or absence of their petals, into *polypetalous*, *monopetalous*, and *apetalous*. 2. According to the insertion of their stamens, which is *hypogynous* or *perigynous*. 3. According to the adhesion or non-adhesion of their calyx with the ovary, which

is either superior or inferior. 4. According to the position of the stamens with respect to the petals. 5. According to the structure of the fruit. 6. According to the structure of the seed. And 7. According to the modifications of their vegetation, as far as they indicate a corresponding peculiarity in the parts of fructification, which is often the case, and which wonderfully facilitates the acquisition of a knowledge of the natural orders of plants. Thus all Rubiaceæ have opposite entire leaves with intervening stipulæ; all Labiata have opposite resinous leaves, without stipulæ; all Leguminosæ have alternate leaves, with stipulæ, and leaflets always jointed with the petiole, and, when compound, furnished with stipulæ at the base of each pair of leaflets.

80. Monocotyledones are also subdivided according to the above principles, as far as they are applicable to them, but as this group is much more simple in its structure, and less extensive than dicotyledones, the mode of its division is necessarily different. Its principal section is that of cryptogamia, which is characterised by the absence of apparent flowers.

81. Acotyledones, which contain the plants of the simplest structure, have no sexes, but reproduce themselves by what are called sporules, that is to say seedlike bodies, which differ from seeds in germinating indifferently from any point of their surface, and in not being the result of sexual contact. This group answers to the Linnaean cryptogamia, excluding filices.

82. From this statement of the principles upon which the natural system of plants has been contrived, it must be obvious that the difficulties which the advocates of the Linnaean method pretend that it offers to the student do not exist, and that, in fact, the difficulties in the application of the Linnaean method are much greater, as far as the mere student is concerned. In the Linnaean system nothing is learned in the investigation of the name of a plant, except the simple and often very unimportant fact, that its stamens or styles exist in a certain quantity or position; in the natural method, on the contrary, the same process brings the student acquainted, not only with all the characters of that plant which is under his consideration, but also with a comparative knowledge of those plants to which it is allied by nature. In the Linnaean system no step can be advanced till the flower is examined; in the natural method almost any other part of the fructification, and often the foliage or habit of the plant only, will suffice. The Linnaean system produces empirical botany, the natural method scientific botany.

83. It will be seen that, except with reference to the two modern systems of botany, the history of the science, since the time of Linnaeus, is here scarcely noticed. The facts and actors since that period are too recent to require explanation, and too much connected with living writers to make a task requisite which would necessarily be ungrateful. After the decease of that great man, a long interval elapsed, which has reached even to our own times, during which but little improvement in the science took place among his followers. They have added, indeed, to the number of recorded plants, by describing and

defining according to the principles of their master; but it is to France, and to the disciples of the French school elsewhere, that we must look for the progress of scientific botany.

84. By the united endeavours of the followers of the two systems, the advance of botany, since the days of Linnaeus, has been most extraordinary. The number of plants of all denominations now recorded, cannot fall short of 100,000. The elegance and the classical form bestowed upon the science by the labors of the learned Swede, and the attractions offered by the more philosophical principles of Jussieu, and of the French school of botany, have given to the study of the vegetable world that rank among the sciences which its actual importance demands. Princes and potentates have become its patrons, and nobles its professors; vast sums have been expended in its support by the governments of Spain, of France, of the various German states, of Denmark, and of Russia; and in Great Britain the private munificence of individuals has amply compensated for the indifference of the government. The advantages arising from such powerful aid have not disappointed the expectations entertained from them; and the rapid progress of the science towards perfection has amply justified the patronage it has received.

85. But great as the progress of modern systematic botany has undoubtedly been, the progress of modern physiological botany is perhaps still greater. For to give an idea of the mass of talent that has been directed to the elucidation of this difficult department of the study of vegetables, since the period of the investigations of Grew and Malpighi, it will be sufficient to mention, in addition to the name of Linnaeus, that of Hales, Bonnet, Du Hamel, Hedwig, Spallanzani, each of whom has peculiarly distinguished himself in the field of phytological investigation, and eminently contributed to the advancement of the science. But Dr. Priestley deserves to be particularised, as being the first who introduced into the study of phytology the aid of pneumatic chemistry, which, under the happy auspices of Ingenhouz, Senneber, Saussure, and others, has done more to elucidate the phenomena of vegetation, than all other means of investigation put together; so that our knowledge of the physiology of vegetables may now be regarded as resting upon the foundation of a body of the most incontrovertible facts, and assuming a degree of importance inferior only to that of the physiology of animals.

86. But although the labors of phytologists have been directed with success to the explication of a variety of the most important phenomena of vegetation, and although we have been already favored with a condensed and systematic view of the result of their investigations by writers of the highest celebrity, yet there seems to be still wanting some work that shall exhibit them more in detail, and serve the purpose not merely of a brief and rapid sketch, to assist the recollection of the adept, but of a clear and copious introduction, to facilitate the studies of the novice, by presenting to him: first, such an elementary view of the vegetable kingdom, in general, as shall be directly preparatory to phy-

siological research ; and secondly, such a view of the process of vegetation as shall render the rationale of the preceding phenomena preparatory to that of the following, and shall not necessarily suppose any previous knowledge of the subject.

III. THE ANATOMY AND PHYSIOLOGY OF PLANTS.

87. Without entering, in this division of the subject, into all the differences of opinion with which botanists have occupied the world during the slow journey by which we have arrived at the present state of our knowledge, it will be enough to explain, in a clear and sufficient manner, those principles of vegetation, and laws of vegetable increase, which are now believed to be correctly ascertained. In this department, the writings of Aubert du Petit Thouars, a distinguished French philosopher, are considered as those which contain the most correct views of the progress of nature.

88. Not to occupy ourselves with the immense variety of forms which cover the whole face of the globe, it will be more convenient, and equally useful, to confine our attention to a single species. For this the commonest weed will answer the same purpose as the stateliest tree of the tropics.

89. After considering its external organs, let us examine its interior, and seek to discover the manner in which they contribute to its existence. By comparing it with other plants, we shall be enabled to determine what it has in common with them, and what are its peculiarities ; thus we shall at once acquire an idea of its essential characteristics, and of its differences. By enlarging a little upon the functions of all the organs of a plant, under this part of our article, it will be only necessary under the head of Pure Botany to enter into the modifications of organs, without further reference to their nature and purposes.

90. Take a plant at hazard, the first you meet with by the path ; it will be found to possess a root, which fixes it to the ground, and which buries itself in the earth ; and a trunk, or stem, which elevates itself in the air. The latter is furnished, at intervals, with leaves which are remarkable for their thinness, and their green color. Near the point where they leave the trunk, is placed a body which is protruded from it also. Without any determinate figure at first, it gradually develops, and produces new leaves similar to those from which it proceeded ; and, gradually separating the leaves from each other, it stops by forming a second stem. This stem is a branch. Each new leaf being supplied with a similar body, or bud, is capable of producing a new branch, unless prevented by injury or accident. This, therefore, is the plan upon which the plant we are examining increases in size ; but the changes of this nature which it undergoes have little effect upon its peculiar characteristics, they only render it of greater or smaller size. But a more remarkable epocha presently arrives. Buds make their appearance of a very different nature from those which formerly produced branches ; they insensibly in-

crease in size, and at a fitting hour, when they have arrived at their greatest growth, the delicate parts which they contain, burst through the scales which envelope them, and expand themselves ; these are the flowers. They are no longer of a monotonous uniform green color, but they assume the most lively hues, they exhale the most delicious fragrance, and they surprise us by the complex mechanism which they contain. But their duration is brief. Of all the parts of which they were composed, one only remains, which is the pistillum and which fills the centre. When all the rest are withered, this alone assumes a new life, and, after a gradual increase in size arrives at maturity, and becomes the fruit. The latter encloses bodies which separate from it at the period of maturity, and which are the seeds.

91. Each of these seeds placed in the earth, and submitted to the effects of time and circumstances, undergoes the process of germination ; that is to say, absorbing, or, as some have it, pumping up humidity, through channels which are invisible to our senses, it swells until it bursts through the coverings in which it is encased. Then a new body makes its appearance. This is the embryo or rudiment of a new plant ; it is formed of two portions ; the one a cylindrical or conical oblong body, and the other two leaf-like processes applied closely upon each other. The cylindrical body lengthens, and endeavours to bury itself in the earth ; whatever may be the position in which the seed is placed, it finally attains this purpose, and, penetrating the soil, becomes a real root ; whence the name of radicle, which is applied to this organ when in a state of rest. The two leaf-like processes separate, and assume a horizontal direction ; they are the cotyledons. In their centre is to be seen a sort of little bud, which is called the plumule, and which is the parent of subsequent leaves ; those which it first develops are rather different from those of the plant which produced itself ; but in the end they become identical, and a new plant is produced, in all respects the same as that by which the seed was originally borne.

92. Having now examined the exterior of a plant, it is time to consider its internal structure. For this purpose it is as well to continue our observations on the little plant which has just emerged from the seed. In its state of infancy and seclusion, the radicle, when cut across, offers nothing more than a succulent homogeneous substance. As soon as it has advanced, and touched the earth, and pushed forth some young roots, if it is broken across it will be seen that it is then divided into two distinct parts ; namely, a cylinder covered over with a sheath, which appears capable of being separated from it in all points. If the plant has also produced young branches, they too, when cut across, exhibit a similar appearance ; that is to say, upon their first coming forth they will be found solid and homogeneous, and presently afterwards they will be seen to consist of a solid cylinder, and of an external case. After all these parts have arrived at a further period of their growth, another difference will be observable. A transverse section then exhibits two concentric circles ; the

inner enclosing a spongy and rather dry cylinder, the exterior a sheath, which is firmer and of a whitish color; besides which will be seen the separate case which was distinguishable from the earliest development of the plant, and which has now become whitish in the inside, but which retains externally its succulent texture and green color. The rest, however, continues to manifest its two original divisions only, which are always white or some other color, but never green.

93. Here then we have three distinct parts, that in the centre is the pith, the case which surrounds it is the ligneous substance, or the wood; and the external covering is the bark. In the root the pith is absent. But are these parts actually as distinct as they appear to be to the naked eye? In the infancy of the plant we have seen that they were not separate. By what means then have they become so?

94. At the period when they appear most distinct let us examine the pith with a pocket lens. We shall perceive that it consists of a mass of little bladders, or cells, the section of which exhibits a figure more or less hexagonal, and which constitute polyhedral figures, the sides of each of which appear to be common to two cells. They are not so, however, in fact; each polyhedral cell being, as is now known, distinct and separable from those next it, with which it is only in a state of cohesion. Following the direction of these cells with care, it will be seen, that some of them pass horizontally through the ligneous substance, and lose themselves in the bark; if no trace of these appears on the surface of the wood when the bark is stripped off, that will be attributable only to the extreme tenuity of the traversing cells, which snapping asunder upon the slightest violence, leave no perceptible vestige, and offer no sensible resistance. If they are traced in the bark itself, it will be found that they maintain a connexion with the external part of it, where they form a continuous layer, which is what preserves that green color which is always obvious on the outside.

95. The only difference which exists between these parts is, that the centre has expended all its juices, and that the outside of the bark preserves them. In this state the latter receives the name of parenchyma. But with the feeble nature, and slight texture which it possesses, in what manner can it be conceived that the pith penetrates the woody substance which seems to be so solid? The first glance is sufficient to explain this phenomenon. There is no sort of difficulty in seeing that the wood is composed of parallel fibres, which interlace each other, and form a kind of net-work, through the meshes of which the parenchyma, or the medullary elongation, finds its way to the bark. There it meets with a net-work of matter far more flexible than that nearest the pith, and composing all the interior of the bark; this latter is named the liber.

96. There is still an essential part of the bark to notice, which is the epidermis. This is easily discovered. All the interior parts of a plant seem both to the eye and the touch saturated with glutinous juices, while the external part is wholly dry. This state of dryness arises with the epi-

dermis, which consists of an exterior membrane, enclosing and holding together all the solid and fluid parts. It originally existed in the embryo, and it continues to cover, without interruption, all the parts subsequently developed. Even the leaves themselves, so delicate and attenuated, are covered over both surfaces with two united skins of this epidermis. The expansion or dilatation to which they are subject proves this fact, and makes them excellent evidences of it.

97. The part by which the leaf is attached to the stem, and which is named the petiole, appears to be composed of a bundle of fibres. The petiole extends from one end to the other of the leaf, and separates it into two nearly equal parts. It diminishes in diameter as it approaches the end of the leaf, because it from time to time sends off young branches from each side, which themselves become subdivided, and, by crossing each other in various directions, form a kind of continuous net-work.

98. Accident, insects, or a very sharp instrument, will separate the epidermis. It then appears in the form of an extremely thin and perfectly transparent membrane. The green color which it exhibits in its natural state, is not proper to itself, but is caused by the succulent substance which is interposed between the meshes of net-work. In the latter there is no difficulty in recognising the parenchyma in a state of vegetation; for it is certain that the green color is the constant attendant of that state, and that by its means the parenchyma may be discovered wherever it exists.

99. The fibres which form this net-work proceed from the petiole; but whence does the petiole itself derive its origin? It appears to spring from the bark; in that case would it be any thing more than the meshwork of the liber in a state of development? Such has been the opinion of some writers; but, if its origin be carefully traced, it will be found to arise within the woody substance itself; and to be in fact a detached portion of the wood.

100. The phenomena which took place at the period of germination are renewed by every leaf which successively unfolds itself. The cotyledons were the source of the fibres which were sent down into the earth through the root; in like manner every leaf is enabled to maintain a communication between itself and the soil by the means of fibres. Hence arises another kind of increase, of which no notice has yet been taken; the increase in thickness. A stem which at the hour of its birth was no thicker than a pin, in a few months acquires the diameter of an inch or more. This arises from the successive superposition of the bundles of fibres, which are created upon the development of each leaf, and of every leaf-bud. The latter makes its first appearance under the form of a green point, which originates from the inner layers of the ligneous body, which it traverses, and penetrates into the bark. A short time after its first appearance, it may be perceived that the bud is surrounded by a portion of woody fibre, which passes downwards, covers over the wood previously formed, and thus forms a new layer. The existence of

this is easy to demonstrate ; for the fibres of the leaves separate easily from the wood, but the leaf-buds when broken off evidently arise from the interior of the wood. All the new parts formed by the leaf-bud soon become so completely identified with the old wood, that, after a short period, no marks of separation remain.

101. We have now followed the plant through all its stages of increase. We have next to consider what the source is from which it has obtained the substances it has assimilated. There can be no doubt that the roots, which penetrate into the earth, contribute much to this purpose ; for a long time, indeed, it was believed that plants were capable of absorbing even earth itself. But more accurate observation has shown that nothing but humidity can be carried up into the plant through its roots. Mere humidity, however, is insufficient to maintain life and health in a plant. Experiments have been tried to induce plants to exist with their roots plunged into water only : they all proved abortive, although in some cases life was maintained in the subjects of the experiments for several years. Various substances or agents, in combination with humidity, doubtless afford the nutriment upon which vegetables live. But by what curious mechanism is the requisite humidity conveyed to the parts which require it ?

102. In the rapid coup d'œil which has been cast upon the internal structure of plants, we have perceived nothing more in the ligneous body and the liber of the bark, than elongated fibres, which cross each other and form a net-work. Of this we may be convinced with little trouble, by examining against the light, with a pocket lens, a very thin transverse section of a branch. It will be seen to be pierced full of holes, of different forms and sizes ; these are the extremities of as many continuous tubes. The true structure of these tubes is much a matter of conjecture and dispute ; some observers discover an infinite variation of figure and organisation ; others reduce them all to the woody fibre and the spiral vessels or tracheæ. While one microscopic botanist sees pores and holes in the sides of these tubes, simple tubes, mixed tubes, and many more ; others declare that the pores are imaginary, the difference nonexistent, and that all the tubes are essentially the same. In this war of observation, which, however curious as a matter of speculation, bears very little upon the most important part of vegetable physiology, or upon the functions of parts, we shall at present content ourselves with one kind only, which is easy to observe. Twist a young shoot so as to break it with as little violence as possible, and the two separated parts will be found to be held together by extremely delicate threads. If you consider them with care you will find that they are each one a simple thread, rolled up in an admirable manner in the way of a corkscrew. The spires of this screw being closely applied to each other, it forms a continuous tube ; vessels of this kind are called spiral vessels and are found in the nerves of the leaves, or in the bundles of vessels in communication with the leaves. It was long thought that in these parts a striking analogy was perceptible between animals and plants ; and

a comparison was drawn, apparently with reason, between the spiral vessels of plants, and the tracheæ of animals, especially of insects which are constructed in a very similar manner. It was, therefore, inferred, that these were the respiratory passages of plants, but experience has not confirmed this notion. Nevertheless, it is certain, that air acts a great part in the economy of vegetation, and that it is by the leaves that its influence is manifested. They have a direct communication with the roots, whither all their intermediate tubes extend ; and the pores which terminate them may be seen with different degrees of facility according to circumstances. By their agency, the humidity which is sucked from the earth is raised and forms what is called sap, which deposits successively all that is necessary for the supply of the different parts through which it passes. Having arrived at the leaves, a portion escapes by perspiration, a portion is deposited, and the remainder descends, charged with new principles, which the leaves have absorbed from the surrounding atmosphere. The leaves therefore contribute to the increase of the plant. When this motion of the sap is once established it continues to increase ; and it is supposed that the superfluous power which it has acquired occasions the production of new branches, and of flowers.

103. But what is the cause of this motion ? The most obvious is heat, which, by dilating those upper points, which are most subject to its action, occasions a void in them ; the juices which are below them ascend to replace the void, and the continual recurrence of this operation occasions what we call the circulation or motion of the sap. This mechanical action will be a sufficient explanation for those who are contented with looking only at the surface of things ; but it will not explain all the difficulties connected with the motion of the sap ; and, especially will it not account for the first tendency of the radicle to the earth, on which tendency all subsequent phenomena necessarily depend ; of such a tendency, gravitation and a thousand other laws have been offered as an explanation, each being more unsatisfactory than the other. Surely it is wiser at once to admit that it depends upon that inherent principle of life which is peculiar to organic matter, which accompanies the vegetable through all stages of its existence ; and which is infused into those new individuals which the parent produces. It is a first impulse received in the beginning of its existence, which has extended into every part, and which finally passes into the seeds. It is that first creative impression to which it owes the faculty of assimilating the various molecuæ of matter, and of applying them ; by whose influence the roots are directed towards the side where the most fitting nourishment is to be found ; which compels the leaves to present their upper surface always to the light ; which induces many to assume that peculiar position during the night which has been compared to the sleep of animals ; and finally which gives rise to those various phenomena of vegetation which seem to distinguish plants from the general laws of physics.

104. This, perhaps, would be the proper place

to consider the relation which is borne by this vital principle of plants, to that life which we ourselves enjoy, and which we see descending in the scale of creation, growing weaker and weaker as it approaches the inferior animals, of which in general it appears to be the attribute. But, as we can be guided in this labyrinth by force of reasoning only, this question belongs less to the department of natural history than to that of metaphysics.

105. There are many other instructive ideas which may be obtained from the consideration of a single plant; but they perhaps, will be best understood by a comparison with other plants; and by ascertaining by that means, whether all are formed upon the same plan, composed of the same parts, and subject to the same changes.

106. One of the most obvious contrasts presented by the vegetable kingdom, is between the tribes which rapidly expand their foliage, and push up their flower-bearing stems, and by bringing their fruit to perfection fulfil the purpose of their creation in the space of a few months, or even weeks, and those monarchs of the forest which bear aloft their majestic branches in the air, and see centuries passing by them, while generation after generation of herbs, and even men, are perishing at their feet. One would think that if anything could indicate a difference of organisation it would be peculiarities like these. In fact, if we examine one of these vegetable colossi, which storms or other accidents have levelled with the earth that was so long overshadowed by its branches, we perceive that its interior consists of a solid, compact, homogeneous substance, which seems to be analogous to nothing in the annual plant; we also see, however, that a section of this substance is marked by concentric circles. In order to ascertain the origin of these circles, it is necessary to revert to the seeds, which such a tree produces in vast abundance. There we discover the same parts as in the annual plant; two cotyledones; a cylinder, which attempts to fix itself in the earth by the production of roots; and an intermediate bud. The impulse once given to its developement, this seed, with its apparently feeble resources, will become in the lapse of years and ages similar to that giant which produced it. In the leaves and buds consist the sources of its magnitude. The former being under the necessity, on the one hand of coming into contact with air, and on the other of establishing a communication with the soil, establish the action of vegetation. The first year passes on as in the annual plant, except that the parts of the tree are unfolded with less rapidity and that the buds present neither flowers nor fruit, but a tree covered with scales. Upon the arrival of winter, the annual perishes, the tree loses only its leaves. As soon as the season again becomes milder, vegetation, which had been suspended, is renewed; the buds insensibly expand, and the unfolding of new leaves gives a new life to the plant; each of these leaves is accompanied by its bud. Thus each successive season, producing a mass of foliage, which increases by a rapid geometrical progression, and an equal number of new buds, occasions the formation of a new body of ligneous substance, which

overlays the old body, and thus forms the whole tree into a kind of cone.

107. The whole mass of the wood is thus composed of thin successive cones. They are easily perceived in many trees, and it is they which form those concentric circles observable in a trunk cut across. Each circle, depending wholly upon the increase caused by the return of successive seasons, becomes a sure testimony of the age of the tree.

108. The principal part of our trees exhibits these laws of development. The buds may be more or less apparent; and the scales which enclose them may be more or less numerous, being increased in number in proportion to the greater sensibility of the organs they enclose. For a more sure protection, the scales are often covered with glutinous or resinous exudations. But even with this safeguard, the fostering hand of nature does not rest. Thick furs are frequently interposed during the winter among the buds, and are thrown over the tender shoots.

109. By this means the buds remain safely upon the tree. We generally remark one which is a termination of the branch, and which will the following year prolong the branch in its original direction; all the others are seated at the axillæ of the leaves.

110. Trees present many peculiarities, which depend upon their woody state. The pith, which occupies the centre of young plants, disappears in trees. It is probable that, besides the increase in diameter which takes place externally, some peculiar operation goes forward in the inside, and that the solid layers of wood compress the pith in such a way as to leave scarcely any traces behind. Around it vegetation is evidently maintained for a long time, as is shown by the green tinge which surrounds it. Larger and more obvious vessels are placed about it than elsewhere, and constitute what is called the *étui médullaire* by the French, which there is reason to think is one of the most important accessories of vegetation.

111. The wood does not at once arrive at that solidity which it subsequently possesses, but acquires it by slow degrees, from the centre to the circumference. For this reason the external layers are much less compact, and paler than the internal; they are called the *albumen*. Dutrochet accounts for this difference in the old and new layers of wood with his usual sagacity. He is of opinion that a portion of the sap, elaborated and sent downwards by the leaves under the state of proper juice, is absorbed laterally by means of the radiating vessels, or silver grain, and is gradually deposited in the originally empty vessels of the wood; that the compactness and weight of wood depends upon these juices so deposited, and not upon any constitutional difference in the wood itself, and that in certain trees, which are remarkably light, as the poplar, no deposit, or scarcely any, takes place.

112. The bark also undergoes material changes in the course of time. The first branches which are produced are green, like the leaves; their color being occasioned by the transparency of the epidermis, which allows the cellular tissue, or the parenchyma, to show through. By slow de-

grees the epidermis thickens, and assumes a deeper color, under which appearance it is seen in the winter season. If it is raised up, the green color of the parenchyma is still manifest enough beneath it. The epidermis necessarily gives way gradually to the growth of the tree, and splitting in various directions is replaced by another; and by slow degrees new layers are formed, and burst in various directions. According to the nature of the plant the epidermis also takes a variety of forms, sometimes forming the misshapen knotty crust which is usually called bark, sometimes peeling off in thin layers, and occasionally falling from the parent tree in hard flakes.

113. It is probable that the bark performs the same functions as the leaves, in the early state of the buds, and occasionally in all states. Otherwise it would not be easy to account for the growth of cacti, euphorbias, some apocynous plants, &c. which are all destitute of leaves. In fine, the bark may be compared to a universal leaf, with one surface only.

114. We have seen what ingenious methods nature adopts to screen the buds from the rigor of winter; but in countries where there is no winter no defence is requisite. These protecting scales diminish therefore, by degrees, as we approach the equator. In the trees which cover countries in such a latitude, the buds break forth at once into leaves and branches, without regarding the order of seasons. By this circumstance the apparent difference between trees and herbs is removed.

115. In like manner, insensible gradations unite the herbs which creep or trail along the ground, and those which carry their heads aloft in the air: the perennial and the annual vegetable. Some exist for two years. The stems of others perish every year, but their roots survive. Some under shrubs scarcely elevate themselves from the soil, yet their slender stems are formed of a firm and woody substance. Next come the shrubs whose branched and entangled stems form bushes. Lastly are perfected the trees which from possessing a stem scarcely loftier than the stature of a man, finally dilate themselves till they become the giants of the forest.

116. We have assigned, as the cause of increase in the bulk of trees, the communication which is established in their system between the leaves and roots. The reciprocity of disposition of these two organs is so strong, that if a bit of a branch of any tree which is robust enough to bear the operation, be placed in the earth it immediately makes good the loss it has sustained by being dissevered. It presently produces fresh roots, and a new plant is formed. The advantage which is taken of this peculiarity of plants, to propagate them by cuttings or layers is well known. But this is not all; a bud separated from its parent, and inserted between the bark and the wood of another tree, soon establishes the requisite communication between itself and the earth, and renders the tree which bears it similar in nature to the kind artificially inserted. Hence the origin of budding and grafting in horticulture.

117. From these observations it has become evident, that the life of a plant is a succession

of several lives; and that the greater proportion of its parts consists of an intermediate system, which only serves to maintain a communication between the extreme points of the vegetable. If a tree is destroyed by the ravages of time, its death can be only occasioned by the destruction of the intermediate portions of its fabric, by which the channel of continuous communication is effectually interrupted. After such interruption has taken place, the still surviving portions of the tree are capable of furnishing layers or cuttings, which will renew the operation of vegetation with unabated vigor.

118. The resources of nature are far from being exhausted by these apparent buds; there exists throughout the vegetable system a creative and expansive power, which, according to circumstances, is able to operate in the development of new buds, where none had been visible before. In fact, there is always an abundance of rudimentary buds dispersed among the substance of a tree, which are only called into action when the ordinary resources of nature begin to fail. They are frequently excited very long after the period which had been originally assigned for their appearance; and even in places where no traces of them could have been expected to exist. Thus in all vegetables there appears to be as obvious a line of demarcation in the system, at that point which is called the collar, whence the first ascending fibres direct their course upwards, and the descending downwards. Buds are only produced by the former, and form no part of the economy of the latter. Yet it not unfrequently happens, that roots exposed in a proper degree to the influence of the air, will form buds, and throw up shoots, in the same way as the branches. Even the leaves have, in a few cases, a similar power of producing buds, and consequently young plants.

119. We have now seen that the growth of plants, and their increase in size, depends upon a peculiar internal movement, acting between the leaves and the roots. But in what way does it operate? This is a problem which has exercised the ingenuity of all students of vegetable physiology, who have contrived theories innumerable to explain the phenomenon, which is called the circulation of the sap.

120. The great and almost impenetrable obscurity in which this subject is unavoidably involved, has occasioned much diversity of opinion among phytologists. Grew states two hypotheses, which he seems to have entertained at different periods, though it is not quite certain to which of them he finally gave the preference. In one of them he attributes the ascent of the sap to its volatile and magnetic nature, aided by the agency of fermentation; but this hypothesis is by much too fanciful to bear the test of serious investigation. In the other he attributes the entrance and first stage of the sap's ascent to the agency of capillary attraction, and accounts for its progress as follows: the portion of the tube that is now swelled with sap, being surrounded with the vesiculæ of the parenchyma, swelled also with sap, which they have taken up by suction or filtration, is consequently so compressed, that the sap therein is forced upwards a second stage, and so on till it reaches the

summit of the plants. But, if the vesiculæ of the parenchyma receive their moisture only by suction or filtration, it is plain that there is a stage of ascent beyond which they cannot be thus moistened, and cannot, consequently, act any longer upon the longitudinal tubes. The supposed cause, therefore, is inadequate to the production of the effect.

121. Malpighi was of opinion that the sap ascends by means of the contraction and dilatation of the air contained in the air-vessels. This supposition is perhaps somewhat more plausible than either of Grew's; but, in order to render the cause efficient, it was necessary that the tubes should be furnished with valves, which were accordingly supposed; but of which the existence has been totally disproved by succeeding phytologists. If the stem or branch of a plant is cut transversely, in the bleeding season, it will bleed a little from above as well as from below: and if the stem of any species of spurge is cut in two, a milky juice will exude from both sections in almost any season of the year. Also if a plant is inverted, the stem will become a root, and the root a stem and branches, the sap ascending equally well in a contrary direction through the same vessels; as may readily be proved by planting a willow twig in an inverted position. But these facts are totally incompatible with the existence of valves; and the opinion of Malpighi is consequently proved to be groundless.

122. The next hypothesis is that of M. De la Hire, who seems to have attempted to account for the phenomenon by combining together the theories of Grew and Malpighi. Believing that the absorption of the sap was occasioned by the spongy parenchyma, which envelopes the longitudinal tubes, he tried to illustrate the subject by means of the experiment of making water to ascend in coarse paper, which it did readily to the height of six inches, and by particular management even to the height of eighteen inches. But, in order to complete the theory, valves were also found to be necessary, and were accordingly summoned to its aid. The sap which was thus absorbed by the root, was supposed to ascend through the woody fibre, by the force of suction, to a certain height; that is, till it got above the first set of valves, which prevented its return backwards; when it was again supposed to be attracted as before, till it got to the second set of valves, and so on till it got to the top of the plant.

123. This theory was afterwards adopted by Borelli, who endeavoured to render it more perfect, by bringing to its aid the influence of the condensation and rarefaction of the air and juices of the plant, as a cause of the sap's ascent. And on this principle he endeavoured also to account for the greater force of vegetation in the spring and autumn; because the changes of the atmosphere are then the most frequent under a moderate temperature; while in the summer and winter the changes of the atmosphere are but few, and the air and juices either too much rarefied, or too much condensed, so that the movement of the sap is thus at least prejudicially retarded, if not perhaps wholly sus-

pended. But as this theory, with all its additional modifications, is still but a combination of the theories of Grew and Malpighi, it cannot be regarded as affording a satisfactory solution of the phenomenon of the sap's ascent.

124. With this impression upon his mind, and with the best qualifications for the undertaking, Du Hamel directed his efforts to the solution of the difficulty, by endeavouring to account for the phenomenon from the agency of heat, and chiefly on the following grounds: because the sap begins to flow more copiously as the warmth of spring returns; because the sap is sometimes found to flow on the south side of a tree before it flows on the north side; that is, on the side exposed to the influence of the sun's heat sooner than on the side deprived of it; because plants may be made to vegetate even in winter, by means of forcing them in a hot-house; and because plants raised in a hot-house produce their fruit earlier than such as vegetate in the open air.

125. On this intricate but important subject, Linnaeus appears to have embraced the opinion of Du Hamel, or an opinion very nearly allied to it, but does not seem to have strengthened it by any new accession of argument, so that none of the hitherto alleged causes can be regarded as adequate to the production of the effect.

126. According to Saussure, the cause of the sap's ascent is to be found in a peculiar species of irritability, inherent in the sap vessels themselves, and dependent upon vegetable life; in consequence of which they are rendered capable of a certain degree of contraction, according as the internal surface is affected by the application of stimuli, as well as of subsequent dilatation, according as the action of the stimulus subsides: thus admitting and propelling the sap by alternate dilatation and contraction. In order to give elucidation to the subject, let the tube be supposed to consist of an indefinite number of hollow cylinders, united one to another, and let the sap be supposed to enter the first cylinder by suction, or by capillary attraction, or by any other adequate means; then the first cylinder, being excited by the stimulus of the sap, begins gradually to contract, and to propel the contained fluid into the cylinder immediately above it. But the cylinder immediately above it, when acted on in the same manner, is affected in the same manner; and thus the fluid is propelled from cylinder to cylinder, till it reaches the summit of the plant. So also, when the first cylinder has discharged its contents into the second, and is no longer acted upon by the stimulus of the sap, it begins again to be dilated to its original capacity, and prepared for the intro-susception of a new portion of fluid. Thus a supply is constantly kept up, and the sap continues to flow.

127. But Mr. Knight has presented us with another, which, whatever may be its real value, merits at least our particular notice, as coming from an author who stands deservedly high in the list of phytological writers. This theory rests upon the principle of the contraction and dilatation, not of the sap vessels themselves, as in the theory of Saussure, but of what Mr. Knight denominates the silver grain, assisted

perhaps by heat and humidity, expanding or condensing the fluids. On the transverse section of the trunk of woody plants, particularly the oak, they appear in the form of the radii of a circle, extending from the pith to the bark; and on the longitudinal cleft or fissure of the trunk of most trees, but particularly the elm, they appear in the form of fragments of thin and vertical laminæ, or plates, interlacing the ascending tubes in a transverse direction, and touching them at short intervals, so as to form with them a sort of irregular wicker-work, or to exhibit the resemblance of a sort of web. Such, then, being the close and complicated union of the plates and longitudinal tubes, the propulsion of the sap in the latter may be easily accounted for, as it is thought, by means of the alternate contraction and dilatation of the former, if we will but allow them to be susceptible to change of temperature; which susceptibility is proved, as it is also thought, from the following facts: on the surface of an oak plant that was exposed to the influence of the sun's rays, the transverse layers were observed to be so considerably affected by change of temperature as to suggest a belief that organs which were still so restless, now that the tree was dead, could not have been formed to be altogether idle while it was alive. Accordingly, on the surface of the trunk of an oak deprived of part of its bark, the longitudinal clefts and fissures, which were perceptible during the day, were found to close during the night. But in the act of dilating they must press unavoidably on the longitudinal tubes, and consequently propel the sap; while in the act of contracting they again allow the tubes to expand and take in a new supply. This is the substance of the theory.

128. But, in drawing this grand and sweeping conclusion, Keith has well remarked, that it should have been recollected, that change of temperature cannot act upon the transverse layers of a tree that is covered with its bark, in the same manner as it acts upon those of a tree that is stripped of its bark, or upon those of a plank; and if it were even found to act equally upon both, still its action would be but of little avail. For, according to what law is the machinery of the plates to be contracted and dilated, so as to give impulse to the sap? According to the alternate succession of heat and humidity? But this is by much too precarious an alternation to account for the constant, and often rapid, propulsion of the sap, especially at the season of bleeding. For there may be too long a continuance of heat, or there may be too long a continuance of humidity; and what is to become of the plant during this interval of alternation? If we are to regard it as happening only once in the space of twenty-four hours, as in the case of the oak, it can never be of much efficacy in aiding the propulsion of the sap. But if we should even grant more, and admit the alternate contraction and dilatation of the vessels to be as frequent as you please, still their effect would be extremely doubtful, owing to a want of unity or co-operation in the action of different plates, or of different portions of the same plate. If heat, like humidity, entered the plant by the

root, and proceeded gradually upwards, like the ascending sap, perhaps it might be somewhat efficacious in carrying a portion of sap along with it; but as this is not the case, and as the roots of plants are but little affected by change of temperature, while the trunk and upper parts may be affected considerably, it can scarcely be supposed that the action of the plates will be uniform throughout the whole plant; or rather, it must be supposed, that it will often be directly in opposition to that which is necessary to the propulsion of the sap. But, admitting that the sap is propelled by the agency of the plates in question, and admitting that it has been thus raised to the extremity of the woody part of the plant, how are we to account for its ascent in such parts as are yet higher; the leaf-stalk and leaf, the flower-stalk and flower; as well as in the herb also, and in the lofty palm, in which no such plates exist? Here it will be necessary to introduce the agency of a new cause, to complete the work that has been thus begun, and of a new set of machinery to supply the deficiency or absence of the machinery that has been already invented.

129. How unsatisfactory the best of these theories is, must be self-evident, even to persons unacquainted with the structure of vegetables. Du Petit Thouars has, therefore, with his accustomed ingenuity, proposed a new hypothesis, which to us seems by far the least objectionable which has yet been contrived. He dismisses the question of the mechanical action by which the motion of the sap is maintained; thinking, with much justice, that no principle of physics, with which we are acquainted, is sufficient to explain it; and he therefore attributes the mere motion to an inherent power, with which nature has been pleased to endow vegetables. But the cause of the renewal of its motion in the spring, after remaining in a quiescent state for several months, he ascribes to the necessity of maintaining a perfect equilibrium in the system of a plant. So that, if a consumption of sap is produced at any given point, the necessity of making good the space so occasioned, consequently throws all the particles of sap into motion, and the same effect will continue to operate as long as any consumption of sap takes place. The first cause of this consumption of sap he declares to be the development of the buds, and already formed young leaves, by the stimulating action of light and heat, but particularly of the latter. As soon as this development occurs, an assimilation and absorption of sap is occasioned, for the support of the young leaves; a vacancy in the immediate vicinity of the leaves is produced, and motion immediately takes place.

130. We will not occupy ourselves with an explanation of the cause of the descent of the sap: gravitation will serve the purpose, in the room of a more plausible conjecture.

131. But, notwithstanding all the differences which exist among trees, they approach each other by insensible degrees; and yet they individually retain a peculiar set of characters, and a physiognomy, which botanists call habit, that renders it easy to distinguish them at great distances; and more easy to eyes habituated to the

sight of them, by practice and long familiarity, than by the aid of theory.

132. Hot countries are beautified, however, by a description of tree, the differences of which are exhibited in an unusual degree. In these regions exist the palms, that patrician order of plants, as Linnaeus termed it, which supports an umbrageous undulating tuft of huge leaves, seated on the summit of a lofty columnar trunk. Here you have no longer an infinite division of branches, as in our trees of Europe, but a trunk of the greatest possible simplicity, covered with rigid scales, or marked by distant circles. If an observer notices a considerable number together, of different ages and sizes, he will perceive that the smallest and the youngest are entirely the same as the largest, except in dimensions. They possess an equal quantity of leaves, their trunks are of equal diameter, and they differ only in stature. Carrying observation yet farther, it will be found that the trunk is not formed, as in European trees, of concentric circles of wood, but that it is formed by the assembly of a vast number of parallel fibres, which extend from the roots to the summit, and every one of which has its communication with a leaf. No trace of pith is discoverable in the centre, nor of liber or bark in the circumference; but the whole body of utricular or parenchymatous matter exists dispersed among the fibres.

133. To understand this peculiar manner of growth, recourse must again be had to the seed, and to its germination. This is easily examined, the seed of the palm-trees being often among the largest in nature. The part, however, by which reproduction takes place, is wonderfully small for the size of the seed; and lies hidden in a peculiar substance of great dimensions, which is called the albumen.

134. This embryo is oblong, and manifests no trace of division, or of separation, at either extremity. As soon as the period of germination arrives, the exterior extremity elongates and opens, producing a kind of sheath, from the base of which descends a root, and the other extremity of which is always retained in the albumen. This sheath encloses a second, which is rather longer; a third appears, becoming yet longer and longer; from one of the sides of the next is unfolded a kind of plaited leaf. Following each other in succession, the one from the bosom of the other, they at length assume the appearance of the adult leaves, differing from them only in dimensions. The parts of the leaves, continually dilating, expand, and throw off the scales which first appeared; and this centrifugal dilatation goes on till a sort of foundation is laid, which is incapable of growing in any direction except in breadth. Roots go on increasing under ground. Finally, a kind of base is formed, of a far more considerable diameter than the future trunk, or stipes; which then shoots upwards, and increases regularly in dimensions, by the successive development of leaves. These are enclosed, one within the other, in a peculiar manner, and constitute a bud of a particular description. Each has a tendency to rise to a fixed height above that which contained it; the old leaves, as they complete their functions, either fall off wholly,

leaving only a scar behind, or partially, still continuing to clothe the stem with their remains. As soon as this stipes, or trunk, has acquired a certain elevation, bunches of flowers make their appearance in the axillæ. Sometimes they expand among the leaves, as in the date and cocoa nut; sometimes they appear from the stem, as in the areca nut. Although they do not appear till the trees have acquired maturity, they are formed long before. Traces of them may be discovered among the first leaves which are developed; but vegetation, powerfully attracted upwards by the summit, gives them no leisure to unfold themselves, till some check is given to the increase of the tree.

135. We have seen that a section of a dicotyledonous tree presents a series of concentric circles, which are, in fact, the register of its life. The scars or the scales of palms offer a similar, and not less certain, chronology of their past existence; and if you search the interior of their bud, or, as it is often named, their cabbage, which is one of the most delicate of foods, you will find that it is equally easy to read its future history. You will there find, without the aid of glasses, flowers and leaves already formed, which will not be finally produced till several years subsequently.

136. For example, in a species of euterpe, found on the Island of Bourbon, the flowers are visible eight years before they are expanded. The summit is formed of twelve leaves, each supplied with a bunch of flowers in its axilla. These leaves only expand each year, so that four years will have elapsed between the expansion of the first flowers and of the last, although even the former were discoverable four, and the latter eight, years previously.

137. Here, then, we have a mode of germination and development very different from those of European plants. It is not, however, peculiar to palms; but is found, at least in an analogous manner, in a great number of the herbs which are natives of our latitudes. Only hot countries produce other trees with a similar peculiarity of organisation. These differences have given rise to the establishment of two great divisions in the vegetable kingdom. Those plants of which we first treated are called dicotyledons, on account of the two lobes or cotyledons of their embryo; those which have been last under discussion are named monocotyledons, their embryo being provided with one cotyledon only.

138. If it were necessary to have recourse to an examination of the seed, whenever it was necessary to ascertain to which of these two great divisions a given plant belonged, few persons would be found who possess either the patience or opportunity required for ascertaining what is often a very minute point. But, fortunately, this division, which is founded in nature, possesses many external characters, which are quite as available as those of the seed. Before explaining them precisely, we will place two common plants under examination.

139. The first is the common onion. The seed of this plant, like the palm, but of much smaller dimensions, consists of an elongated simple embryo, placed in the midst of albumen.

Its extremity, which is protruded by germination, becomes longer. One end becomes thickened, and buries itself in the soil, whence proceeds the root; the other end is elevated, and bears the seed, like a little cap. Presently a green color pervades it, and we can no longer doubt that it is a genuine leaf. A little above the root is a small lateral slit; from this a second leaf is produced, a third follows, and so on. Each is enclosed within the other, as in the palm; and, like it, they all direct their efforts to produce a kind of base; by these means the dilatation of the root takes place; and, the centre constantly forcing the interior outwards, a true onion is at last the consequence. The leaves, withering up as soon as they have performed their functions, perish, and leave behind them nothing but their fleshy sheaths, the most exterior of which wither and perish also; the interior retain their fleshy and swollen habit. As soon as the period of fructification has arrived, a simple leafless stipes is elevated from the centre of the root, and puts an end to the existence of the individual, except when buds exist among the leaves and give birth to what are called off-sets.

140. The second example, which is equally familiar, shall be that of wheat. The valuable seed which is borne by this herb is, like that of the onion and the palm, formed of albumen, which is what we know under the name of flour, and of an embryo, which reposes at its base. The latter is a little different in figure from the two others; but, like them, it gives rise to a sheath, out of which in succession scales and then leaves arise. At the base of each sheath or leaf, in the inside, is found a bud, which is speedily developed, and contributes to form the tuft of herbage, under which appearance the plant is seen in its earlier stages. But, as soon as the flowering season arrives, a stem of a particular description is produced. Each leaf becomes separated from that which is next it by a considerable space; these spaces are hollow, and partitioned off by a particular kind of division. This kind of stem is called a culm. It is now obvious that there is something peculiar in the manner of growth of the monocotyledons, which distinguishes them from dicotyledons. The leaves, however, offer marks of a more decisive kind. We have already seen, that in dicotyledonous plants, the nerves of the leaf resemble a sort of net-work, but in monocotyledons have a parallel and rectilinear direction, passing without interruption from one end to the other; that is to say, those fibres which are nearest the principal rim, run alongside it as far as the tip, where they are lost in the margin; and all the fibres affect the same direction. Hence the almost constant elongated form of their leaves, which are in some sorts comparable to the blade of a sword, being broadest at the base, and terminating in a point. You rarely can perceive the crenatures, or denticulations, or lobes, which are so common in the leaves of dicotyledons.

141. The flowers also offer some aid in distinguishing these two great classes from each other. The number of parts, which is so variable in most plants, appears almost fixed in monocotyledons. Every organ of fructification

is arranged in a ternary mode, simple or double, or multiple. Dicotyledonous plants are much less constant; nevertheless, the number five, simple or multiple, is more commonly peculiar to them than any other number. It is extremely difficult to assign a cause for this peculiarity; perhaps it is to be sought in the manner in which the fibres first proceed from the parent embryo.

142. Having thus examined the progress of development in the internal parts of a plant, and considered them with relation to their functions, we will conclude the subject of Vegetable Physiology by some remarks upon their variations. We have already seen, that the constituent parts of plants are, cellular tissue, woody fibre, and spiral vessels.

143. The *Cellular Tissue* consists of fine and membranous utricles. Individually, they resemble oblong bladders inflated in the middle, as in the case of some plants; or circular or hexagonal cells, as in the case of others. Collectively, they have been compared to an assemblage of threads of contiguous bladders or vesicles, or to the bubbles that are found on the surface or liquor in a state of fermentation.

144. But this description is applicable to them only as they occur in herbaceous plants; though in either case they are not always of the same figure, in all the different parts of the same plant. In the leaf-stalk of the artichoke, for example, their diversity of figure is very conspicuous, presenting, in their free and uncompressed state, whether on a horizontal or longitudinal slice, a beautiful assemblage of hexagonal cells; but in their crowded and condensed state, as they approximate the longitudinal fibres, an assemblage of tubular threads, successively inflated and contracted. In woody plants their diversity of figure is still greater, as must appear evident if it is but recollected that they constitute not only the bags or bladders of the cellular integument and pith, and of the pulp of the leaf and fruit, but also the very fabric of the divergent layers themselves; assuming a peculiarity of aspect, according to the degree of compression they sustain from other parts; or according to the degree of induration they may have undergone, ascending progressively, from the succulent texture of the pulp and pith to that of the firm and perfect wood.

145. The structure of the utricles of the tree is also said to be different from that of the utricles of the herb; the former being composed of a single membrane, and the latter of a double membrane. Senebier is, however, of opinion, that they consist of a double membrane in both cases, though not so conspicuous in the one case as in the other, owing to the more compact and condensed texture of the wood. However, they are all mutually connected with one another, and also with the other vessels of the plant; which double union is rendered evident by means of colored injections, or rather by means of the absorption of colored infusions, from which the utricles, as well as the longitudinal tubes, always receive a tinge. But in the petals, stamens and pistils, they do not seem to be connected with the longitudinal vessels, as in the other parts of the plant; and perhaps they are also somewhat

peculiar in their organisation, as may be inferred from the following fact, namely, that the white and milky juice with which they are filled in the stem and branch of the fig does not ascend above the peduncle. In the pith they are generally larger than in any of the other parts of the plant; and in plants from which part of the trunk has been cut off, it has been remarked that they become altogether larger and more inflated than in plants of the same species that have not been so treated; which enlargement is perhaps to be accounted for from the superabundance of sap that now pervades them, in consequence of the diminished bulk of the vegetable. Senebier speaks of other utricles, distinct from those of the parenchyma, by which he means the pulp or pith, but without saying anything explicit on the subject, and without representing them as different in form.

146. The *woody fibre* is made up of tubes of two kinds, which have been distributed into large tubes and small tubes. The large tubes are distinguishable by the superior width of the diameter which they present, on the horizontal section of the several parts of the plant.

147. In herbaceous plants, they are represented, by M. Mirbel, as being always found in the centre of the longitudinal fibres; while in woody plants, they are often dispersed at random; though they occasionally form regular groups, which are sometimes concentric circles, constituting the principal mass of the ligneous layers. They are generally to be found in great abundance surrounding the medullary canal. They are found also in the bark, and are capable of being traced from their origin in the extreme fibres of the root, to their termination in the extreme summit of the plant; uniting in the body of the root, traversing the collar, penetrating and ascending the stem in a parallel direction, separating and entering the branches, buds, and foot-stalks; separating again, and distributing themselves in smaller bundles, so as to form the nerves and veins of the leaves and petals, the slender fibres of the stamens and pistils, and the firm and woody fibres of the fruit. In the lichens, fungi, and fungi, no large tubes are discoverable, even with the aid of the microscope; though in the transverse section of most other plants they are visible without a microscope.

148. The simple tubes, which are the largest of all the large tubes, are formed of a thin and entire membrane, without any perceptible description of continuity, and are found chiefly in the bark, though not confined to it, as they are to be met with also both in the albumum and matured wood, as well as in the fibres of herbaceous plants. But they are particularly conspicuous in the stem and other parts of the different species of euphorbia and periploca; and in all plants, in general, containing thick and resinous juices, known by the name of the proper juices, to the ready passage of which their great width of diameter is well adapted. Sometimes they are distinguishable by their color, which is that of the juices contained in them, being white as in euphorbia; or yellow, as in celandine; or scarlet as in piscidia erythrina. In this plant they are united in bundles, but are

detachable from one another by means of being steeped for a few days in spirit of turpentine, when they become altogether colorless and transparent, because the resinous matter which they contained has been dissolved. Senebier says they retain their cylindrical form even in their detached state; and if so, the membrane of which they are composed must be very strong. The porous tubes resemble the simple tubes in their general aspect; but differ from them in being pierced with small holes, or pores, which are often distributed in regular and parallel rows. They are found in most abundance in woody plants, and particularly in wood that is firm and compact, like that of the oak; but they do not, like the simple tubes, seem destined to contain any oily or resinous juice.

149. The *spiral vessels* are fine transparent and thread-like substances, occasionally interspersed with other tubes of the plant; but distinguished from them by being twisted from right to left, or from left to right, in the form of a cork-screw. They occur in most abundance in herbaceous plants, particularly in aquatics; but they are also to be met with in woody plants, whether shrubs or trees. If the stalk of a plant of the liliaceous tribe, or a tender shoot of the elder, is taken and partly cut across, and then gently broken or twisted asunder, the spiral tubes may be seen with the naked eye, uncoiled somewhat, but remaining still entire, even after all the other parts have given way; and, if the inferior portion of the stalk is not very large, it may be kept suspended for some considerable time merely by the strength of the tubes, which though now almost entirely uncoiled, by means of the weight they support, will, when they finally break, suddenly wind up at each extremity, and again resume their spiral form.

150. Grew and Malpighi, who first discovered and described them, represented them as resembling in their appearance the trachea, or wind-pipe of animals, and designated them by the same term; an appellation by which they are still very generally known. Du Hamel endeavoured to convey an idea of their form, by comparing it to that of a piece of riband rolled round a small cylinder, and then gently pulled off in the direction of its longitudinal axis. The figure of the riband becomes thus loosely spiral. This is a very good illustration of the figure of the spiral tubes in their uncoiled state, but it does not represent them very correctly as they exist in the plant. But the best illustration of this kind is perhaps that of Dr. Thomson's. Take a small cylinder of wood, and wrap round it a piece of fine and slender wire, so as that the successive rings may touch one another, and then pull out the cylinder. The wire, as it now stands, will represent the spiral tubes as they exist in the plant. And if it is stretched, by pulling out the two extremities, it will represent them in their uncoiled state also. But, although the spiral tubes are to be met with in almost all plants, they are not yet to be met with in all the different organs of the plant; or, at least, there are organs in which they occur but rarely, or in very small numbers.

They do not seem to occur often in the root, or at least they are not easily detected in it.

Grew and Malpighi, do indeed, represent them as occurring often in the root, the former referring for examples to the roots of plants in general, and the latter to those of the asparagus, poplar, convolvulus, elm tree, and reed; all of which, Keith says, 'I have examined with great care, without being able to discover any spiral tubes. Senebier says he found them in the root of the balsams and thorn-apple; in examining which I was equally unsuccessful as in examining the former. I cannot, however, doubt the accuracy of the observations of the above phytologists, and can only set down my own want of success in discovery to the score of some defect, either in the specimens examined, or in my mode of examination. Indeed, the only root in which I have ever found them, after examining a very considerable number, is that of the common garden lettuce, know by the name of *cos* lettuce. Having taken the root of a plant that was just putting out its flowers, and stripped it of its bark, I then cut it partly across, about the middle of its length, and broke the remainder of it gently asunder. On examining the surface of the fracture with the microscope, fragments or spiral tubes were seen projecting from it near the centre. They did not seem very tenacious of their spiral form; and when once uncoiled did not readily resume it.'

151. The spiral threads are to be found also in the stem and branch; but not in all parts of them; or at least not in all periods of their growth. It seems very doubtful, whether they exist at all in the bark. Daubenton professes, indeed, to have seen them in it; but no one else ever has; so that we are, perhaps, sufficiently well warranted in entertaining our doubts. It seems also very doubtful, whether they exist in that part of the stem which consists of matured wood, though Daubenton professes to have seen them in the wood of *cedrela*; in which case he does not altogether stand alone; as they are represented both by Grew and Hedwig, as visible also in the wood. But they have not been found in the matured wood by any other vegetable anatomists. Du Hamel never met with them in any of the woody parts of woody plants, except in the young and herbaceous branches. Mirbel expresses himself to the same effect. And Mr. Knight, who has examined the subject perhaps still more recently, could not detect them in any of the permanent parts of such plants, except in the annual shoot. Keith's observations on this subject have had nearly a similar result. Among many subjects of examination he mentions only the elder, willow, hawthorn, cherry, and elm tree. In the three former, he found them only in the annual shoot, situated immediately without the pith, or rather imbedded in the alburnum; though in the elder some of them seemed to be imbedded even in the pith itself. In the cherry he found also a very few, similarly situated, in the branch of two years old; but none in wood older than that. And in the elm tree he has thought he had discovered them even in the matured wood. Having placed under the microscope a very thin slice, taken from a piece of the trunk of an elm tree, that had been felled at least six or seven

years, he thought he was able to trace the remains of the spiral tubes. The slice was taken from the surface of a longitudinal section passing through the centre of the trunk, and clear of divergent layers; and the tubes seemed to appear most distinct when the slice was so placed as to present their longitudinal dimensions to the light. They seem to resemble ribands wrapped spirally round a cylinder, rather than to form separate vessels, which corresponds very well to their appearance, even in the succulent parts of many plants, as described by Knight. Some of them seemed even separate and entire. And yet, upon repeated observation, he has not been able to satisfy himself entirely on this point; but he has stated the case circumstantially, as being the probable means of inducing some one to take up the subject, who may be more felicitous in his investigations. It cannot be said to be a vain or fruitless enquiry. For as they are known to have existed at least in the tender shoot, it will follow that they must exist, in one shape or other, in the matured wood also. And if their spiral form is there obliterated, under what other aspect do they now appear? It seems certain, from the observations of Hedwig, that they assume a different figure in different stages of the plant's growth. In the peduncle of the *colchicum autumnale*, the rings of the tubes are closer when it begins to appear above ground, than at the time of flowering, from which he concludes, that they are at length entirely obliterated, and the tubes converted into woody fibre. But sometimes it is difficult to detect them, even in the young shoot; though they are generally to be observed by breaking it gently asunder, and then examining the surface of the fracture with a microscope. In this case they appear in small fragments, projecting from the surface, and somewhat uncoiled; but if the shoot is split longitudinally, a portion of them will sometimes be found extended longitudinally on the surface of the fissure in an uncoiled state.

152. In the stem and branches of herbaceous plants, they are generally discoverable, without much difficulty, accompanying the longitudinal fibres, and forming part of the bundles. Keith has found them in the stem and branches of the burdock, even in winter, when the fragments of the mature plant had become quite indurated by means of their exposure to the weather.

153. They are also very easily detected in the foot-stalk, both of the leaf and flower, accompanying, or rather seeming almost entirely to compose, the bundles of longitudinal fibres. This may be well exemplified in the leaf-stalk of the artichoke, when young and fresh, in the fibres of which they are not only remarkably large and distinct, but also remarkably beautiful; some of them exhibiting in their natural position the appearance of spiral coats, investing interior fibres, rather than that of forming a distinct tube, and seeming when uncoiled to be themselves formed of a sort of net-like membrane.

154. They are discoverable also in the leaf, though not quite so easily detected as in the leaf-stalk. But if a leaf is taken and gently torn asunder in a transverse direction, fragments of the spiral tubes will be seen projecting from the

tern edges, and generally accompanying the nerves.

155. They are also to be found both in the calyx and corolla, but not so generally as in the leaf, on which account some botanists have decided rather too hastily with regard to their non-existence in these parts of the flower. Mirbel says, no tracheæ are to be found in the calyx nor in the corolla, except in the claw. But Keith has found them most unequivocally in the calyx of *scabiosa arvensis*; and also in the expansion of the corolla of the same plant, as also in the calyx, both proper and common, of *dipsacus sylvestris*, and in the corolla of the honey-suckle, in which they appear to be placed within the nerves, or at least to be closely united to them.

156. In the other parts they do not seem to occur frequently, or at least it is difficult to detect them. Malpighi represents them, indeed, as occurring in the stamens, but Keith was not fortunate enough to meet with them in the stamens of any flower he examined. He looked for them also in the style of many flowers, and found them in that of the honey-suckle only.

157. According to the observations of Grew and Malpighi, they are to be met with both in fruits and seeds; though Hedwig says, they are not to be seen in the cotyledons, except during the process of germination, and that only by means of their being moistened with some colored infusion. But Gærtner says, they are conspicuous in the thinner cotyledons, even before germination takes place; and Reishel is said to have detected them even in the plumelet and radicle.

158. But, in whatever part of the plant they are found to exist, they are always endowed with a considerable degree of elasticity, as has been already noticed. For though they are forcibly extended, so as wholly to undo the spires, they will again contract, and resume their former figure, when the extending cause is withdrawn; and if they are even stretched till they break, the fragments will again coil themselves up as before. It has been said, however, that those of the *butomus umbellatus*, if once uncoiled, will contract again no more. But this is true only when they are stretched to a great length. For when they are stretched gently and moderately, they will again contract, as has been proved by experiment.

159. Malpighi, in the course of some observations on the spiral tubes during the winter season, fancied he had perceived a sort of vernicular and spontaneous movement in them. But he thought he saw this movement only once, and as it has never since been seen by any subsequent observer, it appears that we must be content to set it down to the score of microscopical deception, or to the effect of the atmosphere upon the tubes when exposed to its action.

160. We have now run over the differences of the most important kind, by which the functions of what Darwin not inaptly called the viviparous system of vegetation, are affected. Let us now proceed to consider the nature and destination of the oviparous system, or of the parts of reproduction by seed. As the former depend upon

internal organisation, so do the latter upon external peculiarities.

161. Hitherto we have scarcely spoken of the flower; that brilliant ornament of plants, which attracts admiration by the splendor of its colors, and the delicacy of its texture, by the delicious perfume which it exhales, and by the wonderful mechanism with which it is constructed. Its base, which acts as an external envelope, is ordinarily of a green color, and is called the calyx. The next envelope, which is the most striking, as it is in it that the beauty of the flower resides, is the corolla. Then succeed the stamens, which are generally delicate threads, terminated by a dilatation of a particular nature; and the pistillum, consisting of ovarium and stigma, which in time becomes the fruit. These parts generally exist all in a single flower, which is then termed complete; if a part of the members is absent, the flower is termed incomplete. Each organ is susceptible of an infinite variety of combinations and modifications in form, in number, in station, in proportion, or in structure, which give rise to the smaller divisions of vegetables called genera. These will be noticed hereafter. The functions only of the organs are to occupy our attention while treating of Vegetable Physiology.

162. The most easy to observe is the corolla; which is composed of one or more pieces called petals; in the former state it is monopetalous, in the latter polypetalous. The petals are either equal or unequal in their form or insertion, whence corollas are either regular or irregular.

163. The stamens appear, from their position, to bear a direct relation with the corolla; thus, in almost all monopetalous flowers, they originate from the corolla itself; but in polypetalous flowers this more rarely happens; then, however, they maintain so many relations with the petals, being alternate or opposite to them, and equal or double or multiple in number, that it is impossible to doubt of the strict alliance by which they are connected. The calyx has a yet more strict analogy with the corolla, the divisions of which are almost always equal in number to those of the calyx, and alternate in insertion, especially when the corolla arises immediately from the calyx. It often happens that it arises from a particular place which is called the receptacle. These three parts, then, have a great analogy with each other; so that one does not vary in the number of its divisions, without affecting the two others by the change. They are themselves, however, subordinate to the pistillum.

*163. There is generally only one pistillum in flowers; occasionally two or more: but these variations in number are independent of the other organs. The ovarium has then a more obvious relation: it is seated in the centre of the flower, at the bottom of the calyx, to which it is attached by its base; sometimes a cohesion takes place between the sides of the calyx and ovarium, which latter then appears to support the flower like a footstalk. From these two modifications arise those two important distinctions among plants, of ovarium superius, or separate from the calyx, and ovarium inferius, or adhering to the calyx; differences which are of extreme importance in

characterising many of the most natural of the systematic combinations of modern botanists.

164. In some flowers the corolla disappears, or is not developed, in others the calyx seem to be wanting. Touching this fact, has arisen a disquisition, which seems to have no end, as to what name ought to be applied to the envelope of a flower when one envelope only is present. By whatever name this single envelope may be called, it bears the same relation to the other parts as the calyx and corolla when both are present; it is in some cases itself almost obliterated, and there are some flowers which consist only of stamens without corolla, and which are then called naked.

165. When both calyx and corolla exist together or one of them only, another set of organs occasionally disappears, namely the stamens, and then the pistillum is found alone in the centre; but in this case it always happens, that, either upon the same plant or upon a different individual, flowers exist which contain stamens only, and no pistillum. Sometimes both organs are developed without covering, and separate from each other. However these two parts may be separated from each other, they always appear at the same period of time, and, ever since the study of plants has been an object of philosophical research, no instance has been found of a perfect plant in which both organs did not co-exist.

166. It appears therefore, from this example, and from many others which could be brought forward, that the stamens and the pistil are the only essential parts of a flower; a fact which is not surprising as far as the pistil is concerned, because we have seen that it contains the rudiments of the future progeny. But what manner of influence is exercised by the stamens? If we examine them in every flower within our reach, we shall find that they have a similar structure: we shall see that they consist of two parts, the upper resembling a little bag, generally yellow, and always divided into one or two cells, which contain a kind of powder, and the lower resembling a thread-like stalk to the former. The former is called the anther, and the latter the filament. The powder which it contains, examined through a microscope, consists of granules, varying in size and form according to their species, and sometimes so remarkably, that it is often possible to distinguish genera by the inspection of the granules only. Thrown into water they swell, and eventually burst, emitting a peculiar fluid which resembles vapor. The name given to the granules is pollen.

167. From the combination of these observations, we come to an important discovery; we perceive that the petals, with the brilliant tints of every color of the rainbow, are in fact the curtains of the nuptial bed of Flora, within the protection of which the mysteries of generation are accomplished. We have, therefore, sexes in plants; these, indeed, appear almost indispensable. In most animals they are separated; but in vermes we see them confounded, and at length disappear entirely. The want of the power of motion in vegetables renders their union in one individual of great importance. But, as if the resources of nature were illimitable, they are in

some cases separated upon the same tree, or upon different trees, and the agency of the wind or of insects, is requisite to enable them to accomplish their destiny.

168. The relation, therefore, of the stamens to the pistillum, gives rise to some further considerations. When they are united in one flower, the flower in that case is called hermaphrodite; if they are in separate flowers, it is declinuous; it is monœcious when the male and female are present in different flowers of the same individual; diœcious, if in flowers of different individuals. Some plants have male and female flowers mixed with such as are hermaphrodites; then they are called polygamous.

14. The pistillum offers a multitude of most important characters. Its ovary is terminated by one or several styles, and each of the latter has one or more stigmata. The ovarium either contains only one rudiment of a seed, called an ovulum, or several, and is divided internally into one cell or many.

170. The fruit, which is the necessary consequence of the ovarium, is generally like it in the number of its parts; the occasional abortion of some one of the latter, is the only way in which the number of parts is smaller in the fruit than in the ovarium. The form, the texture, and the volume of fruit give rise to an infinity of differences. Thus one sees, on the one hand, soft pulpy fruit, and, on the other hand, nuts, the shell of which is hard as wood itself. The manner in which the seeds are attached is also subject to variation, for they either proceed from a central receptacle, or from the paries of the fruit. The point from which they proceed is, in all cases, called the placenta. This organ is of great importance; for it is not only the medium through which the fecundating effluvia of the pollen is communicated to the ovula, but also through which the juices are elaborated, which are required for the development of the embryo. It may be compared to the placenta of animals.

171. The position of the embryo, with relation to the fruit, is also a point of importance. Thus the axis of the seed may be parallel with the axis of the fruit, and fixed by the basis, which is the most natural position; then the seed is called erect. It may become horizontal; or being affixed to the summit of the cell it may become inverted; it is in the latter case said to be pendulous. For various modifications of the position of the seed, see SEED, under PURE BOTANY.

172. Each seed may be considered as an isolated individual; for nature has prepared them for separation from their parent without inconvenience. Their interior consists of a substance of various degrees of texture, which is called the albumen, and of the fleshy body already mentioned as the seminal embryo. The albumen may be absent, the embryo must be present. The coat of the seed consists of two layers, the interior of which is much more membranous than the exterior.

173. But now arises a problem in vegetation which it is very important to resolve. Whence is the origin of the flower? Linnæus has offered an explanation, which he considered capable of of meeting every difficulty, and which he bor-

rowed from Cæsalpinus, whose knowledge ran far beyond that of his age. According to these two authors the flower is only a manifestation of the interior of a plant. The epidermis and cuticle give rise to the calyx, the fibre to the corolla, the woody fibre to the stamen, and the pith to the pistillum: this last part is the most essential, and the centre of vegetation; the others are only accessory.

174. But this ingenious notion, like many other brilliant hypotheses, will not bear a strict scrutiny. The nature of the pith is now better understood, and instead of being a creating organ, it is itself, in fact, a body in a state of disorganisation. A single fact has overthrown the whole theory: this is the more intimate knowledge of the interior of palms, and other monocotyledonous trees. According to the arrangement of their interior, and the mixture of the pith and woody fibre, it would happen, if Linnæus's theory were true, that the flowers of the palm would have quite another arrangement from that of other plants, and that the parts would neither be arranged round a centre, nor be placed in the same relation to each other.

175. It appears certain, that, notwithstanding the striking differences which all parts of a flower exhibit, they have all the same origin; which is indicated by the propensity they all have, under certain circumstances, of changing into each other from circumference to centre, or of reverting to one common appearance; which is that of the leaf. Upon this subject Mr. Lindley remarks, 'that it is well understood that the universal principle upon which perfect vegetables are formed, is by the continual addition of parts one above the other, round a common axis, which is produced by their accretion. This law is not confined to the production of foliage, or branches only, but must be considered to extend to the ultimate point of vegetable development in the ovary; and seems to indicate that the progress of nature is continually onwards. Unless, therefore, it should be shown that the order of alteration in the structure of organs so produced is in monstrous formations reversed, it would be a reasonable inference that nature follows her usual course in transformation, as well as in original production; and that the changes which particular portions of a flower may undergo, always have the character of that series which is placed next them in the inside, and not of that on the outside. The consequence of the prevalence of such a law would therefore be this, with respect to the formation of double flowers, that bractææ, if present, would change into calyx, calyx into petals, petals into stamens, and stamens into ovaries; and that the reverse of that order could not take place.'

176. It may thence be concluded that a flower is a leaf-bud in a particular state of alteration; that the calycine lobes, the petals, the stamens, the pistillum, are all leaves in an altered form, and that they have all a tendency, which may now and then manifest itself, of assuming their primitive habit and structure. Whence they arise, or in what way this extraordinary metamorphosis takes place, we are as yet unable to determine.

177. The pistillum, which is the terminating point of the line of vegetation, is now ascertained to be, not, as was formerly supposed, an anomalous organ, which was referable to none of the simple types upon which the other parts of fructification are modelled, but a leaf or leaves also in a state of greater affinity to their type than any other organ. The style is an alteration of the middle nerve, the stigma a secreting surface proceeding from the tip of the same part, the sides of the ovary the two halves of the leaf, and the placenta the edges of the leaf. This is tolerably obvious in a strictly simple unilocular ovary, such as one segment of a *Pæony* fruit. But in a many-celled pistil it is not so apparent. Mr. Robert Brown, however, has demonstrated, that all multilocular compound ovaries are merely an aggregation of a number of simple ovaries round a common axis; that the cells are occasioned by the interposition and cohesion of the sides of simple ovaries, which in that state are called dissepiments.

178. Besides the plants which are furnished with a flower, there are others in which no apparent flowers exist, which are constructed differently from either monocotyledonous or dicotyledonous plants, and whose methods of reproduction are quite of another nature. These plants are called cryptogamous, and consist of ferns, mosses, hepaticæ, lichens, algæ, and fungi. They are all supposed to be destitute of cotyledons, whence they are also named acotyledonous.

179. In ferns, which are by some authors referred to monocotyledons, the mode of growth resembles in some measure such plants. The grain from which they are reproduced, and which is called a sporule, in germination dilates into a very small leaf of a particular kind, which successively gives rise to others, which finally acquire the stature and the form of adult leaves. A species of trunk or stipes, similar to that of the palm, creeps along the surface of the earth, or elevates itself above it. Its internal structure separates it as far from monocotyledons as from dicotyledons. It has, however, at the first sight, the greatest resemblance to the former; a section of it offers, as in monocotyledons, certain scattered points, among a mass of parenchyma. These points, which vary in almost every different species, are a section of a peculiar substance, which is divided at the base, and united at the summit, and which may be compared in texture to the liber of dicotyledons. It is surrounded by a fur, which is more or less apparent, and more or less deeply colored, and which seems analogous to the woody texture, especially as in arborescent ferns it is that which forms the solid substance. Both these substances are distributed among the nerves of the leaves, which are simple, ramified, or verticillated, according to the species. In the opinion of a celebrated modern physiologist, a fern may be considered as a plant turned inside out.

180. The remaining classes of cryptogamia consist entirely of cellular tissue, amassed in different proportions, and under various forms. They are destitute of woody vessels or of tracheæ, and have no distinction between bark, wood, and epidermis: they may perhaps be considered

to consist wholly of the latter and former confounded.

IV.—PURE BOTANY.

181. We have thus considered botany with respect to its analogies, its history, and its physiology. It now remains for us to explain its practical details, as applied to what is called **SYSTEMATIC BOTANY**, or the science of arranging the natural objects of which it consists.

182. The materials of this branch of the science are the modifications of parts; from a just application of these materials result classifications. We shall first attend to modifications.

183. All perfect plants consist, as has been already seen, of the following organs. 1. The **ROOT**; 2. the **STEM**; 3. the **FOLIAGE**; 4. the **INFLORESCENCE**; 5. the **FLOWER**; 6. the **FRUIT**. Each of these organs must be considered separately. But, before entering upon an explanation of the peculiarities of each of them, it will be proper to notice the terms used in speaking of their size, surface, and color; these terms being applicable to each of the six parts into which a plant is divisible.

184. There are eleven terms which are employed to designate the size or measurement of a plant or its parts, viz.:

1. A hair breadth (*capillus*), the measure of a hair, or the twelfth part of a line.

2. A line (*linea*), the length of the white crescent at the root of the nail of the middle finger, or the twelfth part of an inch.

3. A nail length (*unguis*), the length of the nail of the middle finger, or half an inch.

4. An inch (*pollex, uncia*), the length of the first joint of the thumb, the twelfth part of a foot.

5. A hand breadth (*palmus*), the breadth of four fingers of the hand, or three inches.

6. A span (*dodrans*), as far as one can span with the thumb and the little finger, or nine inches.

7. A small span (*spithama*), as far as one can span with the thumb and fore finger, or seven inches.

8. A foot (*pes*), the length from the elbow to the wrist, or twelve inches.

9. A cubit (*cubitus*), from the elbow to the point of the middle finger, or seventeen inches.

10. An ell (*ulna, brachium*), the length of the whole arm, or four and twenty inches.

11. A fathom or toise (*orgya*), the length of the arms stretched out from the tip of one middle finger to that of the other, or six feet.

For these the following have been substituted by some French botanists:—

The millimètre = $\frac{1440}{1000}$ of a line.

The centimètre = 4 lines $\frac{423}{1000}$.

The decimètre = 3 inches 8 lines $\frac{320}{1000}$.

The mètre = 3 feet 11 lines $\frac{260}{1000}$.

185. The surface of plants is of great importance in distinguishing the species and varieties of plants, but is not of value in generic discrimination. The terms which follow are, or ought to be, used precisely in the sense here ascribed to them; they are extremely well defined by Willdenow, who limits them thus:

1. Shining (*nitidus*), when the surface is so

smooth that it reflects the rays of light, and has a shining or glancing appearance, as in the leaves of the holly, *Ilex aquifolium*.

2. Dull (*opacus*), when the surface does not reflect the rays, and is entirely void of lustre.

3. Even (*lævis*), without striæ, furrows, or raised dots. It is the opposite of Nos. 6, 7, 23, 24, 25, 28, and 29.

4. Smooth (*glaber*), when there are no visible hairs, bristles or thorns. It is the opposite of Nos. 8, 22, 26 and 27.

5. Dotted (*punctatus*), where small fine dots are perceived by the eye but not by the touch. *Thymus vulgaris*.

6. Scabrous (*scaber*), where small raised dots are felt but not seen; as in *Carex acuta*.

7. Rough (*asper*), when these dots are both felt and seen. *Pulmonaria officinalis*.

8. Hispid (*hispidus*), beset with very short stiff hairs. *Myosotis arvensis*.

9. Hirsute (*hirtus*), where the hairs are moderately long but very stiff. *Echium vulgare*.

10. Hairy (*pilosus*), beset with long single hairs, somewhat bent. *Hieracium pilosella*.

11. Villous (*villosus*), where the hairs are long, soft, and white. *Stachys Germanica*.

12. Pubescent (*pubescens*), overgrown with short fine white hairs. *Oenothera mollissima*.

13. Silky (*sericeus*), when the surface is white and shining, by means of thick and almost invisible hairs. *Potentilla anserina*.

14. Woolly (*lanatus*), when the surface is beset with long thick white hairs, easily distinguished. *Stachys lanata*.

15. Tomentose (*tomentosus*), when fine hairs are so matted together that the particular hairs cannot be distinguished. In this case the surface generally appears white, as in *Verbascum*; or of a rust color, as in *Ledum*.

16. Bearded (*barbatus*), when the hairs are in tufts. *Mesembryanthemum barbatum*.

17. Strigose (*strigosus*), when the surface is armed with small, close-lying bristles, which are thickest below. *Lithospermum officinale*.

18. Stinging (*urens*), when a painful burning sensation is caused by small hairs. *Urtica*. Such hairs are called stimuli.

19. Fringed (*ciliatus*), when on the margin of a leaf, or the surface of a stalk, there is a row of hairs of equal length.

20. Warty (*papillosus*), when small fleshy warts appear. *Aloe margaritifera*.

21. Pustular (*papulosus*), when there are small hollow bladders. *Mesembryanthemum hispidum*.

22. Muricated (*muricatus*), armed with small short herbaceous spines. *Asperugo procumbens*.

23. Scaly (*lepidotus*), when the surface is covered with small scales closely placed, by which means the color is changed, as in *Elæagnus angustifolia*.

24. Mealy (*farinosus*), when the surface is thickly covered with a white powder, as in *Primula farinosa*.

25. Hoary (*pruinoseus*), when the surface is strewn with a very fine white dust, like the fruit of some plumbs. *Prunus domestica*.

26. Glutinous (*glutinosus*), when the surface is covered with an adhesive matter, which is soluble in water. *Primula glutinosa*.

27. Viscid (viscidus), when the surface is covered with a viscid juice, which is resinous or greasy. *Cerastium viscosum*.

28. Striated (striatus), when the surface is finely streaked. *Aira caespitosa*.

29. Furrowed (sulcatus), when the streaks form small furrows. *Umbellæ*.

186. The following are the principal colors, which are distinguished by name: this part of the subject is extremely imperfect; and perhaps from its nature will always, like all distinctions depending upon so uncertain a power as that of discriminating between the delicate gradations of so unmanageable an agent as of light, remain in an imperfect state. The Latin names are necessarily employed from the want of equivalent expressions in the English language.

1. Cyaneus; dark blue, like Prussian blue.

2. Cæruleus; sky blue, like the flowers of *Veronica Chamædrys*.

3. Azureus; nearly the same as No. 2, but bright like ultramarine.

4. Cæsius; pale blue, verging towards gray.

5. Atrovirens; dark green, bordering upon dark blue.

6. Æruginosus; light bluish green, like verdigris.

7. Prasinus, saturatè virens, smaragdinus; grass green, without any tinge of yellow or blue.

8. Flavovirens; green bordering upon yellow.

9. Glaucus; green, bordering upon gray.

10. Aureus; golden yellow, without any foreign mixture.

11. Ochraceus; yellow, with a slight tinge of brown.

12. Pallidè flavens; pale or whitish yellow.

13. Sulphureus; bright yellow, like the flowers of the *Hieracium Pilosella*.

14. Vitellinus; yellow, with a slight tinge of red.

15. Ferrugineus; brown, verging towards yellow.

16. Brunneus; the darkest pure brown.

17. Fuscus; brown, running into gray.

18. Badius; Hepaticus; chestnut or liver brown, bordering on dark red.

19. Aurantiacus; orange, or a mixture of yellow and red.

20. Miniatus, or Cinnabarinus; deep red, like red lead.

21. Lateritius; brick color, like the former, but duller and verging towards yellow.

22. Coccineus, or Phœniceus; cinnabar color, with a slight tinge of blue.

23. Carneus; flesh color, something between white and red.

24. Croceus; saffron color, dark orange.

25. Puniceus; fine bright red, like carmine.

26. Sanguineus, or purpureus; pure red, but duller than the foregoing.

27. Roseus; rose color, a pale blood red.

28. Atropurpureus; very dark red, almost approaching to black.

29. Violaceus; violet color, a mixture of blue and red.

30. Lilacinus; lilac, the former color; but duller, and verging towards red.

31. Ater; the purest and deepest black.

32. Niger; black, with a tinge of gray.

33. Cinereus; ash color, blackish gray.

34. Griseus; lively light gray.

35. Canus; hoary, with more white than gray.

36. Lividus; dark gray, running into violet.

37. Lacteus, or Candidus; shining white.

38. Albus; dull white.

39. Albidus; dirty dull white.

40. Hyalinus; transparent, like pure glass.

187. The Root is divided by botanists into four principal forms, viz. the *Rhizoma*, or Roststock, by which is meant the thick fleshy part of a biennial or perennial root; the *Fibre*, or those parts of the root which have the appearance of threads; the *Tuber*, which is a solid fleshy root, furnished with buds on its surface, and being in fact a thickened subterranean stem; and the *Bulb*, which consists only of fleshy imbricated scales, as in the onion. Each of these is subject to a great variety of appearances.

1. The *Rhizoma* is,

1. Woody (lignosum), composed of a woody substance and numerous woody fibres; such as that of trees and shrubs.

2. Fleshy (carnosum), consisting of a fleshy substance more or less firm; as *Daucus Carota*, *Pastinaca Sativa*.

3. Hollow (cavum), that is always hollow in the middle, as *Fumaria Bulbosa*.

4. Partitioned (loculosum), an oblong root, internally furnished with separated cavities; as *Cicuta Virosa*.

5. Entire (integrum), never naturally internally hollow, and thus the opposite of the two last mentioned.

6. Cylindrical (cylindræum), that comes nearest to a cylindrical figure, and is thick; as *Dictamnus albus*.

7. Spindle-shaped (fusiforme) cylindrical above, and tapering to a point as it descends; as in *Daucus carota*, *Pastinaca sativa*.

8. Bitten (præmorsum), where the principal root seems as if it were bitten off, as *Scabiosa succisa*, *Plantago major*.

9. Worm-like (vermicularis), thick and almost cylindrical, but bent in different places; *Polygonum Bistorta*.

10. Turnip shaped (napiforme), belying out above, but below ending in a long taper point, *Brassica Napa*.

11. Roundish (subrotundum, or globosum), that is almost spherical, as *Raphanus sativus*, *Bunium Bulbocastanum*.

12. Flat (placentiforme), a thick round root, which above and below is compressed, so that it almost resembles a plate; *Cyclamen*.

13. Jointed (geniculatum), divided into members, from which the root-fibres proceed; *Gratiola officinalis*.

14. Scaly (squamosum), covered with more or fewer fleshy scales; *Lathræa squamaria*.

15. Toothed (dentatus), a fleshy branched root, having teeth-like prolongations; *Corallorhiza innata*.

16. Tufted (comosum), having as it were tufts of hair at its points, which are the fragments of the petioles, divided like fibres; *Aethusa Meum*.

17. Many headed (multiceps), divided at top

Roots.

into numerous branches, from which new shoots spring; as *Astragalus*, *Geranium macrorhizon*.

18. Simple (*simplex*), having no branches.

19. Branching (*ramosum*), dividing into branches, as all trees, shrubs, and many plants.

20. Perpendicular (*perpendicularis*), going straight down into the earth; *Capsella bursa pastoris*.

21. Horizontal (*horizontale*), running horizontally under ground into the earth, but obliquely, as *Aethusa meum*.

22. Oblique (*obliquum*), going neither perpendicularly nor horizontally into the earth, but obliquely; as *Aethusa meum*.

23. Creeping (*repens*), lying horizontally under the earth, and extending itself in that direction by means of side-branches; as *Rumex Acetosella*.

24. Ringed (*annulatum*), furnished on its upper surface with alternately raised and depressed bands.

25. Knobbed (*tuberculatum*), furnished on its upper surface, with protuberances; as *Aethusa meum*, *Bunium bulbocastanum*.

26. Scarred (*cicatrisatum*), which, upon the perishing of the stem, has depressions or chinks on its upper surface; as *Polypodium vulgare*.

27. Chaffy (*paleaceum*), covered with membranaceous scales; as many of the filices.

28. Even (*laeve*), marked on its surface neither with elevations nor depressions.

2. The Fibre is,

29. Thread-like (*filiformis*), consisting of a single fibre.

30. Fibrous (*fibrosa*), consisting of many fibrous roots; as *Poa annua*.

31. Hair-like (*capillaris*), consisting of numerous very fine fibres; as *Scleropodium acicularis*.

32. Velvet-like (*velutina*), composed of very tender and hardly visible fibres; as in the *Musci frondosi*.

33. Cleft (*fissa*), very short, and at the point dividing into two or three points; *Peltidea canina*.

3. The Tuber, is

34. Knobbed (*granulatum*), the knobs formed like small grains of corn; as *Saxifraga granulata*.

35. Testiculated (*testiculatum*), when two, rarely three, longish depressed knobs hang from the point from which a shoot rises; as in *Orchis*.

36. Palmated (*palmatum*), when two, rarely three, longish depressed knobs, which are divided at the point, hang together; as in the last, *Orchis*.

37. Fingered (*digitatum*), when a single fleshy knob is compressed and divided at the point like fingers; *Dioscorea alternifolia*.

38. Bundled (*fasciculatum*), when many cylindrical or longish roots hang together from the point, so as to resemble a bundle; *Ranunculus Ficaria*, *Epipactis Nidus avis*.

39. Globulated (*conglobatum*), when several round knobs sit upon one another; as *Helianthus tuberosus*.

40. Depending (*pendulum*), when several knobs hang together from fibrous roots; as *Solanum tuberosum*, *Spiræa Filipendula*.

41. Articulated (*articulatum*), when one knob grows out of another, so that the whole seems to consist of connected members.

42. Necklace-like (*moniliforme*), when many knobs hang together by a fibrous root, in rows as if they were strung on; as *Pelargonium triste*.

4. The Bulb is,

43. Imbricated (*imbricatus, squamosus*), when the bulb consists of leaves lying over one another, like the tiles of a house; as *Lilium bulbiferum*.

44. Coated (*tunicatus*), when the bulb is composed of concentric layers; as in *Allium*.

45. Net-like, (*reticulatus*), when the bulb is entirely composed of reticulated membranes; as *Allium Victorialis*.

46. Half-net-like (*semireticulatus*), when the bulb consists of a firm mass, but the outer membrane is net-like; as *Gladiolus communis*.

47. Solid (*solidus*), when the bulk consists of a firm substance throughout; as *Colchicum autumnale*.

48. Nestling (*nidulans*), when small bulbs appear under the external membrane, and the bulb seems to be entirely composed of them; as in *Ornithogalum spathaceum*.

49. Aggregated (*compositus, aggregatus*), when several bulbs stand close together, having a connexion at the base.

50. Two-fold (*geminatus*), when two bulbs are connected by their base; as *Fritillaria pyrenaica*, *Erythronium dens canis*.

51. Doubled (*duplicatus*), when one bulb stands above another, and grows out of it; as *Allium sphaerocephalon*.

52. Supported (*suffultus*), when the body of the root stands at a distance, equalling it in size, and distinctly separated from it; as *Ixia punicea, erecta*.

53. Single (*solitarius*), when neither from the side nor from the base proceeds another bulb.

54. Central (*centralis*), when the shoot proceeds from the middle, as *Galanthus nivalis*.

55. Lateral (*lateralis*), when the shoot issues from the side; as in *Ixia virgata*.

Besides the above there are a few roots which being referable to none of the foregoing, are called nothous, or

Anomalous.

56. Divided (*divisa*), that branches out above stones or other bodies, but does not penetrate into the earth; as *Fucus digitatus*.

57. Byssus-like (*byssacea*), that is divided like wool, and has the appearance of a filamentary byssus; as many species of *Agaricus*.

58. Warty (*papillosa*), consisting of short wart-like small dots, by which the plant attaches itself to wood or stones, in *Lichen*.

59. Shield-like (*scutiformis*), when the base of the ascending stem spreads itself into a thin surface, by which the plant is attached to wood or stones; as *Usnea florida*, *Ceramium filum*.

60. Fading (*evanescens*), when the descending stem penetrates into wood and therein gradually disappears; as *Viscum album*.

188. The STEM is the prolongation of the plant above the soil, or above the part which serves for its support. It is subject to great

diversity of forms, and the number of terms used to distinguish their varieties are numerous.

The stock (cormus), is that part of the plant which serves for the support of the whole, and bears the inflorescence, the leaves, the frond, the flowers and fruit, from it are evolved in most cases all these parts. The following kinds have been distinguished: viz. the stem (caudex), the trunk (truncus), the stalk (caulis), the straw (culmus), the scape (scapus), the stipe (stipes), the shoot (sarculus), the sarment (sarmentum), and the sucker (stolo).

189. The stem (caudex), is a simple perennial shoot, with leaves at its extremity, and is peculiar only to the palms and arboreous filices, having no bark, but set round with the remains of the leaf-stalks. Of this there are the following kinds.

1. Ringed (annulatus), when the remains of the leaves at regular distances resemble annular elevations; as *Corypha rotundifolia*.

2. Scaly (squamosus), when the remains of the leaves surround the stem irregularly; as in *Phoenix dactylifera*, *Chamærops humilis*.

3. Tessellated (tessellatus), when the leaf or the base of the stipe does not remain behind, but leaves a scar, by which the stem puts on a tessellated appearance; as *Polypodium arboreum*.

4. Aculeated (aculeatus), when the remains of the leaf are set with prickles; as in *Cocos aculeatus*, *Polypodium asperum*.

5. Smooth (inermis), the opposite of the last, when the remains of the leaf leave no prickles, as *Phoenix dactylifera*, *Polypodium arboreum*.

190. The trunk (truncus), is peculiar to trees and shrubs, and is perennial. The principal stem in these plants has obtained the following denominations: its principal divisions are called branches (rami), and its subdivisions twigs (ramuli).

1. Tree-like (arboreus); this is simple, and forms at top a crowd or crown of branches (cacumen); it is peculiar to trees.

2. Shrubby (fruticosus), divided below into a number of branches, like all shrubs.

191. The stalk (caulis), is herbaceous, seldom woody, and lasts but one or two years; hence it is proper only to herbaceous plants, however, the term is sometimes applied both to trees and shrubs. The divisions of this are also called branches (rami). The kinds are,

With respect to division.

1. Very simple (simplicissimus), that has no branches, nor is its flower-stalk divided, consequently it can have but one flower or spike, and no flowers in the axillæ of the branches.

2. Simple (simplex), having no branches, but whose flower-stalk may be divided.

3. Somewhat branched (subramosus), sometimes without branches, sometimes with one or two.

4. Branched (ramosus), which is always furnished with branches.

5. Much branched (ramosissimus), where all the branches are not only divided but subdivided.

6. Disappearing (deliquescent), branched, but so divided that the principal stem is no longer to be observed, but is lost in the ramification.

7. Entire (integer), which is branched, but where the principal stem can be traced to the point.

8. Verticillated (verticillatus), when a number of branches are formed at the extremity, from the centre of which the principal stem proceeds, so that the branches, at certain distances, surround the stem in a circular manner; as in *Pinus sylvestris*.

9. Proliferous (prolifer), where the stem is divided into a number of branches, and these again likewise divide, but the principal stem does not proceed from the centre of them; as *Ledum palustre*.

10. Dichotomous (dichotomus), when the stem, even to the smallest branches, divides itself into two; as *Viscum album*.

In respect of the branches.

11. Alternate branches (rami alterni), the branches are so placed that between two on the one side there rises but one on the opposite side.

12. Opposite branches (rami oppositi), when one branch stands on the opposite side to another, and the bases of each nearly meet together.

13. Distichous (distichus), when the branches, being opposite to each other, stand on the same plane.

14. Scattered (sparsus), when the branches stand without order on the stem.

15. Close (confertus), when the branches stand so thick and without order that no space remains between them.

16. Brachiate (brachiatus) when opposite branches stand at right angles to each other, or cross-ways.

17. Rod-like (virgatus), when the branches are very long, weak, and thin.

18. Panicked (paniculatus), when a stem at its point is divided into numerous leaves and flower-bearing branches; as, *Rumex acetosella*.

19. Fastigate (fastigiatus), when all the branches from bottom to top are of such different lengths that they are of equal height.

20. Compact (coarctatus), where the tips of the branches are bent inwards towards the stem.

21. Spreading (patens), when the branches stand nearly at right angles with the stem.

22. Diverging (divergens), where the branches form a right angle.

23. Divaricated (divaricatus), where the branches are so situated that they form an obtuse angle above, and an acute angle below.

24. Deflected (deflexus), the branches hang down forming an arch.

25. Reflected (reflexus), where the branches hang so much down that they almost run parallel with the stem.

26. Retroflected (retroflexus), where the branches are bent towards every side.

In respect of strength.

27. Stiff (rigidus), that will not bend without breaking.

28. Brittle (fragilis), that breaks with the smallest force.

29. Flexible (flexilis), that can be bent in any direction without breaking.

30. Tough (tenax) that can be bent without breaking, and can be with difficulty torn.

31. Lax (laxus), that is firm, but moves with the smallest breath of wind.

32. Parasitical (parasiticus), that fixes itself by its root on the root or wood of other plants; as Viscum, Monotropa.

33. Erect (erectus), when the stem stands nearly perpendicular.

34. Straight (strictus), where the stem is perpendicular, and quite straight.

35. Weak (debilis), when the stem is too slender to maintain itself perfectly upright.

36. Bent upwards (adscendens), when the stem lies on the ground, but the extremity of it stands erect.

37. Bent downwards (declinatus), when the stem is so bent downwards to the earth that it forms an arch.

38. Supported (fulcratus), that from above sends roots down into the earth, which afterwards change into real stems; as in the Rhizophora.

39. Stooping (cernuus), when the point in an upright stem takes a horizontal direction.

40. Nodding (nutans), when the point is bent down towards the horizon.

41. Pendulous (pendulus), when a parasitical plant (No. 32) has its base turned towards the zenith, and its top towards the earth.

42. Procumbent (procumbens, prostratus, humifusus), when the stem lies flat on the ground.

43. Decumbent (decumbens), when the stem is upright below, but above is bent down towards the ground, so that the greater part of it is bent.

44. Creeping (repens), when the stem lies along, and sends out roots from below.

45. Sarmetose (sarmetosus), when the stem lies along, but sends out roots only at certain intervals.

46. Rooting (radicans), when the stem stands upright and climbs, everywhere sending forth small roots, by which it holds itself fast; as in the ivy. *Hedera Helix*.

47. Swimming (natans), lying on the surface of water; as *Polygonum amphibium*.

48. Sunk (demersum), that lies below the surface; as *Ceratophyllum demersum*, *Utricularia*.

49. Flexuose (flexuosus), where the upright stem bends itself in a zig-zag manner, so as to form a number of obtuse angles.

50. Climbing (scandens), a weak stem that fastens itself to some other body for support; as the passion-flower, *Passiflora carulea*.

51. Twining (volubilis), a weak stem that twines in a serpentine form round other plants; it is of two kinds.

a. Turning from the right (dextrorsum), when the stem twines from the right to the left round a supporting body; as in the bind-weed, *Convolvulus*.

b. Twining from the left (sinistrorsum), when the stem twines from the left to the right round a supporting body; as in the hop, *Humulus Lupulus*.

In respect of clothing.

52. Naked (nudus), having no leaves, scales, or the like.

53. Leafless (aphyllous), without leaves only.

54. Scaly (squamosus), covered with scales.

55. Ramentaceous (ramentaceus), that is covered with dry membranous scales; as *Erica ramentacea*.

56. Stipulate (stipulatus), furnished with stipulæ in the axillæ of the leaves; as *Vicia sativa*.

57. Exstipulate (exstipulatus), without stipulæ.

58. Leafy (foliosus), having leaves.

59. Perfoliate (perfoliatus), where the stem goes through a leaf; as *Bupleurum*.

60. Winged (alatus), when a leaf-like membrane runs along the stem.

61. Bulb-bearing (bulbifer), having bulbs or tubercles in the axillæ of the leaves; as *Lilium bulbiferum*, *Dentaria bulbifera*.

62. Prickly (aculeatus), when along the stem there are pointed protuberances coming off with the rind.

63. Spiny (spinous), when there are pointed protuberances on the stem which do not come off with the rind.

64. Smooth (inermis), having neither prickles nor spines.

65. Barren (sterilis), bearing no flowers.

66. Fruitful (fructificans), bearing flowers or fruit.

In respect of figure.

67. Round (teres), that is, quite cylindrical.

68. Half-round (semiteres), that is, round on the one side and flat on the other.

69. Compressed (compressus), when the stem is flat on both sides.

70. Two-edged (anceps), when a compressed stem is sharp on both edges.

71. Angled (angulatus), when a stem has several angles, but the sides are grooved. Of this there are several kinds, viz.

a. Obtuse-angled (obtuse angulatus).

β. Acute-angled (acute angulatus).

γ. Three-angled (triangularis).

δ. Four-angled (quadrangularis, &c.)

ε. Many-angled (multangularis).

72. Three-sided, (triqueter), where there are three sharp corners, and the sides quite flat.

73. Three-cornered (trigonus), when there are three round or obtuse edges, but the sides appear flat. Of this too there are several kinds:

α. Four-cornered (tetragonus).

β. Five-cornered (pentagonus).

γ. Six-cornered (hexagonus).

δ. Many-cornered (polygonus).

74. Membranaceous (membranaceus), when the stem is compressed and thin like a leaf.

75. Knotted (nodosus), when the stem is divided by knobs.

76. Knotless (enodis), when it has neither knobs nor joints.

77. Articulated (articulatus), when the stem has regular knobs at the joints; as in *Cactus*.

78. Jointed (geniculatus), when a stem has regular knobs, not seated on the joints.

In respect of substance.

79. Woody (lignosus), that consists of firm wood.

80. Fibrous (fibrosus), that consists of woody fibres, that can be easily separated.

81. Herbaceous (herbaceus), that is weak and can be easily cut.

82. Fleshy (carnosus), that is nearly as juicy and soft as the flesh of an apple.

83. Firm (solidus), internally hard.

84. Empty (inanis), filled internally with a soft pith.

85. Hollow (fistulosus), without any pith within and quite hollow.

86. With separations (septatus), where either the pith or the hollow space is divided by thin partitions.

87. Cork-like (suberosus), when the outer rind is soft and spongy: as in the ulmi suberosa.

88. Rifted (rimosus), when there are in the rind thin clefts or chinks.

89. Scarred (cicatrizatus), having scars formed by the falling off of the leaves.

192. The straw (culmus) is proper only to the grasses. The kinds of it are nearly the same with those of the stem. The following, however, may be distinguished in addition.

1. Knotted (nodosus), furnished with enlarged joints, as most of the grasses.

2. Knotless (enodis), without any such enlarged joints. *Juncus*, *Carex*, *Scirpus*.

3. Simple (simplex), having no branches.

4. Branched (ramosus), furnished with branches.

5. Leafy (frondosus), furnished with irregular branches, and particularly with small leaves; as *Restio*.

6. Sheathed (vaginatus), that is covered with a foliaceous vagina.

7. Naked (nudus), having neither a foliaceous vagina nor any leaves.

8. Erect (erectus), standing quite upright.

9. Geniculated (geniculatus or infractus), when the first and undermost joint lies prostrate, and the rest stand upright, so that by this flexure nearly a right angle is formed; as in *Alopecurus geniculatus*.

10. Oblique (obliquus), having such a direction as to be intermediate between perpendicular and horizontal; as *Poa annua*.

193. The scape (scapus) is an herbaceous stem that bears flowers, but not leaves, and proceeds from the descending, or intermediate, but never from the ascending stem.

It is proper to the lilies, and is sometimes found in other plants; but in this last case it ought to bear more than one flower, for had it but one flower it would be called pedunculus radicalis. It is only when this single flower sits on a flower-stalk proceeding immediately from the ground that it is called scape.

194. The stipe (stipes). This term is applied only to Filices, Fungi, and Palms. The following are the kinds of it.

In Filices.

1. Chaffy (paleaceous), when it is covered with dry membranaceous scales.

2. Scaly (squamosus), when it is covered with foliaceous scales.

3. Naked (nudus), without any covering.

4. Prickly (aculeatus), having prickles.

5. Smooth (inermis), without prickles.

In Fungi.

6. Fleshy (carnosus), of a fleshy substance.

7. Leathery (coriaceus), consisting of a tough leather-like substance, as *boletus perennis*.

8. Firm (solidus), consisting within of a solid mass.

9. Hollow (fistulosus), forming throughout a hollow cylinder.

10. Pitted (lacunosus), having depressions on the outside; as *Helvella sulcata*.

11. Scaly (squamosus), covered with firmly attached scales.

12. Squarrose (squamulosus), covered with scales which are turned back at the points.

13. Raised (peronatus), that from the bottom to the middle is laid thick over, with a woolly substance ending in a sort of meal.

14. Belying (ventricosus), thicker in the middle than at either end.

15. Bulb-like (bulbosus), that is thick immediately above the root.

195. The shoot (sureculus), is a term applied to the stem which bears the leaves of the mosses. Of this there are the following varieties.

1. Simple (simplex), having no branches; as in the *Polytrichum commune*.

2. Branched (ramosus), dividing into branches; as in *Mnium androgynum*.

3. With hanging branches (ramis deflexis), when the stem is branched but all the branches hang down; as in *Sphagnum palustre*.

4. Irregular (vagus), branched, but the branches set on without order.

5. Intricate (intricatus), branched, and the numerous protuberant branches running into one another.

6. Tree-like (dendroides), standing erect, and at the point a crowd of thick branches like the top of a tree.

7. Pinnated (pinnatus) having at two opposite sides simple branches, of nearly the same length, at equal angles with the stalk.

8. Doubly pinnated (bipinnatus), having the habit of the last, only that its branches are again divided like those of the principal stem; as *Hypnum parietinum*.

9. Trebly-pinnated (triplicatio pinnatus), like the last, but the secondary branches are also pinnated; as *Hypnum recognitum*.

10. Proliferous (prolifer), when, in either of the two last kinds, there shoots forth a new stem out of the old; as in *Hypnum proliferum*.

11. Erect (erectus), which rises perpendicularly; as in *Polytrichum commune*.

12. Prostrate (procumbens), lying along.

13. Creeping (repens), the same with the last, but the branches constantly lengthening and putting forth small roots.

14. Floating (fluitans), swimming under water in a perpendicular direction, and attached to some fixed body; as *Fontinalis antipyretica*.

196. The sarment or runner (sarmentum), is a filiform stem, springing from the root and shooting from the point, so sending forth roots and producing a new plant of the same kind; as *Saxifraga sarmentosa*, *Fragaria*.

197. The sucker (stolo), is a foliaceous creeping stem, springing from the root, covered on its under surface with small roots, but at the point

Leaves.

bearing a number of leaves from which comes a new plant; as *Ajuga reptans*, *Hieracium pilosella*.

198. The *FOLIAGE* consists of the leaves, and their several parts, with the tendrils or other appendages connected therewith. The leaves are the organs in which the juices of the plant are elaborated, and rendered fit for being returned into the system, through the descending vessels of the bark, and the radiating vessels of the wood. They begin where the primordial scales at the base of the plant, if any, terminate; and they cease to be considered leaves as soon as the inflorescence (*inflorescentia*) commences; if situated among the inflorescence they are denominated *bractææ*.

199. The leaf is divided into three distinct parts: the *stipulæ*, the *petiole*, the *lamina*.

200. The *stipulæ* are minute scale-like appendages, seated at the base of the common or partial petiole; occasionally they are foliaceous; their position is liable to slight variation, being sometimes at the base of the petiole, sometimes adnate with its margin, and occasionally placed on the side of the stem opposite to the petiole. The *stipulæ* are to the leaf, what the *bractææ* are to the flowers.

201. The *petiole* is the foot-stalk of the leaf, and is subject to nearly the same variations in form as the stem; the terms applied to which are equally applicable to the petiole.

202. The *lamina* is a term used to express the leaf itself, considered without reference to the petiole or stipulæ.

Leaves are said to be simple when they consist of one lamina only; and to be compound, when they are formed by the union of more laminæ than one. The following are the terms employed in speaking of leaves.

A. SIMPLE LEAVES.

In respect of the apex.

A leaf is said to be:

1. *Acute* (*acutum*), when the leaf ends in a point.
2. *Acuminated* (*acuminatum*), when the point is lengthened out.
3. *Pointed* (*cuspidatum*), when the lengthened-out point ends in a small bristle.
4. *Obtuse* (*obtusum*), when the end of the leaf is blunt or round.
5. *Mucronate* (*mucronatum*), when there is a bristle-shaped aculeus, situated on the round end of a leaf; as in the *Amaranthus blitum*.
6. *Bitten* (*præmorsum*), when the leaf is as it were bitten off at the point, forming a curved line; as in the *Pavonia præmorsa*.
7. *Truncated* (*truncatum*), when the point of the leaf is cut across by a straight line; as in the *Liriodendron tulipifera*.
8. *Wedge-shaped* (*cuneiforme*), when a truncated leaf is pointed on both sides at the base.
9. *Dedaleous* (*dædaleum*), when the point has a large circuit, but is truncated and ragged.
10. *Emarginated* (*emarginatum*), when an obtuse pointed leaf has a part as it were taken out of the apex.
11. *Retuse* (*retusum*), when an obtuse leaf is somewhat emarginated, but in a small degree.

12. *Cleft* (*fissum*), when there is a cleft at the point, extending half way down the leaf. When there is but one cleft at the point, the leaf is called *bifid* (*folium bifidum*); if there are two clefts, it is called *trifid* (*trifidum*); if there are more clefts, the leaf is called *quadrifidum*, *quinquefidum*, &c. *multifidum*, with many clefts.

13. *Fan-shaped* (*flabelliforme*), when a truncated cuneiform leaf is at the point once or oftener cleft.

14. *Tridentated* (*tridentatum*), when the point is truncated, and has three indentations.

In respect of the base.

15. *Heart-shaped* (*cordatum*), when the base is divided into two round lobes, the anterior part of the leaf being ovate.

16. *Kidney-shaped* (*reniforme*), when the base is divided into two round separate lobes, and the anterior part of the leaf is round.

17. *Moon-shaped* (*lunatum*), when both lobes at the base have either a straight or somewhat arched line, and the anterior part of the leaf is round.

18. *Unequal* (*inæquale*), when one side of the leaf is more produced than the other.

19. *Arrow-shaped* (*sagittatum*), when the base is divided into two projected pointed lobes, and the anterior part of the leaf is likewise pointed.

20. *Spear-shaped* (*hastatum*), when the two pointed lobes of the base are bent outwards.

21. *Ear-shaped* (*auriculatum*), when there are at the base two small round lobes bent outwards. It is nearly the hastate leaf, only the lobes are smaller and round.

In respect of circumference.

22. *Orbicular* (*orbiculatum*), when the diameter of the leaf on all sides is equal.

23. *Roundish* (*subrotundum*), differs little from the foregoing, only that the diameter is longer, either from the base to the apex, or from side to side.

24. *Ovate* (*ovatum*), a leaf which is longer than it is broad; the base is round and broadest, the apex narrowest.

25. *Oval* or *elliptical* (*ovale* or *ellipticum*) a leaf whose length is greater than its breadth, but round both at base and apex.

26. *Oblong* (*oblongum*), when the breadth to the length is as one to three, or the breadth always least; but the apex and base vary, that is, they are sometimes obtuse, sometimes pointed.

27. *Parabolic* (*parabolicum*), a leaf is so called which is round at the base, then forms a small bend, and grows less towards the point.

28. *Spatulate* (*spatulatum*), when the fore part of a leaf is circular, growing smaller toward the base, as in the *cucubalus oites*.

29. *Rhombic* (*rhombeum*), when the sides of the leaf run out into an angle, so that the leaf represents a square.

30. *Oblique* (*subdimidiatum*), is that leaf which has one side broader than the other.

Of this leaf there are several varieties: as

a. *Heart-shaped oblique* (*sub-dimidiatio-cor-*

datum) a heart-shaped leaf, which is at the same time oblique, as in the *Begonia nitida*.

b. Trapeziform (trapeziforme), a rhombic leaf, with one side smaller than the other, &c.

31. Panduræform (panduræforme), when an oblong leaf has a deep curve on both sides.

32. Sword-shaped (ensiforme), an oblong leaf, growing gradually narrower towards the apex, which is pointed, the sides are flat, and have more or less of an arch-like form; as in the sword flag, *Iris*.

33. Lanceolate (lanceolatum), an oblong leaf which grows gradually narrower from the base to the point.

34. Linear (lineare), when both sides of a leaf run parallel to each other, so that it is equally broad at the base and the apex.

35. Capillary (capillare), when a leaf has scarcely any breadth, and is as fine as a thread or hair.

36. Awl-shaped (subulatum), a linear leaf, which is sharply pointed.

37. Needle-shaped (acerosum), a linear leaf that is rigid, and generally endures through the winter; as in the pine tribe, *Pinus*.

38. Triangular (triangulare), when the circumference represents a triangle, the apex of which makes the point of the leaf; as in the birch, *Betula alba*.

39. Quadrangular, quinquangular (quadrangulare, quinquangulare), when the circumference of the leaf has four or five angles; as in the *Menispermum Canadense*.

40. Intire (integrum, indivisum), which is not at all cleft or divided.

41. Lobed (lobatum), when a leaf is deeply divided, nearly half its length, into lobes. According to the number of lobes it is denominated bi-lobed (bi-lobum), as in *Bauhinia*; tri-lobed (tri-lobum), quinquelobed (quinquelobum), as in the hop, *Humulus lupulus*, &c.

42. Palmated (palmatum), when there are five or seven very long lobes, that is, when the segments are more than half way divided.

43. Divided (partitum), when in a roundish leaf the division extends to the base; *Ranunculus aquatilis*.

44. Two-ranked (dichotomum), the last leaf, whose linear sections are divided or subdivided into twos.

45. Torn (laciniatum), when an oblong leaf has several irregular clefts.

46. Sinuated (sinuatum), when on the sides of an oblong leaf there are round incisures, as in the oak, *Quercus robur*.

47. Pinnatifid (pinnatifidum), when there are regular incisures, to go almost to the middle rib.

48. Lyre-shaped (lyratum), nearly the foregoing leaf, whose outer segment is very large and round.

49. Runcinate (runcinatum), when the incisures of a pinnatifid leaf are pointed, and form a curve behind, as in the dandelion, *Leontodon taraxacum*.

50. Squarroso-lacinate (squarroso-laciniatum), when the leaf is cut almost into the middle rib, and the incisures run in every direction; as in the thistle, *Carduus lanceolatus*. N. the contour of the leaves from No. 41 to 43 is round. From 44 to 49 it is oblong.

In respect of the margin.

51. Quite entire (integerrimum), when the margin is without either notch or indentation. N. this, No. 50 and No. 40, are often confounded. An entire leaf is merely the opposite of the numbers from 40 and 41 to 49. It may often be either dentated or serrated. A quite entire leaf may, indeed, be formed like numbers from 41 to 47, but it can have no indentations or serratures, as in the following leaves:

52. Cartilaginous (cartilagineum), when the margin consists of a border of a harder substance than the disk.

53. Undulated (undulatum), when the margin is alternately bent in and out.

54. Crenated (crenatum), when the margin is set with small and round notches, having at the same time a perpendicular position.

55. Repand (repandum), when there are on the margin small sinuses, and between them segments of a small circle.

56. Toothed (dentatum), when the margin is set round with small pointed and distinctly separated teeth.

57. Duplicato-dentate (duplicato-dentatum), when each small tooth of the margin is again dentated; as in the elm, *Ulmus campestris*.

58. Dentato-crenate (dentato-crenatum), when each tooth is set with small and round denticuli.

59. Serrated (serratum), when the teeth on the margin are very sharp pointed, and stand so close that one seems to lie on the back of another.

60. Gnawed (erosum), when the margin is unequally sinuated, as if it had been gnawed; as in some species of sage, *Salvia*.

61. Spiny (spinosum), when the margin is set with spines; as in the thistle, *Carduus*.

62. Fringed (ciliatum), when the margin is set round with strong hairs, of equal length, and at a considerable distance from one another.

In respect of their surface.

63. Aculeated (aculeatum), when the surface is covered with spines.

64. Hollow (concavum), when there is a hollow in the middle of the leaf.

65. Channelled (canaliculatum), when the middle rib of a long and narrow leaf is furrowed.

66. Wrinkled (rugosum), when the surface is raised between the veins of the leaf, and thus forms wrinkles; as in sage, *Salvia*.

67. Bullate (bullatum), when the parts raised between the veins on the surface appear like blisters.

68. Pitted (lacunosum), when the raised places between the veins are on the under surface, so that the upper surface appears pitted.

69. Curled (crispum), when the leaf is fuller on the margin than in the middle, so that it must lie in regular folds.

70. Folded (plicatum), when the leaf lies in regular straight folds from the base.

71. Veined (venosum), when the vessels of a leaf rise out of the middle rib. This is the case in most plants.

72. Netwise-veined (reticulato-venosum), when the veins which rise from the middle rib again subdivide into branches, that form a sort of net-work.

73. Ribbed (costatum), when the veins arise out of the middle, and proceed in a straight line towards the margin in considerable numbers, and close together; as in the *Calophyllum inophyllum*, *Canna*, *Musa*, &c.

74. Nerved (nervosum), when the vessels rising out of the petiolus run from the base to the apex.

75. Three-nerved (trinervium), when three nerves take their origin from the base. Thus we likewise say, quinquenervium, septemnervium, &c.

76. Triple-nerved (triplinervium), when out of the side of the middle rib, above the base, there arises a nerve running towards the point; as in *Laurus*, *Cinnamomum*, and *Camphora*.

77. Quintuple-nerved (quintuplinervium), when out of the middle rib, above the base, there arise on each side two nerves running towards the point.

78. Septuple-nerved (septuplinervium), when on each side of the middle rib, above the base, three nerves arise, and proceed to the apex.

79. Venose-nerved (venoso-nervosum), when, in a leaf having nerves, the vessels run into branches, or in a veined leaf; as in the Indian cress, *Tropæolum majus*.

80. Streaked (lineatum), when the whole leaf is full of smooth parallel vessels, that run from the base to the apex.

81. Nerveless (enervium), when no nerves rise from the base.

82. Veinless (avenium), where there are no veins.

83. Dotted (punctatum), when, instead of ribs and veins, there are dots or points; as in the *Vaccinium vitis idæa*.

84. Colored (coloratum), a leaf of some other color than green.

85. Cowled (cucullatum), when in a heart-shaped leaf the lobes are bent towards each other, so as to have the appearance of a cowl.

86. Convex (convexum), when the middle of the leaf is thicker than the rim, raised on the upper surface and hollowed on the under.

87. Keel-shaped (carinatum), when on the under surface of a linear-lanceolate, or oblong leaf, the place of the middle rib is formed like the keel of a ship.

88. Quadruply-keeled (quadricarinatum), when the middle rib, by means of a thin leaf above and below, projects, and the margin is incrossed, so that a horizontal section has the appearance of a cross; as *Ixia cruciata*.

B. Compound Leaves.

89. Compound (compositum), when several leaves are supported by one foot-stalk. To this term belong Nos. 89, 92, 95, 96, 97. But when the leaf agrees with the above definition, although it should not come under any of the following kinds, it is still to be considered a compound leaf.

90. Fingered (digitatum) when the base of several leaves rests on the point of one foot-stalk; as in the horse-chestnut, *Aesculus Hippocastanum*.

91. Binate (binatum), when two leaves stand by their base on the top of one foot-stalk; but if the two foliola of a binate leaf bend back in a horizontal direction, it is called a conjugate leaf, *folium conjugatum*.

92. Bigeminate (bigeminatum, bigeminum), when a divided leaf-stalk at each point bears two leaves; as in some species of *Mimosa*.

93. Trigeminate (trigeminatum or tergeminum), when a divided leaf-stalk on each point bears two leaves, and on the principal stalk, where it divides, there is a leaf at each side; as in the *Mimosa tergemina*.

94. Ternate (ternatum), when three leaves are supported by one foot-stalk; as in the clover, *Trifolium pratense*. Strawberry, *fragaria vesca*.

95. Bitermate (bitermatum, or duplicato-ternatum), when a foot-stalk, which separates into three, at each point bears three leaves.

96. Triternate (tritermatum, or triplicato-ternatum), when a foot-stalk, which separates into three, is again divide at each point into three, and on each of these nine points bears three leaves.

97. Quadrinate (quadrinatum), when four leaves stand on the point of a leaf-stalk; as *Hedysarum tetraphyllum*.

98. Quinate (quinatum), when five leaves are supported by one foot-stalk: this, it is true, has some affinity with No. 89, but varies on account of the number five, as in the other there are generally more leaves.

99. Umbellate (umbellatum), when at the point of a leaf-stalk there stand a number of leaves, closely set, and forming the figure of a parasol; as *Aralia sciodaphyllum*, *Panax chrysophyllum*.

100. Pedate (pedatum, ramosum), when a leaf-stalk is divided, and in the middle, where it divides, there is a leaflet, at both ends there is likewise a leaflet, and on each side, between the one in the middle and that at the end, another or two, or even three leaves. Such a leaf therefore consists of five, seven, or nine leaflets, that are all inserted on one side; as in the *Helleborus viridis*, *fetidus*, and *niger*.

101. Pinnated (pinnatum), where on an undivided leaf-stalk there is a series of leaflets on each side, and on the same plane; of this there are the following kinds: *α*. Abruptly-pinnated (paripinnatum, or abrupte pinnatum), when at the apex of a pinnated leaf there is no leaflet.

β. Pinnate with an odd one (impari-pinnatum, or pinnatum cum impari), when at the apex of a pinnated leaf there is a leaflet.

γ. Oppositely pinnate (oppositè pinnatum), when the leaflets on a pinnated leaf stand opposite to one another.

δ. Alternately pinnate (alternatim pinnatum), when the leaflets on a pinnated leaf stand alternately.

ε. Interruptedly pinnate (interruptè pinnatum), when in a pinnated leaf each pair of alternate leaflets is smaller.

ζ. Jointedly pinnate (articulatè pinnatum), when between each pair of opposite pinnæ, or leaflets, the stem is furnished with a jointed edge.

η. Decursively pinnate (decursivè pinnatum), when from each particular pinnula a foliaceous appendage runs down to the following one.

θ. Decreasingly pinnate (pinnatum foliolis decrescentibus), when the successive foliola on a pinnated leaf grow gradually smaller to the point; as in the *Vicia sepium*.

102. Conjugately pinnated (conjugato-pin-

natum), when a leaf-stalk divides, and each part makes a pinnated leaf.

103. Ternato-pinnate (ternato-pinnatum) when at the point of a principal leaf-stalk there stand three pinnated leaves; as *Hoffmauseggia*.

104. Digitato-pinnate (digitato-pinnatum), when several simply pinnated leaves, from four to five, stand on the point of one stalk; as in *Mimosa pudica*.

105. Doubly pinnate (bipinnatum, duplicato-pinnatum), when a leaf-stalk bears, on one plane on both sides, a number of leaf-stalks, of which each is a pinnated leaf.

106. Trebly pinnate (triplicato-pinnatum, or tripinnatum), when several doubly pinnated leaves are attached to the sides of a foot-stalk on one plane.

107. Doubly compound (decompositum) when a divided leaf-stalk connects several leaves; of this kind are Nos. 90, 91, 93, 98, 99, 100. But the term decompositum is only used when the division of the leaf-stalk of the pinnulæ is irregular.

108. Super-decompound (supra-decompositum), when a leaf-stalk, which is often divided, sustains several leaves; to this belong Nos. 94, 101. But then the term is used only when the divisions of the leaflets are either more numerous or not so regular.

C. In respect of the place.

109. Radical (radicale), when a leaf springs from the root, as in the violet, *Viola odorata*. *Sagittaria sagittifolia*.

110. Seminal (seminale), when a leaf grows out of the parts of the seed, as in the hemp; where, as soon as it springs, there appear two white bodies, which are the two halves of the seed that change into leaves.

111. Cauline (caulinum), which is attached to the principal stem. The root leaves and stem leaves of a plant are often very different.

112. Rameous (rameum), when a leaf rises from the branches.

113. Axillary (axillare or subalare), which stands at the origin of the branch.

114. Floral (florale), which stands close by the flower.

D. In respect of substance.

115. Membranaceous (membranaceum), when both membranes of a leaf lie close upon one another, without any pulpy substance between them; as in the leaves of most trees and plants.

116. Flethy (carnosum), when between the membranes there is much soft and pulpy substance; as in houseleek, *Sempervivum tectorum*.

117. Hollow (tubulosum), when a somewhat fleshy and long leaf, as in the onion, *Allium Cepa*.

118. Bilocular (biloculare), when in a linear leaf, internally hollow, the cavity is divided by a longitudinal partition into two. *Lobelia dortmanna*.

119. Articulate (articulatum, or loculosum), when a cylindrical hollow leaf has its cavities divided by horizontal partitions; as *Juncus articulatus*.

120. Cylindrical (teres), when it is formed like a cylinder.

121. Compressed (compressum), when a thick leaf is flat on both sides.

122. Two-edged (anceps), when a compressed leaf is sharp on both edges.

123. Depressed (depressum), when the upper surface of a fleshy leaf is pressed down, or, as it were, hollowed out.

124. Flat (planum), when the upper surface of a thick leaf forms an even plane.

125. Gibbous (gibbosum, or gibbum), when both surfaces are convex.

126. Scimitar-shaped (acinaciforme); a two-edged thick leaf, on one side sharp and arched, on the other straight and broad.

127. Axe-shaped (dolabriforme), when a fleshy leaf is compressed, circular on the upper part, convex on the one side, sharp edged on the other, and cylindrical at the base.

128. Tongue-shaped (linguiforme), when a long compressed leaf ends in a round point.

129. Three-sided (triquetrum), when the leaf is bounded by three narrow sides, and is at the same time long.

130. Deltoid (deltoideum), when a thick leaf is bounded by three broad surfaces, and is at the same time short.

131. Four-cornered (tetragonum), when a leaf, long in proportion, is bounded by four narrow surfaces; as in the *Pinus nigra*.

132. Warty (verrucosum), when short fleshy leaves are truncated, and stand in thick heaps; as in some *Euphorbiae*.

133. Hook-shaped (uncinatum), when a fleshy leaf is flat above, compressed at the sides, and bent back at the point.

E. In respect of situation and position.

134. Opposite (folia opposita), when the bases of the leaves are next each other, on opposite sides of a stem.

135. Dissimilar (disparia), when of two leaves, placed opposite, the one is quite differently formed from the other; as some species of *Melastoma*.

136. Alternate (alterna), see No. 11.

137. Scattered (sparsa), when the leaves stand thick on the stem, without any order.

138. Crowded (conferta, or approximata), when the leaves stand so close together that the stem cannot be seen.

139. Remote (remota), when the leaves are separated on the stem by certain interstices.

140. Three-together (terna), when three leaves stand round the stem: there are sometimes four, five, six, seven, eight, &c., quaterna, quina, sena, septena, octona, &c.

141. Star-like (stellata, or verticillata), when several leaves stand round the stem at certain distances; as in ladies-bedstraw, *Galium*, &c.

142. Tufted (fasciculata), when a number of leaves stand on one point; as in the larch, *Pinus larix*, *Celastrus buxifolius*.

143. Two-rowed (disticha), when leaves are so placed on the stem that they stand on one plane; as in the pitch fir, *Pinus picea*, *Lonicera symphoricarpos*.

144. Decussated (decussata), when the stem, in its whole length, is set round with four rows of leaves at each branch, and when one looks perpendicularly down upon it, the leaves seem to form a cross; as in *Veronica decussata*.

Flowers.

Inflorescence.

145. Imbricated (*imbricata*), when one leaf lies over another, as the tiles upon a roof. Of this there are the following kinds :

a. Bifariouly imbricated (*bifariam imbricata*), when the leaves are so laid upon one another that they form but two rows longitudinally on the stem.

β. Trifariam imbricata, three rows.

γ. Quadrifariam imbricata, &c. four rows, &c.

F. In respect of insertion.

146. Petiolated (*petiolatum*), when a leaf is furnished with a foot-stalk.

147. Palaceous (*palaceum*), when the foot-stalk is attached to the margin.

148. Peltated (*peltatum*), when the foot-stalk is inserted into the middle of the leaf.

149. Sessile (*sessile*), when the leaf is attached to the stem without any foot-stalk.

150. Loose (*solutum*, or *basi solutum*), a succulent cylindrical or subulate leaf, which seems to have no connexion with the stalk on which it rests, but seems to hang the more loosely ; as *Sedum album*.

151. Riding (*equitans*), a sword-shaped or linear leaf, that forms at its base a sharp and deep furrow, whose surfaces lie on one another, and embrace the stalk ; *Dracaena ensifolia*, *Sisyrinchium striatum*, &c.

152. Decurrent (*decurrens*), when the foliaceous substance of a sessile leaf runs down along the stem.

153. Embracing (*amplexicaule*), when a sessile leaf is heart-shaped at the base, and with both lobes embraces the stem.

154. Connate (*connatum*), when opposite and sessile leaves are joined at their base.

N. A perfoliated leaf (*folium perfoliatum*), is already described in No. 59.

F. In respect of direction.

155. Appressed (*adpressum*), when the leaf turns up, and lays its upper surface to the stem.

156. Erect (*erectum*, or *semiverticale*), when the leaf is directed upwards, and makes with the stem a very acute angle.

157. Vertical (*verticale*), which stands quite upright, and thus makes with the horizon a right angle.

158. Bent sideways (*adversum*), when the margin of a vertical leaf is turned towards the stem.

159. Spreading (*patens*), which goes off from the stem in an acute angle.

160. Bent in (*inflexum*, or *incurvum*), when an upright leaf is bent in at its point towards the stem.

161. Oblique (*obliquum*), when the base of the leaf stands upwards, and the point is turned towards the ground.

162. Horizontal (*horizontalis*), when the upper surface of the leaf makes with the stem a right angle.

163. Bent down (*reclinatum*, or *reflexum*), when the leaf stands with its point bent towards the earth.

164. Bent back (*revolutum*), when the leaf is bent outwards, and its point from the stem.

165. Hanging down (*dependens*), when the base is turned to the zenith, and the point towards the ground.

166. Rooting (*radicans*), when the leaf strikes root.

167. Swimming (*natans*), when the leaf swims on the surface of water ; as in *Nymphaea alba*.

168. Immersed (*demersum*), when the leaves are found under water.

169. Emerging (*emersum*), when the leaf of an aquatic plant raises itself out of the water.

203. Besides the petiole, the stipulae, and the lamina, which have now been described, there are two appendages which properly belong to the foliage, and still remain to be noticed ; these are the ramentum, and the cirrus, or tendril.

204. The rament (*ramentum*), is a small, often bristle-shaped, leaflet, that is oblong, thin, and more or less of a brown color ; sometimes placed, like the stipulae, in the angles of the petiole ; but sometimes, likewise, without any order on the stem. It appears on all trees when their buds open, and falls soon after. On the oak it stands like the stipulae, on the Scotch fir. *Pinus sylvestris*, it is soon dispersed.

When the stem of a plant is covered with fine dry scales, that have the appearance of the Ramentum, it is properly called a ramentaceous stem, *caulis ramentaceus*.

205. The tendril (*cirrus*), is a filiform body, which serves for attaching plants to some support. It is always an alteration of some other part of the plant ; for instance, in the vine, of a leaf, and in the *Artabotrys*, of a part of the inflorescence. Climbing plants are furnished with tendrils. They are in general spiral. The species are as follows :

1. Axillary (*axillaris*), when rising from the axillae of the leaves.

2. Foliar (*foliariis*), when springing from the points of the leaves.

3. Petiolar (*petiolaris*), when standing on the point of the common foot-stalk of a compound leaf.

4. Peduncular (*peduncularis*), when rising from the foot-stalk of a flower.

5. Simple (*simplex*), when not divided.

6. Convolute (*convolutus*), when winding regularly round a prop.

7. Revolute (*revolutus*), when winding irregularly, sometimes to this side, sometimes to that.

206. To the inflorescence are to be referred all those parts which are placed above the articulation, which unites the flower with the plant ; strictly speaking, the term denotes the mode in which the flowers are arranged upon their stalk or rachis. We will first describe the different manners in which this is effected, and then explain the nature and modifications of the accessory leaves.

207. The inflorescence in many plants is an important character, and the following kinds have been described, viz. : The whirl (*verticillus*), the head (*capitulum*), the ear (*spicula*), the spike (*spica*), the raceme (*racemus*), the fascicle (*fasciculus*), the umbel (*umbella*), the cyme (*cyma*), the corymb (*corymbus*), the panicle (*panicula*), the thyrs (*thyrsus*), the spadix (*spadix*), and finally, the catkin (*amentum*).

208. A whirl (*verticillus*), consists of several flowers that encircle the stem, and stand un-

covered at intervals upon it. Of this there are the following kinds :

1. Sitting (*sessilis*), when all the flowers sit close to the stem, without foot-stalk, as in the field mint. *Mentha arvensis*.

2. With a foot-stalk (*pedunculatus*), when the flowers are furnished with short foot-stalks.

3. Headed (*capitatus*), when the flowers stand so thick that they take the figure of a half sphere as ; *Phlomis tuberosa*.

4. Half (*dimidiatus*), when the flowers surround only the half of the stalk ; as in balm, *Melissa officinalis*.

5. Close (*confertus*), when one whirl stands close above another.

6. Distant (*distans*), when the whirls stand at a distance one from another.

7. Leafy (*foliosus*), when there are leaves at the base of the whirl.

8. Leafless (*aphyllus*), when there are no leaves above the whirl.

9. Bracteate (*bracteatus*), when there are floral leaves, or bractæ, at the whirl.

10. Ebracteate (*ebracteatus*), when there are no bractæ at the whirl.

11. Naked (*nudus*), when no leaves or bractæ stand near the whirl.

12. Six, eight, ten, or many flowered (*sex*, *octo*, *decem*, or *multiflorus*), when the whirl consists of many flowers.

209. The head (*capitulum*), is a number of flowers standing thick upon one stalk, so as to form a round head. The flowers have either foot-stalks, or sit close. The following are varieties of this :

1. Spherical (*globosum*, or *sphæricum*), when the flowers have a perfectly round form ; as in the *Gomphrena globosa*.

2. Roundish (*subglobosum*), when the head of flowers is nearly round, but where the length exceeds the breadth ; as in clover ; *Gomphrena globosa*.

3. Conical (*conicum*), when the head is long, drawing towards a point ; as in *Trifolium montanum*.

4. Hemispherical (*dimidiatum*, or *hemisphericum*), when the head is round on one side and flat on the other.

5. Leafy (*foliosum*), when the head is surrounded with leaves.

6. Tufted (*comosum*), having leaves at the point ; as *Bromelia ananas*.

7. Naked (*nudum*), when it is devoid of leaves

8. Standing on the point (*terminale*), when it stands on the top of the stem.

9. Axillary (*axillare*), standing on the angles of the leaves, that is, where the base of the leaf, or of the leaf-stalk, is placed.

10. Alar (*alaris*), sitting on the axillæ of the branches.

210. The ear (*spicula* or *locusta*), is either named from the flowers of the grasses enclosed in the glume ; or we understand by it also, the flowers of the gramineous plants, such as *cyperus*, *scirpus sylvaticus*, &c., which stand closely pressed together on a filiform flower-stalk. It is denominated according to the number of the flowers and their figures.—The following are the kinds of it :—

1. One flowered (*uniflora*), that contains but one flower ; as *Agrostis*.

2. Two flowered (*biflora*), having two flowers ; as in *Aira*.

3. Three-flowered (*triflora*), &c.

4. Many-flowered (*multiflora*), that contains many flowers.

5. Round (*teres*), when the flowers in the spicula are so placed that their horizontal section is round ; as *Glyceria fluitans*, &c.

6. Two ranked (*disticha*), when the flowers in the spicula are placed in two opposite rows on the same level ; as in *Cyperus*.

7. Ovate (*ovata*), when the outline of the spicula resembles the figure of an egg ; as *Bromus secalinus*.

8. Oblong (*oblonga*), when the outline of the spicula exhibits an ellipsis more or less perfect.

9. Linear (*linearis*), when the spicula is long and small, but of equal breadth throughout.

211. The spike (*spica*) is that sort of inflorescence when many flowers, without any foot-stalk, sit on a simple filiform principal flower-stalk. If there be a foot-stalk, it must be much shorter than the flower. The kinds are,

1. Glomerate (*glomerata*), when the spike consists of a spherical selection of flowers.

2. Interrupted (*interrupta*), when the flowers upon the spike are interrupted by naked interstices.

3. Verticillated (*verticillata*), when the flowers, leaving naked interstices on the spike, appear on that account to be placed in whirls.

4. Imbricated (*imbricata*), when the flowers stand so thick together that one lies upon another.

5. Distichous (*disticha*), when the flowers are arranged on the spike in two rows.

6. One-rowed (*secunda*), when the flowers are all arranged on one side of the spike, so that the other side is naked.

7. Cylindrical (*cylindrica*), when the spike is equally covered with flowers both above and below.

8. Linear (*linearis*), that is very slender, and of equal thickness.

9. Ovate (*ovata*), that is thick above, more slender below, and appears of an oval form.

10. Ventricose (*ventricosa*), thick in the middle, and slender at both extremities.

11. Leafy (*foliosa*), having leaves between the flowers.

12. Comose (*comosa*), having leaves at the apex.

13. Fringed (*ciliata*), having hairs between the flowers.

14. Simple (*simplex*), without branches.

15. Branched or compound (*ramosa*, or *composita*), when several spikes stand on one branched or divided stalk.

16. Conjugate (*conjugata*), when two spikes standing on one stalk unite at the base.

17. Bundled (*fasciculata*), when several spikes standing on one foot-stalk unite at the base.

18. Terminal (*terminalis*), standing on the apex of the stalk or branch.

19. Axillary (*axillaris*), standing in the angles at the origin of the leaves.

20. Lateral (*lateralis*), standing on the wood

of the former year, that is, on the place now destitute of leaves.

212. The Raceme (racemus) is that sort of inflorescence to which several pedunculated flowers are longitudinally attached, nearly of equal length, or at least where the lowest flower-stalks are little longer than the upper. Here follow the different kinds of Raceme;—

1. One-sided (unilateralis), when only one side of the stem is set with flowers.

2. One-rowed (secundus) when the flower-stalks are situated round the principal stem, but the flowers themselves are directed only to one side.

3. Limber (laxus), when the raceme is very pliant and flexible.

4. Stiff (strictus) when the raceme does not bend.

5. Simple (simplex), when it is unbranched.

6. Compound (compositus), when several single racemes unite on one stem.

7. Conjugate (conjugatus), when two racemes, standing on one stem, unite at the base.

8. Naked (nudus), without leaves or bractæ.

9. Foliate (foliatus), set with leaves or bractæ.

10. Bracteate (bracteatus), when there are bractæ at the flowers.

11. Ebracteate (ebracteatus) having no bractæ.

12. Erect (erectus), standing upright.

13. Straight (rectus), straight without bending.

14. Cernuous (cernuus), when the apex of the raceme is bent downwards.

15. Nodding (nutans), when the half of the raceme is bent downwards.

16. Hanging (pendulus), when the raceme hangs down perpendicularly.

213. The Fascicle or bundle (fasciculus) is a number of simple foot-stalks, of equal height, which arise at the point of the stem, not from one point, but from several. As an example of the fasciculus may be quoted *Dianthus carthusianorum*.

214. The umbel (umbella) consists of a number of flower-stalks, of equal length, that rise from the point. In an umbel the flower-stalks are called rays (radii). There are the following varieties of the umbel.

1. Simple (simplex), when the rays bear but one flower.

2. Compound (composita), when each ray of the umbel supports a simple umbel. The rays which support the simple umbels are called the universal or general umbel, umbella universalis. The simple umbels are called the particular or partial umbels, umbella partialis or umbellula.

3. Sitting (sessilis), when the umbel has no stalk.

4. Pedunculated (pedunculata), when it is furnished with a stalk.

5. Close (conferta), when the rays of the umbel stand so near one to another that the whole umbel becomes very thick and close.

6. Distant (rara), when the rays stand wide.

7. Poor (depauperata), when the umbel has but few flowers.

8. Convex (convexa), when the middle rays are high but stand thick, so that the whole form a globular figure.

9. Flat (plana), when the rays being of equal length, the flowers form a flat surface.

215. The cyme (cyma) is that species of inflorescence where the whole at first view has the appearance of a compound umbel, only the principal flower-stalk and those which support the particular florets do not rise from the same point. The flower-stalks rise close above one another and are divided into irregular branches. Examples of the cyme are found in *Sambucus nigra*, and *Viburnum opulus*.

216. The corymb (corymbus) is properly speaking an erect racemus, the lower flower-stalks of which are either branched or simple, but always so much produced as to be of equal height with the uppermost.

217. The panicle (panicula) consists of a number of simple flowers that stand on unequally divided branches, and on a long peduncle. The kinds are,

1. Simple (simplex), that has only undivided side branches.

2. Branched (ramosa), when the branches are again branched.

3. Much branched (ramosissima), when the side branches are much divided.

4. Disappearing (deliquescent), when the foot-stalk so loses in branching that it cannot be traced to the end.

5. Spreading (patentissima), when the branches stand wide from one another, and spread out on all sides.

6. Crowded (coarctata), when the branches stand very close together.

7. One-rowed (secunda), when the branches incline all to one side.

218. The Thyrsus (thyrsus) is a condensed panicle, whose branches are so thick that the whole has an oval form; as in the flower of the privet, *Ligustrum vulgare*, *Tussilago petasites*.

219. The Spadix is peculiar to the palms, and some plants allied to the genus *Arum*. All flower-stalks that are contained in a vagina, are called Spadix. This organ is sometimes found like a spike, racemus, or panicle, and from these it takes its name.

The terms appropriated to it are the following:

1. Spiked (spicatus), having the appearance of a spike.

2. Raceme-like (racemosus), forming a raceme.

3. Paniculated (paniculata), having the form of a panicle.

220. The Catkin (amentum, or julus,) is a long and always simple stem, which is thickly covered with scales, under which are the flowers, or their essential parts.

Examples of this are found in the willows (salices), hazle (*Corylus avellana*), hornbeam (carpinus), &c.

1. Cylindrical (cylindricum), which is equally thick above or below.

2. Attenuated (attenuatum), which grows thinner and thinner to the point.

3. Slender (gracile), which is long but has few scales, and also is slender in proportion to its length.

4. Ovate (ovatum) which is thick below and around, but grows gradually more slender to the point.

221. The accessory leaves of the inflorescence

are the bractæ, of which the spatha, and the involucrem are varieties.

222. The bractæ are small leaves, placed above the articulation of the inflorescence, near or between the flowers, and in general are of a different shape and color from the other leaves. They are subject to many variations of figure, duration, &c.; the terms to express which are the same as are applied to leaves under similar circumstances.

223. The spatha and the involucrem differ from bractæ in being situated immediately below the articulation of the inflorescence with the plant. They are both subject to several variations of form, which are designated by particular names.

224. *The spatha is,*

1. Univalve (univalvis) when it consists but of one leaf; as in *Arum maculatum*.

2. Bivalve (bivalvis) when two leaves stand opposite each other, as in *Stratiotes*.

3. Halved (dimidiata) when the flowers are covered on one side only.

4. Permanent (persists) when it remains unchanged till the fruit appears.

225. The involucrem consists of several leaves, surrounding one or several flowers. It is chiefly known in umbelliferous plants, and in compound flowers. In the former the terms employed do not differ from those used for other parts of a plant; in the latter it is altogether of another kind, and requires a particular description.

226. The common calyx, common perianthium, or anthodium, as it is sometimes called, is an involucrem, which contains a great number of flowers, in such a manner as that these flowers appear to form but one; as in the dandelion (*Leontodon taraxacum*), blue bottle (*Centaurea cyanus*), sun flower (*Helianthus annuus*), &c. The kinds are,

1. One leaved (monophyllum), that consists but of one leaf, united at the base, but divided at top.

2. Many leaved (polyphyllum), that is compounded of several leaves.

3. Simple (simplex), when the flowers are surrounded with a single row of leaves.

4. Equal (æquale), when in a simple perianth the leaves are of equal length.

5. Scaly or imbricated (squamosum or imbricatum), when the common perianth consists of closely imbricated foliola.

6. Squamose (squamosum), when the foliola are bent back at the point.

7. Scariosc (scariosum), when the foliola are hard and dry; this is found in *Centaurea glastifolia*.

8. Fringed (ciliatum), when the margins of the foliola are beset with short bristles of equal length.

9. Muricated (muricatum), when the margins of the foliola are set with short stiff prickles.

10. Thorny (spinosum), when each leaflet is provided with a thorn: these are either simple thorns (spinæ simplices), or branched (ramosæ).

11. Turbinate (turbinatum), when the perianth has quite the figure of a top.

12. Spherical (globosum), when it has the form of a perfect sphere.

13. Hemispherical (hemisphæricum), when it is round below and flat above.

14. Cylindrical (cylindricum), when the perianth is round and long, as thick above as below.

15. Flat (planum), when the foliola of the perianth are spread out quite flat.

16. Doubled or calyculated (auctum or calyculatum), when at the base of the common perianth there is another row of foliola, that appear to form another involucrem; as in dandelion, *Leontodon Taraxacum*.

227. The Flower is the part immediately terminating the twigs or branches of the inflorescence, and containing the commencement of the fruit. Its parts are the *Calyx*, the *Corolla*, the *Stamens*, and the *Pistillum*; besides which must be noticed the *Discus*.

228. When the calyx and corolla are so con-founded as not to be capable of being distinguished they are called perianthium; as in *Butomus*.

229. The calyx immediately encloses the flower. It is,

1. Abiding (persists), remaining after the flower falls off; as in the henbane, *Hyoscyamus niger*.

2. Deciduous (deciduus), that falls off at the same time with the flower; as in the lime tree, *Tilia Europea*.

3. Withering (marcescens), that withers after the flower, but still remains for some time, and at last drops off; as in the apricot, *Prunus Armeniaca*.

4. Caducous (caducus), that falls off before the flower; as in the poppy, *Papaver somniferum*.

5. Simple (simplex).

6. Double (duplex), when a double calyx encloses the flower; as the strawberry, *Fragaria vesca*; mallow, *Malva rotundifolia*.

7. One leaved (monophyllus), when the calyx consists of one leaf, that is, it may be divided into equal or unequal laciniae, but all of them are connected at the base.

8. Two, three, four, five-leaved, di-tu-ri-tetra-penta-&c. phyllus, many leaved (polyphyllus), when it consists of two or more foliola.

9. Dentated (dentatus), when it has at the margin short segments or indentations, but which are not deeper at most than the fourth part of the whole calyx. According to the number of these segments the calyx is, bi, tri, quadri, quinque, &c. or multidentatus, with two, three, four, five, or many segments.

10. Cleft (fissus), when the calyx is divided into laciniae, but which reach only to the middle. It is often bi-tri-quadri-multifidus.

11. Parted (partitus), when it is divided down to the base. These divisions are also named according to their number, as bi-tri-quadri-&c. multipartitus.

12. Labiated or bilabiated (labiatus or bilabiatus), when it is deeply divided into two laciniae, both of which are dentated; as in garden sage, *Salvia officinalis*.

13. Entire (integer), when a monophyllus ca-

lyx is short, round at the base, and entire on the margin.

14. Urceolated (urceolatus), when a monophyllous calyx is short, round at the base, and entire on the margin.

15. Shut (clausus), when a polyphyllous, or divided calyx, applies itself closely to the corolla.

16. Tubular (tubulosus), when a divided, cleft, or indented calyx, at its origin is cylindrical, and forms a tube.

17. Spreading (patens), when, in a monophyllous or polyphyllous calyx, the foliola or laciniae, stand quite open.

18. Reflected (reflexus), when either the segments, or laciniae in monophyllous calyxes, or the foliola in polyphyllous, are bent back.

19. Inflated (inflatus), when the calyx is hollow, and bellies out.

20. Abbreviated (abbreviatus), when the calyx is much shorter than the corolla.

21. Colored (coloratus), when the calyx is of another color than green.

230. The corolla is the envelope, or small leaves enclosed by the calyx, surrounding the interior parts of the flower, of a more delicate structure than the calyx, and of another color than green. It consists either of one piece or of several; the first called a monopetalous corolla (corolla monopetala), the last polypetalous (corolla polypetala). The pieces it consists of are called petals (petala).

231. The monopetalous corolla is that which consists but of one piece, which, however, may be divided into segments, but which must always be entire at the mouth. The following are varieties of this corolla:—

1. Tubular (tubulosa), that consists of a single piece, hollow and of equal thickness. The small corolla or floret, which is found included in a common perianthium, is also called tubular, although it sometimes departs from this form.

2. Club-shaped (clavata), which forms a tube, growing gradually wider upwards, and narrower at the aperture.

3. Spherical (globosa), which is narrow above and below, and wide in the middle.

4. Bell-shaped (campanulata), that grows gradually wider to the mouth, so that it has nearly the appearance of a bell.

5. Cup-shaped (cyathiformis), when a cylindrical tube grows gradually wider from below upwards, but the margin is upright, and not bent back or contracted.

6. Urceolated (urceolata), when a short cylindrical tube extends itself into a wide surface, the margin of which is erect.

7. Funnel-shaped (infundibuliformis), when the tube of the corolla grows gradually wide, above that is obversely conical, but the rim pretty flat and turned outwards.

8. Salver-shaped (hypocrateriformis), when the tube of the corolla is perfectly cylindrical, but very long, and the rim forms a broad expansion; as in *Phlox*.

9. Wheel-shaped (rotata), when a cylindrical tube is very short, nearly shorter than the calyx, sometimes hardly perceptible, and its margin is quite flat. It is almost the same with the fore-

going, only the tube is very short; as in shepherd's club, *Verbascum*.

10. Tongue-shaped (ligulata), when the tube is not long, suddenly ceases, and ends in an oblong expansion; as in the *Aristolochia clematitis*, and in some flowers that are contained in a common perianthium.

11. Difform (difformis), when the tube gradually becomes wider above, and is divided into unequal lobes; as in some corollas that are included in a common perianthium, e. g. the blue bottle, *Centaurea cyanus*.

12. Ringent (ringens), when the margin of a tubular corolla is divided into two parts, of which the upper part is arched, the under oblong, and has some resemblance to the open mouth of an animal; as in sage, *Salvia officinalis*.

13. Masked (personata), when both segments of the ringent flower are closely pressed together: as in snap-dragon, *Antirrhinum majus*.

14. Bilabiate (bilabiata), when the corolla has two segments or lips, which lie over against each other, and which are themselves often laciniated or cleft.

15. One-lipped (unilabiata), when in a ringent, personate, &c. corolla, the upper or under lip is wanting, as in *Teucrium*.

232. The kinds of the many-petalled corolla (corolla polypetala) are,

1. Rose-like (rosacea), when petals which are pretty round, and at their base have no unguis, form a corolla.

2. Mallow-like (malvacea), when five petals, which at the base are considerably attenuated, so unite below that they appear to be monopetalous.

3. Cross-like (cruciata), when four petals, which are very much produced at their base, stand opposite to one another; as in *Sinapis alba*, *Brassica oleracea*, *viridis*, &c.

4. Pink (caryophyllacea), when five petals at their base are much elongated, and stand in a monophyllous calyx; as in *Dianthus caryophyllus*, &c.

5. Lily-like (liliacea), when there are six petals, but no calyx. In some there are only three, in others they form a tube at the bottom. This makes the idea somewhat indefinite, but it ought to be remarked that this kind of corolla never has a calyx, and that it is only proper to the lilies.

6. Two, three, four, five, many petalled (di-tri-tetra-penta-&c. polypetala), thus the corolla is denominated, according to the number of the petals.

7. Papilionaceous (papilionacea), when four petals differing in figure stand together; to these petals the following names have been given (for instances, examine the flowers of the common pea, *pisum sativum*, or vetch, *vicia sativa*):

a. The standard (vexillum) is the uppermost petal, which is commonly the largest, and is somewhat concave.

b. The two wings (alæ) are the two petals, which stand under the vexillum, and opposite to each other on each side.

c. The keel (carina) is the undermost petal; it is hollow, and stands under the vexillum, and opposite to it, and contains the ovary, with the stamina and pistillum.

8. *Orchideo* (*orchidea*), is a corolla, composed of five petals, of which the undermost is long, and sometimes cleft; the other four are arched, and bent towards one another.

9. *Irregular* (*irregularis*), consisting of four or more petals, which are of different lengths and inclination, so that they do not come under the description of the other kinds.

233. A single division of the corolla, as we have observed, is called a petal (*petalum*); when this is plain the upper part is called *lamina*, the under part *unguis*.

234. The particular parts of the corolla have besides appropriate names. The following are those of the *monopetalous* corolla:—

1. The tube (*tubus*) of a *monopetalous* corolla is the under part, which is hollow, and in general of equal thickness. All flowers with this kind of corolla have a tube, except the bell-shaped, and sometimes the wheel-shaped.

2. The border (*limbus*), is the opening of the corolla, especially when it is bent back. The *limbus* is often dentated or deeply divided, and the divisions are called

3. Segments or lobes (*laciniae* or *lobi*), and they are denominated according to their figure, number, and situation.

4. The helmet (*galea*) is the upper arched lacinia of a ringent or masked corolla, which is further denominated according to its situation, figure, and segments or laciniae.

5. The gape (*riktus*) is, in ringent flowers, the space between the two extremities of the helmet and the under lip.

6. The throat (*faux*), in a *monopetalous* and ringent corolla, is the opening of the tube.

7. The palate (*palatum*), in a *personate* corolla, is the arch of the under lip, which is so elevated as to close the *faux*.

8. The *labellum* is the under lip of a ringent and *personate* corolla.

9. The lips (*labia*), in the *bilabiate* and *unilabiate* flowers, are two divisions, the one called the upper lip (*labium superius*), and the other the under lip (*labium inferius*). The *galea* and *labellum* are likewise by some botanists called lips.

235. The stamens are the male organs of the plant, and are seated between the corolla and the ovarium. Their parts are three; the filament, the anther, and the pollen.

236. The filament (*filamentum*) is a longish body, that is destined for the support and elevation of the anther. In its figure it is very various.

1. *Capillary* (*capillare*), that is all of equal thickness, and as fine as a hair.

2. *Filiform* (*filiforme*), like the former, only thicker.

3. *Awl-shaped* (*subulatum*), which is thicker below than above.

4. *Dilated* (*dilatatum*), that is so compressed on the sides as to appear broad and leaf-like.

5. *Heart-shaped* (*cordatum*), the same with the foregoing, but with a margin above and pointed below; as in *Mahernia*.

6. *Wedge-shaped* (*cuneiforme*), a dilated filament, that is pointed below, but cleft above; as in *Lotus tetragonolobus*.

7. *Loose* (*liberum*), that is not attached to any other filament.

8. *Connate* (*connatum*), when several grow together, forming a cylinder; as in the mallow, *Malva*.

9. *Bifid* (*bifidum*), when a filament is divided into two parts.

10. *Multifid*, or branched (*multifidum* or *ramosum*), when it is divided into many branches; as in *Carolinea princeps*.

11. *Jointed* (*articulatum*), when the filament has a moveable joint; as in sage, *Salvia officinalis*.

12. *Connivent* (*connivens*), when several filaments bend towards one another at their points.

13. *Incurved* (*incurvum*), that has a bend like a bow.

14. *Declined* (*declinatum*), when several filaments do not stand erect, but by degrees, without describing a large curve, bend towards the upper or under part of the flower; as in *Pyrola*.

15. *Hairy* (*pilosum*), set with fine hairs.

16. *Equal* (*æquale*), that are all of equal length.

17. *Unequal* (*inæquale*), when some are long and some short.

237. The anther (*anthera*), is a hollow cellular body, that contains a quantity of pollen. Its kinds are the following:—

1. *Oblong* (*oblonga*), which is long and pointed at both ends.

2. *Linear* (*linearis*), that is long and flat, but all of equal breadth.

3. *Spherical* (*globosa*), when perfectly round.

4. *Kidney-shaped* (*reniformis*), that is spherical on one side, but concave on the other; as in ground ivy, *Glechoma hederacea*, fox-glove, *Digitalis purpurea*, &c.

5. *Doubled* (*didyma*), when two seem to be joined together.

6. *Arrow-shaped* (*sagittata*), that has a long point, and is cleft at the base into two parts.

7. *Bifid* (*bifida*), that is linear, but cleft above and below, as in the grasses.

8. *Peltated* (*peltata*), that is circular, flat on both sides, and attached by the middle to the filament; as in the yew, *Taxus baccata*.

9. *Dentated* (*dentata*), that on the margin has dents or indentations; as in the yew, *Taxus baccata*.

10. *Hairy* (*pilosa*), that is covered with hair; as in the dead nettle, *Lamium album*.

11. *Two-horned* (*bicornis*), which has at its apex two subulate prolongations, as in *Pyrola*, *Arbutus*, *Erica*, &c.

12. *Awned* (*aristata*), that at the base has two bristle-shaped appendages, as in *Erica*.

13. *Crested* (*cristata*), when two cartilaginous points are set on the sides or on the base; as in some heaths, *Ericæ*.

14. *Awnless* (*mutica*), when it has neither awn nor crest. It is the opposite of No. 12, 13.

15. *Angulated* (*angulata*), that has several deep furrows that form four or more angles.

16. *Bilocular* (*bilocularis*), when the anther is divided by a partition into two parts or cells.

17. *Unilocular* (*unilocularis*), when there is but one cell or cavity in the anther.

18. *Bursting at the side* (*latere dehiscens*.)

19. Bursting at the point (apice dehiscens.)
20. Free (libera), that is not attached to another anther.
21. Connate (connata), when several grow together, forming a tube.
22. Erect (erecta), standing with its base straight on the point of the filament.
23. Incumbent (incumbens), that is perpendicularly, or even obliquely, attached to the filament.
24. Lateral (lateralis), that is attached, by its side, to the point of the filament.
25. Moveable (versatilis), when Nos. 23 and 24 are so slightly attached to the filament that the least motion agitates the anther.
26. Adnate (adnata), when the anther is closely attached to both sides of the point of the filament.
27. Sitting (sessilis), that has no filament.
238. The pollen is a powder, that appears in the form of the finest dust. In the microscope its figure is various, being hollow, and filled with a fertilising moisture.
239. The Pistillum is the organ which occupies the centre of the flower, and which finally terminates the development of the inflorescence, just as a bud terminates the progress of the foliage. Hence it has been philosophically considered as a bud in a particular state. It consists of three parts; the ovarium, the style, and the stigma.
240. The Ovarium is the undermost part of the pistillum, and is the rudiment of the future fruit. The number of ovaria is very various; they are reckoned from six to eight, after which they are said to be several or many ovaria. The figure is also very different. The principal kinds are:—
 1. Sitting (sessile), that has no foot-stalk.
 2. Pedicelled (pedicellatum), furnished with a foot-stalk.
 3. Superior (superum), when the germen is encircled by the calyx, or, when this is wanting, by the other parts of the flower.
 4. Inferior (inferum), when the ovary is situated under the calyx, or, when this is wanting, under the corolla.
241. The style (stylus), is seated upon the germen, and resembles a small column or stalk. The kinds of it are the following:—
 1. Hair-like (capillaris), that is very slender, and of equal thickness.
 2. Bristle-like (setaceous), as slender as the former, but somewhat thicker at the base.
 3. Thread-like (filiformis), which is long and round.
 4. Awl-shaped (subulatus), thick below, above sharp pointed.
 5. Gross (crassus), that is very thick and short.
 6. Club-shaped (clavatus), thicker above than below.
 7. Two, three, four, &c. multifid (bi-tri-quadrifid, &c., multifidus), cleft in a determined manner.
 8. Dichotomous (dichotomus), divided into two parts, which are again divided at the points.
 9. Terminal (terminalis), which stands on the top of the germen.
 10. Lateral (lateralis), attached to the inside of the germen.
 11. Erect (rectus), which stands straight up.
 12. Declined (declinatus), that inclines towards the side.
 13. Abiding (persistens), that does not fall off.
 14. Withering (marcescens), that withers and afterwards falls off.
 15. Deciduous (deciduus), that falls off immediately after impregnation.
- The number of the styles must likewise be accurately counted; for there is often more than one style to one germen, and this must be particularly observed. The length of the style, whether longer or shorter than the stamina, is also to be mentioned.
242. The stigma means the top of the style. The kinds of it are as follows:—
 1. Pointed (acutum), when it has a sharp point.
 2. Blunt (obtusum), when it forms a blunt point.
 3. Oblong (oblongum), when it is thick and elongated.
 4. Club-shaped (clavatum), resembling a small club.
 5. Spherical (globosum), forming a perfectly round globe.
 6. Capitate (capitatum), a hemisphere, the under side flat.
 7. Emarginated (emarginatum), when the last-mentioned kind has a notch in it.
 8. Peltated (peltatum), that is formed like a shield.
 9. Uncinated (uncinatum), hooked at the point.
 10. Angular (angulosum), when it is furnished with close and deep furrows, which occasion projecting angles.
 11. Three-lobed (trilobum), which consists of three round bodies, somewhat pressed flat.
 12. Dentated (dentatum), when it is set with fine teeth.
 13. Cruciform (cruciforme), when it is divided into four parts, of which two are always opposite to each other.
 14. Pencil-like (penciliforme), consisting of a number of short, thick, close, fleshy fibres, in form of a pencil.
 15. Hollow (concavum), when it is of a globular or longish form, but quite hollow, as in the violet.
 16. Petal-like (petaloideum), when it has the appearance of a petal; as in Iris.
 17. Two, three, and multifid (bi, tri, &c. multifidum).
 18. Bent-back (revolutum), when the points of a bifid or multifid stigma are rolled back outwards.
 19. Bent in (convolutum), when the points of a divided stigma are rolled inwards.
 20. Spiral (spirale), when a multifid stigma is rolled up like the spring of a watch.
 21. Plumose (plumosum), when the stigma is set with fine hairs on both sides, so as to have the appearance of a feather; as in the grasses.
 22. Hairy (pubescens), that is set with short white hairs.
 23. Lateral (laterale), which is situated on the side of the stylus or of the germen.

24. Sitting (sessile), which, when there is no style, rests on the germen.

The stigma, properly speaking, consists of a number of inhaling tubercles, which are not always visible without a magnifier. In the *Mirabilis Jalapa* they are to be seen most distinctly.

243. The discus is a fleshy ring, surrounding the pistillum at its base; and is one of the various things which Linnaeus indiscriminately named nectary. It generally exists in the form of a ring, or annulus, into which the stamens are inserted, or not, as the case may be. Occasionally it is so much enlarged as to enclose the pistillum in part, as in *Paonia Moutan*, or entirely, as in *Nelumbium*, when it constitutes the principal part of the fruit.

244. The fruit is the perfection of vegetation. It is by this part that all plants are perpetuated; and with this, in many plants, existence terminates. In common language, the term is applied to such as are fleshy and eatable; but, in scientific language, it signifies the fecundated ovary in a ripe state; and, in a more extended sense, the aggregation of several ripe ovaria, even belonging to different flowers.

245. The essential parts of a fruit are the pericarp and the seed.

246. The pericarp is the covering of the seed, and the most external part of the fruit. It is terminated at the one end by the vestiges of the style, and at the other by the receptacle or peduncle. It consists of three parts: 1. the epicarp, which is the skin or outer coat; 2. the sarcocarp, which constitutes the flesh in fleshy fruits, and is the substance immediately covered by the epicarp; 3. the endocarp, which is the inner lining of the fruit, and the same as Gartner has called putamen.

247. The pericarp is always present in the ovary, but sometimes is obliterated in the fruit. It is sometimes internally divided by partitions, which are called dissepiments, and which bear on some part of their surface, generally at the inner angle, a fleshy or spongy mass, which is called the placenta, and on which the seeds are placed.

248. The pericarp varies in the mode of dehiscence, in degree of combination, in texture, and in relation to the perianthium. From variations in these modifications, fruits may be divided into five classes, and forty genera, disposed in the following manner:—

SECT. I. SIMPLE

* SUPERIOR.

1. † Unilocular, or simple.

‡ *Dehiscens*.

1. Utriculus.

2. Achenium.

3. Cariopsis.

4. Catoclesium.

5. Scleranthum.

6. Samara.

7. Glans.

8. Nux.

9. Drupa.

10. Lomentum.

* INFERIOR.

† Unilocular, or simple.

‡ *Dehiscens*.

11. Stephanium.

12. Areosthida.

* SUPERIOR.

1. † Unilocular, or simple.

‡ *Dehiscens*.

13. Legumen.

14. Folliculus.

2. † Plurilocular, or compound.

‡ *Indehiscens*.

15. Nuculanum.

16. Bacca.

17. Hesperidium.

18. Carcerulus.

19. Sterigma.

‡ *Dehiscens*.

25. Siliqua

26. Silicula.

27. Pyxidium.

28. Capsula.

29. Regmatus.

3. † Gynobasic.

31. Microbasis.

32. Sarcobasis.

4. † Multiplex.

33. Acinos.

34. Eterio.

35. Amalthea.

36. Asimina.

5. † Aggregate.

37. Sorosus.

38. Strobilus.

39. Ananassa.

* INFERIOR.

1. † Unilocular, or simple.

† Plurilocular, or compound.

‡ *Indehiscens*.

20. Polyachenium.

21. Pomum.

22. Pepo.

23. Acrosarcum.

24. Balausta.

‡ *Dehiscens*.

30. Diplostegia.

249. The foregoing are distinguished among themselves by the following additional characters:—

1. *Utriculus*. Pericarp bladdery monospermous, not adhering to the seed. Eleusine.

2. *Achenium*. Pericarp coriaceous, monospermous, or oligospermous, not adhering to the seed. Rosa. Thecidium of Mirbel is a variety.

3. *Cariopsis*. Pericarp usually thin, monospermous, always adhering closely to the seed and inseparable from it. Grasses. Also called Cerio.

4. *Catoclesium*. Pericarp coriaceous, monospermous, covered by the calyx, which does not adhere to it, but which is much enlarged. Sal-sola. To this must be referred Sacellus and Sphalerocarpium.

5. *Scleranthum*. Pericarp thin, monospermous, covered by the indurated base of the calyx or perianthium. Mirabilis. Also called Dylecium.

6. *Samara*. Pericarp coriaceous, oligospermous, with a long wing at its back. Acer. This fruit is either compound or simple, but always unilocular in its divisions.

7. *Glans*. Pericarp coriaceous, mono-dispermous, covered at the base by an indurated involucre, which takes the name of cup. Quercus, Laurus. Also called Calybio.

8. *Nux*. Pericarp woody, mono-dispermous, covered at the base by a foliaceous involucre. Peculiar to Corylus. The term is applied by many authors to nearly all the hard fruits, which

have only one or two seeds. Called also *Nucula* by Desvauz; but that term is employed by some botanists for the *Achenium*.

9. *Drupa*. Sarcocarp fleshy; endocarp bony and separable, mono-dispermous. *Amygdalus*. From this *Tryma* is not distinguishable.

10. *Lomentum*. Pericarp polyspermous, contracted at the interval between each seed, and separating there into joints. A form of the *Legumen*. *Hedysarum*.

11. *Stephanæum*. Pericarp inseparable from the calyx, and of variable consistence, monospermous. *Compositæ*. Also called *Cypsela*.

12. *Arcesthida*. Spherical monospermous, formed by the cohesion of several fleshy scales. *Juniperus*.

13. *Legumen*. Polyspermous, two-valved, one-celled. *Vicia*.

14. *Folliculus*. Polyspermous, one-valved, often spuriously two-celled. *Pæonia*.

15. *Nuculanum*. Sarcocarp fleshy, endocarp bony, often confluent. *Verbenacæ*. Differs from *drupa* in being compound. Also called *Pyrena* and *Nucula*.

16. *Bacca*. Pericarp pulpy, the cells obliterated, the seeds nidulant in the pulp, and having no distinct mode of connexion with the pericarp when ripe. *Jasminum*. This term is often applied very vaguely.

17. *Hesperidium*. Sarcocarp coriaceous, endocarp and placentas fleshy or pulpy, seeds nidulant, cells distinct. *Citrus*. Also called *Aurantium*.

18. *Carcerulus*. Pericarp dry, cells not more than five, within confluent or distinct. *Tilia*.

19. *Sterigmmum*. Pericarp dry, cells very numerous, more than five, occasionally dehiscent slightly. This is hardly different from the last. *Malva*.

20. *Polyachenium*. Pericarp and calyx inseparable, dry, cells opposite, separating from the top of the common axis. *Umbelliferae*. Called *Carpodellum* when the cells exceed two, and the pericarp is slightly fleshy; as in *Aralia*.

21. *Pomum*. Pericarp and calyx inseparable, forming a fleshy mass, endocarp variable in texture, never pulpy. *Pyrus*.

22. *Pepo*. Pericarp and calyx inseparable, fleshy, endocarp pulpy, seeds parietal, when ripe nidulant in pulp. *Cucumis*. Also named *Peponida*.

23. *Acrosarcum*. The same as *bacca*, but the calyx adheres to the pericarpium. An inferior berry. *Ribes*.

24. *Balausta*. Pericarp coriaceous, enclosing a number of irregular cells, containing seeds with a pulpy testa. *Punica*. An inferior *Hesperidium*.

25. *Siliqua*. Pericarp linear, polyspermous, two-valved, valves separating from the face of the dissepiment. *Brassica*.

26. *Silicula*. Pericarp round or oblong, oligospermous, two-valved, valves separating from the face of the dissepiment. *Draba*.

27. *Pxyidium*. Pericarp polyspermous, separating into two halves by a circular horizontal separation, so that the valves resemble two hemispheres. *Anagallis*. The lower valve is called *amphora*, the upper *operculum*.

28. *Capsula*. Pericarp polyspermous, separating vertically into valves. *Silene*.

29. *Regmatus*. Pericarp separating with elasticity into mono or dispermous cells (*cocci*), which are pendulous from the apex of a common axis, and are more or less dehiscent. *Euphorbia*. Scarcely distinct from *polyachenium*. Also called *Cremocarpium*.

30. *Diplostegia*. Pericarp polyspermous, variable in consistence, inseparable from the calyx, dehiscing in various manners. May be considered an inferior capsule. *Hydrangea*.

31. *Microbasis*. Pericarpia several, monospermous, indehiscent, dry, attached by the base to a common style, and seated on a receptacle called the *gynobase*. *Labiatae*. The naked seeds of *Linnaea*.

32. *Sarcobasis*. A mere variety of the last, from which it scarcely differs, except in having fleshy pericarpia upon an enlarged fleshy gynobase. *Ochna*.

33. *Acinus*. Drupes, very small and numerous, arranged on an elongated receptacle, and when becoming confluent when ripe, having a membranous covering. *Fragaria*. This is the *Syncarpa* of Richard, but not of others. *Polyssecus* seems to be not distinguishable from this.

34. *Etærio*. Pericarpia several, formed from distinct ovaries, and arranged around an imaginary centre, generally polyspermous and dehiscent. *Sempervivum*. This is also the *Platycarpium* of Desvauz.

36. *Amalthea*. Composed of several achenia, enclosed within the cavity of a coriaceous calyx. *Rosa*. Also called *Cynarrhodon*.

37. *Asimina*. Ovaries numerous, bacciform, one-celled, produced from a single flower, and united in a solid fleshy fruit. *Anona*. Very near the *acinus*, from which it differs chiefly in size, and in having its outer coat coriaceous, not membranous.

38. *Sorosus*. Pericarpia very numerous, dry, generally achenia, arranged upon a fleshy receptacle, which is urceolate, and enclosed at its mouth. *Ficus*. Also called *Syconus*.

39. *Strobilus*. Pericarpia many, indehiscent, unilocular, monospermous, each enclosed in an indurated scale. Scales imbricated, forming by their cohesion a hard irregular cone. *Pinus*. Of this *Galbalus* is a mere variety.

40. *Ananassa*. Pericarpia many, indehiscent, polyspermous, cohering with the calyx, and seated each in the axilla of a fleshy scale, which coheres with them, and in maturity forms a solid fleshy mass. *Bromelia*.

250. THE SEED is that part of the fruit which is enclosed in the pericarp, and which contains the rudiments of the future plant. It consists of three distinct parts, the *testa*, the *albumen*, and the *embryo*.

251. The *testa* is the external covering or coat of the seed. Some writers distinguish it into three parts; calling the external skin the *testa*, the intermediate substance the *sarcodermis*, and the interior pellicle the *endopleura*.

252. The scar upon the *testa*, which indicates the point by which the seed was attached to the placenta, is called the *hilum*. On this space two distinct points are observable, viz. the *omphalo-*

dium, a protuberant point, situated for the most part in the middle of the hilum, and indicating the point by which the nourishing vessels have passed; and the micropyle or foramen, which is a point situated by the side of the umbilicus, and is supposed by some authors to mark the spot by which the fecundating vessels have terminated; but is declared by Mr. Brown to indicate a perforation existing in the ovulum, through which a fecundating aura is communicated to the embryo, and which never has any vascular connexion with the pericarpium.

253. Chalaza is a point marked upon the endopleura, and indicates the place where the umbilical cord pierces it. This point is ordinarily under the hilum; sometimes it is at a distance from it, in which case it is connected with the hilum by a bundle of vessels called the raphe.

254. Strophiole are callous or fungous lumps, generally found about the hilum of certain seeds; sometimes they are otherwise stationed.

255. The kernel is the name given to all the parts of the seed included under the testa.

256. The albumen is that part of the kernel which surrounds the embryo, which never adheres to it, which possesses no vascular organisation, and which is of various degrees of texture, being either fleshy, or corneous, or ligneous, or feculent, or granular, &c.

257. The embryo is that part of the kernel which exists in all fecundated seeds, and which is destined to reproduce the plant which bore it. It is divided into three parts, viz. the radicle, the plumula, and the cotyledons.

258. The radicle is that part of the embryo which becomes the root, and which, in the ripe seed, is always directed away from the chalaza.

259. The plumula is the part which is destined to be the stem, and which is situated at the base of the cotyledons.

260. The cotyledons are the organs which adhere to the plumula, and which become the first leaves of the plant. Their purpose is to supply nourishment to the young plant, until it shall be in a condition to elaborate food for itself.

261. The merits and objects of the artificial and natural systems of botany having been already discussed, it now only remains to explain the peculiar details of each, for which purpose, that of Linnæus, as it was left by him and that of Jussieu, as at present received, will suffice.

LINNEAN SYSTEM

262. The classes of this system depend either upon the number, proportion, or insertion, of the stamens or male organs, as explained in the following table:

TABLE OF THE CLASSES.

Plants celebrate their nuptials.	Plants, which have visible flowers are either.	Among the Monoclinia, there is either	In these the stamina are either	Either PUBLICLY, i. e. have visible flowers:	
				MONOCLINIA, males and females in the same bed: i. e. The flowers are all hermaphrodite:	
				DIIFFINITAS, the males or stamina unconnected with each other:	
				<i>Indifferentissima</i> , i. e. the males have no fixed proportion as to length:	
				1. MONANDRIA, i. e. one male or stamen in a hermaphrodite flower.	
				2. DIANDRIA, . two males or stamina.	
				3. TRIANDRIA, . three males.	
				4. TETRANDRIA, . four males.	
				5. PENTANDRIA, . five males.	
				6. HEXANDRIA, . six males.	
				7. HEPTANDRIA, . seven males.	
				8. OCTANDRIA, . eight males.	
				9. ENNEANDRIA, . nine males.	
				10. DECANDRIA, . ten males.	
				11. DODECANDRIA, . twelve males.	
				12. ICOSANDRIA, . twenty, or more males inserted into the calyx.	
				13. POLYANDRIA, . all above twenty males inserted into the receptacle.	
				Or <i>Subordinata</i> , two of the males are uniformly shorter than the rest.	
				14. DIDYNAMIA, . four males, two long and two short.	
				15. TETRADYNAMIA, six males, four long and two short.	
				Or ATFINITAS, the stamina either connected to each other, or to the pistillum.	
				16. MONADELPHIA, the stamina united into one body by the filaments.	
				17. DIADELPHIA, the stamina united into two bodies by the filaments.	
				18. POLYADELPHIA, the stamina united into three or more bodies by the filaments.	
				19. SYNGENESIA, the stamina united into a cylindrical form by the antheræ.	
				20. GYNANDRIA, the stamina inserted into the pistillum.	
				Or DICLINIA, males and females in separate beds: i. e. plants that have stamina and pistilla in different flowers in the same species.	
				21. MONOCIA, male and female flowers distinct in the same plant.	
				22. DIOICIA, males and females in different plants, of the same species.	
				23. POLYGAMIA, male, female, and hermaphrodite flowers in the same or different plants.	
				Or CLANDESTINELY, i. e. have their parts of fructification either invisible or not distinct.	
				24. CRYPTOGAMIA, the flowers invisible, so that they cannot be ranked according to the parts of fructification, or distinctly described.

LINNEAN SYSTEM.
Classes

PLATE II.

BOTANY.
 LINNEAN SYSTEM
Classes

PLATE I.

The orders of the first thirteen classes are distinguished by the number of the styles; of the fourteenth by the nature of the fruit, which is what the Linnæan botanists call 'naked seeds' in the first, and 'covered' in the second; of the fifteenth by the length of the pericarpium; of the sixteenth, seventeenth, eighteenth, twentieth,

twenty-first, and twenty-second, by the number or situation of the stamens; of the nineteenth by the relative sexes of the florets of the disk, and ray of the capituli; of the twenty-third by the sex of the flowers; and of the twenty-fourth by such general characters as are used in discriminating genera. The following is a

TABLE OF THE ORDERS.

CLASSES.	NUMBER and NAMES of the ORDERS.
1. MONANDRIA	2 Monogynia, Digynia.
2. DIANDRIA	3 Monogynia, Digynia, Trigynia.
3. TRIANDRIA	3 Monogynia, Digynia, Trigynia.
4. TETRANDRIA	3 Monogynia, Digynia, Tetragynia.
5. PENTANDRIA	6 Monogynia, Digynia, Trigynia, Tetragynia, Pentagynia, Polygynia.
6. HEXANDRIA	5 Monogynia, Digynia, Trigynia, Tetragynia, Polygynia.
7. HEPTANDRIA	4 Monogynia, Digynia, Tetragynia, Heptagynia.
8. OCTANDRIA	4 Monogynia, Digynia, Trigynia, Tetragynia.
9. ENNEANDRIA	3 Monogynia, Trigynia, Hexagynia.
10. DECANDRIA	5 Monogynia, Digynia, Trigynia, Pentagynia, Decagynia.
11. DODECANDRIA	5 Monogynia, Digynia, Trigynia, Pentagynia, Dodecagynia
12. ICOSANDRIA	5 Monogynia, Digynia, Trigynia, Pentagynia, Polygynia.
13. POLYANDRIA	7 { Monogynia, Digynia, Trigynia, Tetragynia, Pentagynia, Hexagynia, Polygynia.
14. DIDYNAMIA	2 Gymnospermia, Angiospermia.
15. TETRADYNAMIA	2 Siliculosa, Siliquosa.
16. MONADELPHIA	8 { Triandria, Pentandria, Octandria, Enneandria, Decandria, Endecandria, Dodecandria, Polyandria.
17. DIADELPHIA	4 Pentandria, Hexandria, Octandria, Decandria.
18. POLYADELPHIA	4 Pentandria, Dodecandria, Icosandria, Polyandria.
19. SYNGENESIA	6 { Polygamia æqualis, Polygamia superflua, Polygamia frustranea, Polygamia necessaria, Polygamia segregata, Monogamia.
20. GYNANDRIA	2 Monandria, Diandria.
21. MONÆCIA	11 { Monandria, Diandria, Triandria, Tetrandria, Pentandria, Hexandria, Heptandria, Polyandria, Monadelphica, Syngenesia, Gynandria.
22. DIÆCIA	15 { Monandria, Diandria, Triandria, Tetrandria, Pentandria, Hexandria, Octandria, Enneandria, Decandria, Dodecandria, Icosandria, Polyandria, Monadelphia, Syngenesia, Gynandria.
23. POLYGAMIA	3 Monœcia, Diœcia, Triœcia.
24. CRYPTO GAMIA	4 Filices, Musci, Algæ, Fungi.

NATURAL SYSTEM.

263. The following is the arrangement, adopted by the most modern botanists of reputation, of the natural orders of plants. The basis of it is the system of B. Jussieu, published, in 1789, by his nephew, Anthony Jussieu; but so many alterations and additions have been consequent upon the progress of modern science, that it has at present only a distant resemblance to its original. The best works to be consulted upon the natural system, are, for British plants, Hooker's *Flora Scotica*; for general botany, the *Regni Vegetabilis Systema Naturale* of De Candolle, the *Prodromus Systematis Naturalis Regni Vegetabilis* of the same author, the *Nouveaux Elémens de la Botanique* of Richard, the *Théorie Élémentaire de la Botanique* of De Candolle, &c. There is at present (June, 1826,) no English work upon the subject of the natural arrangement of plants which deserves to be consulted.

TABLE OF THE NATURAL ORDERS OF PLANTS, ARRANGED IN A LINEAR SERIES.

I. VASCULAR OF COTYLEDONEOUS. (System furnished with cellular tissue, and tubular vessels. Reproductive organs spermeaceous.)

* DICOTYLEDONEOUS, or EXOGENOUS. (Vessels arranged in concentric layers, of which the youngest are exterior. Cotyledons opposite or whorled.)

† COMPLETE. Calyx and corolla, both present.

1. POLYPETALOUS.

§ *Petals hypogynous.*

a. *Carpella numerous, or stamens opposite the petals.*

i. Ranunculaceæ.

1. Clematidææ.
2. Anemoneæ.
3. Ranunculeæ.
4. Helleboreæ.
5. Pæoniaceæ.

ii. Dilleniaceæ.

1. Delimeæ.
2. Dilleneæ.

iii. Magnoliaceæ.

1. Illicieæ.
2. Magnolieæ.

iv. Anonaceæ.

v. Menispermaceæ.

1. Lardizabaleæ.
2. Menispermææ.
3. Schizandreæ.

vi. Berberidææ.

- vii. Podophyllacæ.
 - 1. Podophyllæ.
 - 2. Hydropeltideæ.
- viii. Nymphaeacæ.
 - 1. Nelumboneæ.
 - 2. Nymphaeæ.

β. *Carpella solitary or consolidated; Placentas parietal.*

- ix. Papaveracæ.
 - x. Fumariacæ.
 - xi. Cruciferæ.
 - 1. Arabideæ.
 - 2. Alyssineæ.
 - 3. Thlaspidæ.
 - 4. Euclidieæ.
 - 5. Anastaticæ.
 - 6. Cakilineæ.
 - 7. Sisymbreæ.
 - 8. Camelineæ.
 - 9. Lepidineæ.
 - 10. Isatideæ.
 - 11. Archonieæ.
 - 12. Brassicæ.
 - 13. Velleæ.
 - 14. Psychineæ.
 - 15. Zilleæ.
 - 16. Raphaneæ.
 - 17. Buniadæ.
 - 18. Erucarieæ.
 - 19. Heliophileæ.
 - 20. Subularieæ.
 - 21. Brachycarpeæ.
 - xii. Capparideæ.
 - 1. Cleomeæ.
 - 2. Cappareæ.
 - xiii. Resedacæ.
 - xiv. Flacourtianeæ.
 - 1. Patrisieæ.
 - 2. Flacourtieæ.
 - 3. Kiggelarieæ.
 - 4. Erythrospermeæ.
 - xv. Bixineæ.
 - xvi. Cistineæ.
 - xvii. Violarieæ.
 - 1. Violeæ.
 - 2. Alsodineæ.
 - 3. Sauvageæ.
 - xviii. Droseracæ.
 - xix. Polygalæ.
 - xx. Tremandreeæ.
 - xxi. Pittosporææ.
 - xxii. Frankeniaceæ.
- γ. *Ovary solitary. Placenta central.***
- xxiii. Caryophyllæ.
 - 1. Sileneæ.
 - 2. Alsineæ.
 - xxiv. Linæ.
 - xxv. Malvacæ.
 - xxvi. Byttneriaceæ.
 - 1. Sterculieæ.
 - 2. Byttnerieæ.
 - 3. Lasiopetaleæ.
 - 4. Hermannieæ.
 - 5. Dombeyaceæ.
 - 6. Wallichieæ.
 - xxvii. Iiliacæ.
 - xxviii. Elæocarpææ.
 - xxix. Chlenacæ.

- xxx. Ternströmiaceæ.
 - 1. Ternströmiæ.
 - 2. Frezierieæ.
 - 3. Sauraveæ.
 - 4. Laplaceæ.
 - 5. Gordonieæ.

- xxxii. Camellieæ.
- xxxiii. Olacineæ.
- xxxiv. Aurantiaceæ.
- xxxv. Hypericineæ.
 - 1. Vismieæ.
 - 2. Hypericeæ.
- xxxvi. Guttiferæ.
 - 1. Clusieæ.
 - 2. Garcinieæ.
 - 3. Calophylleæ.
 - 4. Symphonieæ.
- xxxvii. Marcgraaveaceæ.
 - 1. Marcgraavieæ.
 - 2. Noranteæ.
- xxxviii. Hippocrateaceæ.
- xxxix. Erythroxyleæ.
- xxxix. Malpighiaceæ.
 - 1. Malpighieæ.
 - 2. Hiptageæ.
 - 3. Banisterieæ.

- xl. Acerineæ.
- xli. Hippocastaneæ.
- xlii. Rhizoboleæ.
- xliii. Sapindaceæ.
 - 1. Paullinieæ.
 - 2. Sapindeæ.
 - 3. Dodonæaceæ.

BOTANY BAY. See **SOUTH WALES, NEW.**

BOTANY-BAY RESIN, a gum which exudes spontaneously from the trunk, or wounded bark, of the *acarois resinifera* of New Holland. It is produced in such quantity that a man may collect thirty or forty pounds in a few hours. It pulverises without caking; and has a slightly sweet astringent taste. It melts at a moderate heat, and when kindled emits a white fragrant smoke. It imparts to water the flavor of storax. Out of nine parts six are soluble in water, and astringent to the taste; and two are woody fibre. In cases depending on a sluggishness, a debility, or flaccidity of the system, this medicine, assisted by proper exercise and diet, has, by removing the symptoms of dyspepsia, and by restoring the tone and action of the muscular fibres, been found very serviceable.

BOTARGO, in the culinary art, is a kind of sausage. The best kind comes from Tunis in Barbary: it must be chosen dry and reddish. The inhabitants of Provence use a great deal of it. The common way of eating it is with olive oil and lemon juice. There is also a great consumption of it throughout the Levant.

BOTCH, *v. & n.* } *Bozza,* pronounced
BOTCHER, } *botza,* Ital., or from the
BOTCH'Y, } Dutch *boetsen*, to bodge,
BOTCH'EDLY. } or *botche*; to patch together clumsily; unsuitably; unskillfully; to mend any thing awkwardly with pieces of a different quality or color: and thus irregularities in the skin, disfiguring spots, tumors, or eruptions have received the appellation of botches, as well as any adventitious parts, clumsily added, whether sentences or words, in composition; whether aberrations from nature, or bungling attempts of art; whatever is unsightly: an offence to the eye is a botch.

Go with me to my house,
 And hear thou there, how many fruitless pranks
 This ruffian hath *botched* up, that thou thereby
 May smile at this. *Shakspeare.*

Her speech is nothing,
 Yet the unshaped use of it doth move
 The hearers to collection; they aim at it,
 And *botch* the words up fit to their own thoughts. *Id.*
 And those biles did run—say so;—Did not the
 general run? Were not that a *botchy* rose? *Id.*

He was a *botcher's* prentice in Paris, from whence
 he was whipt for getting the sheriff's fool with child. *Id.*

With him,
 To leave no rubs or *botches* in the work,
 Fleance, his son, must embrace the fate. *Id.*

Time, which rots all, and makes *botches* pox,
 And, plodding on, must make a calf an ox,
 Hath made a lawyer. *Donne.*

Botches and blains must all his flesh imboss,
 And all his people. *Milton.*

To *botch* up what they had torn and rent,
 Religion and the government. *Hudibras.*

Botchers left old cloaths in the lurch,
 And fell to turn and patch the church. *Id.*

If both those words are not notorious *botches*, I am
 deceived, though the French translators think otherwise. *Dryden.*

Their coats, from *botching* newly brought, are torn.
Id.

For treason *botched* in rhyme will be thy bane;
 Rhyme is the rock on which thou art to wreck. *Id.*

VOL. IV

A comma ne'er could claim.

A place in any British name;
 Yet, making here a perfect *botch*,
 Thrusts your poor vowel from his notch. *Swift.*
 Young Hylas, *botched* with stains too foul to name,
 In cradle here renews his youthful frame. *Garth.*

It proves far more inconvenient, which, if it were
 propelled in boils, *botches*, or ulcers, as in the scurvy,
 would rather conduce to health. *Harvey.*

BOTEREIUS (Rodolph), advocate in the
 grand council of Paris, was author of the History
 of Henry IV. in Latin, from 1594 to 1610, in 3
 vols.

BOTETOURT, a large mountainous county
 in Virginia, bounded on the north by the Fluvanna,
 which separates it from Rock and Bath
 counties; on the north-west by Green-briar;
 and on the east by Bedford; south by Franklin,
 and south west by Montgomery. Fincastle is
 the chief town. It abounds with chalk, and is
 forty-four miles long and forty broad.

BOTH, *adj. & conj.* Sax. *batwa*, *batpa*, the
 two; as well the one as the other. Fr. *Et l'un*
et l'autre. It is used only of two. The con-
 junction is used as well: it has the conjunction
and to correspond with it.

A great multitude *both* of the Jews and also of the
 Greeks believed. *Acts.*

The sommer passeth; and the nightes long
 Encreasen, double wise, the peines strong,
Both of the lover [rover] and of the prisoner;
 I n'ot which hath the wofuller mistere.

Chaucer's Canterbury Tales

My lord (quod I) this lady herc,
 Whom I esteeme aboue the rest,
 Doth knowe my guilte if any were;
 Wherefore hir doome shall please me best:
 Let hir bee judge and jurour *boathe*,
 To try me guiltless by myne oathe. *Gascoigne.*

So he my love away with me hath borne,
 And left me here *both* his and mine owne love to
 mourne. *Spenser.*

Power to judge *both* quick and dead. *Milton.*

Both the boys were worthy to be praised,
 And Stimichon has often made me long
 To hear, like him, so sweet a song. *Dryden.*

Among the French, the odes of Jean Baptiste
 Rousseau have been much and justly celebrated.
 They possess great beauty *both* of sentiment and ex-
 pression. *Blair's Lectures.*

The general construction of the Hebrew poetry is of
 a singular nature, and peculiar to itself. It consists
 in dividing every period into correspondent, for the
 most part into equal, members, which answer to one
 another, *both* in sense and sound. *Id.*

Born (Andrew and John), Flemish painters,
 and both pupils of Bloemart. The union of these
 brothers was very singular: they were inseparable
 in their studies, travels, and paintings. John
 painted landscapes in the manner of Lorrain, and
 Andrew figures and animals in the style of Bam-
 boccio. John was drowned in 1650, and An-
 drew died in 1656.

BOTHAGIUM, boothage, in law, customary
 dues to the lord of the market, for the liberty of
 pitching booths or tents.

BOTH'ER. Perhaps the same as pother,
 both, ear, to make a din; to be addressed by
 several at the same time; to confuse by noise;
 to be assailed at both ears. Skinner says to
 pother is to make a pudder, or rather a puther,
 2 E

q. d. a powder; to raise a dust, as a horse running with speed; to perplex; to puzzle; to confound

With every lady of the land

Soft Strephon kept a *potter*;

One year he languished for one hand,

And next year for another.

Swift.

With the din of which tube my head you so *bother*,
That I scarce can distinguish my right ear from t'other.

Id.

BOTHNIA, an extensive province of northern Europe, part of the ancient Scandinavia, and divided by the gulf of that name into East and West Bothnia. East Bothnia has the gulf on the west, and the range of mountains which separates it from the governments of Archangel and Olonetz on the east. It is bounded by Finland on the south, and Lapland on the north, and was in the year 1809 ceded by Sweden to Russia. It is included in the government of Finland, being in extreme length about 300 miles, its breadth varies from sixty to upwards of 200 miles. The population is estimated at 70,000. Near the western shore it is low and marshy, but good pasturage is found inland, and in favorable seasons the progress of vegetation is rapid; at other times it is often wholly destroyed by the frost. Eastward forests of excellent timber are found, and the lakes and rivers yield a copious supply of salmon. The inhabitants are chiefly Finns, who are occupied in fishing, hunting, and attending their cattle. The timber and some few mineral productions are the only articles of commerce. The principal rivers, most of which are near the coast, are Ulea, Cafana, Brahestad, Carleby, Jacobstadt, Mana, and Wasa.

West Bothnia, extending from the borders of Angermanland to the river Tornea, about 400 miles in length, and 100 in breadth, still belongs to the crown of Sweden. It forms part of the province of Nordland. The population is estimated at about 50,000. It abounds with forests of pine, mingled with juniper and birch trees. Von Buch says, that, in the vicinity of Tornea, the last rise above the Spanish and Scotch firs. West Bothnia is subdivided into the districts of Umea, Pitea, Lulea, and Tornea, having each a chief town of its own name. Umea is the capital of the whole. Corn and good pasturage are yielded here, sufficient for the consumption of the inhabitants; who in their occupations and manners resemble the East Bothnians. They carry on a small trade in pitch, tar, timber, fish, and skins. Dr. Clarke bears the following high testimony to their character: 'The natives of Westro-Bothnia, beyond all their countrymen, rank the foremost in pious and loyal disposition, and in simplicity and honesty. A foreigner who leaves his open truck in their inn-yards and stables, amidst all the haste and confusion which must sometimes take place in travelling day and night, and amidst the inability to attend to them, occasioned by pain or sickness, or weariness and want of rest, will have nothing with which to reproach the inhabitants.' Here, also, are some few iron and copper mines.

BOTHNIA, GULF OF, is that northern part of the Baltic which separates Sweden from Finland, and takes its name from the above province. It

is generally regarded as beginning at the island of Aland, and extending 360 miles in length, and 135 in extreme breadth, to Tornea, between lat. 60° 20' and 65° 50' N. It is often so completely frozen as to afford a safe and short passage between the countries. In common with the rest of the Baltic, its water, from the small evaporation, possesses a peculiar degree of freshness, and contains only one-third of the proportion of salt found in other sea water. It abounds in seals, from whose flesh the inhabitants of the shores obtain great quantities of train oil, and in salmon. The waters are said to be rapidly diminishing.

BOTHRIAS, or **BOTHRION**, *βοθριον*, in surgery; 1. The alveolus or socket of a tooth; 2, a small, narrow, but deepish, ulcer of the cornea of the eye, resembling a round puncture.

BOTHWELL (James Hepburn, Earl), a nobleman memorable in the Scottish history, as the husband of Mary Queen of Scots. After the murder of Darnley he seized upon her person, and carried her prisoner to Dunbar, where he prevailed on her to marry him; but a powerful confederacy having been formed against him, he was obliged to flee to the Orkneys, where he died in 1547.

BOTHWELL BRIDGE, an ancient bridge of four arches over the Clyde, in Bothwell parish, Lanark, Scotland, memorable for an engagement fought on the south side of it in 1679, between the royalists under Monmouth and the Whigs, wherein the latter were defeated with the loss of 400 slain and 1200 taken prisoners.

BOTHWELL CASTLE, an ancient and magnificent structure, now in ruins, adjacent to Bothwell, originally built of polished stones of a red color. The ruins lately occupied a space of 234 feet by 90; and one of the towers was an immense height above the Clyde. Bothwell castle once made a figure in Scottish history.

BOTUL TABACOSIMA, or **BOTAL TABAGOSIMA**, an island in the Chinese sea, south of Formosa, and north of the Bashee islands. It is of such a height, that in clear weather it is visible at the distance of fifteen leagues; but being enveloped in fogs, it generally appears to be of much smaller size. The summit seems crowned with large trees. Some fruits also appear to be cultivated, and villages may be seen here at intervals, but no navigator has described the interior. About a mile off is an uninhabited rocky islet. Long. 117° 12' E., lat. 21° 57' N.

BOTOTOE, in natural history, a name given by the people of the Philippine islands to a very beautiful bird of the parrot kind. It is somewhat smaller than the common parrot, and all over of a fine deep blue color.

BOTRIA, in botany, a genus of plants. Class, pentandria monogynia. General character: cal. bell-shaped perianth, five-toothed: cor. petals, fleshy, recurved at the point: stam. filaments, five: pist. germ. superior: stig. concave: per. a berry, with one seed. Species, only one; climbing shrub, with heart-shaped, villous leaves; and small reddish flowers on axillary peduncles. A native of Africa.

BOTRYCHUM, in botany, a genus of the class cryptogamia, order filices. Capsules globular,

clustered in a racemelike spike, one-celled, opening from the top to the base. Species, five; *B. lunaria*, is a native of our own country.

BOTRYITES, in natural history, the grape-stone, from *βοτρυς*, a grape, a stone of the gem kind, resembling a branch of young grapes.

BOTRYITES, or **BOTRITES**, a sort of burnt cadmia, found somewhat in the form of a bunch of grapes adhering to the upper parts of furnaces, where the mineral is calcined. It differs from the placites, which is gathered on the lower part of the furnace; though Schroeder gives a different distinction, viz. into botrites, found in the middle of the furnace, placites in the upper, and ostracites in the lowest part.

BOTRYLLUS, in zoology, a name of a genus of the class ascidiæ, order tethydes, family tethyæ, well described by Savigny. The family includes two divisions, simplices and compositæ; to the second of which this genus belongs. Generic character: the common substance gelatinous or cartilaginous, encrusting other bodies, and composed of systems round or elliptical, raised above the common surface, and annular. Animals disposed either in a single series, or in several which are regular and concentric. Branchial orifice simply circular, and without rays; intestinal orifice small, elongated to a point, and enveloped in the border of the central cavity of the system. Several species found on our coasts, of which *B. conglomeratus*, is alcyonium conglomeratum of the Syst. Nat.

BOTRYOCEPHALUS, in zoology, a genus of intestinal worms. The body is soft, elongated, flat, jointed; the suckers consisting of two longitudinal depressions opposite to each other.

BOTRYOID, *adj.* *βοτρυοειδής*, having the form of a bunch of grapes.

The outside is thick set with *botryoid* efflorescencies, or small knobs, yellow, bluish, and purple; all of a shining metallic hue. *Woodward.*

BOTRYOLITE, a brittle and moderately hard mineral, which occurs in maxillary concretions. Color, pearly or grayish yellow. It is composed of 36 silica, 39.5 boracic acid, 13.5 lime, 1 oxide of iron, 6.5 water. It fuses before the blow-pipe into a white glass. It is found in Norway.

BOTRYS, **BOTRUS**, or **BOSTEA**, in ancient geography, a town of Phœnicia, on the Mediterranean, built by Saturn, twelve miles north of by Byblus, and twenty south of Tripolis. It is now almost in ruins, and called Boteron or Botten.

BOTS. See **BOTTS**.

BOTT, } Ang.-Sax. *bitan*, to bite; a species of small worms in the entrails of horses; answering, perhaps, to the ascarides in human bodies.

Pease and beans are as dank here as a dog, and that is the next way to give poor jades the *botts*.

Shakspeare.

BOTT, among bone-lace weavers, a round cushion of light matter placed on the knee, whereon they weave their lace with bobbins, &c.

BOTT (Thomas), a learned divine born at Derby in 1688. His grandfather was a major during the republic, and Thomas was educated

among the dissenters; but he took orders in the church of England in 1725; and was successively presented to the rectories of Reymerston, Spixworth and Edgefield, in Norfolk. He died at Norwich in 1754, aged sixty-six. He wrote, 1. *The Peace and Happiness of this World the Immediate Design of Christianity*; 2. *A Defence of this*; 3. *A Refutation of the Religion of Nature Delineated*; *An Answer to Vol. I. of Warburton's Divine Legation of Moses*; and several sermons.

BOTTARI (John), a celebrated cardinal, was born at Florence in 1689. He was the patron of learning, and himself contributed to her stores, 1. *Vita di Francesco Sacchetti*, 8vo. 2. *Sculture et Pitture sacre estratte*, &c. 3 vols. fol. 3. *Vocabularia della Crusca*, 6 vols. 4. *De Museo Capitolino*, 3 vols. fol. 5. *Dialoghi sopra tre Arti del Disegno*, 4to. He died in 1775.

BOTTICELLI (Alexander), was born at Florence in 1437, and learned the rudiments of painting under Philip Lippi. He executed several pictures for pope Sixtus IV. and the city of Florence; for which he received large sums; yet died at last in great distress, aged seventy-eight. He was a man of letters. The famous edition of Dante's poem of Hell, printed at Florence by Magna, A. D. 1481, and to which Botticelli undertook to write notes, was intended to have been ornamented with prints, one for each canto; a few of which were designed, if not engraved, by Botticelli. The two first plates only were printed upon the leaves of the book, and for want of a blank space at the head of the first canto, the plate belonging to it is placed at the bottom of the page. Blank spaces are left for all the rest; that as many of them as were finished might be pasted on.

BOTTLE, *v.* & *n.*

BOTTLED.

BOTTLING.

BOTTLE-COMPANION,

BOTTLE-SCREW.

Fr. *bouteille*; Ital. *botiglia*; Span. *botija*. Vossius and Menage derive this word from the Greek *buttic*. Lye and Serenius from the Ang.-Sax. *bytta*, a butt or cask; a small vessel of leather, glass, or other substance, with a narrow mouth, to contain liquor; sometimes used for the liquor itself.

And when this riotour with sory grace
Hath filled with win his grete *bottes* three,
To his felawes, agen, repairerth he.

Chaucer. Canterbury Tales

Here, in this *bottle*, sayd the sory mayd,

I put the tears of my contrition,
Till to the brim I have it full defrayd:
And in this bag which I behind me don.

I put repentance for things past and gon.
Yet is the *bottle* leake and bag so torne,
That all which I put in fals out anon,
And is heinde me troden down of Scorne.

Who mocketh all my paine, and laughs the more I
mourn. *Spenser.*

The shepherd's homely curds,
His cold thin drink out of his leather *bottle*,
Is far beyond a prince's delicates. *Shakspeare.*

Methinks I have a great desire to a *bottle* of hay;
good hay, sweet hay, hath no fellow. *Id.*

Sir, you shall stay, and take the other *bottle*. *Spectator.*

When wine is to be bottled off, wash your bottles immediately before you begin; but be sure not to drain them. *Swift.*

A good butler always breaks off the point of his bottlescrew in two days, by trying which is hardest, the point of the screw, or the neck of the bottle. *Id.*

Sam, who is a very good bottle-companion, has been the diversion of his friends. *Addison.*

Then if thy ale in glass thou wouldst confine,
Let thy clean bottle be entirely dry. *King.*

He threw into the enemy's ships earthen bottles filled with serpents, which put the crew into disorder. *Arbutnot on Coins.*

In the bottle discontent seeks for comfort, cowardice for courage, and bashfulness for confidence. *Johnson.*

BOTTLES, among the ancient Jews, were cags made of goats or other wild beasts' skin, with the hair on the inside, well sewed and pitched together; an aperture in one of the animal's paws serving for the mouth of the vessel.

BOTTLES are now chiefly made of thick coarse glass; though there are likewise bottles of boiled leather made and sold by the case-makers. Fine glass bottles covered with straw or wicker, are called flasks or bottees. The quality of the glass has been found to affect the liquor in the bottle. Glass bottles are better for cyder than those of stone. Foul glass bottles are cleansed by sand or small shot; musty bottles, by boiling them. See GLASS. Dr. Perceval cautions against the practice of cleansing wine bottles with leaden shot. It frequently happens, he thinks, through inattention, that some of the little pellets are left behind; and when wine or beer is again poured into the bottles, this mineral poison dissolves, and impregnates those liquors with its deleterious qualities. The sweetness which is sometimes perceived in red port wine may arise from this cause, when such an adulteration is neither designed nor suspected. Potash is recommended for cleansing bottles; a small quantity in the water will clean two gross.

BOTTLING, the operation of putting up liquors in corked bottles, to keep, ripen, and improve. The writers on economy give rules concerning the bottling of beer, cyder, &c. Mineral waters are sometimes taken to distant places, well bottled and corked, otherwise they lose both their taste and smell. To preserve them, it is necessary that the bottles be filled up to the mouth, to exclude the air. The cork is also further secured by a cement. Some endeavour to improve their bottled beer, by putting crystals of tartar and wine, or malt spirits; and others, by putting sugar, boiled up with the essence of some herb, and cloves, into each bottle. Cyder requires special precautions in the bottling; being more apt to fly and burst the bottle, than other liquors. The best way is to have the liquor thoroughly fine before it be bottled. For want of this some leave the bottles open a while, or open them after two or three days bottling, to give them vent. If one bottle break through fermentation, it is best to give them all vent, and cork them up again. Mean cyder is apter to break the bottles than rich. Some soak the corks in scalding water, to render them more pliant and serviceable. Another particular to be observed is, to lay the bottles so as that the liquor may always keep the cork wet and swelled. Something also

depends on the place where the bottles are set, which ought be such as exposes them as little as possible to the alterations and impressions of the air: the ground is better for this purpose than a frame; sand better than the bare ground, and a running water, or a spring often changed, best of all. To hasten the ripening of bottled liquors they are sometimes set in a warm place, or even exposed to the sun, when a few days will bring them to maturity. A machine has recently been invented for corking bottles, by which much labor is abridged, and time saved.

BOTTOM, *v. & n.* } Dutch, *bodem*; Germ.
BOT'TOMED, } *boten*; Swed. *botn*. The
BOT'TOMLESS. } lowest part of anything;
the ground under the water; the foundation;
the groundwork; a dale; a valley; a low
ground; the part most remote from the view;
the deepest part; bound; limit; sometimes
used for a ship; metaphorically, the extent of
capacity; concealed, or out of sight. To venture
on the same bottom is to run the same risk
as those who have ventured to embark themselves
or property in the same ship's bottom: to bottom
is to rest, place, or stand upon; to fix, found, or
establish.

With that water that ran so clere,
My face I washe; tho saw I wele
The botome ipaved everidele
With gravel, full of stones shene.

Chaucer. Romaunt of the Rose.

For if a man woulde in a bote
(Whiche is without botome) rowe,
He must nedes overthrowe.

Gower.

From Holland, Zealand, and from Flanders won,
By weekly pay, three score twelve bottomis came,
From fifty upward to five hundred ton,
For every use a mariner could name.

Drayton.

In the purlieu stands a sheep-cote,
West of this place; down in the neighbour bottom.

Shakspear.

Is not my sorrow deep, having no bottom?
Then be my passions bottomless with them. *Id.*
I will fetch off these justices: I do see the bottom
of Justice Shallow: how subject we old men are to
lying! *Id.*

Therefore, as you unwind your love for him,
Lest it should ravel, and be good to none,
You must provide to bottom it on me. *Id.*

There being prepared a number of flat-bottomed
boats to transport the land-forces, under the wing and
protection of the great navy. *Bacon.*

Wickedness may well be compared to a bottomless
pit, into which it is easier to keep one's self from
falling, than being fallen, to give one's self any stay
from falling infinitely. *Sidney.*

On a sudden open fly,
With impetuous recoil and jarring sound,
The infernal doors, and on their hinges grate
Harsh thunder, that the lowest bottom shook
Of Erebus. *Milton.*

Him the Almighty Power
Hurled headlong flaming from the ethereal sky
To bottomless perdition. *Id.*

He puts to sea upon his own bottom; holds the
stern himself; and now, if ever, we may expect new
discoveries. *Norris.*

He spreads his canvas, with his pole he steers,
The freights of flitting ghosts in his thin bottom bears.

Dryden.

Shallow brooks that flowed so clear,
The bottom did the top appear. *Id.*

They may have something of obscurity, as being *bottomed* upon, and fetched from, the true nature of the things.

Hale.

Pride has a very strong foundation in the mind; it is *bottomed* upon self love.

Collier.

The grounds upon which we *bottom* our reasoning, are but a part; something is left out, which should go into the reckoning.

Locke.

His proposals and arguments should with freedom be examined to the *bottom*, that, if there be any mistake in them, nobody may be misled by his reputation.

Id.

Action is supposed to be *bottomed* upon principle.

Atterbury.

On this supposition my reasonings proceed, and cannot be affected by objections which are far from being built on the same *bottom*.

Id.

He wrote many things which are not published in his name; and was at the *bottom* of many excellent counsels, in which he did not appear.

Addison.

On both the shores of that fruitful *bottom* are still to be seen the marks of ancient edifices.

Id. on Italy.

Aye—when the red swollen stream comes roaring down—

Full many a glorious flower and stately tree
Floats on the ruthless tide, whose unfelt sway
Moves not the mire that stagnates at the *bottom*.

Maturin's Bertram.

BOTTOMRY, *bottomree*, *fœnus nauticum*, in law and commerce, is generally where a person lends money to a merchant, who wants it to traffic, and is to be paid a greater sum at the return of a certain ship, standing to the hazard of the voyage; in this case, though the interest be greater than that allowed by law, it is a species of insurance and not usury. See **INSURANCE**.

BOTTOMY. A cross *bottomy*, in heraldry, terminates at each end in three buds, knots, or buttons, resembling, in some measure, the three-leaved grass; on which account Segoin, in his *Tresor Heraldique*, terms it *croix treffle*. It is the badge of the order of St. Maurice.

BOTTRIGARI (*Hercules*), a person eminently skilled in music, though not a musician, was a man of rank in Bologna, and had the title of Count. He published several controversial pieces on music. He entertained strong prejudices in favor of the ancient music; and attempted to introduce the chromatic genus into practice, but with no better success than Vincenzio and others had done. He corrected Gogavino's Latin version of Ptolemy in many instances, to so good purpose, that Dr. Wallis has in general conformed to him, in his translation of it. He also translated into Italian Boetius de Musica, with as much of Plutarch and Macrobius as relates to music; and made annotations upon Aristoxenus, Franchinus, Spataro, Vicentino, Zarlino, Galilei, and almost every musical treatise he could lay his hands on; as appears by the copies which were once his, and are now deposited in many libraries in Italy. His works contain greater proofs of his learning and skill in music, than of his abilities as a writer, his style being remarkably inelegant; nevertheless, he affected the character of a poet; and there is extant a collection of poems by him, in 8vo. printed in 1577. He died in 1609.

BOTTS, or *Bors*, in zoology, a species of short worms, said to be produced and nourished only in the intestines of the horse, the larvæ of the oestrus. See **OESTRUS** and **FARRIERY**.

BOTZEN, a town and district of Austria in the Tyrol, situate on the Eisach, at the influx of the Taffer. It is noted for its wines, and the beauty of its environs. Here are four great fairs, much frequented by Germans and Swiss, a castle, a court of justice, and considerable silk manufactures. The town is the residence of the Austrian governor of the Etschland, or Adige district. The quarter, of which it is the capital, contains 462 square miles, and 27,800 inhabitants. The town itself about 8000. Eighteen miles southwest of Brixen, and twenty-seven north of Trent. Botzen was taken by the French under Buonaparte in March 1797, and retaken in April, by the Austrians under general Laudon.

BOTZENBURG, a town of Germany, in the duchy of Mecklenburg. It had a castle, which was destroyed by the Danes in 1202. It is seated on the Elbe, and the vessels that pass by are obliged to pay a considerable toll.

BOVA, a considerable town of Calabria Ultra, Italy, situated at the southern extremity of the Appennines, and near the sea. It is said to have been founded by the emigrant Albanians, who quitted their country on the death of George Castrioti, generally known by the name of Scanderbeg. Their descendants in this part of Italy still amount to the number of 100,000, and speak the Albanian language. Bova has the title of a county, and a population of about 2300 individuals. It is the see of a bishop, who is suffragan of the archbishop of Reggio, from which it is distant south-east about twenty miles.

BOUATI, in botany, a genus of plants, class hexandria, order digynia. Its generic characters are, *cal.* small three parted perianth: *cor.* three, pointed, concave petals, longer than the calyx: *stam.* six: *pist.* germ superior, compressed, dimpled at its summit: *stig.* two, sessile: *per.* capsule, heart-shaped, sharp edged, dimpled at its summit, bilocular: *seed*, one in each cell. It is a small tree, a native of the East Indies.

BOVATA TERRE, in ancient law writers signifies an oxgate of land, or so much as may be ploughed in a year with one ox; by some reckoned at twenty-five acres, by others at eighteen or twenty; and valued from 13s. to 20s. yearly rent.

BOUCHAIN, a fortified town of France, in the department of the North, and ci-devant province of Hainault. It is divided into two parts by the river Scheldt. It was taken by the French in 1676: and by the allies under the duke of Marlborough in 1711, which was the last military achievement of that great general; but the following year it was retaken by the French. It had also its share of suffering in the late war, being only nine miles west of Valenciennes.

BOUCHARDON (*Edme*), an eminent French sculptor, was born in 1698 at Chaumont. His father was a sculptor and architect, and designing that his son should follow the same profession, sent him to Paris to the school of Coustou the younger. Here he made such progress that he was elected king's pensioner, and sent to Rome

for the further prosecution of his studies. In Rome, his assiduity and consequent improvement were conspicuous. He examined minutely, and copied carefully, the remains of ancient sculpture, and the master-pieces of modern painting. He returned to Paris, and, in the works he was employed to execute in that metropolis, displayed the proficiency he had made by the powers of his own fancy, and the opportunities he had had of forming his taste upon the models of excellence left by his predecessors. In 1736 he was appointed designer to the academy of Belles Lettres; in 1744 he was admitted into the academy of painting; and in two years afterwards he was made professor. He died in 1762, possessed of a considerable fortune, and enjoying a character highly respectable. His works for the decoration of Paris were, the Fountain in the Rue de Grenelle, Fauxbourg St. Germaine, and the equestrian statue of Louis XIV.

BOUCHE or **COURT**, the privilege of having meat and drink at court scot-free. The word is also written *howge*, *bouge*, and *budge*. The French long used the phrase, *avoir bouche à la cour*; that is, to have table or diet at court. This privilege was sometimes only extended to bread, beer, and wine: and was anciently used in the houses of noblemen, as well as in the king's court. Thomas earl of Lancaster retained Sir John de Ewre, to serve him with ten men at arms in time of war, allowing them *bouge* of court, with livery of hay and oats, horse shoes and nails.

BOUCHET (John), a French poet and historian who flourished in the sixteenth century. The best of his writings are his *Annals of Aquitaine*, and his *Chaplet des Princes*. He died in 1555.

BOVEY COAL, an inflammable fossil found in England, France, Italy, Switzerland, Germany, Ireland, &c. Its color is brown or brownish-black, and of a laminar structure. It is composed of wood, penetrated by bitumen; and frequently contains pyrites, alum, and vitriol. By distillation it yields an ill-smelling liquor, mixed with volatile alkali and oil, part of which is soluble in alcohol, and part insoluble, being of a mineral nature.

BOUFFLERS (Louis Francis), duke of Boufflers, a peer and marshal of France, was born in 1644. He distinguished himself by his valor and conduct in several sieges and battles, and had the command of the right wing when the French were defeated at the bloody battle of Malplaquet. He also gained extraordinary honor by the defence of Lille in 1708. The siege lasted four months, and when at length obliged to submit, prince Eugene observed to Boufflers: 'I am very vain in having taken Lille, but I should still prefer the glory of having defended it like you.' The king of France rewarded him for this service, by creating him a peer of France, and giving him the reversion of the government of Flanders to his son. He was as distinguished for nobleness of character and munificence as for bravery and military skill, and not only rejected with indignation a proposal to assassinate prince Eugene during the siege of Lille, but threatened to confine the person who had ventured to make the observation. It is related in the continuation of the History of Eng-

land, by Rapin, that when king William took Namur in 1695, he made Boufflers prisoner, in violation of the articles of capitulation. On his remonstrance against this conduct, he was answered that it was in the way of reprisal, because of the French having detained the garrisons of Dixmude and Deinse in the same manner. 'In that case,' replied the marshal, 'my garrison ought to be arrested, and not I.' 'Sir,' he was answered, 'you are valued at more than 10,000 men.' He died at Fontainebleau in 1711.

BOUFFLERS (Marshal), the son of the duke, is famous for having been the deliverer of Genoa, where he died.

BOUGAINVILLE (Louis Antony de), was born at Paris on the 11th of November, 1729. He was the son of a notary, and descended from an ancient family in Picardy. While at college he was distinguished by an ardent desire for knowledge. A professor one day explaining the phases of the moon, and its various positions, quoted two Latin verses respecting them. Young Bougainville was bold enough to consider them as of an inferior kind; and being challenged to make better, he answered almost instantly, it is said, by four verses far more accurate, and more instructive. On leaving college he was admitted an advocate in the parliament, and enrolled himself in the musqueteers. Chance made him a neighbour to Clairaut and d'Alembert, and he attached himself warmly to these two geometers; he visited them often; and at the age of twenty-five produced the first part of his *Integral Calculus*, to serve as a continuation of De l'Hôpital's *Infinitesimals*. With that candour which was always one of the most striking traits in his character, he declared in his preface, that nothing in the whole work was his own but the arrangement. The committee of the Academy, however, observed, that by clearly explaining the methods of the various geometers, he had made them his own. In 1755 he was made a major, and visiting London as secretary to the French embassy, was elected a fellow of the Royal Society. Next year he accompanied general Montcalm to Canada, with the title of captain of dragoons. Before he embarked he put to press the second part of his *Integral Calculus*, having requested his friend Bezout to read the proof sheets. Immediately on his arrival in America he marched at the head of a detachment amidst ice and snow, and through almost impenetrable forests, to the extremity of lake Sacrament, where he burnt an English flotilla under the guns of the fort which protected it. In 1758 a detachment of 5000 French troops was pursued several days by an army of 20,000 English. Bougainville inspired his fellow-soldiers with resolution to wait for the enemy; they fortified their position in less than twenty-four hours, and compelled the English to fall back with a loss of 6000 men. Bougainville was wounded on this occasion in the head by a musket ball. The French governor despairing, however, of saving the colony, if he did not receive reinforcements, our hero was sent to France to solicit them, and returned with the rank of colonel and the cross of St. Louis. Montcalm placed him at the head of the grenadiers and volunteers, to cover the retreat of the army,

which was forced to fall back on Quebec. He performed this important service with his usual intrepidity and skill. But the death of the general hastened the loss of the colony; and Bougainville returned to France.

He now followed M. Choiseul de Stainville into Germany, where he again signalised himself, and his bravery was rewarded with the gift of two pieces of brass cannon. During the peace that ensued, the favorable situation of the Falkland Islands gave rise to the idea of forming an establishment there, and the French court patronising the undertaking in 1763, Bougainville offered to commence it at his own expense. In concert with two of his relatives he fitted out two ships at St. Maloes, and embarked some families, with whom he reached the islands called the Malouines on April 3d, 1764. They were inhabited; but no violence or injustice attended his occupation of them. An abundant pasturage, fishery, and birds, which at first permitted themselves to be taken with the hand, secured the means of subsistence; but no wood for fuel or erecting houses was to be procured. The foundations of a fort however were laid; and in the centre an obelisk erected, with the hemistich, 'Tibi serviat ultima Thule,' inscribed under a portrait of the French king: another inscription exhibited the line in Horace, 'Conamur tenues grandia.' When these first labors were over, Bougainville returned to France, leaving the government of the colony to one of his relations. Next year he returned with a supply of provisions, and new inhabitants. An excursion to the straits of Magellan procured him wood for the purposes of building, and 10,000 young forest and fruit trees. An alliance was concluded with the Patagonians; most kinds of the grain cultivated in Europe were naturalised, and cultivated with success; the multiplication of the cattle was a matter of certainty, and the number of the inhabitants rapidly increased from 80 to 150. But though these acquisitions did not satisfy the active mind of the founder, they had alarmed the Spaniards, and complaints had been made by them to the French government. Bougainville was therefore ordered to deliver up his possession, and the court of Spain agreed to pay him for his works, and to refund his expenditure. As a farther consolation, the court of France appointed him to make a voyage round the world. The command of the frigate la Boudeuse, and a store-ship, the Etoile, was given him, and Commerçon, the naturalist, and Veron, as astronomer, embarked with him, at his request, to examine the new methods of finding the longitude. This expedition justly places Bougainville in the foremost rank of enterprising seamen. The dreadful weather he encountered rendered all his astronomical attempts useless. Upon his return France was at peace. A wandering and agitated life had now blunted his taste for the mathematics, and for a time he gave himself up to enjoyments which the bustle of his early life had not permitted him to share: but his active mind was soon again employed in the service of his country, and when France declared for America, he successively commanded the French ships Bienaimé, Languedoc, Guerrier, and Auguste, under

admirals Piquet, D'Estaing, and De Grasse. At the request of D'Estaing he was appointed chef d'escadre, and the same year received the rank of field-marshal. He commanded the van at the memorable battle of the Chesapeake in 1781, and beat off the English van, obtaining the honorable testimony of count de Grasse to his having contributed more than any other person to the victory. On the disastrous 12th of April, when the commander-in-chief was reproached with being more occupied with the safety of his own ship than with that of the squadron, and the squadron with not supporting their commander-in-chief, Bougainville, who commanded the rear-guard, did all that could be expected of him: by a bold manœuvre he saved the Northumberland; and although the Auguste, which he commanded, was one of the most roughly handled of the whole fleet, he collected and conducted to St. Eustatia the remains of the shattered squadron. The peace which secured the independence of America, again restored M. de Bougainville to the pursuit of the sciences. The Academy conferred upon him the title of honorary member. Lagrange, on giving his vote, observed 'To you I was indebted for being received into the Academy, since your works opened to me the career which I pursued.' About this period he conceived the project of tracing the icy regions of the north, and penetrating to the pole. A distinguished astronomer offered to accompany him, and the route was sketched. The French ministry, however, did not accede to his terms, and the Royal Society of London, solicited the use of his plans. He transmitted them immediately, pointing out the route which he would take. Captain Phipps, afterwards Lord Mulgrave, preferred another (one also of Bougainville's suggesting), but could not proceed further than eighty degrees. When a spirit of insubordination broke out in the French navy, and in the Brest fleet in particular, M. de Bougainville, by his reputation, his courage, and his firmness, mixed with the most amiable qualities, seemed to be the only man capable of recalling the seamen to their duty. But his exertions were unavailing; the flames of Jacobinism had spread too far, and he retired from the service in disgust. In 1791 his name was put upon the list of vice-admirals. This distinction redoubled his attachment to his prince, now almost totally abandoned. From the massacres of 1792 he escaped as if by a miracle, and took refuge on his estate in Normandy, where he found his two pieces of cannon, the only recompense which he had received for forty years' service. On the restoration of order he was appointed to the Board of Longitude; but whether he did not think matters sufficiently settled, or the care which it was necessary to take of his fortune prohibited him from leaving his estate, he sent in his resignation, and was succeeded by count Fleurieu. When the Institute was formed, M. de Bougainville was nominated to a seat at the Board of Navigation and Geography. As president of the Class of Sciences, it was his duty to deliver to Napoleon the reports of that department, and he acquitted himself with great dignity. As a senator, his pecuniary circumstances were made perfectly

easy; and although old age was coming on, he possessed all the fire and vivacity of youth. He was still desirous of partaking in some hazardous maritime enterprise; and when his friends mentioned his age, he replied, that Nestor was not altogether useless in an army which boasted such heroes as Achilles, Ajax, and Diomed. Although his temperance and sobriety were great, and strong hopes were entertained of prolonged existence, he died on the 31st of August, 1811, after an illness of ten days.

BOUGAINVILLE'S ISLAND, an island of the South Pacific Ocean, in the sixth degree of south latitude, and 156th of east longitude. A narrow strait separates it on the north from the island of Bouka, and on this side it is very low; other parts contain mountains separated by considerable plains, and covered with wood. The western coast is rocky and dangerous, and the island thinly inhabited.

BOUGE', to bilge or bulge. See **BILGE**. To swell out; something swelling or bellying out.

Which ancor cast, we soone the same forsooke,
And cut it off, for feare lest thereupon
Our shippe should bouge.

Gascoigne.

BOUGEANT (William Hyacinth), a famous Jesuit, who first taught the learned languages at Caen and Nevers, and afterwards settled at the college of Paris, where he employed himself in writing several works, particularly, 1. Curious Observations on all parts of Natural Philosophy, extracted from the best authors; 2. An History of the Wars and Negotiations which preceded the Treaty of Westphalia, &c. He died in 1743.

BOUGH, or } Ang.-Sax. bug-an, to bow.
Bow. } The branch of a tree, so called because it bows or bends from the trunk or stem.

There might men does and roes ysee
And of sqirels full great plentie,
From bow to bow alway leping,

Chaucer. Romaunt of the Rose.

The boisterous winds oft theire high *boices* do blast.

Wyat.

But now the gray moss marred his rine,
His bared *boughes* were beaten with stormes;
His toppe was bald and wasted with wormes,
His honour decayed; his branches sere.

Spenser.

Like as the culver, on the bared *bough*,
Sits mourning for the absence of her mate;
And, in her songs sends many a wishful vow
For his returne that seems to linger late:
So I alone, now left disconsolate,
Mourn to myselfe the absence of my love;
And wandering here and there, all desolate,
Seek with my playnts to match that mournful dove.

Id.

Their lord and patron loud did him proclaim,
And at his feet their laurel *boughs* did throw.

Faerie Queene.

A vine-labourer finding a *bough* broken, took a branch of the same *bough*, and tied it about the place broken.

Sidney.

From the *bough*
She gave him that fair enticing fruit.

Milton.

As the dove's flight did guide Æneas, now
May thine conduct me to the golden *bough*.

Denham.

Under some favourite myrtle's shady *boughs*,
They speak their passions in repeated vows.

Roscommon.

See how, on every *bough*, the birds express,
In their sweet notes, their happiness.

Dryden.

'Twas all her joy the ripening fruits to tend,
And see the *boughs* with happy burdens bend. *Pope.*

All abandoned to despair, she sings
Her sorrows through the night; and on the *bough*
Sole sitting. *Thomson's Seasons.*

Speak to me!

For I have called on thee in the still night,
Startled the slumbering birds from the hush'd *boughs*
And woke the mountain wolves, and made the caves
Acquainted with thy vainly echoed name
Which answered me—many things answered me—
Spirits and men—but thou wert silent all.

Byron's Manfred.

BOUGUS, GREEN, anciently made a part of the decoration of altars and temples, especially on festival occasions. Oaken *boughs* were offered to Jupiter; those of laurel to Apollo; of olive to Minerva; myrtle to Venus; ivy to Bacchus; pine to Pan; and cypress to Pluto. Our country youth commemorate the preservation of Charles II. in an oak, after the battle of Worcester, by wearing oak *boughs*, gilding the apples, &c.

BOUGHT', or } From the Anglo-Saxon,
Bour'. } bugan, to bow, to bend, to turn. Folds or involutions are bouts; a twist; a link; a knot; a curve; a flexure.

His huge long tail wound up in hundred folds,
Whose wreathed *boughts* whenever he unfolds,
And thick entangled knots adown does slack.

Faerie Queene.

The flexure of the joints is not the same in elephants as in other quadrupeds, but nearer unto those of a man; the *bought* of the fore-legs not directly backward, but laterally, and somewhat inward.

Brown's Vulgar Errors.

Immortal verse,

Such as the melting soul may pierce,
In notes, with many a winding *bought*
Of linked sweetness, long drawn out. *Milton.*
Bought, the past tense, and past participle of the verb to buy.

Great riches have sold more men than they have bought.

Bacon.

The chief were those who not for empire fought,
But with their blood their country's safety bought,

Pope.

BOUGIE; Fr. a wax candle; an instrument that is introduced into the urethra for removing obstructions. Different compositions are used. The old method of making them up was as follows: having spread any quantity of the linen rag with the composition that is chosen for the purpose, cut it into slips from six to ten inches long, and from half an inch to an inch broad; then roll them on a glazed tile or marble into the form of a wax candle; and as the end of the bougie that is to be entered first into the urethra should be somewhat smaller than the rest, cut the slips a little tapering. When the bougies are rolled up, that side must be outward on which the plaster is spread. Bougies are likewise formed of catgut, which are well calculated to pass through an aperture which takes a winding sort of direction, a case in which the common bougie very frequently fails. M. Darn and others attributed the action of the bougies to the composition they made use of in forming them, but, apparently, as much of their efficacy is owing to the compression they make on the affected part, as to any other principle; and, as

bougies of very different compositions succeed equally well, in curing the same disorders in the urethra, it is plain that they do not act by means of any peculiar qualities in their composition. Catgut involved in elastic gum makes the best bougie; the gum defends the catgut from the moisture of the urethra, and renders the bougie pliant in all its parts, whilst a very suitable degree of firmness results from the intermixture of the catgut. The caustic bougie differs from the ordinary one in having a thin roll of caustic in its middle, which destroys the stricture, or any part it comes in contact with. The practice of keeping the bougie in for several hours together has been relinquished of late years, on account of the injury supposed to be done by it to the muscoli acceleratores. It is now the practice to wear a bougie only for a few minutes at a time.

BOUGUER (John), a good French mathematician, and professor royal of hydrography, was author of a Complete Treatise on Navigation. He died in 1713.

BOUGUER (Peter), a celebrated French mathematician born at Croisic in 1698, was the son of the professor. He learned mathematics from his father, and became a proficient in the science while he was yet a child. Being sent early to the Jesuits' college at Vannes, he instructed the regent in mathematics, at eleven years of age. At thirteen he had a public contest with a professor of mathematics, upon an erroneous proposition he had advanced, and gained so complete a victory over him that he left the country. At fifteen, upon his father's death, he was, after a public examination, appointed to succeed him in his professorship. In 1727 he obtained the prize given by the Academy of Sciences for the best way of masting ships; in 1729 another for the best manner of observing at sea the height of the stars; and in 1731 a third prize for the most advantageous way of observing the declination of the magnetic needle. In 1730 he was removed to Havre. In 1731 he was appointed geometriician to the Academy, and in 1735 pensioner-astronomer: when he was also sent along with Messrs. Godin, Condamine, and Jussieu, on the commission to South America, to determine the measure of the degrees of the meridian and the figure of the earth. In this laborious business, of ten years' duration, chiefly among the lofty Cordillera mountains, he determined several other new points, besides the main object; particularly respecting, 1. the expansion and contraction of metals, &c. by heat and cold; 2. the refraction of the atmosphere by the tops of the mountains; 3. the density of the air at different heights; 4. the effect of the mountains upon the plummet; 5. a method of rectifying the errors committed by navigators in determining their route; and 6. a new construction of the log for measuring a ship's way, &c. He died 15th August, 1758, aged sixty. His chief works are, 1. *The Figure of the Earth*, determined by the Observations made in South America, 1749, 4to. 2. *Treatise on Navigation and Pilotage*, 1752, 4to. abridged by La Caille, in one vol. 8vo. 1768. 3. *Treatise on Ships*, 4to. 1756; and 4. *On the Gradation of Light*, 1729 and 1760, 4to. He wrote also a vast number of important papers,

inserted in the *Memoirs of the Academy*, of which Dr. Hutton gives a complete list in his *Mathematical and Philosophical Dictionary*, pp. 219, 220.

BOUHOURS (Dominic), a celebrated French critic, born at Paris 1628. He was entered into the society of Jesuits at the age of sixteen; and was appointed to read lectures upon polite literature in the college of Clermont at Paris, where he had studied: but was so incessantly attacked with the head-ache, that he could not pursue the destined task. He afterwards undertook the education of two sons of the düké of Longueville, which he discharged with great applause. The duke had such a regard for Bouhours, that he wished to die in his arms; and the Account of the pious christian death of this great personage was the first work which Bouhours gave to the public. He was sent to Dunkirk to the popish refugees from England; and in the midst of his missionary occupations found means to compose and publish books. Among these were *Entretiens d'Ariste et d'Eugene*, *Dialogues between Aristus and Eugenius*; a critical work concerning the French language. It was printed five times at Paris, twice at Grenoble, at Lyons, Brussels, Amsterdam, Leyden, &c. and embroiled him in quarrels with a great many censors; with Menage in particular, who however lived in friendship with him both before and after. This piece recommended Bouhours so effectually to the celebrated minister, Colbert, that he trusted him with the education of his son, the marquis of Segnelai. He wrote afterwards several other works, the chief of which are, 1. *Remarks and Doubts upon the French Language*; 2. *Dialogues upon the Art of thinking well in Works of Genius*; 3. *The Life of St. Ignatius*; 4. *The Art of Pleasing in Conversation*; 5. *The Life of St. Francis Xavier, Apostle of the Indies and of Japan*. This last work was translated from the French into English by Mr. Dryden, and published at London in 1688, with a dedication prefixed to the queen of James II.

BOVILLÆ; from *bos*, an ox, because cattle were supposed subject to it; the scientific name for the measles.

BOUILLE (Marquis de), was a lieutenant-general in the army of Louis XVI. and knight of the order of St. Esprit. He was born in Auvergne, and connected by birth with the family of La Fayette. During the American war he commanded in the French Windward Islands, and returning to Europe, was made governor of Mentz at about the breaking out of the Revolution. Here he first distinguished himself as a staunch royalist, and drew on himself in consequence the marked displeasure of the Jacobins. On the king's unfortunate flight to Varennes, Bouillé advanced with a strong force to receive him, but from some mismanagement was too late: upon finding that the royal party was captured, he addressed a letter to the National Assembly from Luxembourg, menacing them with summary vengeance should any attempt be made on the life of the king. This threat however, only served to accelerate the event, and Bouillé himself was sentenced to death *par contumace*. Bouille, on the death of his unhappy prince, proceeded to

Vienna, and afterwards to Sweden; he also served for a while in the emigrant army under the prince of Condé, but on the final failure of the royal cause retired to England, where in 1797 he published his *Memoirs of the Revolution*, 8vo. He died in London, Nov. 14th, 1824.

BOUILLON, a duchy of the Netherlands, situated between the grand duchy of Luxembourg and the principality of Liege. It lies in the woody and mountainous tract called the Ardennes, to the department of which name it for the most part belonged while in the French empire, is about eighteen miles long, and nine broad, and comprises the towns and villages of Bouillon, Mirwart, St. Hubert, Rochefort, Logne, and Hiergues. Though so small a state it has been at different times the subject of much litigation. Godfrey, general of the first crusade, and king of Jerusalem, mortgaged it when a principality, to the bishopric of Liege, in the year 1096, for the sum of 1500 silver marks, on condition that, if he returned, the estate was to be restored; otherwise to remain attached to the diocese. He died in the Holy Land without issue, so that his estate remained in the possession of the see of Liege until 1483, when it was ceded to the count of Mark. Charles V., however, restored it to its former owners. The French family of La Tour d'Auvergne, descendants of the count of Mark, brought forward at different periods pretensions to the duchy, which they relinquished in 1641, on receiving an indemnity of £15,000 sterling. But the bishop of Liege having taken part against France in the war of 1672, Louis XIV. put the family of La Tour d'Auvergne in possession. The title of prince of Bouillon was therefore assumed in 1792, with the consent of his Majesty, by Philip d'Auvergne, captain in the British navy, and he continued to bear it till his death, which happened in 1816. The congress, which met at Vienna in 1815, appointed commissioners to investigate the comparative claims of this nobleman and prince Charles of Rohan. They decided in favor of the latter, who now possesses it.

BOUILLON, the chief town in the duchy, is situated in a hilly district, near the junction of the Semois with the Maese. It contains a population of about 2000 individuals, and has a castle standing upon a high rock. The French took it so long ago as 1676. In 1794 the Austrian general Beaulieu took the town after an obstinate resistance, and compelled a party of French troops to take refuge in the castle; but on the approach of a French army, he was obliged to retreat in the direction of Namur. Bouillon is distant from Namur about fifty miles towards the south-east.

BOUILLON, in the menage, a lump or excrescence of flesh, that grows either upon or just by the frush, inasmuch that the frush shoots out like a lump of flesh, and makes the horse halt; and this is called the flesh blowing upon the frush.

BOUIN, an island of France, off the coast of Brittany, in a bay formed by the shores of that province and those of Poitou. It is separated from the coast of Brittany by a narrow channel, and included in the department of Vendée. The inhabitants are chiefly employed in fishing and

making salt. It contains a small town of the same name.

BOVIUM, in ancient geography, a town of the Silures, in Britain, fifteen miles south of Isca Silurum, or Caer-leon, in Monmouthshire, now called Cowbridge, or according to Baudiand, Bangor in Caernarvonshire.

BOVIUS (Thomas), one of those empirics that rose in Italy about the middle of the sixteenth century, when the proper rules of philosophising were unknown, when the boundaries of science and quackery were undefined, and when men, instead of consulting nature, and learning her secrets from experiment, pretended to derive their knowledge from the efficacy of a charm, or the intercourse of a familiar spirit. He had a tutelar genius which he called Zephyriel. He contrived a preparation of mercury and gold dissolved in aqua regia, that he called Hercules; and this Hercules was an overmatch for plague, pestilence, and many other giant distempers. He cured epilepsy with antimony, and suppressed menses with hellebore. He performed an exploit upon a patient as great as any of the twelve labors, expelling a tape-worm from his body that measured fifty yards in length. He prepared aurum potable, with which among other nostrums he restored to health no less than 7000 patients. He entertained a great contempt for all regular physicians, as probably unable to use so quick despatch as himself; and, like Dr. Sangrado, took every opportunity of reproaching their practice and extolling his own. He was, however, more scrupulous in the period and method of bleeding than the aforesaid eminent practitioner, as he believed that a knowledge of astrology was necessary for performing this operation, and that it could be resorted to with success only in certain aspects of the planets. As his life was a struggle against what he thought the ignorance and obstinacy of the professors of the medical art, so his works are filled with satire and abuse. The titles they bear, which are the following, are a sufficient indication of the nature of their contents: *Flagello contra de Medici comuni detti Razionali*; *Fulmine contro de Medici putatitii Razionali*; *Confusione de Medici sospisti de Claudio Gelli*. This 'whip and thunder-bolt' for the doctors have now lost their terrors, and our quacks in the present day are more dreadful to their patients than their opponents.

BOVIS, in entomology, a species of pediculus, with which cattle are infested. Eight transverse ferruginous lines on the abdomen; also a species of oestrus, the wings of which are brown, the abdomen black, white at the base, and fulvous at the tip.

BOUJELAH, or **BUGIA**, a considerable fortified sea-port in the eastern part of Algiers, situated on the declivity of a mountain, and upon the ruins of a large city, probably the ancient Saldo. A castle, on the summit of a hill, commands the town and harbour, besides which there are two others built at the lower part of the hill. Breaches yet appear in the walls, which were made by Sir Edward Spragg, in 1671, when he destroyed seven vessels in this harbour. Here is a small iron manufactory, and an export trade in oil and wax. Eighty miles east from Algiers.

BOUKA, or Lord Anson's Island, an island in the South Pacific Ocean, separated from Bougainville's Island by a narrow strait. It rises inland to a considerable altitude, and is covered with wood; but has near the sea extensive plantations of cocoa trees. The expedition in search of La Perouse visited this island, and the natives are described as being of a middle stature, strong and active; their color nearly black, their hair on their heads thick and curled, but carefully removed from every other part of the body. Their heads large; forehead, face, and nose, flat, and chin prominent. Their ears were loaded and greatly extended with large rings made of shells. Some had their bodies streaked, and all had a cord or bandage tied round the waist several times. Bracelets formed of the fibres of the cocoa-nut were common. But little clothing was seen on any of them. They were very fond of brisk and noisy music. Their canoes were ingeniously formed, and capable of carrying forty or fifty men each, and they were armed with bows and arrows, which they used with great skill. They also seemed well acquainted with barter, and most valued nails and scarlet cloth. The northern point of this island is situated in about five degrees of south latitude, and in the 155th degree of east longitude.

BOULAINVILLIERS (Henry de), Lord of St. Saire, and an eminent French writer, was descended from a very ancient and noble family, and born at St. Saire in 1658. His education was among the fathers of the oratory; where he manifested from his infancy those uncommon abilities for which he was afterwards distinguished. He applied himself principally to history; in which his performances are numerous and considerable. He was author of a History of the Arabians; Fourteen Letters upon the Ancient Parliaments of France; a History of France to the Reign of Charles VIII.; the State of France, with Historical Memoirs concerning the Ancient Government of that Monarchy to the time of Hugh Capet; 'written,' says M. Montesquieu, 'with a simplicity and honest freedom worthy of that ancient family from which their author was descended.' He died at Paris in 1722; and after his death was published his Life of Mahomet.

BOULANGER (John), a French engraver, who flourished towards the end of the seventeenth century. He adopted a manner, which, though not original, he greatly improved: He finished the faces, hands, and all the naked parts of his figures, very neatly with dots instead of strokes, or strokes and dots. The effect is by no means unpleasing. This style of engraving has been since carried to its greatest perfection in England. His draperies are heavy, and the folds not well marked. However, his best prints possess much merit, and are deservedly held in esteem.

Boulanger (Nicholas Anthony), a very singular Frenchman, was born at Paris in 1722, and died there in 1759, aged only thirty-seven. He is said to have come out of the college of Beauvais almost as ignorant as he had entered into it; but struggling hard against his unaptness to learn, he at last overcame it. At seventeen he began to study mathematics and architecture; and, in three or

four years, made such progress as to accompany the baron of Thiers to the army in quality of engineer. Afterwards he had the supervision of the highways and bridges; and he executed several public works in Champagne, Burgundy, and Lorraine. His works are: 1. *Recherches sur l'origine du Despotisme Oriental*, 2 vols. 12mo.; a very bold work; but not so bold and licentious as, 2., *L'Antiquité dévoilée*, 3 vols. 12mo. This was posthumous. 3. He furnished to the *Encyclopædia* the articles *Deluge*, *Corvée*, *Société*, and *Guebres*, *Hebrew Language*, and *Political Economy*.

BOULAY, or **BULÆUS** (Cæsar Egasse du), was born at St. Ellier in France, and became professor of humanity at the college of Navarre, rector, and historiographer of the University of Paris. He died in 1768, after having published several works. The principal of them are: A History of the University of Paris, in Latin, 6 vols. folio; and the *Treasure of Roman Antiquities*, in 1 vol. folio.

BOULETTE, in the menage, an epithet of a horse, when the fetlock bends forward out of its natural position, through violent riding, or by being too short jointed.

BOULLONGNE (Bon de), a painter of eminence, born at Paris in 1649. From his father he learned the first principles of the art; but went to Rome to perfect himself from the works of the best masters. He abode in Italy five years. He excelled in history and portrait. His talents for copying the pictures of the great Italian painters were very extraordinary, so that he frequently deceived the best judges. He died at Paris in 1717, aged sixty-eight.

BOULLONGNE (Lewis de), was born at Paris in 1654, was the younger brother of Bon, and, like him, learned from his father the first principles of painting, and afterwards went to Rome to complete his studies. His works, on his return, were so much esteemed, that Louis XIV. made him knight of St. Michael, appointed him his principal painter, allowed him several pensions, and raised him to the rank of nobility. He embellished the church of the Invalids, the chapel of Versailles, &c. He chiefly excelled in history and allegory. He died at Paris in 1734, aged eighty.

BOULOGNE, a sea-port of France, in the department of the Pas de Calais, Picardy. It was the capital of the ci-devant government of Boulonnais, and is divided into two parts, the Upper and Lower; the latter being frequently called *Boulogne-sur-Mer*, as lying near the shore. The former is situated on an eminence. The Lower town is the larger and more populous; but the harbour has been of late nearly choked up with sand; and, though considerable exertions have been made to improve it, only small vessels can enter. Ships of war either anchor in the road, or off the port of St. Jean, a few miles further north. The trade, however, is considerable in fresh and salt fish, especially herrings and mackerel; also in coal, salt, fresh and salted butter, soap, and earthenware; as well as in linen and woollen stuffs manufactured in the town. Great part of our Champagne and Burgundy sent to England passes through this port. Boulogne was the see

of a bishop before the revolution, including 277 parishes; but has since been joined to that of Arras. A late French account states the number of inhabitants at 12,700; among which it is estimated that about 3000 English are included. It is about 154 miles from Paris, thirty from New Romney in Kent, and twenty-two south of Calais. It is generally preferred to the former port, for the return passage across the channel to Dover. In the neighbourhood is a chalybeate spring called the Fontaine de Fer.

BOULTER (Hugh), D.D., was born in or near London, of reputable and wealthy parents. Before the Revolution he was admitted a commoner of Christ Church in Oxford. Some time after he was chosen a demy of Magdalen college, at the same election with Mr. Addison and Dr. Wilcox. From the merit and learning of the persons elected, this was commonly called by Dr. Hough, president of the college, the golden election. He was invited to London by Sir Charles Hodges, principal secretary of state in 1700, who made him his chaplain, and recommended him to Dr. Tenison, archbishop of Canterbury. By the influence of the earl of Sunderland he was promoted to the parsonage of St. Olave in Southwark, and the archdeaconry of Surrey; where he continued discharging faithfully his pastoral office, till he was recommended to attend king George I. as his chaplain, when he went to Hanover in 1719. He taught prince Frederick the English language, and by his conduct so won the king's favor that he promoted him to be dean of Christ Church, and bishop of Bristol. Five years afterwards he received a letter from the secretary of state, acquainting him that the king had nominated him archbishop of Armagh and primate of Ireland. This honor he would gladly have declined; and desired the secretary to use his good offices with his majesty to excuse him from accepting it. Ireland happened to be at this juncture in a great flame, occasioned by Wood's ruinous project; and the ministry thought that the bishop would greatly contribute to quench it by his judgment, moderation, and address. The king therefore laid his absolute commands upon him; to which he at last submitted. When he had taken possession of the primacy, he began to consider that country, in which his lot was cast for life, as his own; and to promote its true interest with the greatest zeal and assiduity. Accordingly, in innumerable instances, he exerted himself in the noblest acts of beneficence and public spirit. In seasons of the greatest scarcity he was more than once instrumental in preventing a famine. On one of these occasions he distributed vast quantities of corn throughout the kingdom, for which the House of Commons passed a vote of public thanks; and at another time 2500 persons were fed at the poor-house in Dublin every morning, and as many every evening, for a considerable time together, mostly at the primate's expense. When schemes were proposed for the advantage of the country, he encouraged and promoted them not only with his counsel but his purse. He had great compassion for the poor clergy of his diocese, who were disabled from giving their children a proper education; and he maintained

several of the children of such in the university. He erected four houses at Drogheda for the reception of clergymen's widows, and purchased an estate for the endowment of them. His charities for augmenting small livings and buying glebes amounted to upwards of £30,000, besides what he devised by will for the like purposes in England. In short, the instances he gave of his generosity, benevolence, virtue, piety, and wisdom, are almost innumerable; and the history of his life is his noblest panegyric. This excellent prelate died at London, on the 2d of June 1742, and was interred in Westminster Abbey, where a beautiful monument is erected to his memory.

BOULTINE, in architecture, a convex moulding, of one fourth of a circle; placed below the plinth in the Tuscan and Doric capital.

BOULTON (Matthew), the celebrated manufacturer and engineer of Soho, near Birmingham, was born at the latter place the 14th of September 1728, and educated at the neighbouring grammar school of Deritend. He was early called into life upon the death of his father, which took place in 1745. Inheriting an ample fortune, he devoted it throughout his career of business to the most liberal and scientific modes of accomplishing the various manufactures in which he engaged. He first attempted a new mode of in-laying steel; and soon obtained such a demand for the products of his manufactory, which were principally exported, that his articles of this kind were not uncommonly re-imported for domestic use.

In 1762 he purchased the then barren heath of Soho, and transferred thither his establishment at an expense of £10,000. At about the same time he engaged in a new method of copying oil paintings, and accomplished them with such great accuracy, by means of a mechanical process invented by a Mr. Egginton, that connoisseurs would frequently mistake the copy for an original. He was also now employed in the imitation of ormolu. In 1762 he first erected a steam-engine, upon the imperfect construction of Savary; but quickly requiring a more powerful first mover, gladly adopted the improvements of Mr. Watt of Glasgow, who had obtained a patent for them in 1769, the privileges of which were extended in 1775, by an act of parliament, to a term of twenty-five years. Mr. Boulton soon induced that gentleman to remove to Birmingham, and commenced a partnership with him in business, for the manufactory of steam-engines. Their execution of them, it is well known, kept pace so well with the advances of science, and the public demand, that the Soho engines were in full request after the expiration of the term of the legal privilege. Principally for the purpose of carrying on this manufactory with greater convenience, the proprietors established an iron-foundry of their own at Smethwick.

Mr. Boulton, in 1785, was made a Fellow of the Royal Society. Three years after, he turned his attention to the improvement of our public coinage, and erected very extensive and complete machinery for the purpose: the coins, it is said, could not be imitated by any single artist for their nominal value; each of the stamps coining, with the attendance of a little boy only,

about eighty pieces in a minute. The preparatory operation of laminating and cutting out the metal, was performed in an adjoining room; and all personal communication between the workmen employed rendered unnecessary, by the conveyance of the work by machinery, from one part of the establishment to another. At this mint, a coinage of silver was executed for the Sierra Leone Company, and another of copper for the East Indies, besides the pence and halfpence at present in circulation throughout England, together with a large quantity of money of all kinds for Russia. The emperor Paul, in acknowledgment of his skill with regard to the last of these undertakings, presented him with a valuable collection of medals and minerals.

In 1797 Mr. Boulton made some ingenious improvements in the application of what has been called Montgolfier's hydraulic ram. Daniel Bernoulli had demonstrated, in the beginning of the last century, that water flowing through a pipe, and arriving at a part in which the pipe is suddenly contracted, would have its velocity at first very greatly increased; and Mr. Whitehurst, in 1792, had set up at Oulton, in Cheshire, an air-vessel, communicating with a waterpipe by a valve, which was forced open by the pressure or rather impulse of the water, its passage through the pipe being suddenly stopped by turning a cock, as in the ordinary course of domestic economy; and although the pipe through which the water was forced up, was of moderate height, the air-vessel, which was at first made of lead, was soon burst by the momentous force. Boulton now added to it a number of modifications, which the reader will find in the ninth volume of the *Repertory of Arts*, p. 145.

This ingenious and worthy man having long been at the head of that important class of scientific manufacturers, among whom he was born, died, after a protracted illness, at Hardsworth, near Soho, 24th August, 1809, and was attended to his grave by 600 workmen, each of whom had a silver medal presented to him on the mournful occasion. He left an only son as his successor.

BOULUKE, in the military orders of the Turks, a body of the janissaries, with an officer in the place of a colonel at their head, sent upon some particular enterprise. They are selected out of the body, and, as soon as the business is over, are received again into their former companies.

BOUM, in ancient geography, a town in Ethiopia, beyond Egypt, on the west side of the Nile.

BOUM SOLIS STABULA, in ancient geography, the territory of Mylæ, a peninsula on the east coast of Sicily, north of Syracuse; remarkable for its fertility and rich pastures: whence arose the fable of the oxen of the sun feeding there. Pliny and Seneca say, that something like dung is thrown out on the coast of Mylæ and Messina, which gave rise to the fable of the oxen of the sun being stalled there; and the inhabitants still affirm the same thing.

BOUNCE, *v. & n.* } A word formed from the
BOUNCING, } sound, says Skinner. Per-
BOUNCER. } haps from bound, to fly

back, to be struck back, as a ball; a quick sound; a rapid motion, with noise returning like an echo upon the ear; to fly against any thing with great force so as to rebound; to make a sudden leap or explosion; to be bold; to boast, to bully. A bouncer is a boaster beyond the truth.

They snuf, they snort, they bounce, they rage, they

rore,
 That all the sea, disturbed with their traine,
 Doth frie with fume above the surges hore;
 Such was between these two the troublesome uprore.

Spenser.

Yet still he bet and bound at upon the dore,
 And thundred strokes thereon so hideouslie,
 That all the peece he shaked from the flore;
 And filled all the house with feare and great uprore.

Id.

What cannoneer begot this lusty blood?
 He speaks plain cannon fire, and smoke, and bounce;
 He gives the bastinado with his tongue.

Shakespeare.

The fright awakened Arcite with a start,
 Against his bosom bounced his heaving heart.

Dryden.

High nonsense is like beer in a bottle, which has,
 in reality, no strength and spirit, but frets and flies,
 and bounces, and imitates the passions of a much
 nobler liquor.

Addison.

Just as I was putting out my light, another bounces
 as hard as he can knock.

Swift.

Two hazel-nuts I threw into the flame,
 And to each nut I gave a sweetheart's name;
 This with the loudest bounce me sore amazed,
 That in a flame of brightest colour blazed.

Gay.

BOUND, *v. & n.* } From the Fr. *bondir*.

BOUNDING STONE. } To be struck back; to
 bound; to rebound; to leap; jump; to rise
 suddenly and swiftly upwards; to rise by con-
 cussion; repercussion.

Do but note a wild and wanton herd,
 Or race of youthful and unhandled colts,
 Fetching mad bounds, bellowing and neighing loud.

Shakespeare.

Mark then a bounding valour in our English,
 That being dead, like to the bullets grazing,
 Breaks out into a second course of mischief.

Id.

Due entrance he disdained, and in contempt
 At one slight bound high overleaped all bound
 Of hill or highest wall, and sheer within
 Lights on his feet.

Milton's Paradise Lost.

I am past a boy;
 A sceptre is but a plaything—and a globe
 A bigger bounding-stone.

Dryden.

Torrismond appeared,
 Gave me his hand, and led me lightly o'er,
 Leaping and bounding on the billows' heads.

Id.

These inward disgusts are but the first bound of this
 ball of contention.

Decay of Piety.

Before his lord the ready spaniel bounds;
 Panting with hope, he tries the furrowed grounds.

Pope.

Warbling to the varied strain, advance
 Two sprightly youths, to form the bounding dance.

Id.

When sudden through the woods a bounding stag
 Rushed headlong down, and plunged amidst the
 river.

Rowe.

The horses started with a sudden bound,
 And flung the reins and chariot to the ground.

Addison.

Dexterous he 'scapes the coach with nimble bounds,
 Whilst every honest tongue—Stop thief resounds.

Gay.

Thunders the sport of those who with a gun
 And dog, impatient bounding at the shot,
 Worse than the season, desolate the fields.

Thomson.

All, all, the storm
Devoured; and now, o'er his late envied fortune
The dolphin's *bound*, and watery mountain's roar
Triumphant in his ruin. *Young's Revenge.*

BOUND', v. & n. } To bound is formed
BOUND'ARY, } upon the past tense
BOUND'EN, } and past participle of
BOUND'ER, } the verb to bind; to
BOUND'LESS, } limit; to terminate; to
BOUND'LESSNESS. } restrict; to circum-
scribe: metaphorically, to lay under obligation.

And with his wif he maketh feste and chere,
And telleth hire that chaffare is so dere,
That nedes must he make a chevisance;
For that he was *bonde* in a recognizance;
To payen twenty thousand sheldes, anon,
For which this marchant is to Paris gone
To borwe, of certain frendes that he hadde,
A certain frankes, and some with him he ladde.

Chaucer. Canterbury Tales.

Three hundred foxes toke Sampson, for ire,
And all hir tayles he togeder *bound*,
And set the foxes tayles all on fire;
For he in every tayle had knit a bond,
And they brent all the corners in that lond,
And all hir oliveres, and vines eke,
A thousand men he slaw, eke with his hond,
And had no weapon but an asses cheke.

Id.

And as these heavens still by degrees arise
Until they come to their first mover's *bound*,
That in his mightie compasse doth comprize
And carrie all the rest with him around. *Spenser.*

His be that care, whom most it doth concern,
Said he; but whither with such hasty flight
Art thou now *bound*? for well might I discern
Great cause, that carries thee so swift and light.

Id. Faerie Queene.

Hereafter, in a better world than this,
I shall desire more love and knowledge of you.—
I rest much *bounden* to you: fare you well.

Shakespeare.

Take but degree away,
The *bounden* waters
Would lift their bosoms higher than the shores,
And make a sop of all this solid globe. *Id.*

We also most humbly besought him to accept of us
as his true servants, by as just a right as ever men on
earth were *bounden*. *Bacon.*

Princes are not *bound* to communicate all matters
with all counsellors, but may extract and select. *Id.*

A man may plead not guilty, and yet tell no lie;
for by the law no man is *bound* to accuse himself.

Selden.

Illimitable ocean! without *bound*,
Without dimension; where length, breadth, and
height,

And time, and place, are lost. *Milton.*

Stronger and fiercer by restraint he roars,
And knows no *bound*, but makes his power his shores.

Denham.

They summoned the governor to deliver it to them,
or else they would not leave one stone upon another.
To which the governor made no other reply, than
that he was not *bound* to repair it; but, however, he
would, by God's help, keep the ground afterwards.

Clarendon.

Sensation and reflection are the *boundaries* of our
thoughts; beyond which the mind, whatever efforts
it would make, is not able to advance. *Locke.*

God has corrected the *boundlessness* of his voluptu-
ous desires, by stinting his capacities. *South.*

Kings and priests are in a manner *bound*
For reverence sake to be close hypocrites. *Dryden.*

Though we make duration *boundless* as it is, we
cannot extend it beyond all being. God fills eternity,
and it is hard to find a reason why any one should
doubt that he fills immensity. *Locke.*

Some guide the course of wandering orbs on high,
Or roll the planets through the *boundless* sky. *Pope.*

Majestic woods of every vigorous green,
Stage above stage, high waving over the hills,
Or to the far horizon wide diffused
A *boundless* deep immensity of shade.

Thomson's Seasons.

Hail social life! into thy pleasing *bounds*

Again I come to pay the common stock,
My share of service, and in glad return
To taste the comforts and protected joys. *Id.*

Within these woods I reign alone,
The *boundless* forest is my own. *Gay.*

BOUN'TY, } Fr. *bonté*; Ital. *bontà*;
BOUN'TEOUS, } Span. *bondad*; Lat. *boni-*
BOUN'TEOUSLY, } tas. Generosity, liberal-
BOUN'TEOUSNESS, } ity, munificence; goodness,
BOUN'TIFUL, } virtue; largely; in a libe-
BOUN'TIFULLY, } ral manner. It seems dis-
BOUN'TIFULNESS, } tinguished from charity, as
BOUN'THEAD. } a present from an alms.

Bountie cometh all of God, not of the stren-
Of which they ben ygendred and ybore.
I trust in Goddes *bountee*; and therefore
My marriage, and min estat, and rest,
I him betake; he may don as him list.

Chaucer's Canterbury Tales.

There thou them placest in a paradise
Of all delight and joyous happy rest,
Where they doe feede on nectar heavenly-wise,
With Hercules and Hebe, and the rest
Of Venus' darlings through her *bountie* blest. *Spenser.*

This goodly frame of temperance,
Formerly grounded, and fast settled
On firm foundation of true *bountihead*. *Faerie Queene.*

How shall frail pen, with fear disparaged,
Conceive such sovereign glory, and great *bountihood*? *Id.*

And now thy alms is given,
And thy poor starveling *bountifully* fed. *Dowse.*
It is affirmed, that it never raineth in Egypt; the
river *bountifully* requiting it in its inundation.

Brown's Vulgar Errors.

We do not so far magnify her exceeding *bounty*, as
to affirm, that she bringeth into the world the sons of
men, adorned with gorgeous attire. *Hooker.*

If you knew to whom you show this honor,
I know you would be prouder of the work,
Than customary *bounty* can enforce you. *Shakespeare.*

Every one,
According to the gift which *bounteous* nature
Hath in him closed. *Id.*

Such moderation with thy *bounty* join,
That thou mayest nothing give that is not thine. *Denham.*

Though in heaven the trees
Of life ambrosial fruitage bear, and vines
Yield nectar; though from off the boughs each morn
We brush mellifluous dews, and find the ground
Covered with pearly grain; yet God hath here
Varied his *bounty* so with new delights,
As may compare with heaven; and to taste
Think not I shall be nice. *Milton.*

If you will be rich, you must live frugal; if you
will be popular, you must be *bountiful*. *Taylor.*

Tell a miser of *bounty* to a friend, or mercy to the
poor, and he will not understand it. *South.*

Those godlike men, to wanting virtue kind,
Bounty well placed, preferred, and well designed,
To all their titles. *Dryden.*

He bounteously bestowed unenvied good
On me.

Id.

Think not the good,
The gentle deeds of mercy thou hast done,
Shall die forgotten all; the poor, the prisoner,
The fatherless, the friendless, and the widow,
Who daily own the *bounty* of thy hand,
Shall cry to Heaven, and pull a blessing on thee.

Rowe's Jane Shore.

The gods in *bounty* work up storms about us,
That give mankind occasion to exert
Their hidden strength, and throw out into practice
Virtues that shun the day, and lie concealed
In the smooth seasons, and the calms of life.

Addison's Cato.

Hence! from the *bounteous* walks
Of flowery spring, ye sordid sons of earth,
Hard and unfeeling of another's woe,
Or only lavish to yourselves.

Thomson.

The generous pride of virtue
Disdains to weigh too nicely the returns
Her *bounty* meets with;—like the liberal gods,
From her own gracious nature she bestows
Nor stoops to ask reward. *Id. Coriolanus.*

Whence can such wondrous *bounty* spring
To such a vain and worthless thing. *Rowe.*

BOUNTY, in commerce, a premium paid by government to the exporters of certain commodities, as sail cloth, gold and silver lace, silk-stockings, fish, corn, &c. See NAVIGATION ACT.

BOUNTY OF QUEEN ANNE, for augmenting poor livings under £50 per annum, consists of the produce of the first fruits and tenths, after the charges and pensions payable out of the same are defrayed. A corporation for management of the same was settled, &c. in 1704. See AUGMENTATION.

BOURBON (Nicholas), a famous Latin poet in the sixteenth century, was a native of Vandœuvre near Langres, and the son of a wealthy smith. Margaret de Valois appointed him preceptor to her daughter Jane d'Albret of Navarre, the mother of king Henry IV. At length he retired to Condé, where he had a benefice, and died about 1550. He wrote eight books of epigrams; and a poem on the forge, entitled *Ferraria*. He had great knowledge of antiquity and of the Greek language. Erasmus praises his epigrams.

BOURBON (Nicholas), a celebrated Greek and Latin poet, was nephew of the preceding. He taught rhetoric in several colleges of Paris; and cardinal Perron got him appointed professor of Eloquence in the Royal College: he was also canon of Langres, and one of the forty of the French Academy. He died in 1644, aged seventy. He is esteemed one of the greatest Latin poets France has produced. His poems were printed at Paris in 1630.

BOURBON, a small county of the United States, in Kentucky, bounded on the south-east by Clarke county; on the south-west by Fayette; north by Harrison, and north-west by Scott county. Bourbon-town is the chief town.

BOURBON, a river of North America, in Labrador, which issues from Lake Christianaux, passes through Lake Assinipoils, and falls into Hudson's Bay at York factory.

BOURBON, an island in the Indian Ocean about forty-eight miles long, and thirty-six broad,

about 400 miles east of Madagascar. It was discovered by the Portuguese in 1545, and at first called Mascarenhas. The French, however, first settled upon it, in 1642. For some years it was used as a place of banishment for offenders; but in 1649 M. de Flacourt, governor of Madagascar, formed an establishment on a large scale, and gave it the name of Bourbon, in honor of the French royal family. During the revolution it was called Reunion.

The island is composed of two volcanic mountains; in the smallest of which one considerable crater throws up continually, with terrific noise, flame, smoke, and ashes; and it makes lateral openings, through which the lava rolls down the sides of the mountain in a sort of fiery cascade. The light is seen far out at sea, and serves as a species of pharos. The present crater is said to have been formed during an eruption of the volcano in 1791. A burning vapor appeared rising from the summit in the beginning of June; then the side of the mountain opened, and a vast torrent of lava rushed into the sea. On the seventeenth of the following month a subterranean noise, like the discharge of cannon, was heard throughout the island; after which there rose from the top of the mountain an enormous column of deep black smoke, interspersed with white spots. Soon after the column fell down, and formed a species of arch over the volcano. The falling in of the interior, undermined by the previous discharge, is supposed to have been the cause of the tremendous sound, and of the opening of the crater at this time. This is said to be the most active volcano known in history. *Ætna*, since the Christian era, has counted but twenty-seven eruptions; and *Vesuvius* twenty-four. A resident at Bourbon told M. Bory, that from 1785 to 1802, the mountain had vomited flames at least twice every year, and eight of the streams had entered the sea. In the northern mountain, though no eruptions have been observed, the rapid rivers, bordered by perpendicular walls, hillocks thrown into the valleys and obstructing the bed of the torrents, and basaltic prisms disposed in regular colonnades, attest the ancient and terrible revolutions that have taken place. The soil around is a deep black, hard and brittle, and full of holes and crevices. In other parts the island is fertile, the air pure, and the climate delicious. The violence, however, of the mountain torrents during the rainy season, has in many places washed away the earth, and reduced the fields to sterility. A line of about four miles parallel to the coast is the only part cleared. Coffee has long been the staple product. The plants were first brought from Mocha in 1718, and throve to such a degree, that the coffee of Bourbon was long considered as only second to that of Arabia. But during the revolution, the demand became irregular, and attention being no longer paid to its culture, the quality deteriorated. The tobacco is of good quality. Iron is found in the mountains and the forests, with which a great part of the island is covered, containing wood fit for ship-building; also aloes, ebony, palm, with a variety of odoriferous gum-trees, particularly benzoin. It produces corn, rice, and maize, more than suf-

ficient for its own consumption, exporting the surplus to Mauritius. The sugar-cane has been cultivated with some success, and a species of fermented liquor extracted from its juice. Horned cattle, hogs and goats, are also abundant. The coasts and rivers are well stocked with fine turtle, and ambergris, coral, and very beautiful shells, are found on the shores. The only noxious animals are rats and mice; and the chief inconvenience, the very violent hurricanes that occur. They take place from the middle of December to the beginning of April.

The following is a recent account of the total produce of the island on an average of several years:

Coffee	73,200 cwt.	Value 732,000 piastres.
Cloves	180,000 lbs.	540,000
Cotton	240,000	60,000
Grain	185,000	57,000
Maize	2,500,000	21,000
Peas	200,000	4,000
Potatoes	280,000	2,800

1,416,800 piastres.

The population of Bourbon has been taken so high as 65,000; but Bory St. Vincent, a recent traveller, assures us he found it to contain only 400 white inhabitants and 15,000 slaves. The darker and fairer complexions of mankind are sometimes singularly mixed here. A French writer assures us that he saw in a church one family, consisting of six generations, of all complexions. The eldest was a female, 108 years of age, of brown black, like the Indians of Madagascar; her daughter a mulatto; her granddaughter, a mestizo; her great granddaughter, of a dusky yellow; her daughter, again, of an olive color; and the daughter of this last, as fair as any English girl of the same age. It has nine parishes, but not a single good harbour, and along the whole coast sunken rocks abound.

BOURBON LANCY, a town of France, in the department of the Saone and Loire, and late province of Burgundy. It is remarkable for its castle and hot mineral waters; and has a large marble pavement, called the Great Bath, which is a work of the Romans. It is thirty-five miles south-east of Autun, and contains 2300 inhabitants.

BOURBON L'ARCHAMBAUD, a town of France, in the department of the Allier, and late province of Bourbonnois. It is situated in a valley, near the river, and is remarkable for its hot baths, and for giving name to the family of the late unfortunate king of France. It is fourteen miles west of Moulins, and 362 south of Paris. Population about 2800.

BOURBON-VEHDEE, a small town of France, in Lower Poitou, and the department of Vendée, of which it is the capital. It was called Napoleon during the reign of Buonaparte. In the vicinity of this town the royalists experienced a signal defeat, on the 28th of December, 1795. In 1807 the inhabitants were under 1000 in number, but have since increased considerably.

BOURBONNE-LES-BAINS, a town of France, in the department of the Upper Maine, and late province of Champagne, famous for its hot baths.

It is twenty miles east of Langres, and has a population of about 3000.

BOURBONNOIS, a province and government of Old France, bounded on the north by Nivernois and Berry; on the west by Berry and part of Marche; on the south by Auvergne; and on the east by Burgundy and Forez. It is watered by the Loire, the Allier, and the Cher; and abounds in corn, fruit, pasture, wood, game, and wine. It now forms the greater part of the department of the ALLIER, which see.

BOURBONTOWN, a post town of Kentucky, and capital of the county of Bourbon, seated on the west side of the river Stony-fork. It is a flourishing town, and has several valuable mills adjacent to it. It lies twenty miles north-east of Lexington, sixty east of Frankfort, and 754 from Philadelphia.

BOURBOURG, a town of France, in the department of the North, seated on a canal that goes to Dunkirk.

BOURCHIER (John), lord Berners, grandson and heir of a lord of the same name, was created a knight of the Bath, at the marriage of the duke of York, second son of Edward IV. and was first known by quelling an insurrection in Cornwall and Devonshire, raised by Michael Joseph, a blacksmith, in 1495, which recommended him to the favor of Henry VII. He was captain of the pioneers at the siege of Therouanne, under Henry VIII. by whom he was made chancellor of the exchequer for life, lieutenant of Calais and Marches, appointed to conduct the lady Mary, the king's sister, into France, on her marriage with Louis XII. and had the extraordinary good fortune to continue in favor with that fickle tyrant for eighteen years. He died at Calais in 1532, aged sixty-three. He translated Froissart's Chronicle, printed in 1513, by Richard Pinson, the fifth on the list of English printers. His other works were a whimsical medley of translations, from French, Spanish, and Italian novels; viz. the Life of Sir Arthur, an Armoric Knight; the Famous Exploits of Sir Hugh of Bourdeaux; Marcus Aurelius; and the Castle of Love. He wrote also a book of the duties of the inhabitants of Calais; and a comedy, entitled *Ite in Vineam*, which is mentioned in none of our catalogues of English plays. Wood says it was usually acted at Calais after Vespers.

BOURCHIER, BOWSCHYRE, or BOWCER (Thomas), archbishop of Canterbury, in the successive reigns of Henry VI., Edward IV., Richard III., and Henry VII., son of William Bourchier, earl of Eire, in Normandy. He was made chancellor of Oxford in 1433, and at the same time promoted to the see of Worcester. In 1443 he was translated to the bishopric of Ely, and in 1434 was elected archbishop of Canterbury. He was the principal promoter of the introduction of printing to this country.

BOURDALOUE (Louis), a celebrated preacher among the Jesuits, and one of the greatest orators France has produced, was born at Bourges, on the 20th of August, 1632. After having preached at Provence, he, in 1669, went to Paris; and there met with such applause, that the king resolved to hear him; on which he was sent for to

court, and frequently preached before Louis XIV. He assisted the sick, visited the prisoners and hospitals, and was liberal in giving alms. He died at Paris on the 13th of May, 1704. The first edition of his sermons in sixteen volumes is the best.

BOURDEAUX, an ancient and large commercial town of France, in the department of the Gironde, and ci-devant province of Guienne. It has an university, which was founded in 1441, and which has a valuable library, and an academy of arts and sciences. Before the revolution it was the capital of the Bordelois, and of the whole of Guienne. It is built in the form of a bow, of which the Garonne is the string. This river is bordered by a noble quay, and the water rising four yards at full tide, the largest vessels can come up to it very readily. A castle, called the Trumpet, improved by Vauban, was seated at the entrance of the quay, and the river went round its walls, but it has been long destroyed. Most of the great streets lead to the quay. The town has twelve gates, opening towards the river; and near another castle are beautiful walks. Though considerable in point of size, it was anciently ill built, badly paved, and without police. But is said to have entirely changed its appearance within the last forty years. The remarkable public edifices are the exchange, the palace, founded by Buonaparte in 1810, an old palace of the dukes of Guienne, and an elegant theatre. The cathedral and some other churches are also admired. The streets newly built are regular and handsome. The beauty of the Garonne, and the fertility of the adjoining country, were probably the causes which induced the Romans to lay the foundation of this city. It was called by them *Burdigala*. The ruins of a large amphitheatre remain, which was constructed under the emperor Gallienus. During the irruptions of the barbarous nations, Bourdeaux was ravaged, burnt, and almost entirely destroyed. It only began to recover itself under our Henry II. who having united it to the English crown, by his marriage with Eleanor of Aquitaine, rebuilt the city, and endeavoured to restore it to its ancient lustre. Edward the Black Prince, received Guienne, Gascony, and many inferior provinces, in full sovereignty from his father, Edward III. In 1356 he brought his royal captive, John, king of France, to this city, after the battle of Poitiers; and held his court and residence here during eleven years. His exalted character, his uninterrupted series of good fortune, his modesty, his affability, and his munificence, drew strangers to Bourdeaux from every part of Europe. His son, Richard II. was born in it. In 1453 Charles VII. king of France, re-entered the city, and subjected the whole province of Guienne, which had been near three centuries under the English government. Conscious of the importance of such a conquest, he ordered the Chateau Trompette to be built to defend the passage of the river. In 1548 an insurrection arose on account of an oppressive salt-tax, and among the excesses committed, was the murder of De Morems, the governor. For this the town was severely punished by the constable Montmorency. Bour-

deaux contains upwards of 100,000 inhabitants, and has a flourishing trade in wine and brandy; 100,000 pipes of the former are sometimes exported in a year. There are fourteen sugar refineries, glass-houses, and manufactures of woollen stuffs, earthenware, and lace. The rivers Garonne and Dordogne give it access to a vast range of country, and the maritime commerce of the city is only second to that of Marseilles. Its prosperity has great influence on the whole south-west of France. Raisins, vinegar, plums, chestnuts, walnuts, wood, turpentine, cork, honey, and hams, are other objects of exportation. The principal imports are; from England, woollen stuffs, tin, lead, coal, herrings, salted flesh, leather, dye stuffs, and different kinds of provisions; from Holland, Denmark, and Sweden, staves, deals, timber for ship-building, hemp, pitch, copper and cheese. The Bourdeaux merchants take a part in the whale and cod fisheries, through the medium of the ports of Bayonne, St. Jean de Luz, and St. Malo. The intercourse with the United States is greatly on the increase. The course of exchange comprises London, Antwerp, Amsterdam, Hamburgh and Paris, besides the principal trading towns in France. Two yearly markets, for the wine trade, a fortnight each, are held in March and October. Bourdeaux, during the late revolution, having attached itself to the Girondists, became the open enemy of the convention, and received a treatment similar to that of Lyons and Marseilles. The most opulent and respectable inhabitants were banished or guillotined, and their property confiscated. After the re-establishment of order under Buonaparte, the town was beginning to recover from its sufferings, when the war of 1803 broke out, and dissipated for a time its fair prospects of extensive trade with England. In 1814 Bourdeaux was the first place which declared for the Bourbons.

The Bordelois, or district of Bourdeaux, is twenty-eight miles long and ten broad. The soil is well cultivated, and produces great quantities of the wine so well known as the *vin de Bourdeaux*, or claret. It now forms the greater part of the *arrondissement*. Fifty-five miles south of Saintes, ninety south of La Rochelle, 280 W. S. W. of Lyons and 325 south-west of Paris.

BOURDELOT (John), a learned French critic, who lived at the close of the sixteenth and beginning of the seventeenth centuries. He distinguished himself by writing notes on Lucian, Petronius, and Heliodorus; by an Universal History; Commentaries on Juvenal; a Treatise on the Etymology of French words; and some other works never published.

BOURDELOT (Peter), sister's son to John, changed his name from Michon to oblige his uncle. He had the title of Abbé, and was a celebrated physician at Paris, and gained great reputation by a Treatise on the Viper, and other works. He died in 1685.

BOURDIN, a name given by Bellonius to a genus of univalve shell-fish, commonly known among authors by the name of *auris marina*.

BOURDON (Sebastian), a famous painter,

born at Montpellier in 1619. He studied seven years at Rome, and acquired such reputation, that at his return to France he was made rector of the academy of painting at Paris. He succeeded better in landscapes than in history painting. The most esteemed of all his performances is the martyrdom of St. Peter, drawn for the church of Notre Dame: it is kept as one of the choicest rarities of that cathedral. In 1652 Bourdon went to Stockholm, where queen Christina appointed him her first painter. After continuing in Sweden some time, he returned to France, and obtained abundant employment. Among his best performances at this period, were a Dead Christ, and the Woman taken in Adultery. There are also a great number of his etchings, which are executed in a bold masterly style, and are justly held in the highest estimation by the generality of collectors. He died in 1673, aged sixty-four.

BOURG EN BRESSE, a town of France, in the department of the Ain, and ci-devant province of Bresse. Near this place was the magnificent church and monastery of the late Augustines, the mausoleum of Margaret of Austria, aunt of Charles V. It was the birth-place of the celebrated astronomer, La Lande. It stands on the river Reyssouse, and carries on a trade in grain, cattle, and hides; it has likewise manufactures of coarse stuffs and combs. Twenty miles east of Maçon, forty-two west of Gex, and 260 south-east of Paris.

BOURGEOIS (Francis), born in London, of Swiss parents, in 1756. His early destination was the army; but, evincing a taste for painting, he was placed under Louthierbourg, whose style he adopted. In 1776 he went to Italy, and on his return exhibited several specimens of his talent at Somersethouse. In 1791 he was appointed painter to the king of Poland, who conferred on him the honor of knighthood. Three years afterwards his late majesty George III. nominated him his landscape painter; and he was admitted a member of the Royal Academy. Sometime before his death he became possessed, by the bequest of Mr. Noel Desenfans, of a noble collection of pictures, which he left to Dulwich college, together with £10,000 to keep them in preservation; £2000 for the repair of the gallery, and £1000 to the master and fellows of that foundation. Sir Francis died the 8th of January, 1811.

BOURGEOX, *v. & n.*, of uncertain origin. Fr. *bourgonner*, to operate; to shoot into branches; to put forth buds.

Long may the dew of heaven distil upon them, to make them *bourgeon* and propagate among themselves.

Howel.

O that I had the fruitful heads of Hydra,
That one might *bourgeon* where another fell!
Still would I give thee work.

Dryden.

BOURGES, an ancient town of France, in the department of the Cher, and forming the capital of the province of Berry. It has a university, founded or restored by Louis XI. who was born here. Although in extent it is one of the largest cities in France, the inhabitants hardly amount to more than 18,000, and their trade is inconsiderable. Bourges was also the birth-place of

the celebrated preacher Bourdaloue. The nobility, clergy, and students, who reside here, are the chief supports of the town, but there are manufactures of silk, woollen, and cotton stuffs, as well as of stockings, caps, and other articles of clothing. The chief objects of trade are corn, wine, cattle, wool, hemp, and cloth.

This city was the Avaricum of the ancients, so called from the river Avara, now the Yevre. Cæsar took it by storm after a protracted siege, and regarded it as one of the best fortified towns in Gaul. Besides being the capital of the department of the Cher, Bourges is the headquarters of the commandant of the twenty-second military division, the seat of a royal court for the departments of the Cher, the Indre, and the Nièvre, and the head of an arrondissement, which contains ten cantons. Thirty-six miles north-west of Nevers, sixty-one south-east of Orleans, eighty-four east by south of Tours, and 155 south of Paris.

BOURGET (Dominic John), an ingenious French antiquary, was born at the village of Beaumains, near Falaise, in the diocese of Seez, in 1724. He was educated at Caen, and pursued his studies with great diligence and success till 1745, when he became a Benedictine monk of the abbey of St. Martin de Seez. Some time after, he was appointed prior, and went through several successive promotions till at last he was removed to the abbey of Bec, where he resided till 1764. He was elected an honorary member of the Society of Antiquaries of London, January 10th, 1765; in which year he returned to the abbey of St. Stephen, at Caen, where he continued to the time of his death. These honorable offices, to which he was promoted on account of his great abilities, enabled him not only to pursue his favorite study of the history and antiquities of some of the principal Benedictine abbeys in Normandy, but likewise gave him access to all their charters, deeds, registers, books, &c. These he examined with great care, and left behind him in MS. large and accurate accounts of the abbeys of St. Peter de Junieges, St. Stephen, and the Holy Trinity, at Caen, founded by William the Conqueror, and his queen Matilda, and a very particular history of the abbey of Bec. These were all written in French. The History of the Royal Abbey of Bec, which he presented to Dr. Ducarel in 1764, is only an abstract of his larger work. This ancient abbey, which has produced several archbishops of Canterbury, and other illustrious prelates of this kingdom, is frequently mentioned by our old historians. He died 1st of January, 1776, much regretted.

BOURGOGNE, or **BURGUNDY**, a ci-devant province of France, bounded on the east by Franche Comté, on the west by Bourbonnois and Nivernois, on the south by Lyonnais, and on the north by Champagne. It is fertile in corn, fruits, and excellent wines. It is 112 miles in length, and seventy-five in breadth; and is now formed into the four departments of Cote d'Or, Saône and Loire, Yonne, and Ain. It is watered by the rivers Seine, Ain, Dehune, Brebine, Armançon, Ouche, Suzon, Tille, and Saône. Dijon was the capital.

BOURGOING (Jean François de), a traveller, was born of a good family, at Nevers, November 20th, 1748. He was brought up in the military school at Paris; and at the age of seventeen sent to Strasburg, where he studied the law. He received a commission, at the end of three years, in the regiment of Auvergne; and, when scarcely twenty, he was appointed secretary of legation at the Diet of Ratisbon. In 1777 he went as first secretary to M. de Montmorin, in the embassy in Spain; and eight years afterwards became charge d'affaires at Madrid. In 1787 he was sent as minister plenipotentiary to Ham-
burgh; and in 1791 revisited Spain in the same capacity. Here he remained until 1793. In 1801 he was appointed by Buonaparte, then first consul, on a mission to the court of Denmark, and afterwards to Stockholm. In 1808 he went as minister plenipotentiary to the court of Dresden, where he contracted a disorder which terminated his life at Carlsbad, July 29th, 1811. His works are: 1. *Nouveau Voyage en Espagne, ou Tableau de l'Etat actuel de cette Monarchie*, 3 vols 8vo. 1789, but afterwards republished with the title of *Tableau de l'Espagne Moderne*. 2. *Memoires Historiques et Philosophiques, sur Pie VI. et sur son Pontificat*, 2 vols. 8vo. 1798. 3. *Histoire des Flibustiers*, traduite de l'Allemand de M. d'Archenholz, 8vo. 1804. 4. *Histoire de l'Empereur Charlemagne*, traduction libre de l'Allemand du Prof. Hegewisch, 8vo. 1805. 5. *Correspondence d'un jeune Militaire, ou Memoires du Marquis de Lusigny et d'Hortense de St. Just*, 2 vols. 12mo. 1778. He was also the editor of Voltaire's *Correspondence with Bernis*, and some other books.

BOURGUIGNONS, or **BURGUNDIANS**, one of the northern nations who over-ran the Roman empire, and settled in Gaul. They were of a great stature, and very warlike; for which reason the emperor Valentinian the Great engaged them in his service against the Germans. They lived in tents close to each other, that they might the more readily unite on any unforeseen attack. These conjunctions of tents were called burghs; and they served them for towns. Sidonius Apollinaris tells us, that they were long hair, took great pleasure in singing, and were fond of praise for their vocal talents. He adds, that they ate great quantities; and anointed their hair with butter, deeming that unction very ornamental. Their crown was at first elective, and the authority of their kings depended on their success. They were not only accountable for their own misconduct, but likewise for the calamities of nature and fortune. They were deposed if they lost a battle; if they succeeded ill in any enterprise; or if, in short, any great event had not corresponded with the hopes of the people. They were not more favorably treated in case of a bad harvest or vintage, or if any epidemical distemper ravaged the state. At first they were governed by many kings, and Hendin was the title of the royal dignity. But in later times they were subjected to one sovereign; and on the introduction of Christianity, they grew humane and civilised. Before that epoch, their religion was much the same with that of the other northern nations. They had many

priests, the chief of whom was entitled *sinistrus*. He was perpetual, and they paid him great respect.

BOURIGNON (Antonieta), a famous enthusiastic preacher, and pretended prophetess, born at Lisle, in 1616. At her birth she was so deformed, that it was debated some days in the family whether it was not proper to stifle her as a monster; but her deformity diminished, and she was spared; and afterwards obtained such a degree of beauty, that she had her admirers. From her childhood to her old age, she had an extraordinary turn of mind. She set up for a reformer, and published a great number of books filled with very singular notions; the principal of which are entitled, *The Light of the World*; *The Testimony of Truth*; and, *The Renovation of the Gospel Spirit*. She was an enemy to reason, which she maintained ought to give place to the illumination of divine faith; and asserted, that whenever any one was born again by embracing her doctrine, she felt the pains and throes of a woman in labor. With regard to the jarring doctrines of predestination and free-will, which philosophers, divines, and metaphysicians, in all ages, have puzzled themselves in vain to reconcile, she cut the Gordian knot at once; by asserting, that although God can foresee every future event, yet his power being equal to his wisdom, he withholds from himself the foreknowledge of the actions of those to whom he has given free-will, and thus leaves them entirely free to act as they please; without which, she affirms, he could not be just in punishing their sins. She dressed like a hermit, and travelled to France, Holland, England, and Scotland. In the last she made a strong party, and some thousand converts, and died at Franeker, in Friesland, October 30th, 1680. Her works have been printed in eighteen vols. 8vo. An Apology for her life and opinions was written by professor Garden, of Aberdeen.

BOURIGNONISTS, a name given to the followers of Antonietta Bourignon, who set up a kind of quietism, pretending to be guided by immediate revelation.

BOURN', Ang.-Sax. byrna, burn; Dutch, *born*; Germ. *born*, *brunn*; Swed. *brunna*, from *rinna*, *berinna*, *brinna*, to run.

Diverse *bornes* sodainly brake out of the hollowe places of the earth, and overflowed a great part of Canterbury citie, the streame whereof run so swift and violent, that it bare down buildings and houses, and drowned manie people. *Stow. Ann.* 1271.

Ne swelling Neptune, ne loud thundering Jove,
Can change my cheer, or make me ever mourn:
My little boat can safely pass this perilous *bourne*.

Spenser.

BOURN, n. s. Fr. *borne*, a bound; a limit; the end or furthest compass of a thing.

Bourn, bound of land, till, vineyard, none.

Shakspeare.

That undiscovered country, from whose *bourne*
No traveller returns. *Id.*

False,

As dice are to be wished by one that fixes
No *bourne* 'twixt his and mine. *Id.*

I know each lane, and every alley green,
And every bosky *bourne* from side to side. *Milton.*

BOURN, an ancient market town of Lincolnshire, seated on a rivulet. It was the birth-

place of the great Lord Burleigh and the unfortunate Dr. Dodd. King Edmund was crowned in it. It has a good corn market, and three fairs. It is seventeen miles north of Peterborough, thirty-five south of Lincoln, and ninety-seven north of London.

BOURNE (Vincent), a modern Latin poet, was educated at Westminster school, whence he removed to Trinity College, Cambridge, and took the degree of M.A. in 1721. He afterwards occupied for some years the situation of under-master at Westminster, and died in this situation in 1747. His character was respectable, but his habits and manners so contrary to those of common life, as to expose him frequently to the pleasantry of his pupils. His poems, consisting of originals and translations, have been often printed.—‘I love the memory of Vinny Bourne,’ says the amiable Cowper to his friend Unwin. ‘I think him a better Latin poet than Tibullus, Propertius, Ausonius, or any of the writers in his way, except Ovid, and not at all inferior to him. It is not common to meet with an author who is always entertaining and yet always harmless, and who though always elegant and classical, to a degree not always found in the classics themselves, charms more by the simplicity and playfulness of his ideas, than by the neatness and purity of his verse. Yet such was poor Vinny.’ *Vide Hayley’s Life of Cowper.*

BOURNONITE, in mineralogy, an ore found in Cornwall containing copper, lead, and antimony, mineralised by sulphur, it is named after its discoverer the Comte de Bournon.

BOURO, one of the Molucca Islands in the East Indian ocean, the largest next to Ceram. It is well cultivated, and subject to the Dutch, who have built a fortress in it, near the only town of the Island, called Cajeli. It is about seventy-five miles in length by forty broad. Some of its mountains are exceedingly high, and the sea on each side is uncommonly deep. Here is also an internal lake, said to increase periodically; and to have an island in the middle which appears and disappears at particular seasons. The inhabitants consist of two races, besides the Dutch settlers; the aborigines, or Alforese, and, the Moors, or Mahomedans. The former are a savage pagan tribe, of whom, living in the interior, little is known, they seem to be under some imperfect control from their chiefs, and are apparently of the same race that formerly inhabited Amboyna, and Borneo. The Moors acknowledge the authority of the Dutch, and have also chiefs who are generally at the seat of the Dutch government. They are not a warlike race, and are in great dread of the Papuas: are said to be ignorant of the value of money; and readily exchange provisions and cayooputi oil, for red and white China handkerchiefs. Cayeli Road is on the north-east coast, a spacious secure harbour, much frequented by English whalers. Here is a river called Aer-Bessar, or the Great Water, by the natives the Dutch fort, and a small garrison. Rice and Sago flour are produced here in large quantities, oranges, lemons, citrons, and pepper. The cayooputi tree, or melaleuca catigolia is very plentiful; the natives obtain much cayooputi oil by distilling the leaves.

Fine hard timber also, including many kinds of beautiful wood for inlaying, is also found, and is in great request among the Chinese; besides black and white ebony, teak, &c. Fish is not plentiful, but turtle may be obtained, and the shores are covered with beautiful shells. Wild boars, snakes of all sizes, goats, and deer, inhabit the woods, among the latter is the babirusa, or true hog deer. Buffaloes are kept by the Dutch. The river Abbo likewise affords shelter to immense alligators, which are said in some cases to attack people in boats. Bouro was once subject to the king of Ternati; but the Dutch influence has been long predominant; they principally value it as yielding rice and sago for Amboyna, from which it is distant fifty-five miles west. Their fort stands in long. 12° 4’ E., lat. 3° 24’ S.

BOURTANG, a town and fortress of Groningen, in the Netherlands, surrounded by an extensive morass of the same name, which extends to Lower Munster. It was taken by the Spaniards in 1593; besieged unsuccessfully by the bishop of Munster in 1672, and taken by the French in 1795. It is twelve miles S.S.W. of Winschoten.

BOUSE, } Dutch, *buysen*. According to Bou-y’, } Kilian, the buyse is a cup with two handles, which, on account of its size, is taken up and set down with both hands: hence to drink lavishly; to tope.

As he rode, he somewhat still did eat,
And in his hand did bear a *bousing can*,
Of which he sipt. *Faerie Queene.*

With a long legend of romantick things,
Which in his cups the *bousy* poet sings. *Dryden.*

The guests upon the day appointed came,
Each *bousy* farmer with his smirking dame. *King.*

BOUSTROPHEDON, in literature, an ancient method of writing among the Greeks, wherein the lines were continued forwards and backwards, like the furrows in plowing. Pausanias mentions several ancient inscriptions written in this manner: the laws of Solon are said to have been thus written. The second line is turned on the contrary side, beginning at the end of the former, thus:

EK ΔΙΟΣ ΑΡ-
ΨΟΞΕΚΩΝ

BOUT, *n. s.* See BOUGHT. Ital. *botta*, a turn; as much of an action as is performed at one time, without interruption; a single part of any action carried on by successive intervals.

The play began: Pas durst not Cosma chase;
But did intend next *bout* with her to meet. *Sindey.*

Ladies, that have your feet
Unplagued with corns, we’ll have a *bout*. *Shakespeare.*

When in your motion you are hot,
As make your *bouts* more violent to that end,
He calls for drink. *Id.*

If he chance to ’scape this dismal *bout*,
The former legatees are blotted out. *Dryden.*

A weasel seized a bat; the bat begged for life:
says the weasel, I give no quarter to birds: says the bat, I am a mouse; look on my body: so she got off for that *bout*. *L’Estrange.*

We’ll see when ’tis enough,
Or if it want the nice concluding *bout*. *King.*

BOUTADE, in music, an irregular flight or movement, without art or study.

BOUTAEL, in ichthyology, the name of an East Indian fish, of the lamprey kind, called also neegen oogen, and by Mr. Ray, *lampetra Indica*. It is caught in lakes, ponds, and other standing waters, and is a very wholesome and well tasted fish. From its general description, it seems to be rather of the *mustela* than the *lampetra* kind; but if, as its name expresses, it has several apertures for the gills, its Dutch name signifying nine eyes, it is absolutely a new genus.

BOUTANT, or **ARCH-BOUTANT**, in architecture, an arch, or part of an arch, abutting against the reins of a vault to prevent its giving way.

BOUTANT PILLAR, a large chain or pile of stone, made to support a wall, terrace, or vault.

BOUTE, in the menage, an epithet for a horse, when his legs are in a straight line from the knee to the coronet: short-jointed horses are apt to boute, but not long-jointed ones.

BOUTON, an island near the south-east coast of Celebes, about eighty-five miles in length, by twenty to thirty in breadth. It is high and woody, abounding in fruits and vegetables, and on the whole not ill cultivated. Buffaloes are found wild in large herds; and in the woods there are deer and wild boars. The inhabitants are of tawny complexion, short stature, and very ugly. On the coast they speak the Malay language, and are Mahomedans. The Island is well peopled, but little known internally; its peace is constantly disturbed by the invasion of pirates; who however are frequently captured by the natives, and sold as slaves. It is said to be governed by a sultan, whose dominion extends over the neighbouring island Pangesani, and some others. His residence is at the town of Bouton, in a stone fort. This town is at the top of a steep declivity near the entrance of the straits, on the north-west coast, and is surrounded with thick walls. The streets are straight and narrow; and the houses built of bamboo, covered with palm leaves, consist but of one story. The inhabitants manufacture a quantity of cotton cloth; of very fine texture, and bearing a good price. They barter for hardware and cutlery, but prefer money. The Dutch formerly had a factory, together with a detachment and an officer, here; but after these had been massacred, about a century ago, they were not replaced. Forts are built throughout the country, on the most inaccessible heights. The town of Bouton is in long. 122° 30' E., lat. 5° 28' S.

BOUTONNE, a river of France in the department of the Lower Charente, which rises in the cidevant province of Poitou, becomes navigable at St. Jean D'Angely, and falls into the Charente.

BOW', v. & n.	} Bow is the past tense and past participle of the Ang.-Sax. bygan. To bend; to curve; to crook; to arch; to incline; to decline. In every application of this word, however its modes of signification may be affected by its connexion, it always means one and the same thing, viz. bended or curved. The verb is used, to give way; to yield; to submit; to slip aside; to avoid danger, by bending or shrinking.
Bow'ing,	
Bow'back,	
Bow'hand,	
Bow'bent,	
Bow'man,	
Bow'er,	
Bow'shot,	
Bow'yer,	
Bow'string.	

Take, I pray thee, thy weapons, thy quiver, and thy bow, and go out to the field, and take me some venison.

I do set my bow in the cloud, and it shall be for a token of a covenant between me and the earth.

Id. ix. 13.

And eke he brake his arrows and his bowe,
And after that thus spake he to the crowe.

Chaucer's Canterbury Tales.

He saw befor him ride

A gay yeman under a forest side;
A bow he bore, and arwe bright and kene.

He had upon a courtiepy of grene,

An hat upon his hed with fringes blake,

Sire, quod the Sompnorer, haile, and wel atake. *Id.*

She sees her son, her God.

Bow with a load

Of borrowed sins; and swim

In woes that were not made for him.

Crashaw's Sancta Maria Dolorum.

Ye gods of love that pitie lovers paine,
(If any gods the paine of lovers pitie),

Looke from above, where you in joys remaine,

And bow your cares unto my doleful dittie. *Spenser.*

Perdie with love thou diddest fight;

I know him by a token.

For once I heard my father say,

How he him caught upon a day,

(Whereof he will be wroken,)

Entangled in a fowling net,

Which he for carrion crows had set,

That in our pear-tree haunted;

He said he was a winged lad,

But bowe and shaftes as then none had,

Els had he sore been daunted. *Id.*

Cupid and my Campaspe played

At cards for kisses, Cupid paid;

He stakes his quiver, bow, and arrows,

His mother's doves, and team of sparrows;

Loses them too, then down he throws

The coral of his lip, the rose

Growing on's cheek (but none knows how),

With these the crystal of his brow,

And then the dimple of his chin,

All these did my Campaspe win.

At last he set her both his eyes,

She won, and Cupid blind did rise.

O Love has she done this to thee,

What shall, alas! become of me!

Lyly's Alexander and Campaspe.

As the ox hath his bow, Sir, the horse his curb, and the faulcon his bells, so man hath his desire. *Shakspeare.*

A threepence bowed would hire me,

Old as I am, to queen it. *Id.*

Orpheus, with his lute, made trees,

And the mountain tops that freeze,

Bow themselves when he did sing. *Id.*

Rather let my head

Stoop to the block, than these knees bow to any,

Save to the God of heaven, and to my king. *Id.*

Surely he shoots wide on the bow-hand, and very far from the mark. *Spenser's Ireland.*

This is the great idol to which the world bows; to this we pay our devoutest homage. *Decay of Piety.*

The white faith of history cannot show

That e'er the musket yet could beat the bow.

Allegne's Henry VII.

A sybil old, bow-bent with crooked age,

That far events full wisely could presage. *Milton.*

To bow and sue for grace,

With suppliant knee, and deity his power,

Who from the terror of this arm so late

Doubted his empire; that were low indeed;

That were an ignominy and shame beneath

This downfall.

Milton's Paradise Lost.

Their instruments were various in their kind;
Some for the *bow*, and some for breathing wind:
The sawtry, pipe, and hautboy's noisy band,
And the soft lute trembling beneath the touching
hand. *Dryden's Fables.*

A warped *bow*, though strung with silken threads,
And crooked arrowes, tipt with golden heads,
Delight not archers, yet such uselesse toys
Be fit enough for buglers and for boyes.

George Wither.

Good folks take heed; for here's a wanton wagge,
Who, having *bowes* and arrowes, makes his bragg
That he hath some unhappy trick to play;
And vows to shoot at all he meets to-day.
Pray be not careless; for the boy is blinde,
And sometimes strikes, where most he seemeth kinde:
This rambling archer spares nor one, nor other;
Yea otherwhile the monkey shoots his mother. *Id.*

Curse on this love, this little scare-crow love
That frights fools with his painted *bow* of lath
Out of their feeble senses. *Ottaway's Orphan.*

Though he were not then a *bow-shot* off, and made
haste; yet, by that time he was come, the thing was
no longer to be seen. *Boyle.*

Some clergy too she would allow,
Nor quarrelled at their awkward *bow*. *Swift.*

They smile and *bow*, and hug and shake the hand,
Even while they whisper to the next assistant
Some cursed plot to blast its owner's head

Beller's Injured Innocence.

Now wasting years my former strength confound,
And added woes may *bow* me to the ground. *Pope.*

Yet still a lover's warmth he shows,
And makes his visits and his *bows*. *Somerville.*

There the sycophant, and he
That with bare-headed and obsequious *bows*
Begs a warm office, doomed to a cold jail
And groat per diem, if his patron frown.

Coutper's Task.

Meantime refracted from yon eastern clouds,
Bestrident earth, the grand ethereal *bow*
Shoots up immense, and every hue unfolds
In fair proportion, running from the red
To where the violet fades into the sky. *Thomson.*

Perchance she died in youth: it may be, *bowed*
With woes far heavier than the ponderous tomb
That weighed upon her gentle dust; a cloud
Might gather o'er her beauty, and a gloom
In her dark eye, prophetic of the doom
Heaven gives its favorites—early death. *Byron.*

Or view the Lord of the unerring *bow*,
The God of life, and poesy, and light,
The sun in human limbs arrayed, and brow
All radiant from his triumph in the night;
The shaft hath just been shot, the arrow bright
With an immortal's vengeance; in his eye
And nostril beautiful disdain, and night,
And majesty, flash their full lightnings by,
Developing in that one glance the Deity. *Id.*

Bow, as above defined, is also called the long bow, by way of distinction from the cross bow. The bow is the most ancient, and the most universal of weapons. It has been found to obtain among the most barbarous people who had the least communication with the rest of mankind. Barbarous nations often excel in the fabric of the particular things which they have the greatest necessity for in the common offices of life. The Laplanders, who support themselves almost entirely by hunting, have an art of making bows, which we, in these improved parts of the world,

have never arrived at. Their bow is made of two pieces of tough and strong wood, shaved down to the same size and flatted on each side; the two flat sides of the pieces are brought closely and evenly together, and then joined by means of a glue made of the skins of perch, which they have in great plenty, and of which they make a glue superior in strength to any which we have. The two pieces, when once united in this manner, will never separate, and the bow is of much more force to expel the arrow, than it could possibly have been under the same dimensions if made of only one piece. Among the ancients, the bow-string, called *τρίχωςτος*, was made of horse hair, and hence also called *ἰππεία*; though we find Homer's bow-strings frequently made of hides cut into small thongs; whence *τοῖα βόττα*. The uppermost part of the bow, to which the string was fastened, was called *κορὴν*, being commonly made of gold, and the last thing towards finishing the bow. The Grecian bows were frequently beautified with gold or silver; whence we have mention of aureus arcus; and Apollo is called *Ἀργυροτόχος*. But the matter of which they were ordinarily composed, seems to have been wood; though they were anciently, Scythian-like, made of horn, as appears from that of Pandarus in Homer's *Iliad*. δ. v. 105. The invention of the bow is usually ascribed to Apollo, by whom it was communicated to the primitive inhabitants of Crete, who are said to have been the first people who understood the use of bows and arrows. And hence, even in later ages, the Cretan bows were famous, and preferred by the Greeks to all others. Some, however, rather choose to honour Perses, the son of Perseus, with the invention of the bow; while others ascribe it to Scythes, son of Jupiter, and progenitor of the Scythians, who were excellent at this art, and by many reputed the first masters of it. From them it was derived to the Grecians, some of whose ancient nobility were instructed by the Scythians in the use of the bow, which in those days passed for a most princely education. It was first introduced into the Roman army in the second Punic war. The Scythian bow was famous for its incurvation, which distinguished it from the bow of Greece and other nations; being so great as to form a half moon or semicircle: whence the shepherd in *Athenæus*, in describing the letters in Theseus's name, and expressing each of them by some apposite resemblance, compares the third to the Scythian bow; meaning not the more modern character Σ, but the ancient C, which is semicircular, and has the third and sixth place in Θ ΗΣΥΕΥC. The Indians still retain the bow. In the repository of the Royal Society there is a West Indian bow two yards long. The use of the bow and arrow was first abolished in France under Louis XI. in 1481, and in their place was introduced the Swiss arms; viz. the halberd, pike, and broad sword. The long bow was formerly in great vogue in England; most of our victories in France were acquired by it; and many laws were made to regulate and encourage its use. See ARCHERY. The parliament under Henry VIII. complain of the disuse of the long bow, 'heretofore the safe-

guard and defence of this kingdom, and the dread and terror of its enemies.' 33 Hen. VIII. cap. 6. The art of using bows is called archery, and those practised therein, archers, or bowmen. The strength of a bow may be calculated on this principle, that its spring i. e. the power whereby it restores itself to its natural position, is always proportionate to the distance of space it is removed therefrom. See ARTILLERY, ANCIENT.

Bow, for taking the sun's altitude, consisted of a large arch of 90° graduated, a shank or staff, a side vane, a sight vane, and an horizon vane. It is now out of use.

Bow, in music, a small machine, which, being drawn over the strings of a musical instrument, makes it resound. It is composed of a small stick, to which are fastened eighty or a hundred horse-hairs, and a screw which serves to give these hairs a proper tension. In order that the bow may touch the strings briskly, it is usual to rub the hairs with resin. The ancients do not appear to have been acquainted with bows of hair; in lieu of which they touched their instruments with a plectrum; over which our bows have great advantage, for giving long and short sounds, and other modifications which a plectrum cannot produce.

Bow, in navigation, an arch of the horizon comprehended between some distant object and that point of the compass which is right a-head, or to which the ship's stern is directed. The phrase 'on the bow' is equally applicable when the object is beheld from the ship, or discovered by trigonometrical calculation: As, we saw a fleet at day-break bearing three points on the star-board-bow; that is, three points from that part of the horizon which is right a-head, towards the right-hand. See BEARING.

Bow, in ship-building, the rounding part of a ship's side forward, beginning at the place where the planks arch inwards; and terminating where they close, at the stem or prow. It is proved by a variety of experiments that a ship with a narrow bow is much better calculated for sailing swiftly than one with a broad bow; but is not so well fitted for a high sea, into which she always pitches or plunges her fore-part very deep, for want of sufficient breadth to repel the volume of water which she so easily divides in her fall. The former of these is called by seamen a lean, and the other a bluff bow. 'The bow which meets with the least resistance in a direct course, not only meets with least resistance in oblique courses but has the additional property of driving the least to leeward; which is a double advantage gained by forming the bow so as to give it that figure which will be least resisted in moving through any medium.' *Bouguer Traité de Navire*.

Bow, or DRILL-BOW, among artificers, an instrument so called from its figure; used by goldsmiths, gunsmiths, locksmiths, watchmakers, &c. for making a drill go. Among turners it is the name of a pole fixed to the ceiling, to which they fasten the cord that whirls round the piece to be turned.

Bow, CROSS, or ARBALEST, consists of a steel bow, set in a shaft of wood, furnished with a string and a trigger; and is bent with a piece of

iron fitted for that purpose. It serves to throw bullets, large arrows, darts, &c. The ancients had large machines for throwing many arrows at once, called balistæ. See ARTILLERY.

Bow of A SADDLE, the fore bow which sustains the pommel, is composed of the withers, the breasts, the points or toes, and the corking. The hind bow bears the trosequin or quilted roll. The bows are covered with sinews to make them strong, and strengthened with bands of iron to keep them tight; and on the lower side are nailed the saddle straps, with which they make fast the girths.

Bow DYE, a kind of scarlet red, superior to madder; but inferior to the true scarlet grain for fixedness and duration. It was brought into England, and first practised at the village of Bow, near London, by Kephler, a Dutchean, in 1643.

BOWDICH (Thomas Edward), an enterprising modern traveller, was born at Bristol, in 1793, and received his education partly in his native city and partly at Corsham, in Wilts. He went for a short time, to Oxford, and was soon matriculated; and, marrying early, commenced business at Bristol. In 1814 he went to Cape Coast castle as a writer in the service of the African Company, the governor of that place being his uncle. The following year he was appointed second in an embassy to the king of Ashantee, which trust he discharged so satisfactorily as to be promoted to the head of the mission. Returning to England, in 1816, he prepared an Account of the Ashantees, and a detail of the mission, in one quarto volume, embellished with curious plates. After the publication of this work in 1819, Mr. Bowdich went to France, where he translated a Treatise on Taxidermy, and Mollien's Travels to the Sources of the Senegal and Gambia. He also wrote, An Essay on the Geography of North-west Africa, accompanied by a map of his own drawing. To this performance succeeded An Essay on the Superstitions, Customs, and Arts, common to the ancient Egyptians, Abyssinians, and Ashantees; and a piece entitled The Contradictions in Park's Last Journal Explained. This was followed by A Mathematical Investigation, with Original Formulæ for Ascertaining the Longitude at Sea by Eclipses of the Moon. Mr. Bowdich sailed for Lisbon, in August 1822, accompanied by his wife, where he collected information respecting the Portuguese discoveries in Angola and Mozambique, the result of which has been since published. His destination was for the river Gambia, where he undertook a survey of its course, in the execution of which he caught a fever, and died Jan. 10th, 1824. Mrs. Bowdich, since his death, has prepared for the press, A Description of the Island of Madeira, with a Narrative of her husband's last Voyage, Remarks on the Cape de Verd Islands, and a Description of the English Settlements on the Gambia. Mr. Bowdich is said to have been a good classic, and to have been sufficiently versed in the physical and mathematical sciences to have rendered him a traveller of great eminence.

BOWDLER (John and Thomas), were the sons of a banker in London, the former was born March 18th, 1746. He was placed, at an early

age, under the tuition of Mr. Graves, of Claverton, near Bath, the well known author of the *Spiritual Quixote*. Thence he was removed to a school at Brompton, and finally, to the academy of the Rev. Mr. Brett, at Spring Grove, with whom he continued till his entrance at the Temple in 1765; but, being of a feeble constitution, and possessing a good fortune, he never followed the law as a profession. In 1778 he married the daughter of Mr. Hanbury, vice consul of the English factory at Hamburgh, by whom he had a numerous family. In this lady he had the happiness to find a woman of unusually strong judgment, enriched with knowledge; yet adorned with a meek and quiet spirit. The family was prolific in talent. Mr. Bowdler's eldest sister had a peculiar facility in acquiring languages; and her ardent piety, and genius are exhibited in a volume of poems and essays, published after her death, in 1784, for the benefit of the Bath hospital. The following year Mr. Bowdler's father died, on which he removed to Seven Oaks, in Kent, next to Hayes, and afterwards to Eltham; where he exerted himself in a variety of good works. Here he published *Reform or Ruin, Take Your Choice*; a tract on Religious Education; and some other useful works. He died June 29th 1823.

Thomas Bowdler, Esq. F.R.S. and S.A. died at Rhyddings in the parish of Swansea, in 1824, at the age of seventy, and published *The Family Shakspeare*; in which the offensive passages of the poet have been removed with considerable taste and judgment. He performed the same work of expurgation on Gibbon's *Decline and Fall of the Roman Empire*. He was, also, the author of a volume of travels; a memoir of Lieutenant General Vilettes; and other works.

BOWEL, v. & n. Fr. *boyau, boyaux*. Ju-BOWELS, } nius thinks that the Eng-BOWELLESS, } lish word is taken from-BOWELPRIER. } bow, to bend; to wind; to twist; on account of the folds and convolutions of the bowels within us: intestines, the vessels and organs within the body; the inner part of any thing; tenderness; compassion; the seat of pity or kindness.

His bowels did yearn upon him. *Genesis.*

He smote him therewith in the fifth rib, and shed out his bowels. *2 Sam. xx. 10.*

And the bowel-prying soothsayer (as it is reported) shewed to Decius the head of the liver on the inner side wounded (as it were) and cut off.

Holland. Livius.

His stalking steps stayde

Upon a slaggie oke which he had torne
Out of his mother's bowelles, and it made
His mortal mace, wherewith his foeman he dismayde. *Spenser.*

Had we no quarrel else to Rome, but that
Thou art thence banished, we would muster all
From twelve to seventy; and pouring war
Into the bowels of ungrateful Rome,
Like a bold flood appear. *Shakspeare.*

His soldiers spying his undaunted spirit,
A Talbot! Talbot! cried out again,
And rushed into the bowels of the battle. *Id.*

Hector gave Ajax a sword, which so long as he fought against enemies, served for his help and de-

fence; but after he began to hurt harmless creatures with it, turned to his own hurtless bowels.

Burton. Anat. of Mel.

He had no other consideration of money, than for the support of his lustre; and whilst he could do that, he cared not for money; having no bowels in the point of running in debt, or borrowing all he could.

Clarendon.

Miserable men commiserate not themselves; bowels unto others, and merciless unto their own bowels.

Browne.

Nay you, yourselves, do sometimes find the paines Of sickness in your bowels and your veins;
The harbingers of death, sometime begin
To take up your whole bodie for their ine.

George Wither.

As he saw drops of water distilling from the rock, by following the veins, he has made himself two or three fountains in the bowels of the mountain. *Addison.*

Behold at hand,

With three months training on his head,
An instrument whom I have bred,
Born of these bowels far from sight
Of virtue's false but glaring light;
My youngest born, my dearest joy,
Most like myself, my darling boy.

Churchill's Duellist.

They threw him [Edward II.] on a bed; held him down violently with a table, which they flung over him; thrust into his fundament a red-hot iron, which they inserted through a horn; and though the outward marks of violence upon his person were prevented by this expedient, the horrid deed was discovered to all the guards and attendants by the screams with which the agonizing king filled the castle while his bowels were consuming. This horrid murder was perpetrated 21st of September, 1327.

Hume. Hist. England.

BOWELS. See ANATOMY.

BOWER (Archibald), a writer of some celebrity, but principally remarkable for his religious vacillations was born near Dundee, of Catholic parents, in 1686. He received his education at the Scots College in Douay, after which he went to Rome, and became a member of the order of the Jesuits. In 1726 he settled at Macerata, where he enjoyed, as he states, the place of counsellor to the Inquisition, but quitted it in 1726, and fled to England, professing himself a convert to Protestantism. Here he was engaged as a tutor in a nobleman's family, and, for a while, conducted the *Historia Literaria*, a monthly review of books. He also wrote part of the *Universal History*, in sixty vols. 8vo. He is now said to have given, or lent, money to the society of the Jesuits, and to have purchased his re-admission among them about the year 1744. In 1748 he published, by subscription, the first volume of a *History of the Popes*, and the same year, through the interest of the honorable George Lyttleton, was appointed keeper of the queen's library. His history displayed such violent zeal against popery, as exposed him to the animadversions of Mr. Alban Butler, a learned Catholic; while its literary merits were at the same time severely canvassed by Dr. Douglas, afterwards bishop of Salisbury. His money transactions with the Jesuits coming, also, to light, he was now generally believed to be destitute of all moral or religious principle, and died, almost friendless, in 1766. Lord Lyttleton is said, however, always to have been his patron.

BOWER, *v. & n.* } Bower, in the present
 BOWER-ANCHOR, } acceptation of the word,
 BOWER'MAN, } signifies a seat shaded
 BOWERY. } with boughs; an arbor;
 Danish, *buur*, signifying a cage; Goth. and
 Swed. *bur*; Sax. *bur*; Teut. *bauer*, a dwelling;
 an apartment, from Goth. *buā*. Junius thinks
 bower is so called because formed of the bows
 or boughs of trees. Bower-anchor, with us, ap-
 pears to be named from the bow of the ship;
 but in Belgic from having a buoy attached to it.

What Alison! heres thou not Absolon,
 That chanteth thus under our *boures* wal?

Chaucer's Canterbury Tales.

Full sooty was her *boures*, and eke her halle;
 In which she ete many a slender mele;
 Of poignant sauce ne knew she never a dele,
 No deintee morsel passed through her throte,
 Hire diete was accordant to hire cote. *Id.*

Full many a maide, bright in *bour*,
 They mourned for him, par amour,
 When hem were bet to slepe,
 But he was chaste and no lechour,
 And swete as is the bramble flour,
 That beareth the red hepe.

Id. Rime of Sire Thopas.

And though they faulty were, yet well he wayde,
 That God to us forgiveth every howre
 Much more than that why they in bands were layd;
 And he that harrowed hell with heavy stowre,
 The faulty soules from thence brought to his heavenly
bourre. *Spenser.*

From a close *bower* this dainty musique flowed—
 A *bower* apparel'd round with divers roses,
 Both red and white, which by their liveries showed
 Their mistris faire, that there herselfe reposes;
 Seemed that would strive with those rare musique
 closes,

By spreading their faire losomes to the light,
 Which the distracted sense should most delight;
 That raps the melted eare, this both the smel and
 sight. *Id. Brittain's Ida.*

Thou didst *bower* the spirit
 In mortal Paradise of such sweet flesh. *Shakespeare.*

Alone they passed
 On to their blissful *bower*,—it was a place
 Chosen by the sovran planter, when he framed
 All things to man's delightful use; the roof,
 Of thickest covert, was inwoven shade,
 Laurel and myrtle, and what higher grew
 Of firm and fragrant leaf; on either side
 Acanthus and each odorous bushy shrub
 Fenced up the verdant wall; each beauteous flower,
 Iris, all hues, roses and jessamin
 Reared high their flourished heads between and
 wrought

Mosaic; underfoot the violet,
 Crocus, and hyacinth, with rich inlay
 Broïdered the ground, more coloured than with store;
 Of costliest emblem. *Milton.*

But O, sad virgin, that thy power
 Might raise Musæus from his *bower.* *Id.*

The gods appealing, when I reach their *bowers*
 With loud complaints, they answer me in showers. *Waller.*

Prophet, take notice, I disclaim thy paradise,
 Thy fragrant *bowers* and everlasting shades;
 Thou hast placed woman there—and all thy joys
 Are tainted. *Rouée's Tamerlane.*

Refreshed, they wait them to the *bower* of state,
 Where, circled with his peers, Atrides sat. *Pope.*

Landships how gay the *bowery* grotto yields,
 Which thought creates, and lavish fancy builds!
Tickell.

Snatched through the verdant maze, the hurried
 eye

Distracted wanders; now the *bowery* walk
 Of covert close, where scarce a speck of day
 Falls on the lengthened gloom, protracted sweeps.

Thomson.

Let not the fervent tongue,
 Prompt to deceive, with adulation smooth,
 Gain on your purposed will: nor in the *bower*,
 Where woodbines flaunt and roses weave a couch,
 While Evening draws her crimson curtains round,
 Trust your soft minutes to betraying man. *Id. Spring.*

Dear lovely *bowers* of innocence and ease,
 Seats of my youth, where every sport could please;
 How often have I loitered o'er thy green,
 Where humble happiness endeared each scene.

Goldsmith's Deserted Village.

And, as in beauty's *bower* he pensive sate,
 Poured forth this unpremeditated lay,
 To charms as fair as those that soothed his happier
 day. *Byron's Child Harold.*

BOWER, in gardening, differing only from an
 arbor, as being round or square, and made with
 a kind of dome or ceiling at top; whereas the
 arbor is always built long and arched. This,
 as well as the harbor, is generally formed of tim-
 ber lattice work, sometimes of woven rods, or
 wicker work, and occasionally of wire. It may
 be shaded with fruit trees, or with climbing or
 herbaceous shrubs.

BOWERS, in the sea language, are generally
 two, called first and second, great and little, or
 best and small bowers. See ANCHOR.

BOW ISLAND, an island in the South Pacific
 Ocean, near the eastern extremity of the So-
 ciety Isles. It was discovered by captain Cook
 on the 5th of April 1769, during his first voyage.
 It is about ten or twelve leagues in compass,
 lies low, and is of a very extraordinary figure,
 being shaped like a bow. The arch and cord
 are land, the space between them water. The
 cord is a flat beach, three or four leagues long, but
 not above 200 yards broad to appearance. It is
 entirely destitute of vegetation, exhibiting no-
 thing but heaps of sea-weed, lying in ridges,
 as they are left by the tide, but most of the arch
 was seen covered by trees of different heights, and
 smoke was seen rising from different parts of the
 island. No bottom was found half-way along the
 beach, with a line of 130 fathoms. Long. 141°
 12' W., lat. 18° 23' S.

BOWL, *v. & n.* } The hollow of a cup;
 BOWL'ER, } a wooden ball; a round
 BOWL'ING, } mass: Goth. *dau*; and
 BOWL'ING-GREEN. } Sax. *bolla*; Armoric, *beol*;
 the Gothic word signified rotundity, either con-
 cave or convex. To bowl is to play with bowls:
 to roll any thing along; bowling-green, a smooth
 shaven sward, prepared as the place for playing
 at bowls.

Bring, eke, with you a *bolle*, or elles a panné,
 Ful of water: and ye shul wel see, thanne,
 How that our businesse shal thrive and peve.

Chaucer. Cant. Tales.

And who can counsell a thirstie soule
 With patience to forbear the offered *boule.* *Spenser.*

But the main matter is so to convey the water,
as it never stay either in the *bowl* or in the cistern.

Bacon.

Give me a *bowl* of wine ;
I have not that alacrity of spirit
Nor cheer of mind that I was wont to have.

Shakespeare.

Like to a *bowl* upon a subtle ground,
I've tumbled past the throw.

Id.

How finely dost thou times and seasons spin ?
And make a twist checkered with night and day !
Which, as it lengthens, winds, and winds us in,
As *bowls* go on, but turning all the way. Herbert.

If a piece of iron be fastened on the side of a *bowl*
of water, a loadstone, in a boat of cork, will make
unto it.

Brown.

A *bowl* equally poised, and thrown upon a plain
bowling-green, will run necessarily in a direct line.

Bentley.

Like him, who would lodge a *bowl* upon a precipice,
either my praise falls back, or stays not on the
top, but rows over.

Dryden.

Men may make a game at *bowls* in the summer,
and a game at whist in the winter.

Dennis's Let.

Though that piece of wood, which is now a *bowl*,
may be made square, yet, if roundness be taken away,
it is no longer a *bowl*.

Watts's Logic.

With flowing *bowls* from life's eternal spring
And heavenly fruits refresh my fainting soul. Rowe.
Meantime the vigorous dancers beat the ground,
And songs were sung, and flowing *bowls* went round.

Pope.

Did not the painted kings of India greet
Our queen, and lay their sceptres at her feet :
Chiefs who full *bowls* of hostile blood had quaffed,
Famed for the javelin and envenomed shaft,
Whose haughty brows made savages adore,
Nor bowed to less than stars or suns before.

Tickell's Miscellanies.

Death leads the dance, or stamps the deadly die,
Nor ever fails the midnight *bowl* to crown.

Young's Night Thoughts.

BOW-LEGGED, OR BANDY-LEGGED. Some children are bow-legged from their birth; others become so from setting them on their feet too early. The tibia of some is crooked; the knees of others are distorted; from a fault in the ankle, the feet of some are turned inwards. These are called *vari*; and in others, who are called *valgi*, they are turned outwards. The best method of preventing these disorders in weakly children is to exercise them duly, but not violently, by tossing them about in one's arms; and not setting them much upon their feet, at least not without properly supporting them; if the disorder attends at the birth, or increases after it is begun, apply emollients, then boots of strong leather, wood, &c. so as gradually to dispose the crooked legs to a proper form. Other instruments may be used instead of boots, which, when not too costly, are usually to be preferred. Slighter instances of these disorders yield to careful nursing, without instruments. The cold bath has been recommended, and may often be of service; but if the child be very weak, it will do more hurt than good. A strengthening diet will always be of service.

BOW-LINE, s. a cord fastening the sails of a ship. Swed. *boglina*, *bolin*; Belg. *boelyn*; Fr. *boline*. From bunt, swelling with the wind; and line, a slender string. Lat. *linca*; Fr. *line*.

BOW-LINES are only used when the wind is so unfavorable that the sails must be all braced sideways, or close hauled to the wind. In this situation the bow-lines are employed to keep the weather or windward edges of the principal sails tight, forward, and steady, without which they would always be shivering, and rendered incapable of service. To check the bow-line is to slacken it, when the force of the wind requires it.

BOWLING, the art of playing at bowls. This game is practised either in open places, as bays and bowling-greens, or in close bowling-alleys. The sides being selected, each player has two bowls, which have numerical figures, to ascertain to whom they belong. The leader sends off a smaller bowl, called the jack, to what distance he pleases, it being by the toss his privilege so to do: this he follows with his first bowl, getting as near the jack as possible: he is then followed by one of the adverse party, the partner of the first following, and so in rotation till all the bowls are played; as many of the bowls, on either side, as are nearer to the jack than the nearest on the opposite side, so many do the successful party score that time towards the game, and so on in succession, till one side or the other have won the match. Sometimes, a ball, lying very near the jack, is removed to a distance by the hit of an adversary's bowl, which remains nearer the jack than the bowl it has driven away: this is called a rub. Strutt gives a plate from a manuscript preserved in the Royal Library, 20 Ed. IV., which represents bowling, as early as the thirteenth century. It was, at one time, a game in great repute in the higher ranks of society. Charles I. was fond of it, and it formed, according to comte de Grammont, a daily share in the diversions of the court of Charles II. at Tunbridge.

BOW-NET, OR BOW-WHEEL, an engine for catching fish, chiefly lobsters and craw-fish, made of two round wicker baskets, pointed at the end, one of which is thrust into the other; at the mouth is a little rim, four or five inches broad, somewhat bent inwards. It is also used for catching sparrows.

BOW-SPRIT, s. The mast projecting from the bow of a ship. From bow and sprit; sprit signifies to shoot, spurt, spout. Goth. *sprida*, *sprita*; Swed. *spruta*, to eject; Belg. *spriet*; the spar in a ship called the bowsprit.

Sometimes I'd divide,

And burn in many places; on the topmast,
The yards, and *boltsprits*, would I flame distinctly.

Shakespeare.

Then on the leeward sheet the seamen bend,
And haul the *bowline* to the bowsprit end.

Falconer's Shipreck.

BOWSPRIT, a large boom or mast, which projects over the stem, to carry sail forward, in order to govern the fore part of a ship, and counteract the force of the after-sails. It is otherwise of great use, as being the principal support of the fore-mast, by confining the stays whereby it is secured. See **STAY**. The rule for the rise of the bowsprit is an angle of nearly thirty-six degrees above the horizon.

The bowsprit should be two-thirds the length of the main-mast, and its thickness equal to the

mizen-mast: when it is twelve fathoms five feet long, its yards must be eight fathoms two feet long, and the topmast of the bowsprit three fathoms and one foot.

A BOWYER, or BOWMAKER, was anciently a distinct business from a fletcher, or arrow-maker. The company of bowyers was incorporated so late as 1620, and consists of a master, two wardens, twelve assistants, and thirty on the livery.

BOWYER (William), the most learned printer of his age, was born at White Friars, London, Dec. 17th, 1699. His father, whose name also was William, had been eminent in the same profession; and his maternal grandfather, Ichabod Dawks, was employed in printing bishop Walton's celebrated Polyglott Bible. Having acquired a grammatical education, under Mr. Ambrose Bonwicke, he made great advances in literature, and a firm attachment commenced betwixt him and his master. On the 30th Jan. 1713, his father's whole property being destroyed by fire, Mr. Bonwicke generously undertook the education of his pupil for another year. In 1716 young Bowyer was admitted a sizar at St. John's College, Cambridge, where he continued under Dr. Newcombe till June, 1722. Soon after this he had an opportunity of repaying Mr. Bonwicke's kindness, by officiating, some time after his death, as a schoolmaster for the benefit of his family. He next entered into the printing business along with his father. One of the first books which received the benefit of his correction was the complete edition of Selden in 3 vols. fol. by Dr. David Wilkins. It was begun in 1722, and finished in 1726; and Mr. Bowyer's great attention to it appeared in his drawing up an epitome of Selden de Synedriis, as he read the proof sheets. In 1727 he drew up an excellent sketch of W. Baxter's Glossary of the Roman Antiquities; called A View of a Book Entitled Reliquiæ Baxterianæ: in a letter to a friend; one sheet 8vo. By this first public proof of his abilities, Dr. Wotton and Mr. Clarke were highly pleased; but as it was never published, and very few copies printed, it is very seldom found with the glossary. In Oct. 1728 he married Miss Ann Prudom, his cousin, a very accomplished lady, by whom he had two sons; of whom William survived him. In 1729 he published a curious treatise, entitled, A Pattern for Young Students in the University; set forth in the life of Ambrose Bonwicke, some time scholar of St. John's College, Cambridge; which was generally ascribed to Mr. Bowyer, though it was in reality written by Mr. Bonwicke the elder. About this time Mr. Bowyer had written a pamphlet against the Separatists, though neither the title nor the occasion of it are now remembered. The same year, through the friendship of the R. H. Arthur Onslow, he was appointed printer of the votes of the House of Commons; which office he held for nearly fifty years. In 1731 he published, and, it is believed, translated Voltaire's Life of Charles XII. This year also his wife dying, he remained a widower till 1747, when he married Mrs. Elizabeth Bill, by whom he had no children. In 1733 he published, in two sheets 4to, *The Beau and the Academic*, being a translation from a Latin poem

recited that year at the Sheldonian theatre; and, in 1736, he was admitted into the Society of Antiquaries, where he became a useful member. In 1742 he published a translation of Trapp's Latin Lectures on Poetry, in which he was assisted by Mr. Clarke. In 1750 he annexed a prefatory critical dissertation, and some notes, to Kuster's Treatise De Usu Verborum Mediorum; a new edition of which, with farther improvements, appeared in 1773. He wrote likewise, about the same time, a Latin preface to Leedes's *Veteres Poetæ Citati*, &c. Being soon after employed to print an edition of Col. Bladen's translation of Cæsar's Commentaries, that work received considerable improvements from Mr. Bowyer's hands, with the addition of such notes in it as are signed Typogr. In 1751 he wrote a preface to Montesquieu's *Reflections on the Rise and fall of the Roman Empire*; translated the Dialogue between Sylla and Socrates; made several corrections to the work from the Baron's Spirit of Laws, and improved it with his own notes. A new edition, with many new notes, was printed in 1759. In 1751 he published the first translation that ever was made of Rousseau's paradoxical Oration, which gained the prize at the academy of Dijon in 1750; and which first announced that singular genius to the attention and admiration of Europe. On the publication of the third edition of Lord Orrery's *Remarks on the Life and Writings of Dr. Swift*, in 1752, Mr. Bowyer wrote and printed, but never published, *Two Letters from Dr. Bentley in the Shades below, to Lord Orrery in a Land of Thick Darkness*. The notes signed B, in the ninth 4to. vol. of Swift's works, are extracted from these letters. In 1753 he endeavoured to allay the ferment occasioned by the Jew bill; with which view he published, in 4to., *Remarks on the Speech made in Common Council, on the Bill for permitting Persons professing the Jewish Religion to be Naturalised*, so far as Prophecies are supposed to be affected by it. This little tract was written with spirit, and well received by all who were superior to narrow prejudices. Its design was to show that Christianity was in no danger of being prejudiced by the intended protection promised to the Jews. The same year some of Mr. Bowyer's notes were annexed to Bishop Clayton's Translation of A Journey from Grand Cairo to Mount Sinai and back again. In 1761 Mr. Bowyer was appointed printer to the Royal Society, through the interest of the earl of Macclesfield; and enjoyed that office till his death. In 1763 Mr. Bowyer published an excellent edition of the Greek Testament, in two vols. 12mo., which sold with great rapidity: the Conjectural Emendations were well received by the learned, and are thought valuable. The president and fellows of Harvard College, in Cambridge, expressed their approbation of this edition in very high terms; and reckoned it of more value than many large volumes of the commentators. A second edition of the Conjectures on the New Testament, with enlargements, was published in one vol. 8vo. in 1772. Dr. Warburton's *Divine Legation* received very considerable advantage from Mr. Bowyer's corrections; and this even in an edition which was necessarily given to another press. In

1761 he printed his *Doctrine of Grace*. In 1765, at the request of Thomas Hollis, Esq., Mr. Bowyer wrote a short Latin preface to Dr. Wallis's *Grammatica Linguae Anglicanae*. He wrote also a large English preface for it, which, however, still remains unprinted. In 1766 he wrote an excellent Latin preface to Joannis Harduini, Jesuitæ, ad Censuram Scriptorum veterum Prolegomena. Juxta Autographum. In 1767 he was appointed to print the Journals of the House of Lords, and the Rolls of Parliament. This year he printed Mr. Clarke's learned work on *The Connexion of the Roman, Saxon, and English Coins*; and wrote some notes upon it, which are interspersed with those of the author. Part of the Dissertation on the Roman Sesterce was likewise Mr. Bowyer's; and the index, which is an uncommonly good one, was drawn up by him entirely. In 1771 he printed a small pamphlet, entitled, *Remarks*, occasioned by a late Dissertation on the Greek and Roman Money. In 1773 he published three tracts, entitled *Select Discourses*. 1. Of the correspondence of the Hebrew months with the Julian, from the Latin of Professor Michaelis. 2. Of the Sabbatical years, from the same. 3. Of the years of jubilee, from an anonymous writer in Masson's *Histoire Critique de la Republique des Lettres*. In 1774 he corrected a new edition of Schrevelius's Greek Lexicon; to which he added a number of words (distinguished by an asterisk) which he had collected in the course of his studies. Considerable additions, still in MS., were made by him to the lexicons of Hederic and Buxtorf, the Latin ones of Faber and Littleton, and the English Dictionary of Bailey; and he left behind him many other proofs of his critical skill in the learned languages. In 1774 was published *The Origin of Printing*, in two essays. 1. The substance of Dr. Middleton's Dissertation on the Origin of Printing in England. 2. Mr. Meerman's Account of the Invention of the Art at Haarlem, and its Progress to Mentz, with Occasional Remarks, and an Appendix. The original idea of this valuable tract was Mr. Bowyer's; but it was completed by Mr. Nichols. During the last ten years of his life he was afflicted with the palsy and stone; yet he not only preserved a remarkable cheerfulness of temper, but was enabled to support the labor of almost incessant reading; and he regularly corrected the learned works, especially the Greek books, which came from his press. This he continued to do till near his death, which happened in November 1777, in his seventy-eighth year. For more than half a century Mr. Bowyer was unrivalled as a learned printer; and many of the most masterly productions of this kingdom have come from his press. To his literary and professional abilities he added an excellent moral character; and he was particularly distinguished by his inflexible probity, and an uncommon alacrity in relieving the necessitous. His life and character have been much illustrated by Mr. Nichols' *Anecdotes*, 1782.

BOX', s. Sax. *box*; *boxus* Latin, a shrub. The leaves are pennated and evergreen; it hath male flowers, that are produced at remote distances from the fruit, on the same tree; the fruit is shaped like a porridge-pot inverted, and

is divided into three cells, containing two seeds in each, which, when ripe, are cast forth by the elasticity of the vessels. The wood is very useful for engravers and mathematical instrument makers; being so hard, close, and ponderous, as to sink in water.—*Miller*.

There are two sorts; the dwarf *box*, and a taller sort. The dwarf *box* is good for borders, and is easily kept in order, with one clipping in the year. It will increase of slips set in March, or about Bartholomew tide; and will prosper on cold barren hills, where nothing else will grow. *Mortimer*.

Box', v. & n. } The substantive, signifies a
Box'EN. } case of wood. Sax. *box*, *bosg*;
Belg. *bus*; Teut. *buchse*; Armoric, *boest*; Fr. *boete*. These all signify a box or tube, and are supposed to be from *burus*, Lat.; Russ. and Scot. *boss*, means hollow; void; a case; a small chest; an enclosed spot; a snug dwelling.

This cursed man hath, in his hand, yhent,
This poison in a *box*. *Chaucer's Canterbury Tales*.

Thin ypcoras, and eke thy galianes,
And every *boiste* full of thy lectuarie,
God bless hem and our lady Seinte Marie. *Id.*

This messenger drank sadly ale and wine,
And stolen were his lettres prively
Out of his *box*, while he slept as a swine. *Id.*

A magnet, though put in an ivory *box*, will, through
the *box*, send forth his embracing virtue to a beloved
needle. *Sidney*.

Prince Arthur gave a *boxe* of diamond surc,
Embowed with gold and gorgeous ornament,
Wherein were closed few drops of liquor pure,
Of wondrous worth, and vertue excellent,
That any wound could heale incontinent. *Spenser*.

He was, to weete, a stout and sturdy thiefe,
Wont to rob churches of their ornaments,
And poore men's *boxes* of their due reliefe. *Id.*

About his sheldes

A beggarly account of empty *boxes*. *Shakspeare*.

Upon his belt (fastened with leather laces),
Black *boxes* hung, sheaths of his paper—swords
Filled up with writs, subpoenas, trial cases.

Fletcher's Purple Island.

Is it a *box* of pills

To cure the duke's ills?

He is too far gone to begin it!

Or does your fine show

In procession go

With the pix and the host within it. *Marvell*.

The young gentlemen learned, before all other
things, to design upon tablets of *boxen* wood. *Dryden*.

Her faded cheeks are changed to *boxen* hue,
And in her eyes the tears are ever new. *Id.*

'Tis left to you; the *boxes* and the pit
Are sovereign judges of this sort of wit. *Id.*

She glares in balls, front *boxes*, and the ring;
A vain, unquiet, glittering, wretched thing. *Pope*.

This casket India's glowing gems unlocks,
And all Arabia breathes from yonder *box*. *Id.*

'Twas this the morning omens seemed to tell;
Thrice from my hand the trembling patch-*box* fell.

Id. Rape of the Lock.

Box'd in a chair, the beau impatient sits,
While spouts run clattering o'er the roof by fits.

Swift.

One who makes himself talked of, though it be for
the particular cock of his hat, or for prating aloud in
the *boxes* at a play, is in a fair way of being a favor-
ite. *Spectator*.

As lads and lasses stood around,

To hear my *boxen* hautboy sound. *Gay*.

Sir Traffic's name, so well applied,
 Awaked his brother-merchant's pride ;
 And Thrifty, who had all his life
 Paid utmost deference to his wife,
 Confessed her arguments had reason ;
 And by the approaching summer season
 Draws a few hundreds from the stocks,
 And purchases his country *box*. *Lloyd.*

Box, *v. & n.*, to fight with fists; *Swed. bocka*; *Teut. bocken*; *Belgic, beuken*; signifying to strike, or probably to butt like a buck goat: and it is possible that this may have been the origin of our word; for in America butting was more used than what is now called boxing: *Gr. πρῦξ*; *Lat. pugio*; *Ro-maunce pois*, however, signifies the first.

For the *box* o' th' ear that the prince gave you, he gave it like a rude prince. *Shakspeare.*

If one should take my hand perforce, and give another a *box* on the ear with it, the law punisheth the other. *Bramhall.*

There may happen concussions of the brain from a *box* on the ear. *Wiseman's Surgery.*

Olphis, the fisherman, received a *box* on the ear from Thestylis. *Addison's Spectator.*

The fighting with a man's shadow consists in brandishing two sticks loaded with plugs of lead; this gives a man all the pleasure of *boxing*, without the blows. *Id.*

He hath had six duels, and four-and-twenty *boxing* matches in defence of his majesty's title. *Id.*

The ass very fairly looked on, till they had *boxed* themselves a-weary, and then left them fairly in the lurch. *L'Estrange.*

A leopard is like a cat; he *boxes* with his fore-feet as a cat doth her kitlins. *Grew.*

Box is also used for an uncertain quantity or measure; thus a box of quicksilver contains from 100 to 200 lbs.; a box of prunellas only 14 lbs.; a box of rings for keys, two gross, &c. See also *DICE BOX*, and similar compounds of *Box*, in their order.

Box, in botany. See *BUXUS*.

BOXERS, among the Romans, were called pugiles. The ancient boxers battled with great force and fury, insomuch as to dash out each others' teeth, break bones, and often kill each other. The strange disfigurements these boxers underwent were such that they frequently could not be known, and rendered them the subject of many railleries. In the Greek anthology there are four epigrams of Lucilius, and one of Lucian, wherein their disfigurements are pleasantly enough exposed.

BOX-HAULING, in sea language, a particular method of veering a ship, when the swell renders tacking impracticable; performed by keeping the helm hard-a-lee, and hauling off all; bracing about the head as well as the after-sails, hauling close forward the lee, fore and fore-top-bowlines, and up mizen and down after-stay-sails at the same time; the wind will then act upon the sails thus aback, and the water upon the lee-side of the rudder, by her stern way, will box the ship short round upon her keel, with her stern up to the wind, far enough aft for the after-sails to draw full the right way to act with the helm, which must be shifted hard-a-weather, when the stern-way ceases, so that the head-way with the wind so far aft will readily bring the ship round on the other tack. The main and fore-

tacks are easily got down when the wind is upon the quarter, and shivers the sails; the main-sheet is easily hauled aft, and the after-sails braced up and trimmed sharp, as the ship brings the wind more aft, which helps her round the faster, till the wind comes on the other quarter, that the mizen and mizen-stay-sail may be set to take the right way to bring her to the wind, while you tend and trim the head-sails as she comes home.

BOXHORNIIUS (Marc Zuerius), a learned critic, born at Bergen-op-Zoom in 1612, was professor of eloquence at Leyden, and at length of politics and history in the room of Heinsius. He published, 1. *Theatrum Urbium Hollandiæ*. 2. *Scriptores Historiæ Augustæ, cum Notis*. 3. *Poetæ Satyrici Minores, cum Comment.* 4. *Notes on Justin, Tacitus, and a great number of other works.* He died in 1653, aged forty-one.

BOXING, the exercise of fighting with the fists, either naked or with a stone or leaden ball grasped in them. It coincides with the pugilatus of the Romans. When the champions had σφαραι, or balls, whether of lead or stone, it was properly denominated sphæromachia. The ancient boxing differed from the pugna cæstum, in which the combatants had leathern thongs in their hands, and balls to assault their antagonists; though this distinction is frequently overlooked, and fighting with the cæstum ranked as a part of the business of pugiles. There were three species of boxing, viz. 1. both the head and hands naked; 2. the hands armed, and the head naked; and 3. the head covered with a kind of cap called amphotides, and the hands also furnished with the cæstus. Boxing is an ancient exercise, having been in use in the heroic ages. Those who prepared themselves for it, used all the means that could be contrived to render themselves fat and fleshy, that they might the better endure blows: whence corpulent men or women were called pugiles. In modern times this art has been in a manner appropriated by the English. A century ago, it formed a regular exhibition, encouraged by the first ranks of the nobility, and tolerated by the magistrates. A booth was erected at Tottenham Court, in which the proprietor, Mr. George Taylor, invited the professors of the art to display their skill, and the public to be present at their exhibition. The bruisers then had the reward due to their prowess, in a division of the entrance-money, which was sometimes £100 or £150. The general mode of sharing was for two-thirds to go to the winning champion, while the remaining third was the right of the loser; though sometimes by an express agreement of the parties, the conqueror and the vanquished shared alike. The nobility and gentry having complained of the inconveniences sustained at Taylor's Booth, prevailed on Mr. Broughton, who was then rising into note as the first bruiser in London, to build a place better adapted for such exhibitions. This was accordingly done in 1742, principally by subscription, behind Oxford road. The building was called Broughton's New Amphitheatre; and, besides the stage for the combatants, had seats corresponding to the boxes, pit, and galleries. After a course of years, however, these exhibitions became gradually less

patronised and frequented. Once, indeed, they seemed to be reviving, and for some time considerably engaged the attention of the public: but a fatal issue which attended one of them, brought the practice again into disrepute. One of the combatants was killed on the spot. The Prince of Wales was present, and declared he would have some settlement made on the nearest relation of the deceased, but that on account of the dreadful example he had then witnessed, he would never either see or patronise another stage fight.

BOXING, among sailors, is used to denote the rehearsing the several points of the compass in their proper order.

BOXING is also used for the tapping of a tree to make it yield its juice. The boxing of maple is performed by making a hole with an axe or chisel into the side of the tree about a foot from the ground; out of it flows a liquor of which sugar is made.

BOXTEL, a market town of the Netherlands, in Dutch Brabant, situated on the Dommel. It contains about 3000 individuals, and is provided with several sluices. Near this town an engagement took place, on the 14th of August, 1794, between the French army and allied British and Dutch troops, under the command of his Royal Highness the Duke of York, which ended in the defeat of the latter, and obliged him to retire behind the Maese. It is about five miles south of Bois-le-Duc.

BOY, *v. & n.* } A male child; a lad; Per-
BOY BLIND, { sian, *buch*; Goth. *buog*, *buick*,
BOY'ERY, { *puick*; Danish. *pog*; Swed.
BOY'ISH, { *bagge*; Irish, *buai*: the root
BOY'ISM, { of this word seems to be
BOY'SHIP. } Gothic, *ug*; Irish, *og*, young;
Armoric, *buchel*, and Fr. *puceau*, are from Lat. *puellus*: the verb, and sometimes the noun, is used contemptuously.

Our first fo, the serpent Sathanas,
That hath in Jewes herte his waspes nest,
Up swale and said; O, Ebraike people, alas!
Is this to you a thing that is honest,
That swiche a boy shal walken as him leste
In your despit, and sing of swiche sentence,
Which is again our lowes reverence?

Chaucer. *Cunt. Tales.*

One day it chanced, thrice happy day and chance!
While Loves were with the Graces sweetly sporting,
And to fresh musique sounding, play, and dance,
And Cupid's self, with shepherds' boys consorting,
Laughed at their pritty sport and simple courting,
Faire Venus seats the fearful boy close by her,
Where never Phœbus' jealous looks might eye her,
And bids the boy his mistress and her name descry
her.

Spenser's *Britain's Ida.*

Anthony
Shall be brought drunken forth, and I shall see
Some squeaking Cleopatra boy my greatness,
I' th' posture of a whore. Shakspeare.

Where is this Hector?

Come, come thou boy-queller, show thy face;
Know what it is to meet Achilles angry. Id.

Speak thou, boy,

Perhaps thy childishness will move him more
Than can our reasons. Id. *Coriolanus.*

They called the children that were past infancy
two years, irene; and the greatest boys, melirenes;

as who would say, ready to go out of boyery. This boy, who was made overseer of them, was commonly twenty years of age. North. *Plutarch.*

Or must his boyship prey

On all our seniorities.

Beaumont.

A lytle boy among them asked,
What meaneth that gallow-tree?
They sayde, to hang a good yeaman,
Called Wyllyame of Cloudele.

Old Ballad of Adam Bell, &c.

Put case be cured he so boyblind and foolish.

Beaumont and Fletcher.

So lost his treasure, getting nought in lieu,
But ostentation of a foolish pride,
While women fond, and boys stood gaping wide;
But wise men all his waste, and needless cost
deride. Fletcher's *Purple Island.*

Thus night, oft see me in thy pale career,
Till civil-suited morn appear,
Not trickt and frownced as she was wont
With the attie boy to hunt,
But kercheft in a comely cloud,
While rocking winds are piping loud.

Milton. *Il Penseroso.*

If you should look at him in his boyhood, through
the magnifying end of a perspective, and, in his man-
hood, through the other, it would be impossible to spy
any difference: the same air, the same strut. Swift.

He had complained he was farther off, by being so
near, and a thousand such boyisms, which Chaucer
rejected as below the subject. Dryden.

Thanks to the gods, my boy has done his duty:

—Portius, when I am dead, be sure you place
His urn near mine. Addison's *Cats.*

A wife he takes; and now for heirs,
Again he worries heaven with prayers.
Jove nods assent: two hopeful boys
And a fine girl reward his joys. Gay's *Fables.*

Two boys, whose birth, beyond all question, springs
From great and glorious, though forgotten kings,
Shepherds of Scottish lineage, born and bred
On the same bleak and barren mountain's head.

Churchill's *Prophecy of Famine.*

And I have loved thee, ocean! and my joy
Of youthful sports was on thy breast to be
Borne, like thy bubbles, onward: from a boy
I wantoned with thy breakers—they to me
Were a delight; and if the freshening sea
Made them a terror—'twas a pleasing fear;
For I was as it were a child of thee,
And trusted to thy billows far and near,
And laid my hand upon thy mane—as I do here.

Byron's *Childe Harold.*

The little shepherd in his white capote
Doth lean his boyish form along the rock,
Or in his cave awaits the tempest shock. Id.

BOYAU, in fortification, a ditch covered with
a parapet, which serves as a communication between
two trenches. It runs parallel to the
works of the body of the place; and serves as a
line of contravallation, not only to hinder the
sallies of the besieged, but also to secure the
mines. But when it is a particular cut that runs
from the trenches to cover some spot of ground,
it is drawn so as not to be enfiladed or scoured
by the shot from the town.

BOYCE (William), Mus. D., was a native
of London, and pupil of Dr. Maurice Greene,
organist of St. Paul's, who bequeathed him a
valuable collection of church music. Though
afflicted with deafness, which finally increased
to such a degree as to render him almost insensi-
ble of sound, he acquired an uncommon pro-

ficiency in music, and in 1736 was chosen organist to the church of St. Michael, Cornhill; and organist and composer to the Chapel Royal. In 1749, he was honored with the degree of doctor of music, and succeeded Dr. Greene in 1757, as master of the king's band. His fame chiefly rests on his sacred compositions. Dr. Burney says that 'there is an original and sterling merit in his productions, founded as much upon the study of our own old masters as on the best models of other countries, that gives to all his works a peculiar stamp and character, for strength, clearness and facility, without any mixture of styles or extraneous ornaments.' He died of the gout in 1779, at the age of sixty-eight, and was buried in St. Paul's cathedral.

BOYD (Mark Alexander), an extraordinary genius, was son of Robert Boyd of Pinkhill. He was born at Galloway in 1562, and came into the world with teeth. The rudiments of Latin and Greek were taught him at Glasgow; but he was of so high and untractable a spirit, that his tutors despaired of ever making him a scholar. Having quarrelled with them, and burnt his books, he foreswore learning, and went into the French army. Having dissipated his little fortune, he became roused by that emulation which is natural to great minds, and applied himself to letters with unremitting ardor, till he rose to be one of the most consummate scholars of his age. He is said to have translated Cæsar's Commentaries into Greek, in the style of Herodotus, and to have written many Latin poems, little inferior to the productions of the Augustan age. He also left several MSS. on philological, political, and historical subjects, in the Latin and French languages. He could with facility dictate to three amanuenses at the same time, in different languages, and on different subjects. He was also one of the best Scottish poets of the age. And his personal beauty and accomplishments were equal to his mental superiority. He died at Pinkhill, in 1601. The following works of his, which are all that have been printed, were published in *Deliciæ Poetarum Scotorum*; Amstel. 1637, 12mo. 1. *Epigrammata*, lib. ii. 2. *Heroidem Epistolæ* XIV. lib. i. 3. *Hymni* XIV.

BOYD (Hugh Macauley), was educated at Trinity College, Dublin, and intended for the bar; but coming to London he dissipated his fortune, and then went to Madras as secretary to Lord Macartney, and died there in 1794. He was once honored with being thought the author of the Letters of Junius, but the publication of his political tracts, in two vols. 8vo, sufficiently refuted this extravagant claim.

BOYDEL (John), Alderman of London, and Lord Mayor in 1790; was born in Staffordshire in 1719, and intended for a land surveyor, which was his father's occupation; but accidentally meeting with Baddeley's Views of different Country seats, he conceived a strong inclination for engraving, and when about twenty, bound himself apprentice for seven years to a Mr. Toms, a London artist. In 1745 he published some small landscapes, and afterwards a volume of Views near London. With the profits of these works he commenced business as a printseller,

and soon established for himself a high reputation as the patron of ingenious artists. He employed Woollet to engrave the celebrated pictures of Niobe and Phaeton, and gradually established an extensive export trade in English prints. Having established an English school of engraving, with which his name will long be connected, he engaged the first artists of the day to furnish a collection of pictures, known as the Shakspeare Gallery. The funds of his business falling short during the war, he was induced in 1804 to obtain an act of Parliament to permit him to dispose of his gallery and paintings by lottery, and lived to see every ticket disposed of, but died before his lottery was drawn, on the 12th of December, 1804. He was succeeded in business by his nephew, Alderman Josiah Boydell, who also practised the art of engraving. The latter resigned his gown some time before his decease, in 1818.

BOYER (Abel), an eminent historiographer, born at Castres in France, in 1664. He went first to Geneva on the revocation of the edict of Nantz, then to Franeker, and finally to England, where he applied himself so closely to the study of the language, that he became an author of considerable note, and was employed in several periodical and political works. He, for many years, had the principal management of a newspaper called the *Post-boy*. He likewise published monthly, a work, entitled, the Political state of Great Britain, and he wrote a life of Queen Anne in folio, which is esteemed a very good chronicle of that period; but he is most celebrated for his Dictionary and Grammar of the French language, which are still in use. He also wrote, or rather translated from the French of Racine, the tragedy of Iphigenia, which he published under the title of *The Victim*. It was performed with success at the theatre of Drury Lane, and affords a strong proof of the abilities of its author. He died in 1729.

BOYER, in navigation, a kind of Flemish sloop, or small vessel of burden, having a bolt-split, a castle at each end, and a tall mast: chiefly fit for the navigation of rivers, and in many of its parts resembles a smack.

BOYLE (Charles), earl of Orrery, and baron Marston, the second son of earl Roger, was born in August 1679. He was educated at Christ-church in Oxford, and became distinguished as an author, a soldier, and a statesman. He translated the life of Lysander from the Greek of Plutarch; and published a new edition of the epistles of Phalaris, which engaged him in a literary dispute, respecting the genuineness of these epistles against Dr. Bentley. See BENTLEY. He was three times member for Huntingdon; but his elder brother, Lionel earl of Orrery, dying on the 23d of August 1703, without issue, he succeeded to that title: and, entering into the queen's service, had a regiment given him. In 1709 he was raised to the rank of major-general, and sworn one of her majesty's privy council. Shortly after he was appointed the queen's envoy to Brabant and Flanders; and having honorably discharged the trust, created a British Peer, by the titles of lord Boyle, and

baron Marston. He enjoyed several other additional honors in the reign of king George I.; but falling under the suspicion of being concerned in laying a plot, he was committed to the tower for six months. He died August 22nd, 1731. His title was given as a name to a celebrated astronomical instrument, invented by a Mr. G. Graham whom he patronised. He also published a comedy called *As you find it*; a copy of verses to Dr. Garth upon his Dispensary; and a prologue to Southerne's play of the siege of Capua.

BOYLE, (John), earl of Cork and Orrery, a nobleman distinguished by his learning and genius, was the only son of earl Charles, and was born on the 2d of January 1707. He was educated at Westminster, and at Christ-church College, Oxford. His works were, 1. The Letters of Pliny the Younger, with Observations, &c. 2 vols. 4to. 2. Remarks on the Life and Writings of Dr. Swift, Dean of St. Patrick's, Dublin. 3. Memoirs of the Life of Robert Cary, earl of Monmouth. 4. The Discourse upon the Theatre of the Greeks. 5. The Original of Tragedy. 6. The Parallel of the Theatres. 7. Letters from Italy, a posthumous work. He died in 1762.

BOYLE, (Richard), a statesman of the seventeenth century, sometimes styled the great earl of Cork, was the youngest son of Mr. Roger Boyle, of Herefordshire, and born at Canterbury, October 3rd 1566. He studied at Bennet college, Cambridge; and afterwards became a student in the Middle Temple. Unable to support himself in the prosecution of his studies, he became clerk to Sir Richard Manwood, chief baron of the exchequer; but finding his employment far from lucrative, he went to Ireland in 1588, and was employed by several members of the Irish government, in drawing up memorials, cases, &c. In 1595 he married Joan the daughter of William Ansley, of Pulborough, Esq. who dying in labor of her first child, left him an estate of £500 a-year in land. Some time after, he was accused by Sir H. Wallop and others, of being a spy in the pay of the king of Spain. Upon this, he was taken up and his papers searched; but having fully vindicated himself in presence of queen Elizabeth, and laid open the villainy of Wallop, she not only liberated him, but appointed him clerk of the council of Munster, and recommended him to Sir G. Carew, the president. After this, by his various services, and the great abilities he displayed, he gradually rose to the highest offices, and was at last raised by James I. to the peerage of Ireland; by the title of baron Youghall. In 1620 he was created viscount Dungarvan and earl of Cork; and in 1631 lord treasurer of Ireland, an office that was made hereditary to his family. In 1603 he married Mrs. Catherine Fenton, daughter of Sir George Fenton, Secretary of State. He afterwards distinguished himself by the noble stand he made for king Charles I. He turned the castle of Lismore, his capital seat, into a fortress; armed and disciplined his servants and protestant tenants; and by their assistance, and a small army raised and maintained at his own expense, which he put under the command of his four

sons, he defended the entire province of Munster, and in the space of a year took several strong castles, and killed upwards of 3000 of the enemy, paying his forces all the time regularly; and when all his money was gone, he converted his plate into coin. This great man died in 1644, aged seventy-eight.

BOYLE, (Robert), one of the greatest philosophers, as well as best of men, that any nation has ever produced, the seventh son and fourteenth child of Richard, earl of Cork, was born at Lismore, January 23rd 1626-7. In 1635, his father sent him to Eton, under Sir Henry Wotton, who was the earl of Cork's old friend and acquaintance. Here he soon discovered a surprising force of understanding, and a disposition to cultivate and improve it to the utmost. In 1638 he attended his father in London; and remained with him at the Savoy, till in October he was sent abroad with his brother Mr. Francis Boyle, under the care of Mr. Marcombes. During his stay at Geneva, Mr. Boyle resumed his acquaintance with the mathematics. In September 1641 he quitted Geneva, and spent the winter at Florence. Here he devoted himself to reading modern history in Italian, and the works of the celebrated astronomer Galileo, who died in a neighbouring village during Mr. Boyle's residence. About the end of March, 1642, he quitted Florence for Rome, and had the fortune he tells us, to see Pope Urban VIII. at chapel, with the cardinals, who severally appearing mighty princes, in that assembly looked like a company of common friars. He returned to Florence; from thence to Leghorn; and so by sea to Genoa: then passing through Nice, he crossed the sea to Antibes, where he exposed himself to some danger for refusing to honor the crucifix: from thence he went to Marseilles by land. He was in that city in May 1642, when he received his father's letters, which informed him of the rebellion which had broken out in Ireland, and with what difficulty he had procured the money then remitted to him. This money, £250, was never received, and the brothers were obliged to return to Geneva. Here they continued a considerable time, without either advices or supplies, but contrived at last to reach their native country in 1644. On their arrival, Mr. Boyle found his father dead; and though the earl had made ample provision for him in the manor of Stalbridge in England, as well as other considerable estates in Ireland, it was some time before he could receive any money. In March 1646 he retired to Stalbridge, where he resided till May 1650, and applied himself with incredible industry to various studies. He was one of the first members of that small but learned body of men, styled the philosophic college, which, when all academical studies were interrupted by the civil wars, secreted themselves about the year 1645; and held private meetings, first in London, afterwards at Oxford, for the sake of canvassing subjects of natural knowledge, upon the plan of experiment recommended by Lord Bacon. After the Restoration, they were incorporated and distinguished by the name of the Royal Society. In the summer of 1651 he put in execution a design he had formed for some time

of residing at Oxford. It was during his residence here that he made his improvements on that important engine the air-pump. But, philosophy, and enquiries into nature, though they engaged his attention deeply, did not occupy it entirely. He continued to pursue his critical and theological studies. In these he had the assistance of Dr. Edward Pocock, Mr. Thomas Hyde, and Mr. Samuel Clarke. He was also intimate with Barlow, afterwards bishop of Lincoln, a man of various and extensive learning. In 1659 Mr. Boyle being acquainted with the unhappy circumstances of the learned Sanderson, afterwards bishop of Lincoln, who had lost all his preferments on account of his attachment to the royal party, conferred upon him an honorary stipend of £50 a year. Mr. Boyle, upon the Restoration, was treated with great civility and respect by the king, as well as by lord treasurer Southampton and lord Clarendon. By the latter he was solicited to enter into orders, but he considered, that as a layman, whatever he wrote respecting religion would have much greater weight. He continued, therefore, to pursue his philosophical studies, and began to communicate to the world the fruit of them in, 1. *New Experiments, Physicomechanical, touching the Spring of the Air and its Effects*, 8vo. 2. *Seraphic Love; or some Motives and Incentives to the love of God*, pathetically discoursed of in a letter to a friend. 3. *Physiological Essays and other Tracts*, 1661, 4to. 4. *Sceptical Chemist*, 1662, 8vo.; reprinted 1679, 8vo. with the addition of experiments and notes about the producibility of chemical principles. In 1663, the Royal Society being incorporated by king Charles II. Mr. Boyle was appointed one of the council: and as he might be justly reckoned among the founders of that learned body, so he continued one of the most useful and industrious of its members during the whole of his future life. In June, 1663, he published, 5. *Considerations touching the usefulness of Experimental Natural Philosophy*, 4to. 6. *Experiments and Considerations upon Colors*; to which was added a Letter, containing Observations on a Diamond that shines in the dark, 1663, 8vo. 7. *Considerations on the style of the Holy Scriptures*, 1663, 8vo. In 1664, he was elected into the company of the royal marines; and the following year published his, 8. *Occasional Reflections*, upon several subjects, 8vo.; which exposed him to the ridicule of Dean Swift, who wrote *A Pious Meditation upon a Broomstick*, in the style of the honorable Mr. Boyle. The same year he published an important work, entitled, 9. *New Experiments and Observations upon Cold*, 1665, 8vo. In 1666, 10. *Hydrostatical Paradoxes*, made out by new experiments, for the most part physical and easy, in 8vo. 11. *The Origin of Forms and Qualities, according to the corpuscular philosophy*, illustrated by considerations and experiments. At this time he also communicated to his friend Mr. Oldenburgh, secretary to the Royal Society, several excellent short treatises, which are printed and preserved in the *Philosophical Transactions*. In 1668, Mr. Boyle resolved to remove to London, to the house of his sister, lady Ranelagh, in Pall-Mall. He pub-

lished, in 1669, 12. *A Continuation of his Experiments touching the Weight and Spring of the Air*; and, 13. *Tracts about the Cosmical Qualities of Things*. In 1671, 14. *Considerations on the usefulness of Experimental and Natural Philosophy*: part 2d, 4to. 15. *A Collection of Tracts, upon several useful and important points of Practical Philosophy*, 4to. 16. *An Essay about the Origin and Virtues of Gems*, 1672, 8vo. 17. *A Collection of Tracts upon the relation between Flame and Air*; and several other useful and curious subjects: besides furnishing, in this and the former year, a great number of short dissertations, upon a vast variety of topics, addressed to the Royal Society, and inserted in their *Transactions*. 18. *Essays on the Strange Subtlety, Great Efficacy, and Determinate Nature of Effluvia*; to which were added, a variety of experiments on other subjects, 1673, 8vo. 19. *A Collection of Tracts upon the saltiness of the Sea, the moisture of the Air, the natural and preternatural state of Bodies: to which is prefixed, a Dialogue concerning Cold*, 1674, 8vo. 20. *The Excellency of Theology compared with Philosophy*, 1674, 8vo. This was written in 1665, while Mr. Boyle, to avoid the great plague which then raged in London, was forced to go from place to place in the country, and had little or no opportunity of consulting his books. It contains a great number of curious and useful, as well as just and natural, observations. 21. *A Collection of Tracts, containing suspicions about hidden qualities of the Air*; with an Appendix touching celestial Magnets; Animadversions upon Mr. Hobbes's Problem about a Vacuum; a Discourse of the cause of Attraction and Suction, 1674, 8vo. 22. *Some Considerations about the reconcileableness of Reason and Religion*; by T. E. a layman. To which is annexed, a Discourse about the possibility of the Resurrection. by Mr. Boyle, 1675, 8vo. In 1676, he published, 23. *Experiments and notes about the Mechanical Origin or Production of particular Qualities, in several discourses on a great variety of subjects, and among the rest on electricity*. In 1678, he communicated to Mr. Hook a short memorial of some observations upon an artificial substance that shines without any preceding illustration; which that gentleman thought fit to publish in his *Lectiones Cutlerianæ*. 24. *Historical Account of a degradation of Gold made by an anti-elixir*. This made a great noise both at home and abroad, and is looked upon as one of the most remarkable pieces that ever fell from his pen; since the facts contained in it would have been esteemed incredible, if they had been related by a man of less integrity and piety than Mr. Boyle. The regard which the great Newton had for Mr. Boyle, appears from a very curious letter, which the former wrote to him at the end of this year, to be found in Dr. Birch's *Life of Mr. Boyle*. In 1680 he published, 25. *The Aerial Noctiluca; or some new Phenomena, and a Process of a Facitious Self-shining Substance*, 8vo. This year the Royal Society, as a proof of the just sense of his great worth, and of the constant and particular services which through a course of many years he had done them, made choice of him for

their president; but he scrupled to take the oaths required, and declined the honor. We need not particularise the other tracts of this great philosopher. In the year 1690 he gave to the world *The Christian Virtuoso*; shewing, that by being addicted to Experimental Philosophy, a man is rather assisted than indisposed to be a good Christian. To which are subjoined, 1. A Discourse about the distinction that represents some things as above reason, but not contrary to reason. 2. The first chapters of a Discourse intitled *Greatness of Mind promoted by Christianity*. The last work which he published himself, was in the spring of 1691, and is intitled, *experimenta et Observationes Physicæ*; wherein are briefly treated several subjects relating to natural philosophy in an experimental way, 8vo. On the 18th of July, 1691, he signed and sealed his last will, and died on the 31st of December, aged sixty-five. He was buried at Westminster on the 7th of January, his funeral sermon being preached by Bishop Burnet, from *Eccles. xi. 26*, 'For God giveth to a man that is good in his sight, wisdom, knowledge, and joy;' in which that prelate mentions his being at the sole charge of a translation and impression of the New Testament into the Malay language, which he sent over all the East Indies; that he nobly rewarded the translator of Grotius's incomparable book *Of the Truth of the Christian Religion*, into Arabic; and was at the expence of an entire impression. He also promoted the translation of the New Testament into the Turkish language; spent £700. on an edition of the Irish Bible, and contributed largely to an impression of the Welsh Bible. During his life, he gave £300. to advance the propagation of the Christian religion in America; and as soon as he heard that the East India Company were entertaining propositions for the same design in the East, he sent them £100. In other respects his charities amounted to upwards of £1000. a-year. The celebrated Boerhaave says of him, 'Mr Boyle, the ornament of his age and country, succeeded to the genius and inquiries of the great chancellor Verulam. Which of all Mr. Boyle's writings shall I recommend? All of them. To him we owe the secrets of fire, air, water, animals, vegetables, fossils; so that from his works may be deduced the whole system of natural knowledge.' Mr. Boyle was never married; but Evelyn was assured, that he courted the beautiful and ingenious daughter of Cary, earl of Monmouth, and that to this passion was owing his Seraphic Love. His posthumous works are, 1. *The general History of the Air* designed and begun. 2. *General Heads for the Natural History of a Country*, great or small; drawn out for the use of Travellers and Navigators. 3. A Paper of the Honorable Robert Boyle's, deposited with the secretaries of the Royal Society, October 14th, 1680, and opened since his death; being an account of his making the phosphorus, September 30th, 1680. Printed in the *Philosophical Transactions*. 4. *An Account of a Way of examining Waters*, as to freshness or saltness. 5. A free Discourse against customary Swearing, and a Dissuasive from Cursing, 1695, 8vo. 6. *Medicinal Experiments; or a Collection of Choice*

Remedies, chiefly simple and easily prepared, useful in families, and fit for the service of the country people. The third and last volume, published from the author's original MS. whereunto is added several useful notes explicatory of the same, 1698, 12mo. Beautiful editions of all his works have been printed at London in five vols. folio, and six vols. 4to. He bequeathed by will £50. a year, for the endowment of a lecture in defence of Christianity, 'without descending to any controversies among Christians;' an appointment to which we are indebted for many able treatises.

BOYLE (Roger), earl of Orrery, the fifth son of earl Richard, was born in 1621; and by the credit of his father with the lord deputy Falkland, raised to the dignity of baron Broghill, when only seven years old. He was educated at Dublin, where he soon distinguished himself. He afterwards made the tour of France and Italy; and at his return assisted his father in opposing the rebellious Irish; in which he behaved with all the spirit of a young, and the discretion of an old, officer. Upon the death of the king, he retired to Marston, in Somersetshire; but at length resolved to attempt something in favor of Charles II.; and under the pretence of going to Spa for his health, to apply to that prince for a commission to raise what forces he could in Ireland. Having raised a considerable sum of money, he came up to London to prosecute his voyage: but had not been long in town when he received a message from Cromwell, who was then general of the parliamentary forces, that he intended to wait upon him. Lord Broghill was surprised at this message, having never had the least acquaintance with Cromwell; and desired the gentleman to let the general know, that he would wait upon his excellency. But while he was waiting the return of the messenger, Cromwell entered the room; and after mutual civilities, told him, that the committee of the state were apprised of his design of applying to Charles Stuart for a commission to raise forces in Ireland, and had determined to make an example of him. Lord Broghill assured him, that the intelligence which the committee had received was false, and that he neither was in a capacity, nor had any inclination, to raise disturbances in Ireland: but Cromwell, instead of making any reply, drew out of his pocket copies of several letters, which his lordship had sent to those in whom he most confided, and put them into his hands. Broghill, upon the perusal of these papers, finding it to no purpose to dissemble, asked his excellency's pardon for what he had said, returned him thanks for his protection against the committee, and intreated his direction how to behave in such a delicate conjuncture. Cromwell told him, that though till this time he had been a stranger to his person, he was not so to his merit and character; he had heard how gallantly his lordship had behaved in the Irish wars; and therefore, since he was named lord lieutenant of Ireland, and the reducing that kingdom was now become his province, he had obtained leave of the committee to offer his lordship the commission of a general officer, if he would serve in the war; and he should have no oaths or engage-

ments imposed upon him, nor be obliged to draw his sword against any but the Irish rebels. Broghill was infinitely surprised at so generous and unexpected an offer. He saw himself at liberty, by all the rules of honor, to serve against the Irish, whose rebellion and barbarities were equally detested by the royal party and the parliament. He desired, however, some time to consider of what had been proposed to him. But Cromwell briskly told him, that he must come to some resolution that very instant: that he himself was returning to the committee, who were still sitting; and if his lordship rejected their offer, they had determined to send him to the tower. Upon this, lord Broghill, finding that his liberty and life were in the utmost danger, gave his word and honor that he would faithfully serve the parliament against the Irish rebels; on which Cromwell once more assured him, that the conditions which he had made with him would be punctually observed; and then ordered him to repair to Bristol, adding, that he himself would soon follow him into Ireland. Lord Broghill, therefore, went over into that country; where, by his conduct and intrepidity, he performed many important services, and fully justified the opinion Cromwell had conceived of him. By his own interest he now raised a troop of horse, consisting chiefly of gentlemen attached to him by personal friendship; a corps which was soon increased to a complete regiment of 1500 men. These he led into the field against the Irish rebels; and was speedily joined by Cromwell, who placed the highest confidence in his new ally, and found him of the greatest consequence to the interest of the commonwealth. When Cromwell became protector, he sent for lord Broghill, merely to take his advice occasionally. And we are told, that, not long after his coming to England, he formed a project for engaging Cromwell to restore the old constitution. The basis of the scheme was to be a match between the king (Charles II.) and the protector's daughter. As his lordship maintained a secret correspondence with the exiled monarch and his friends, it was imagined that he was beforehand pretty sure that Charles was not averse to the scheme, or he would not have ventured to propose it seriously to Cromwell: who at first seemed to think it not unfeasible. He soon changed his mind, however, and told Broghill that he thought his project was impracticable: 'For,' said he, 'Charles can never forgive me the death of his father.' In time, the business came to nothing, although his lordship had engaged Cromwell's wife and daughter in the scheme. On the death of the protector, lord Broghill continued attached to his son Richard, until he saw the dark clouds of anarchy hovering over the nation; when he deemed it prudent to retire to his command in Ireland, and became not a little instrumental in the king's restoration. In consideration of his eminent services in this respect, Charles created him earl of Orrery by letters patent bearing date September 5th, 1660. He was soon after made one of the lords justices of Ireland. But his lordship's active life at length induced a fever, which fell into his feet, and joined to the gout, with which he was often afflicted, abated much

of his vigor. Notwithstanding his infirmities, on the king's desiring to see him in England, he went over in 1665, and was the means of reconciling the duke of York and Charles II. On his return, he found himself called to a new scene of action. The duke de Beaufort had formed a scheme for a descent upon Ireland; but this was rendered abortive by the extraordinary diligence, military skill, and prudent measures, of lord Orrery. In the midst of his labors, however, a dispute arose between him and his old friend the duke of Ormond, then lord lieutenant; the bad effects of which were soon felt by both disputants, who resorted to England to defend their respective interests and pretensions, both having been attacked by secret enemies who suggested many things to their prejudice. This quarrel, though private, at last became so public as to produce an attempt to frame an impeachment against the duke of Ormond, and an actual impeachment ultimately against the earl of Orrery. He defended himself, however, so well, that the prosecution came to nothing. He nevertheless lost his public employments; but not the king's favor: he still came frequently to court, and sometimes to council. After this he made several voyages to and from Ireland; was often consulted on affairs of the utmost consequence; and on all occasions gave his opinion and advice with the freedom of an honest plain-dealing man. In 1678, being attacked more cruelly than ever by his old enemy the gout, he gave the strongest proofs of Christian patience and rational fortitude, and breathed his last on the 16th of October, 1679, in the fifty-ninth year of his age. He wrote, 1. *The Art of War*. 2. *Parthenissa*, a romance, in one volume folio. 3. *Several Poems*. 4. *Dramatic Pieces*, in two volumes. 5. *State Tracts*, in one volume folio, &c. Walpole says, he never made a bad figure but as a poet.

BOYLE (Richard) third earl of Burlington and fourth earl of Cork, was born in 1695, and married in 1721 one of the coheirs of Savile, marquiss of Halifax. In 1730 he was installed knight of the garter, but though a prosperous courtier, he retired in 1731 to his beautiful seat at Chiswick, the plan of which, borrowed from a well-known villa of Palladio, he now improved, and new fronted Burlington-house. His enthusiasm for architecture was so great, that he even contributed his own money to repair St. Paul's church, Covent-garden, because it was the work of Inigo Jones. His house at Chiswick went to the Devonshire family by the marriage of his only daughter to the then duke. Pope dedicated to Lord Burlington his fourth epistle, and he is said to have been the first patron of bishop Berkeley. He died in 1753, when the Burlington title became extinct.

BOYLE, a market town of Ireland, in the county of Roscommon, situated on a river of the same name, which is crossed by two noble bridges, on one of which is a statue of king William III. Here there are barracks for a troop of horse. The linen manufacture flourishes in the neighbourhood, and the town is now populous. Before the union it sent two members to the Irish parliament. Here are also the remains of a round tower, and of an ancient Cistercian

abbey, the latter of which was plundered when taken by the English in 1225. These stand near Lough Key. Distant eighteen miles south of Sligo, twenty-three N. N. W. of Longford, and eighty-four from Dublin.

BOYNE, a river in Ireland, which rises in Queen's county, near the source of the Barrow, and running, north-east by Trim and Cavan, falls at last into the Irish channel, a little below Drogheda. It will admit vessels of 150 tons burden up to that town, and has excellent internal communications with other parts of Ireland by means of canals. About two miles from Drogheda, was fought, in June 1690, the celebrated battle which bears in history the name of the river, and which, as deciding the final retreat of James II. from the British throne, may claim to be shortly sketched in this place. James II. having received a reinforcement of 6000 infantry from France, had been in no small degree surprised to learn at Dublin on the 20th., that his son-in-law had been in Ireland at the head of 36,000 men for six days. His own army amounted to about this number, exclusive of his troops in garrison. He now therefore left Dublin under escort of Luttrell's militia, and, occupying a very advantageous post on the banks of the Boyne, resolved to hazard a battle with the English army. His ally Louis XIV. had promised to equip a fleet to destroy William's transports, on the return of his convoy, which was now seen sailing along the coasts, and a council of war advised James to wait the issue of the naval operations. But he was determined to have, as he said, 'one good blow' for his crown. The river in front of his position was deep, and skirted by a morass and a rising ground: so that a superior force could here be easily repulsed; and, with all his own personal bravery, he seems to have taken it for granted that his rival would attack him.

William III. arrived at the opposite bank of the Boyne on the evening preceding the battle, and being observed, as he was reconnoitring the position of the enemy, received a wound from a field-piece. A man and two horses were killed at his side, and a ball rebounding from the earth grazed his right shoulder, and produced some confusion among his attendants. The adherents of James perceiving this, shouted that he was killed; the rumor spread through the Irish camp, and was conveyed to Dublin, and thence to France; where bonfires and illuminations were ordered in token of the great monarch's joy. In the meantime William rode through his own line, little affected by the accident, held a council of war at night, and resolved, against the advice of the duke of Schomberg, to pass the river with his army, and advance upon the enemy in three divisions in the morning.

At six o'clock, lieutenant-general Douglas led on the right wing of the English infantry towards Slanebridge, and passed it without much opposition; but soon perceived the enemy in considerable force on the other side of the morass, where he waited for reinforcements; and then charged through this disadvantageous ground with his infantry, while the young count Schomberg rode round it with the cavalry, and attacked the Irish in flank. They instantly fled in all direc-

tions. King James however directed a reinforcement to be sent to this quarter from the centre, and was successfully holding the English forces in check, when William's main body passed the river, breast high, under protection of his artillery. James's cannon had been most unthinkingly removed from the opposite side, where only a body of musketeers opposed a feeble fire to the impetuosity of the assailing battalions. Before they could form, however, general Hamilton brought up a considerable body of infantry and cavalry, who for a while produced some confusion among king William's troops. At this moment, the old duke Schomberg passed the Boyne at the head of the French Protestants, and so impetuously mingled himself and his men among the enemy, that he received a fatal shot as it was supposed from his own supporters. The infantry of James now rallied; but William passing the river in person with his left wing, attacked them so vigorously, that they appeared struck with a sudden panic; halted, and commenced their retreat to the village of Dunore. Here an intrepid stand was made on behalf of James; and his valiant rival, at the head of his choicest troops, was compelled for a short time to give way. The whole wing would have been routed, it is said, but for the timely arrival of the dragon regiments of Cunningham and Levison, who dismounted and raked the enemy with a murderous fire through the hedges. William had thus time to re-form his cavalry, and the Irish abandoned the field. During the whole action, king James had posted himself on the hill of Dunore, surrounded with a small body of horse, and seeing the victory decidedly incline towards his opponent, rode off for Dublin, where he arrived that evening.

In this battle, lords Dongan and Carlingford, the marquis of Hocquincourt, and Sir Neile O'Neile fell in his service. On the other side, the brave and experienced duke Schomberg; Caillemotte, a French Protestant general of great valor and talent; and Walker, the clergyman of Londonderry, who had been so conspicuous in the siege of that place. King William displayed the greatest personal courage while he fought upon the worse military theory; James was evidently careful of his person, until in a fair pitched battle, with considerable advantages on his side, he lost his confidence and his crown.

BOYS, BOYSE, or BOIS (John), one of the translators of the Bible in the reign of James I. was the son of William Bois, rector of West Stowe, and born at Nettlestead in Suffolk, in 1560. The rudiments of learning were taught him by his father, and his capacity was such, that at five years of age he read the Bible in Hebrew. At fourteen he was admitted of St. John's College Cambridge, where he distinguished himself by his skill in Greek. Happening to have the small-pox when he was elected fellow, he, to preserve his seniority, caused himself to be carried in blankets to be admitted. He for some time studied medicine, and was ten years chief Greek lecturer in his college, and read every day. For some years he voluntarily read a Greek lecture at four in the morning, in his own chamber. On the death of his father, he succeeded him in the rectory. At the age of thirty-six, he married

the daughter of Mr. Holt, rector of Boxworth, whom he succeeded in that living, Oct. 13th 1596. Here his young wife proving a bad economist, and he himself being wholly addicted to his studies, he soon became so much involved in debt, that he was obliged to sell his choice collection of books, consisting of almost every Greek author then extant. When a new translation of the Bible was by king James I. directed to be made, Mr. Boys was elected one of the Cambridge contributors. He performed not only his own, but also the part assigned to another, with great reputation; though with no profit, for he had no allowance but his commons. He was also one of the six who met at Stationers' Hall to revise the whole. He afterwards assisted Sir Henry Savile in publishing the works of St. Chrysostom. In 1615 Dr. Lancelot Andrews, bishop of Ely, bestowed on him, unasked, a prebend in his church. He died 14th Jan. 1643, aged eighty-four. He left many MSS. particularly a commentary on almost all the New Testament.—When a young student at Cambridge, he is said to have received from the learned Dr. Whitaker three rules for avoiding those distempers which usually attend a sedentary life; to which he adhered with equal constancy and success. The first was, to study always standing; the second, never to study in a window; and the third, never to go to bed with his feet cold.

Boyse (Samuel), a poet of the last century, was a man remarkable for the fineness of his genius, the lowness of his manners, and the wretchedness of his life. He was born in 1708, and received the rudiments of his education in Dublin. When he was eighteen years old, his father, a dissenting minister, sent him to the University of Glasgow, to finish his education. He had not been a year there, when he fell in love with a daughter of a tradesman of that city, and terminated his education by marrying her before he had entered his twentieth year. His extravagance soon exposing him to want, and obliged him to go over with his wife and sister to Dublin. The whole three it is said were notorious libertines. An estate his father possessed in Yorkshire was sold to discharge his debts. Soon after his father's death, we find Mr. Boyse at Edinburgh, where his poetical genius raised him many friends, and some patrons of eminence. He published a volume of poems in 1731, to which he subjoined *The Tablature of Cebes*, and a *Letter on Liberty*, inserted in the *Dublin Journal*, 1726; addressed to the countess of Eglinton. On the death of viscountess Stormont, Boyse wrote an elegy, entitled *The Tears of the Muses*, which was much applauded by her ladyship's relations. Lord Stormont on this occasion ordered a handsome present to be given to Boyse by his attorney. The duchess of Gordon now employed her interest in procuring a place for him, and gave him a letter which he was to deliver to one of the commissioners of the customs at Edinburgh, but it happened that the morning on which he was to have rode to town with her grace's letter proved to be rainy, he delayed going to town with it, and, while he let slip the opportunity, the place was bestowed upon another. He now quitted the Scottish for the English metropolis,

and the duchess having still a high opinion of his abilities, gave him a letter of recommendation to Mr. Pope, and obtained another for him to Sir Peter King, the lord chancellor of England. These, however, on his arrival he was wholly careless in delivering, and entered only into acquaintance of the lowest cast. He had no taste for any thing elegant, and yet was to the last degree expensive. Often when he had received a guinea in consequence of a supplicating letter, he would go into a tavern, order a supper to be prepared, drink of the richest wines, and spend all the money that had just been given him in charity, while his wife and child were starving at home! About 1740 Boyse was reduced to the last extremity of human wretchedness; he had not a shirt, a coat, or any kind of apparel to put on; the sheets on which he lay were carried to the pawn-brokers, and he was obliged to be confined to his bed with no other covering than a blanket. He sat up in bed, we are told, with the blanket wrapt round him, through which he cut a hole large enough to admit his arm, and placing the paper on his knee, scribbled in the best manner he could the verses he was obliged to make: and whatever he got by these or his begging letters, was but just sufficient for the preservation of life. About the year 1745 his wife died, and he pretended much concern at the event. He was then at Reading, compiling a review of the most material transactions at home and abroad during the war; in which he included a short account of the rebellion. On his return to town, his behaviour was more decent than it had ever been. He was employed by a bookseller to translate Fenelon on the Existence of God; during which time he married a second wife, a woman in low circumstances, but well enough adapted to his taste. He now began to live with more regard to his character, and supported a better appearance than usual; but while his circumstances were mending, and his irregular appetites losing ground, his health declined. At this time he had the satisfaction to observe a poem of his, entitled *The Deity*, recommended by two eminent writers, the ingenious Fielding, and Hervey, author of the *Meditations*. A beautiful poem called *The Recantation*, was the last of his productions. He died in May 1747, in obscure lodgings in Shoe-lane, and was buried by the parish. Never were distinguished abilities given to less purpose. His genius was not confined to poetry only. He had a taste for painting, music, and heraldry. His poetical pieces, if collected, would, it is said, make six moderate volumes. Many of them are scattered in *The Gentleman's Magazine* marked with the letter Y, and *Alceus*. Two volumes were published in London. An ode in the manner of Spenser, entitled *The Olive*, was addressed to Sir Robert Walpole, which procured him a present of ten guineas.

BOZRAH, BEZER, or BOSTRA, a city of Judea, seated on a plain, about the south-east border of the land of Reuben, near the source of the Arnon. It was a city of refuge (Josh. xx. 3.), and was taken by the Moabites during the declension of the kingdom of Israel. It was afterwards ravaged by the Chaldeans. It was rebuilt

however, and a Christian church early planted in it, which continued till the Arabians took it under Mahomet's successors. The emperor Trajan favored it, and called it Philippopolis.

BOZRAH, the capital of Edom, situated about 150 miles from the above. It was very ancient, and was the birth place of Jobab, king of Edom. It was ravaged by the Assyrians; afterwards by the Chaldeans, and at last by Judas Maccabeus. It is mentioned in that remarkable prophecy, in Isa. lxiii. 1. Not a vestige of it now remains.

BOZRAH, a town of America, in New-London county, and state of Connecticut; thirty-six miles east from Norwich.

B QUADRO, QUADRATO, or Durale, in music, called by the French, *b* quarre from its square figure. This is what we call *B* natural or sharp, in distinction to *B* mol or flat. See *FLAT* and *SHARP*. If the flat be placed before a note in the thorough bass, it intimates, that its third is to be minor; and if placed with any cypher over a note in the bass, it denotes, that the fifth or sixth thereof are to be flat. But if the quadro be placed over any note, or with a cypher, in the thorough bass, it has the contrary effect: for thereby the note or interval thereto is raised to its natural order.

BRA'BANT, duchy of, an important central province of the kingdom of the Netherlands. It is bounded on the west by Flanders and Zealand; on the north by Holland and Guelderland; on the east by Liege and Limburg, and on the south by Hainault and Namur. It is divided into North and South Brabant, which are separated by the province of Antwerp, once a part of the duchy.

The soil of these provinces is for the most part fertile, yielding excellent pasturage, and large quantities of wheat, hops, and flax. In the north division, however, there are large tracts of heath, moss, and wood. In both, manufactures of linen cloth and lace are carried on to a considerable extent. Its chief rivers are the Demel, Demer, Dyle, and Nethe, assisted by several canals. In North Brabant the inhabitants are chiefly Protestants; in the south, before the French revolution, the majority were Roman Catholics of the lowest grade, ignorant, superstitious, and wretched. By Philip and Alva, these provinces were deluged with blood; the horrors of war brought them first into notice, and they have generally sunk into insignificance, except when they have been made the theatre of conflict, or when, like absolute property, they have been transferred from one princely family to another. As early as the ninth century, we find Brabant, north and south, erected into a duchy, belonging to the monarchy of the Franks. It afterwards became an important fief of the German empire, under the successors of Charlemagne. Otto, the last duke of Brabant, of this line, died in 1005, when the duchy devolved upon Lambert I., count of Louvain, who had married his sister. Thence it descended to Philip II., duke of Burgundy, and from him, by regular succession, to the emperor Charles V. In the seventeenth century, these provinces were held by the Republic of Holland and the house Austria. The northern division appertained to

the former under the name of Dutch Brabant; the southern part was obtained by the latter, a small district of which was called Walloon Brabant.

This duchy is sometimes described as divided into the quarters of Louvain, Brussels, Antwerp, and Bois-le-duc, comprising about twenty-eight fortified towns, and nearly 700 villages. The Austrian division was seized by the French in 1746, but was restored by the peace of Aix-la-Chapelle; it was, however, taken possession of in 1734 by the French Republic, and confined to them by the treaties of Campo Formio and Luneville. By subsequent arrangements, the northern province formed the department of the Deux Nethes, and the southern that of the Dyle. In 1810 Dutch Brabant was, with part of Guelderland, united to the Empire, and formed into the department of the mouths of the Rhine. Austrian Brabant was once highly privileged—it had its own states, consisting of two bishops and eleven abbots, with the barons and seven deputies chosen by the magistrates of Brussels, Louvain, and Antwerp;—these distinctions no longer exist. North Brabant contains a population of about 250,000 persons, and sends seven members to the Representative Assembly of the kingdom; Antwerp likewise sends five; South Brabant sends eight, which together make twenty for the whole of the former duchy, containing about 366,000 souls. In the south a corrupted French is the language of the common people; in the north the Flemish is spoken, but the higher classes of both parts speak good French. The principal places, exclusive of the four chief towns of the quarters, are Tirlemont, Arschott, Diest, Gemblours, Juvigne, Nivelles, Breda, Bergen-op-Zoom, and Eyndhoven.

BRA'B'BLE, <i>v. & n.</i>	} Goth. <i>ropa</i> ; to call out; produced Belgic, <i>beroeop</i> , alteration, and its frequentative <i>brabbel</i> . To clamor; to brawl; to squabble; to confound; to trouble; to rail; to broil; to contest noisily.
BRA'B'BLER,	
BRA'B'BLING,	
BRA'B'BLINGLY,	
BRA'B'LEMENT.	

Away I say.
Now by the gods that warlike Goths adore,
This pretty *brabble* will undo us all. *Shakspeare.*

Here in the streets, desperate in shame and state,
In private *brabble* did we apprehend him. *Id.*

BRABEJUM, the African almond, in botany, a genus of the monœcia order, and polygamia class of plants. Male: cor. four-parted: STAM. four, inverted in the throat: STYLE, bifid and abortive. Female: cor. four-parted, revolved upwards: STAM. four: PIST. one: STIG. two; the fruit is a roundish drupa, with a globular seed. Of this genus there is but one species, viz.: *B. stellulifolium*, the star-leaved African almond, a native of the Cape of Good Hope. It rises with an upright stem, covered with brown bark: the leaves are indented at their edges, standing on very short foot-stalks. The flowers are produced towards the end of their shoots, which are of a pale color, inclining to white.

BRABEUTÆ, or **BRABEUTES**; from *βραβεύων*, a prize; in antiquity, officers among the Greeks, who presided at the public games, and decided controversies that happened among the antagonists in the gymnastical exercises. The number of brabeutæ was not fixed; sometimes there was only one, but more commonly they amounted to nine or ten. Some authors confound them with the Agonothetæ, but they were different. See *AGONOTHETÆ*.

BRACCATA, in entomology, a species of vespa, color black; base of the antennæ and the fore legs yellow; thighs black above. Inhabiting Europe.

BRACCATA, a species of tentredo, color black; thighs rufous; base of the four posterior shanks and part of the antennæ white. Inhabiting Europe.

BRACCATUS, a species of ichneumon, color black; mouth and antennæ yellow; abdomen ferruginous; four anterior legs yellow. Inhabiting Europe.

BRACCIOLINI (Francis), an Italian poet, a native of Pistoia, and the friend of pope Urban VIII. He wrote: 1. An epic poem, entitled, *The Cross Reconquered*, under the emperor Heraclius. 2. *The Mockery of the Pagan Gods*: a heroic poem. 3. *The Election of Pope Urban VIII.* in twenty-three books. He died about 1644, aged eighty.

BRACE', *v. & n.* } Armoric, *breech*; Welch, *braich*; Ital. *braccio*; Fr. *bras*; from Lat. *brachium*; }
BRACE'LET, }
BRAC'ER, } the arm; strength; a support; stay; energy; a cincture; a bandage. To hold, bind, or tie together; to tighten; to strengthen; to fasten; to confine; to restrain. A brace of dogs is a couple of dogs, braced or tied together, and from usage restricted in number to two, hence the general application in this sense. The substantive brace and bracelet are applied particularly to armour, or ornaments, bracing or binding the arm; brace, to a certain part of the rigging of a ship; to certain timbers which are to brace or hold together; to whatever is constringent.—*Encyclo. Met. Johnson. Thomson's Etymons.*

Upon his arme he bore a gaie *bracer*,
 And by his side a swerde and a bokeler.

Chaucer's Canterbury Tales.

As it more concerns the Turk than Rhodes,
 So may he with mere facile question bear it;
 For that it stands not in such warlike *brace*,
 But altogether lacks the abilities
 That Rhodes is dressed in. *Shakespeare.*

But you, my *brace* of lords, were I so minded,
 I here could pluck his highness's frown upon you.
Id.

Why do they crown themselves with gold and silver, use coronets, and tires of several fashions; deck themselves with pendants, *bracelets*, ear-rings, chains, girdles, rings, pins, spangles, embroideries, shadows, rebatoes, versicolor ribbands. *Burton's Anat. Mel.*

Tie about our tawny wrists,

Bracelets of the fairy twists. *Ben Jonson.*

Down from a hill the beasts that reign in woods,
 First hunter then, pursued a gentle *brace*,
 Goodliest of all the forest, hart and hind. *Par. Lost.*

Ten *brace* and more of greyhounds, snowy fair,
 And tall as stags, ran loose, and coursed around his chair. *Dryden's Fables.*

The tympanum is not capable of tension that way, in such a manner as a drum is *braced*. *Holder.*

The diminution of the force of the pressure of the external air, in *bracing* the fibres, must create a debility in muscular motion. *Arbuthnot on Air.*

The women of China, by *bracing* and binding them from their infancy, have very little feet. *Locke*

Frank, with his cargo in his hand,
 Leaped joyful on the golden strand,
 Opened his toyshop in the port,
 Trinkets of various size and sort,
Bracelets and combs, bodkins and tweezers,
 Bath-metal rings, and knives and scissors.

Somerville.

The fore-sail *braced* obliquely to the wind,
 They near the prow, the' extended tack confined.

Falconer's Shipwreck.

That task performed, they first the *braces* slack,
 Then to its station drag the' unwilling tack. *Id.*

BRACE, in architecture. When the brace is framed into the kinglesses or principal rafters, it is by some called a strut.

BRACE, in sea language, to brace the yard, is to bring it to either side. All braces come afterward on; as, the main brace comes to the poop, the main-top-sail brace comes to the mizen top, and thence to the main shrouds, the fore and fore-top-sail braces come down by the main and main-top-sail stay, and so of the rest. But the mizen bowline serves to brace to the yard, and the cross-jack braces are brought forwards to the main shrouds, when the ship sails close by a wind.

BRACE, or **BRASSE**, a foreign measure, answering to our fathom. See *FATHOM*.

BRACELET, an ornament for the arms. The bracelets of the ancients were often ornamented with the richest gems, sculptured in the finest manner. Those of the Grecian females were mostly representations of serpents, such as are on the wrists of a pretended statue of Cleopatra, in the Vatican; but which is now more properly called Ariadne asleep. The Roman generals distributed bracelets called *armillæ*, as marks of valor to the bravest of their soldiers.

BRACER, a smooth piece of leather fastened on the outside of the archer's left arm, which serves to defend his arm from the stripe of the string.

BRACH. Goth. *brakk*; Teut. *brak*; Fr. *braque*; Ital. *bracco*; apparently the same with *rack*, but supposed to be from *rauck*, smell. Specifically a kind of short-tailed setting-dog; generally a dog that scents out, or traces out by the scent; from Anglo-Sax. *raec*; from *reac*, to reek, to send forth a fume or scent; to trace by the scent or odor; a bitch hound, says Johnson.

Truth is a dog must to kennel; he must be whipped out, when the lady *brach* may stand by the fire, and stink. *Shakespeare.*

Lye still ye thief, and hear the lady sing in Welsh.

HOTS. I had rather hear (lady) my *brach* howl in Irish. *Id.*

BRACHIAL ARTERY, *arteria brachialis*, the axillary artery, as it passes behind the tendon of the pectoralis major, receives the name of brachial. It runs down on the inside of the arm, over the musculus coracobrachialis, and anconæus internus, and along the inner edge of the

biceps, behind the vena basilica. Below the bend of the arm it divides into the cubitalis and radialis.

BRACHIAL NERVES, the nerves of the arm. See **ANATOMY**.

BRACHIO CUBITAL LIGAMENT; ligamentum brachio-cubitale. The expansion of the lateral ligament, which is fixed in the inner condyle of the os humeri, runs over the capsular, to which it closely adheres, and is inserted like radii on the side of the great sigmoid cavity of the ulna.

BRACHIO RADIAL LIGAMENT; ligamentum brachio radiale. The expansion of the lateral ligament, which runs over the external condyle of the os humeri, is inserted round the coronary ligament.

BRACHIALIS MUSCULUS. See **ANATOMY**.

BRACHINUS, in entomology, a genus of insects of the order coleoptera, family carabici. Its generic character is: external maxillary and labial palpi filiform; the last joint attenuated at the base; antennæ filiform, longer than the thorax; lower lip entire, produced, subquadrate; the angles of its apex acute; body oblong, obovate; glands at the anus emitting a caustic vapor. The species are: 1. *B. crepitans*, a common insect in this country: when pursued by the calosoma inquisitor, its enemy, it emits with a considerable explosion a quantity of blue vapor from the anus, accompanied with a most nauseous smell, and this immediately stops its assailant. 2. *B. displosor*, with a similar mode of defence: so many of the family of carabici possess it, that one division has acquired the name of bombardiers. *Latr. Hist. Nat. tom. viii. p. 243. Kirby and Spence, vol. ii.*

BRACHIONUS, in entomology, a genus of animalcules of the class of arthrodia, comprehending all the vorticellæ, or wheel species. See **ANIMALCULE**.

BRACHMANS, or **BRACHMINS**. See **BRAMHINS**.

BRACHURUS, in zoology, a name given by Dr. Hill to a genus of animalcules of a roundish figure, with tails shorter than their bodies; their skin is perfectly smooth, thin, and colorless. They are frequent in water-ponds, in pepper-water, and other infusions of vegetable substances. See **ANIMALCULES**.

BRACHYACANTHUS, in entomology, a species of ichneumon; color black, with spotted head and thorax; a small line on the scutellum, and tip of the abdomen white; sting very short. A native of Europe. Also another species of ichneumon; color black; antennæ fuscous; abdomen and legs yellow; sting very short. Inhabiting Europe.

BRACHYCATALEFION, in poetry; from *βραχυς*, short, and *καταληγω*, to end; a verse wanting a syllable at the end.

BRACHYCERUS, in entomology, a genus of insects, of the order coleoptera, family curculionites, *Latr.* Its generic character is antennæ short, straight, with nine articulations; the last forming a truncated club; rostrum rather short, thick, broad, bent downwards; body ovate, turgid, rough; elytra connate; no scutellum; all the joints of the tarsi undivided. It is the cur-

culio apterus of Linnæus. The species are inhabitants of hot climates.

BRACHYCOLON; from *βραχυς*, and *κολον*, a member; a period wherein one member is shorter than another.

BRACHYGLOTTIS, in botany, a genus of plants; class syngenesia, order polygamia superflua. *Ess. Char.* flowers radiate: cor. of the ray few, recurved, and three-toothed: cal. polyphyllous, connivent, cylindric, equal. Down plumose. Species, two, *B. repanda*. Leaves ovate, repando-sinuate. *B. rotundifolio*. Leaves nearly round.

BRACHYGRAPHY, *n. & s.* *βραχυς*, short, and *γραφω*, to write. The art or practice of writing in a short compass, now called shorthand.

All the certainty of those high pretenders, bating what they have of the first principles, and the word of God, may be circumscribed by as small a circle as the creed, when *brachygraphy* has confined it within the compass of a penny. *Glanville.*

BRACHYGRAPHY. See **SHORT HAND**.

BRACHYLOGY; from *βραχυς*, and *λογος*, expression; in rhetoric, the expressing any thing in the most concise manner. This, so far as is consistent with perspicuity, is a beauty; but if obscurity be the consequence, which is often the case, it becomes an inexcusable defect. Quintilian gives an instance of brachylogy from Sallust: *Mithridates corpore ingenti perinde armatus*; 'Mithridates, as it were, armed with the largeness of his stature.'

BRACHYOTOS, in ornithology, a horned species of strix, having the tuft very short; the body fuscous above; pale yellow, longitudinally streaked beneath. This is the short-eared owl of Latham, and the grande chevêche of Buffon. It is found both in America and Europe.

BRACHYPNŒA, in medicine; from *βραχυς*, short, and *πνεω*, to breathe; shortness and difficulty of breathing.

BRACHYPTERA, a term used by Willoughby to denote those hawks which have their wings so short as not to reach to the end of the tail. Of this kind are the goss-hawk, sparrow-hawk, &c.

BRACHYPTERA, in entomology, a species of mantis. Color cinereous; thorax dentated; wings half the length of the abdomen. Found in the sandy deserts of the south of Russia.

BRACHYPTERUS, a species of cimex; color pale; body linear; wing-cases a third part the length of the abdomen. Inhabiting Europe. Also a species of gryllus.

BRACHYPYRENIA: from *βραχυς*, and *πυρην*, a nucleus; in the natural history of fossils, a genus of septariæ, with a roundish nucleus. See **SEPTARIA**.

BRACHYTELOSTYLA, in natural history; from *βραχυς*, short, *τελειος*, perfect; and *στυλος*, a column; the name by which Dr. Hill calls those crystals which are composed of a short hexangular column, terminated at each end by an hexangular pyramid. See **CRYSTAL**.

BRACHYURA, in ornithology, an Italian species of fringilla, entirely yellow: the short-tailed Italian sparrow of English writers, and *passerculus bononiensis* of Brisson.

BRACHYURUS, in entomology, a species of ichneumon, inhabiting Germany. Color fulvous; thorax, eyes, and abdomen black; legs yellow.

BRACHYURUS, in ornithology, a species of lanius, the short-tailed shrike of Latham; color, the head ferruginous gray above; eye-brows whitish; body grayish above; yellowish white beneath; tail rounded. Found only in Hungary. Also a species of *corvus*, of a green color; tawny beneath, and on the head, with a white spot on the wings. This bird inhabits the islands of the Indian ocean.

BRACK'. Ang-Sax. *bræccan*. To break, see break. A breach; a broken part.

The place was but weak, and the *bracks* fair; but the defendants, by resolution, supplied all the defects.

Hayward.

Let them compare my work with what is taught in the schools, and if they find in theirs many *bracks* and short ends, which cannot be spun into an even piece; and, in mine, a fair coherence throughout; I shall promise myself an acquiescence.

Digby.

BRACK', } Goth. *bar*, a tide; Arab.
BRACK'ISH, } *bara*, the sea; Dutch, *brack*,
BRACK'ISHNESS, } salt. Brackish is saltish;
BRACK'Y. } expressing the disagreeable taste of sea water, or of waters approximating to the sea, not perfectly saline nor entirely fresh; the intermediate state of water that belongs not strictly either to oceans or rivers.

Pits upon the sea shore turn into fresh water, by percolation of the salt through the sand: but it is farther noted, after a time, the water in such pits will become *brackish* again.

Bacon.

When I had gained the brow and top,

A lake of *brackish* waters on the ground

Was all I found.

Herbert.

All the artificial strainings hitherto leave a *brackishness* in salt water, that makes it unfit for animal uses.

Cheyne.

The wise contriver, on his end intent,

Mixed them with salt, and seasoned all the sea,

What other cause could this effect produce?

The *brackish* tincture through the main diffuse.

Blackmore.

BRACK'ET. Ital. *bracietto*. See brace, a cramp or stay; a piece of wood fixed for the support of something.

Let your shelves be laid upon *brackets*, being about two feet wide, and edged with a small lath.

Mortimer.

In printing, a bracket or brace is a certain mark, bracing or confining words or lines together, as in a triplet thus:—

Charge Venus to command her son,

Wherever else she lets him rove,

To shun my house, and field, and grove;

Peace cannot dwell with hate or love.

Or thus [].

} *Prior.*

At the head of each article I have referred, by figures included in *brackets*, to the page of Dr. Lardner's volume, where the section, from which the abridgement is made begins.

Paley's Evidences, part ii. chap. 6.

BRACKET, in architecture, a small support against a wall for a figure, lamp, clock, &c. which are susceptible of considerable elegance of design and decoration.

BRACKETS, in gunnery, the cheeks of the carriage of a mortar. They are made of strong planks of wood, of almost a semicircular figure, and bound round with thin iron plates: they are

fixed to the beds by four bolts, which are called bed bolts; they rise up on each side of the mortar, and serve to keep it at any elevation, by means of some strong iron bolts, called bracket bolts, which go through these cheeks or brackets.

BRACKETS, in ships, the small knees, serving to support the galleries, and commonly carved. Also the timbers that support the gratings in the head.

BRACKLAU, or **BRACKLAW**, a palatinate in the eastern part of Podolia; it is also called Lower Podolia, and is of greater extent than Upper Podolia, but is more desolate, on account of the neighbourhood of the Tartars.

BRACKLAW, a strong town in Poland, capital of the palatinate. The houses are built of wood. It was taken by the Turks in 1673, but retaken three years afterwards. It is seated on the river Bog.

BRACKLEY, an ancient borough town of Northamptonshire, seated near Buckinghamshire, on a branch of the river Ouse. It contains two parish churches; is governed by a mayor and aldermen, and sends two members to parliament. It had formerly a college, which is turned into a free school; and contains many vestiges of former greatness. In the neighbourhood is Bayard's Green, formerly celebrated for its tilts and tournaments. The town had once a great trade in wool. It is thirteen miles south-west of Northampton, and sixty-four north-west of London, and seven miles distant from Buckingham.

BRACTEA, in natural history, a plate, spangle, or thin flake of any substance.

BRACTEA, in botany, a thin leaf of any folium floreale. See **BOTANY**.

BRACTEARIA, in natural history, a genus of tales, composed of small plates in form of spangles, each plate either being very thin or fissile into very thin ones. Of this genus there are a great many species, called, from their different colors, mica aurea, or gold-glimmer; and mica argentea, silver-glimmer, or cat's-silver, &c.

BRACTEATA, in entomology, a small species of cicada, inhabiting Cayenne, with a green thorax, without spots.

BRACTEATED COINS, or **BRACTEATI NUMMI**, among antiquaries, coins or medals covered over with a thin plate, or leaf, of some richer metal. They are usually made of iron, copper, or brass, plated over, and edged with gold or silver leaf. Medalists find some bracteated pieces even among the truly ancient coins. The French call them *fourrées*.

BRACTON (Henry), lord chief justice of England in the reign of Henry III. was educated at Oxford, where he took the degree of LL.D. and was made one of the itinerant judges about 1244. Ten years after, he became chief justice, and had the earl of Derby's house in London assigned him for his town residence, during the minority of that nobleman. He filled this important office with singular reputation for twenty years. He wrote *De Legibus et Consuetudinibus Angliæ*, which is one of the most ancient and most methodical books on our laws. His method is copied from Justinian. It was printed at London in 1569, folio, and in 1640, 4to. The first is very incorrect.

BRAD', being an initial, signifies broad.

spacious, from the Saxon *bræð*, and the Gothic, *braid*.

BRAD'. Goth. *brodde*; Swed. and Dan. *brad*; Welsh, *brwyd*. A point; a nail without a head. A sort of nail to floor rooms with. They are about the size of a tenpenny nail, but have not their heads made with a shoulder over their shank, as other nails, but are made pretty thick towards the upper end, that the very top may be driven into, and buried in, the board they nail down; so that the tops of these *brads* will not catch the thrums of the mops, when the floor is washing.

BRADS are distinguished by iron-mongers by different names; as joiners' brads, flooring brads, batten brads, bill brads, or quarter heads, &c. Joiners' brads are for hard wainscot; batten brads are for soft wainscot; bill brads are used when a floor is laid in haste, or for shallow joists subject to warp. See **NAIL**.

BRADBURY (Thomas), a dissenting minister, was a native of Wakefield in Yorkshire, and educated at Mr. Jollie's academy at Attercliffe, where he distinguished himself by a species of low wit and eccentricity. He left that seminary at the age of eighteen, and became a preacher in London, and the successor of the celebrated Daniel Burgess. He engaged in a controversy with Dr. Watts on the subject of the Trinity, and was a warm, but not very liberal advocate of the orthodox opinions. He published also two volumes of sermons, which are esteemed. In private life he is said to have been of a very cheerful disposition, and would occasionally carry his hilarity so far as to sing 'O the roast beef of Old England!' at a public dinner. It is but fair, however, to add that his general conduct was irreproachable, and that he was much respected by bishop Burnet, and many of the episcopal clergy. He died in 1759.

BRADFORD (John), an eminent divine, and martyr of the Reformation, was born in the beginning of the reign of Henry VIII. at Manchester. He was at first secretary to Sir John Harrington, who was several times employed by king Henry, and his successor Edward VI. as paymaster to the troops abroad. Bradford at this time was a gay man, and to support his extravagance made free with the king's money; but conscience checking him, he determined to make restitution, and actually repaid the money. Quitting his employment of secretary about A. D. 1547, he took chambers in the inner temple, and for some time studied the law; but, finding an inclination to preach the gospel, he removed, in 1547, to Catharine Hall, Cambridge, and there applied with such uncommon assiduity to the study of divinity, that in a much shorter time than usual he was admitted to the degree of M. A. Bishop Ridley, who, in 1550, was translated to the see of London, charmed with Bradford's application and zeal, now sent for him to the metropolis, ordained and appointed him his chaplain. In 1553 he was also made chaplain to Edward VI. during which time he became one of the most popular preachers in the kingdom. Mary was hardly in possession of the crown, before Bradford's persecutions began. He was first confined in the tower for sedition,

where he continued a year and a half; during which time he wrote several epistles that were dispersed in various parts of the kingdom. He was afterwards removed to other prisons, and at last brought to his trial before bishop Gardiner, where he defended his principles to the last, and was condemned to the flames. He was accordingly burnt alive in Smithfield, where he behaved with uncommon heroism, on July 1st, 1555. His works are, 1. Seventy-two Letters, written to Various People, whilst the Author was in Prison; printed in Coverdale's Collection. 2. Ten Letters, printed in Fox's Acts and Monuments. 3. Complaint of Verity, 1559, 8vo. 4. Three Examinations before the Commissioners, and his Private Talk with the Priests, with the Original of his Life; 1561, 8vo. 5. Two Notable Sermons; 1574, 8vo, 1631. 6. Godly Meditation and Prayers; 1614, 24mo. 7. Treatise of Repentance, 1622. With several translations and other pieces.

BRADFORD (William, Esq.), an American author, printer, and soldier. During the American war he wrote, printed, and fought for his country. Both his father and grandfather had been printers. In the army he had the rank of colonel. Dr. Franklin said of him that his writings were spirited, his press correct, and his sword active. He died at Philadelphia, in 1791.

BRADFORD, a market town of Wiltshire, the centre of the great fabric of superfine cloths, for which it is famous: 10,000 or 12,000 pieces of twenty yards are made here annually; but the water, while excellent for dyeing, has been said to subject the manufacturers in a remarkable degree to scrofula. The Kennet and Avon canal has much increased the trade. Distant seven miles south-east from Bath, and 100 west from London. Market on Monday.

BRADFORD, or **BRADFORTH**, a market town of Yorkshire, in the West Riding, standing on one of the tributary streams of the Aire. It is noted for its manufactures of worsted stuffs, which are exposed for sale on the market day, in a large hall, built for the purpose. The parish is large, and has an endowed free grammar school, founded in the reign of Edward VI. and incorporated by Charles II. in the fourteenth year of his reign. Besides the parish church, a large and noble edifice, there is a new church, lately built by subscription here, and five meeting-houses for dissenters. Near the town are large iron works, where malleable iron is made, celebrated for its great strength. Coal is here very plentiful and cheap, and great quantities are sent off by the canals. In the vicinity, also, are flags and slate, of excellent quality. The rise of the canal, from the Leeds and Liverpool canal, which it joins near Windhill, is eighty-one feet, by eight locks. By means of this canal Bradford has most extensive navigable communications. The market is on Thursday, but the increase of the population has made a second market on Saturday to be much frequented. According to the two last parliamentary returns, it has very nearly doubled its population. It is ten miles from Leeds, and 196 N. N. W. of London.

BRADLEIA, in botany, a genus of class monœcia, order monadelphia. Male; cor. petals

six, filaments three, anthers three. Female; cor. six-parted; three parts interior: STIG. six to eight: CAP. six-valved, six-celled: SEEDS solitary. Species one, *B. sini*, a shrub, native of China.

BRADLEY (Dr. James), a celebrated English astronomer, was born at Sherborne, in Gloucestershire, in 1692. He was fitted for the university at North Leach, and was sent thence to Oxford, and admitted a commoner of Balliol College, March 15th, 1710; where he took the degree of B. A. in 1714, and of M. A. in 1716. His friends intending him for the church, his studies were regulated with that view, and the bishop of Hereford, who had conceived a great esteem for him, gave him the living of Bridstow, and soon after that of Landewy Welfry in Pembrokeshire. All the time that he could spare from the duties of his function he passed with his uncle, Mr. Pound of Wanstead, a gentleman of considerable mathematical acquirements. At this period he made such observations, as laid the foundation of those discoveries which afterwards distinguished him as one of the greatest astronomers of his age. These observations gained him the notice and friendship of the lord chancellor Macclesfield, Mr. afterwards Sir Isaac Newton, Mr. Halley, and many other members of the Royal Society, of which he was elected a member. Not long after, the chair of Savilian professor of astronomy at Oxford becoming vacant, by the death of the celebrated Dr. Keil, Mr. Bradley was elected to succeed him, October 31st, 1721, at twenty-nine years of age; his colleague being Mr. Halley, was professor of geometry on the same foundation. Upon this appointment Mr. Bradley resigned his church livings, and applied himself wholly to the study of his favorite science. In the course of his observations, which were innumerable, he discovered and settled the laws of the alterations, or aberration, of the fixed stars, from the progressive motion of light, combined with the earth's annual motion about the sun, and the nutation of the earth's axis arising from the unequal attraction of the sun and moon on the different parts of the earth. The theory of the former he published in 1727; and that of the latter in 1737: so that in the space of about ten years, he communicated to the world two of the finest discoveries in modern astronomy. See ABERRATION, NUTATION, and ASTRONOMY. In 1730 Mr. Bradley succeeded Mr. Whiteside, as lecturer in astronomy and experimental philosophy in the Museum at Oxford, which was a considerable emolument to him, and which he held till within a year or two of his death; when the ill state of his health induced him to resign it. He always preserved the esteem and friendship of Dr. Halley; who, being worn out by age and infirmities, thought he could not do better for the service of astronomy, than procure for Mr. Bradley the place of regius professor at Greenwich, which he himself had many years possessed with the greatest reputation. He even offered to resign it in his favor, but died before he could accomplish this kind object. Mr. Bradley, however, obtained the place, by the interest of Lord Macclesfield, who was afterwards president of the Royal Society; and upon this appointment the University of Oxford sent him a

diploma creating him D. D. The appointment of astronomer royal at Greenwich, which was dated February 3rd, 1741-2, placed Dr. Bradley in his proper element; and he pursued his observations with unwearied diligence. Numerous as the collection of astronomical instruments at that observatory was, he endeavoured to increase them; and, in 1748, induced the Royal Society to make application to the king on the subject, who ordered £1000 to be expended on this object. Dr. Bradley thus furnished, pursued his observations with great assiduity during the rest of his life; an immense number of which were found after his death, in thirteen folio volumes, and were presented to the university of Oxford in 1779, on condition of their printing and publishing them; which, however, has never yet been done. During Dr. Bradley's residence at the Royal Observatory, he was offered the living of the church at Greenwich; but he refused to accept it, from a conscientious scruple, 'that the duty of a pastor was incompatible with his other studies and necessary engagements.' King George II. hearing of this, granted him a pension of £250 over and above the astronomer's original salary from the Board of Ordnance; a pension which has been regularly continued to the astronomers royal ever since. Dr. Bradley was elected a member of the Academy of Sciences at Berlin, in 1747; of that of Paris, in 1748; of that of Petersburg, in 1754; and of that of Bologna, in 1757. He married Miss Susanna Peach, in 1744, but never had more than one child, a daughter. He died the 13th July, 1763, at Chalfont; and was interred at Minchinhampton, in Gloucestershire. His papers, which have been inserted in the Philosophical Transactions, are, 1. Observations on the Comet of 1703: 2. The Longitude of Lisbon and of the fort of New York from Wanstead and London, determined by the Eclipse of the first satellite of Jupiter: 3. An Account of a New Discovered Motion of the Fixed Stars: 4. On the Going of Clocks, with Isochronal Pendulums: 5. Observations on the Comet of 1736-7: 6. On the Apparent Motion of the Fixed Stars: 7. On the Occultation of Venus by the Moon; April 15th, 1751: 8. On the Comet of 1757: and 9. Directions for Using the Common Micrometer.

BRADLEY (Richard), F. R. S., a writer on gardening and agriculture, was also chosen professor of botany at Cambridge, but led a dissipated life, and measures were taken to deprive him of the situation, when he died in 1732. His works are, 1. A New Improvement of Planting and Gardening, 8vo. 1717. 2. Philosophical Account of the Works of Nature, 4to. 1721. 3. The Gentleman's and Gardener's Kalendar, 8vo. 4. A General Treatise of Husbandry and Gardening, 2 vols. 8vo. 5. Practical Discourses concerning the four Elements, as they relate to the Growth of Plants, 8vo. 6. *Dictionarium Botanicum*, 8vo. 7. *Historia Plantarum Succulentarum*, 4to. Besides these publications his name was prefixed to a translation of Xenophon's (*Economics*, 8vo. In one of his works he describes an instrument somewhat similar to that which Dr. Brewster has since called the Kaleidoscope, but never seems to have used it.

BRADSHAW (John), president of the high court of justice which tried and condemned Charles I. He was born, according to some writers, in Derbyshire, and, according to others, in Cheshire, but is first known in history as a student in Gray's Inn. Being admitted to the bar, he obtained much chamber practice from the partisans of the parliament, to which he was zealously devoted. He was made joint commissioner of the great seal for six months, in 1646; and in the February following, both houses voted him chief justice of Chester. The trial of the king being determined upon, Bradshaw was selected for president, and after a slight hesitation accepted the office. 'Even according to those principles,' says Mr. Hume, 'which in his present situation he was perhaps obliged to adopt, his behaviour in general will appear not a little harsh and barbarous; but when we consider him as a subject, and one too of no high character, addressing himself to his unfortunate sovereign, his style will be esteemed to the last degree audacious and insolent.' His rewards were certainly ample, amounting, it is said, to not less than £4000 a year. He, however, was finally no favorite with Cromwell, on whose appointment to the protectorate he resigned the chief justiceship of Chester. On the death of Cromwell, and the restoration of the long parliament, he obtained a seat in the council, was elected president, and would have been appointed commissioner of the great seal had his health permitted. He died in November, 1659, and on his death-bed is said to have declared that he felt no remorse for having presided at the trial of the king. At the Restoration, his body was disinterred; and being exhibited on a gallows, was buried under it, at Tyburn.

BRADWARDEN (Thomas), archbishop of Canterbury, was born at Hartfield in Sussex about the close of the thirteenth century. He was educated at Merton College, Oxford, where he took the degree of D. D. and was esteemed a profound scholar, a skilful mathematician, and consummate divine. Pitt says he was a professor of divinity at Oxford. From being chancellor of the diocese of London, he became a courtier and confessor to Edward III. whom he constantly attended during his war with France, assisting that victorious prince with his advice, animating the troops, and fervently praying for their success. After his return he was made prebendary of Lincoln, and archbishop of Canterbury. He died at Lambeth in 1349, forty days after his consecration. His works are, 1. *De Causa Dei*, printed in London, 1618, published by J. H. Savil; 2. *De Geometria Speculativa*, &c. Paris, 1495, 1512, 1530; 3. *De Arithmetica Practica*, Paris, 1502, 1512; 4. *De Proportionibus*, Paris, 1495, Venice, 1505, folio; 5. *De Quadratura Circuli*, Paris, 1495, folio.

BRADY (Nicholas), a divine and poet, born at Bandon, in Cork, in 1659. He studied at Westminster, and afterwards at Oxford and Dublin. He was a zealous promoter of the Revolution; and in 1690, when the troubles broke out in Ireland, by his interest with McCarty, King James's general, he thrice prevented the burning of the town of Bandon. Having quitted

several preferments in Ireland, he settled in London, where he was successively promoted to several livings; and at the time of his death was rector of Clapham, minister of Richmond, and chaplain to the duke of Ormond's troop of horse guards. He composed part of the new version of Psalms, still sung in many churches of England and Ireland; the *Æneid* of Virgil, in 4 vols.; and 3 vols of sermons. He died May 20th, 1726.

BRADY (Robert), born in Norfolk in 1643, was master of Caius College, Cambridge, regius professor, and twice representative of that university in parliament. In 1689 he was made keeper of the records in the Tower, and physician in ordinary to James II. He wrote, *An Introduction to the Old English History*; *An History of England, from the time of the Romans to the end of the reign of Richard II.*; and *A Treatise on English Boroughs*. He died in 1700.

BRADYPEPSIA, from *βραδύς*, slow, and *πepsis*, digestion, weak digestion.

BRADYPUS, the sloth, a species of quadrupeds, belonging to the order of bruta. The characters are these: they have no fore teeth in their jaw; the dog teeth are blunt, solitary, and longer than the grinders; they have six grinders in each jaw. The body is covered with hair. There are three species, viz. 1. *B. didactylus* has only two toes on each fore foot, and no tail; the head is round; the ears are large; and it has no mamma on the breast. The body is covered with ash-colored hair. It is a native of Ceylon. 2. *B. trydactylus*, or American sloth, has a short tail, and three toes on each foot. It is about the size of a fox. The body is covered over with hair of a gray color; the face is naked; the throat yellowish; the fore feet are longer than the hind feet; the claws are compressed, and very strong. It has no mamma on the breast; nor any external ears, but only two winding holes. In this and the last species there is only one common excreting canal as in birds. Its food is fruit, or the leaves of trees. It lives generally in the branches of trees; and it is worthy of remark, that it always prefers to move along the underside of the boughs, its strong fore feet enabling it to clasp it in such a manner as to secure its safety; thus passing, as has been wittily observed, the greater part of his life like a young clergyman nearly related to a bishop, in a state of suspense. When it wishes to descend it rolls itself in a ball and drops from the branch, preferring that 'short road' to the ground, to the labor of creeping down the trunk. Nature has guarded this animal against its enemies, by giving it such strength in its feet, that whatever it seizes it holds so fast that it never can be freed from its claws, but must there die of hunger. A dog who has been set upon the animal has thus been known to be retained in its grasp until it was starved. It walks painfully and slowly, dragging itself forward by the strength of its forefeet; turns its head as if astonished; its note an ascending hexachord; cry miserable. 3. *B. pentadactylus*: five toes on all the feet; tail short. A heavy, clumsy, animal, of a mixed resemblance between the sloth and hog; when irri-

tated gives a short harsh cry; catches what is thrown to it with its paws; eats bread, fruit, and eggs, but not roots.

BRAE-MAR, or **BRAE-MARR**, a mountainous district of Scotland, in Aberdeenshire, situated in the middle of the Grampian hills, about fifty miles west of Aberdeen, and one of the three divisions of that extensive territory called Marr. The mountains are the highest in Great Britain, Ben-Nevis excepted. Macduie, Cairntoul, and Breirareh, rising 4300 and 4220 feet above the level of the sea. Here are various colored crystals of considerable value; several forests, and numerous lakes and rivulets. The inhabitants are computed at about only fifteen to a square mile; and in the mountainous parts they do not reside permanently.

BRAG, *v. n. & adj.* } Goth, *braga, braha*,
BRAG'GER, } (from which we have
BRAG'GERY, } our word *brave*); Isl-
BRAG'GING, *n.* } landic, *brag*; Swedish,
BRAG'GINGLY, } *brage*, a hero; *bragner*,

BRAG'GARDISM, } *ga*; Fr. *braguer*, to ex-
BRAG'GADOCIO, } tol. Junius has ob-
served that *brag* in Scotch is terror, fear; and he quotes several instances from G. Douglas of the word so used; and hence he infers was deduced the English application of the word, to those who endeavour to strike terror into their opponents by the noisiness of their threats. Skinner believes that the word is derived from the Ang.-Sax. *bræc-an*, to break; hence to break or burst out in noisy threats or boastings. Thus we may collect the various meanings of the word—to *brag* is distinguished from the just celebration of our own or another's merit. It implies exaggeration—a person attempting to appear, by his own noisy boasting, either greater, braver, or better than he is. A *brag* is a coward, vaunting his bravery; the ass in a lion's skin, trying to roar when he can only bray. A *braggadocio* is a puffing, swelling, boasting fellow, one who makes clamorous professions.

An horn blew with many boustous *bragge*,
Which all this world with war hath made to wagge.
Chaucer.

Hard by his side grewe a *bragging* brere,
Which proudly thrust into the element,
And seemed to threaten the firmament.

Spencer's Shepheard's Calendar.

But it was scornfull *braggadocio*,
That with his servant Trompart hovered there. *Id.*
Seest not thilk hawthorn stud,
How *bragly* it begins to bud,
And utter his tender head?
Flora now calleth forth each flower,
And bids him make ready Maia's bower.

Shakespeare.

The bruit is, Hector's slain, and by Achilles.—
—If it is so, *bragless* let it be,
Great Hector was as good a man as he. *Id.*

Thou coward! art thou *bragging* to the stars,
Telling the bushes that thou lookest for wars,
And wilt not come? *Id.*

Mark me, with what violence she first loved the
Moore, but for *bragging*, and telling her fantastical
lies. *Id.*

Verona *brags* of him,
To be a virtuous and well-governed youth. *Id.*

A kind of conquest
Cesar made here; but made not here his *brag*
Of came, and saw, and overcame. *Id.*

Who knows himself a *braggart*,
Let him fear this; for it will come to pass,
That every *braggart* shall be found an ass. *Id.*
Knowledge being the only thing whereof we poor
old men can *brag*, we cannot make it known but by
utterance. *Sidney.*

It was such a new thing for the Spaniards to re-
ceive so little hurt, upon dealing with the English,
as Avellaneda made great *brags* of it, for no greater
matter than the waiting upon the English afar off.
Bacon.

His steward was his kinsman, Vain Experience,
Who proudly strove, in matters light, to show
Heroic mind in *braggart* affluence

Fletcher's Purple Island.
With him such self-admiring arrogance
And *brag*; his deeds without a helper praising. *Id.*

Beauty is nature's *brag*, and must be shown
In courts, at feasts, and high solemnities,
Where most may wonder. *Milton.*
Such as have had opportunity to sound these *brag-*
gers throughly, by having sometimes endured the
penance of their sottish company, have found them
in converse, empty and insipid. *South.*

In *bragging* out some of their private tenets, as if
they were the established doctrines of the church of
England. *Sanderson.*

The rebels were grown so strong there, that they
intended then, as they already *bragged*, to come over
and make this the seat of war. *Clarendon.*

Mrs. Bull's condition was looked upon as desperate
by all the men of art; but there were those that
bragged they had an infallible ointment. *Arb.*

The world abounds in terrible fanfarones, in the
masque of men of honor; but these *braggadocios* are
easy to be detected. *L'Estrange.*

By the plot, you may guess much of the characters
of the persons; a *braggadocio* captain, a parasite, and
a lady of pleasure. *Dryden.*

Every busy little scribbler now
Swells with the praises which he gives himself.
And taking sanctuary in the crowd,
Brags of his impudence, and scorns to mend. *Rosc.*
Yet lo! in me what authors have to *brag* on.
Reduced at last to hiss in my own dragon. *Pope.*

As yet, notwithstanding the strutting and lying in-
dependence of a *braggart* philosophy, nature maintains
her rights, and great names have great prevalence.

Burke's Appeal to the Old Whigs.

BRAG, a game at cards, wherein as many may
partake as the cards will supply; the eldest hand
dealing three to each person at one time, and
turning up the last card all round. This done,
each gamester puts down three stakes, one for
each card. The first stake is won by the best card
turned up in the dealing round; beginning from
the ace, king, queen, knave, and so downwards.
When cards of the same value are turned up to
two or more of the gamesters, the eldest hand
gains; but the ace of diamonds wins, to what-
ever hand it be turned up. The second stake is
won by what is called the *brag*, which consists in
one of the gamesters challenging the rest to pro-
duce cards equal to his. A pair of aces is the
best *brag*, a pair of kings the next, and so on; and
a pair of any sort wins the stake from the most
valuable single card. In this part consists the
great diversion of the game; for, by the artful
management of the looks, gesture, and voice, it

frequently happens that a pair of fives, treys, or even deuces, out-brags a much higher pair, and even some pairs royal, to the no small merriment of the company. The knave of clubs is a principal favorite, making a pair with any other card in hand, and with any other two cards, a pair royal. The third stake is won by the person who first makes up the cards in his hand thirty-one; each dignified card going for ten, and drawing from the pack, as usual in this game.

BRAGA, an intoxicating liquor in Russia, brewed from wheat.

BRAGA, a considerable city of Portugal, whose archbishop is the primate of that kingdom. It consists of five parishes, is neatly built, and situated in a broad and cultivated vale, in a pleasant part of the province of Entre Douro-e-Minho, on the Este. Its manufacture of hats supplies a great part of Portugal. This city, which contains about 13,000 inhabitants, is about thirty miles nearly north-east of Oporto: a district of the same name encompasses it, containing thirteen cantons.

BRAGANTIA, in botany, a genus of plants: class gynandria, order hexandria. Its generic characters are, *CAL.* none: *COR.* petal one; tube globular; border divided into three; recurved segments: *STAM.* anthers six, adhering to the middle of the style: *PIST.* style thick; *STIG.* concave: *PER.* four-celled and four-valved: *SEEDS* many: Species only one, a shrub growing on the mountains of Cochinchina.

BRAGANZA, a duchy of Portugal. Braganza, the capital, is seated on an eminence near the rivulet Fervenza; and divided into the old city and the new. The former is upon an eminence, and fortified with a double wall; the citadel is on the opposite side joined to a wall. The new town is in a plain, near the river Sabor, on the frontiers of Galicia; fifty-five miles north-east of Villa Real; and carries on a silk manufacture. The district of Braganza includes ten adjacent villages.

BRAHE (Tycho), a celebrated astronomer, descended of an illustrious family originally of Sweden, but settled in Denmark, was born December 14th, 1546, at Knudstorp in Schonen. He was taught Latin when seven years old, and studied five years under private tutors. His father dying, his uncle sent him in April 1559 to finish his education at Copenhagen. The great eclipse of the sun on the 21st of August, 1560, happening at the precise time that had been foretold, he began to look upon astronomy as something divine; and purchasing the tables of Stadius, gained some notion of the theory of the planets. In 1562 he was sent by his uncle to Leipsic, to study law; but astronomy engrossed all his thoughts, and in purchasing books on that science he employed all his pocket money. Having procured a small celestial globe, he would wait till his tutor was gone to bed, in order to examine the constellations and learn their names; and when the sky was clear spent whole nights in observing the stars. In 1565 Brahe having quarrelled with a Danish nobleman, they fought and he had part of his nose cut off; which defect he so artfully supplied with one made of gold and silver, that it was not perceivable. About this time he began to apply to chemistry, purposing

nothing less than to obtain the philosopher's stone. In 1571 he returned to Denmark, and was favored by his mother's brother, Steno Billes, a lover of learning, with a convenient place at his castle of Hertritzvold near Knudstorp, for making his observations and building a laboratory. But marrying a country girl beneath his rank, a violent quarrel ensued between him and his relations, and Frederick II. king of Denmark was obliged to interpose to reconcile them. In 1574 he read lectures upon the theory of comets at Copenhagen. In 1575 he began his travels through Germany, and proceeded as far as Venice: he then resolved to remove his family, and settle at Basil; but the king being informed of his design, and unwilling to lose such an ornament to his country, promised, to enable him to pursue his studies, to bestow upon him for life the island of Huen in the Sound, to erect an observatory and laboratory there, and to defray all the expences necessary for carrying on his designs. Our astronomer readily embraced this proposal; and accordingly the first stone of the observatory was laid Aug. 8th, 1576. The king also gave him a pension of 2000 crowns out of his treasury, a see in Norway, and a canonry of Roschild, which brought him 1000 more. James VI. of Scotland, going to Denmark to marry the princess Anne, paid him a visit at Uranibourg, made him several presents, and with his own hand wrote a copy of verses in his praise. After the death of King Frederick, in 1588, he was deprived of his pension, see, and canonry; upon which, finding himself incapable of bearing the expences of his observatory, he went to Copenhagen, whither he brought some of his instruments, and continued his astronomical observations till Valkendorf, chamberlain to Christian IV. commanded him, by the king's order, to discontinue them. He then removed his family to Rostock, and afterwards to Holstein, to solicit Henry Rantzau to introduce him to the emperor Rodolphus; and that gentleman complying, he was received by the emperor at Prague with the utmost respect. That prince gave him a magnificent house, till he could procure one more fit for astronomical observations; assigned him a pension of 300 crowns; and promised, upon the first opportunity, a fief for him and his descendants: but he did not long enjoy this happy situation; for, on the 24th October, 1601, he died of a retention of urine, in the fifty-fifth year of his age. He was interred very magnificently, in the principal church at Prague, and a noble monument was erected to his memory. His skill in astronomy is universally known, and he is famed for being the inventor of a new system, which he endeavoured, though without success, to establish instead of the Copernican. He was of a bad temper, we must add, and very observant of astrological and other omens. His principal works are; 1. *De Mundi Aetherei Recentioribus Phænomenis*; 2. *Astronomia Instaurata Mechanica*, fol. 3. *Tabulæ Rodolphinæ*, revised and published by Kepler, at Tycho's desire, fol. 4. *Stellarum Octavi Orbis Inerrantium Accurata Restitutio*, &c. 5. *Historiæ Cœlestis, Partes Duæ*, &c. 2 vols. fol.

BRAHILLOW, a considerable trading town of European Turkey, in Wallachia, the capital of a

district of that name. It stands on the Danube, a branch of which forms a harbour here, and by which it carries on a considerable corn trade. The district is governed by a pacha of three tails, who has his seat in the town. It was formerly the see of a bishop of the Greek church. This town, was twice visited in the year 1770, by the Russians, and nearly burned to the ground. 130 miles S. S. W. of Bender.

BRAHMA, BRAMA, or BRIMHA, in the Hindoo religion, the celebrated deity of Hindostan, from whose person, in various ascending degrees of honor, the four great tribes, or castes, of the Hindoos are said to have proceeded. These castes, from the remotest antiquity, have neither intermarried, taken food, drank, or associated with each other, except when they worship at the great temple of Juggernaut in Orissa, where it would be a crime to make any distinction. From the feet of Brahma were produced the lowest of the castes, viz. that of the Soodra, who generally fill degraded situations and attend to the menial occupations of life. The next caste in this scale, is that of the Byse, Wyse, or Banians, proceeding from the thigh of Brahma, and consisting of merchants, bankers, and shopkeepers. Early writers on Indian affairs have sometimes erroneously ranked all who professed the Hindoo religion under this division. See BANIAN. Sometimes the Byse, are said to have been produced from the belly of Brahma, in allusion to the nourishment and provision which commerce diffuses through the state. The next in order of precedence, is the Ketri, or Cuttery tribe, or military; called also the royal caste, produced from the heart of Brahma. All their kings and rulers should belong to it; its supposed origin indicating the prudence and courage which should distinguish soldiers and rulers. The highest of all the class is that of the Brahmins, or sacerdotal caste, said to have been produced from the head of Brahma, to establish their superiority over all the rest.

A holy obscurity is attached to the mode of Brahma's existence, and various subordinate agents are employed to conduct his government of the world. The two principal of these are Vishnu, the preserver; and Siva, the destroyer; who are said to have been many times avatar, or incarnate; and hence the imagination of the Hindoos has clothed them with a variety of visible forms, each of which has become a distinct deity, to whom worship is daily addressed. Without supernatural intervention, therefore, nothing is done in earth, air, or sea; in consequence of which the winds, the sea, the heavens, the earth, the elements, the sun, the stars, fountains, and streams, are either converted into deities, or each placed under the immediate guardianship of one of this train of gods who crowd the Brahminical heaven. The assemblage is still farther swelled by myriads of demi-gods, many of whom are deifications of the most disgraceful passions and propensities of our nature. Among the animals which have become objects of adoration, the cow is the most sacred in many parts of India. She is frequently called the mother of the gods; and many are kept by the rich for the purpose of being worshipped.

BRAHMINS, BRACHMANS, or BRAMINS, called *Βραχμανα*, Gr. the first of the Hindoo castes, proceed, we are told (see preceding article), from the head of Brahma, and are the only caste that can officiate in the priesthood. The Ketri, the next most honorable tribe in the descending scale of castes, and comprehending all the higher orders of civil society, have the distinguished honor of hearing, for they must not read, the Vedas, or sacred books: this is the exclusive honor of the Brahmins. If a Soodra were convicted of so much as hearing a passage from the Vedas, or Shasters, boiling lead is directed by their oracles to be poured into his ears for his presumption. One could almost imagine some of this favored tribe had been consulted by the western priesthood, in times not very remote from the present, on the policy of giving the Bible to the common people. It is certain, however, that they have not had the courage to adopt any punishment, either so characteristic or so effectual as the Hindoo one. The Hindoo regards the person of a Brahmin as sacred above all things: it is the greatest impiety to fail in the prescribed rules of respect and reverence; and to cause his death, or violate his wife, is a crime without pardon. Of course the boundless influence and inviolability of the order has been subject to the most shocking abuses. A Brahmin, supposing himself aggrieved, has been known to take his mother or his child, and going into the presence of the person who has injured him, to demand satisfaction or threaten to stab them to the heart; and the shameful deed has been, on refusal of such satisfaction, often perpetrated. The person supposed to have driven him to this extremity is henceforth considered as profane, and viewed by the multitude with the most extreme horror. The Brahmin will sometimes sit in dudgeon or dhurna, as it is called, before the door of his enemy, and threaten to take away his own life if he offers to come out of his house before he has given satisfaction: and, as a Brahmin never avows such a design without a determination to carry it into effect, the object of his wrath must either submit to his will, whatever it may be, or incur the odium of having occasioned a Brahmin's death; almost equal to the unpardonable sin of having inflicted it. Our government has endeavoured to check this practice; and ordered every Brahmin discovered sitting in dhurna to be apprehended.

Other customs connected with the inviolability of this order are not cognizable by law, and are inveterate habits of the Hindoos. The slaughter of a Brahmin's cow demands the offering of ten cows and a bull in reparation, and a certain penance to be performed thirty days; in which the head of the offender is shorn, he is clothed in a cow's hide, eats barley mixed with cow's urine, bathes in that fluid for two months, &c.

The whole learning of India has been for ages in the hands of the Brahmins. Many of the Grecian sages, we know, travelled into India to become their pupils, and speak of them under the name of Brachmans, as holding the doctrine of the immortality of the soul, and a state of future rewards and punishments. To this species of knowledge the Brachmin sadded an infinite num-

ber of religious observances, adopted by Pythagoras; such as fasting, prayer, silence, and contemplation. They were looked upon as the friends of the gods, because they affected to pay them so much regard; and as the protectors and benefactors of mankind. No bounds were, therefore, set, at this remote period, to the respect that was shown them: princes did not scruple to consult them upon any critical conjuncture, from a supposition that they were inspired, and all classes venerated them as absorbed in the pure delight of science. But we must not look for the knowledge of the ancient Gymnosophists among the modern Brahmins: their scientific attainments are perfectly despicable, and those ancient records extant among them, to which some writers would attribute an unparalleled antiquity, are, in fact, a tissue of absurd allegories, or extravagant and obscene fables, which common decency forbids to be expounded, quite as jealously as the interests of this artful priesthood.

If Eusebius is correct in stating that the Brahmins of his day worshipped no images (see *Pæpar. Evangelica*, lib. vi. c. 10), the modern sect is in this respect also wretchedly degenerated. True it is, that the Vedas and Shasters assert the unity of God, and illustrate it in sublime and beautiful language; but they introduce also such a complicated machinery of providential and natural agents, that polytheism is the doctrine of the Vedas to a simple mind. The subordinate deities accordingly, although employed by the supreme Brahma, and dependent on him in the government of the universe, attract far more notice; mankind are more closely connected with them. Thus the worship of the Virgin and the saints in the Romish church has at times almost superseded that of the Most High; and in the Indian mythology, it is remarkable that Brahma himself has not a temple devoted to his service, while thousands of pagodas are erected in honor of the inferior deities. The Brahminical priesthood maintains its high honors in one respect in a manner peculiar to itself. It absolutely places, as we have seen, the holders of sceptres and thrones in an acknowledged inferior caste; a circumstance that clearly indicates the high antiquity of the order. In the earliest ages only had the priestly office such influence as to be able to mould the government and manners of a state; then it united, in the same person, the priest and the king. The Brahminical system is evidently an improvement on this. They have devolved the business of civil government on an inferior order, which must act in all respects under their directions.

‘A priest,’ say the institutes of Menu, ‘who well knows the law, needs not complain to the king of any injury, since, even by his own power, he may chastise those who injure him; his own power is mightier than the royal power; by his own might, therefore, may a Brahmin coerce his foes. He may use without hesitation the powerful charms revealed to Athavan and Angiras; for speech is the weapon of a Brahmin; with that he may destroy his oppressors. Let not the king, although in the greatest distress, provoke Brahmins to anger, for they, once enraged, could immediately destroy him with his troops, ele-

phants, horses, and cars. Who without perishing could provoke those holy men, by whom the all devouring flame was created, the sea with waters not drinkable, and the moon with its wane and increase? What prince could gain wealth by oppressing those who, if angry, could frame other worlds and regents of worlds, could give being to other gods and mortals? What man desirous of life, would injure those by the aid of whom worlds and gods perpetually subsist, those are rich in the knowledge of the Veda? A Brahmin, whether learned or ignorant, is a powerful divinity; even as fire is a powerful divinity, whether consecrated or popular. Thus, though Brahmins employ themselves in all sorts of mean occupations, they must invariably be honored, for they are sometimes transcendently divine.’

The morality of this system has been also a subject of eulogy; and many excellent precepts are unquestionably to be extracted from the Vedas; but nothing can be more vile or wretched than the general practice. European writers, who contend earnestly for the antiquity and high moral pretensions of the system, do not scruple to admit that some ignorant or intriguing Brahmin is generally connected with all the robberies and murders of the country. M. Dubois says, that one of their own number defined a Brahmin as ‘an ant’s nest of lies and impostures.’ This same writer adds, that there is nothing in which the Brahmins so far excel the other Hindoos as in the art of lying. ‘It has taken so deep root among them, that so far from blushing when detected in it, many of them make it their boast.’ Captain Wilford states that a learned pundit of Benares, who had been employed by him to translate one of the puranas, interpolated the memorable story of Satyawatra and his three sons, corresponding exactly with that of Noah, in our Bibles. When captain Wilford discovered this trick, he sent for the pundit to upbraid him; but he swore by every thing sacred there was no imposition; and brought, in corroboration of his testimony, ten of the most celebrated pundits of Benares, who were ready to depose to the same falsehood! Brahmins, by the subdivision of their order, are allowed, as we shall see, to engage in all the affairs of civil life; nothing appears unsuited to their habits that can promote their aggrandisement. The Mah-ratta Pashwa was lately a Brahmin; his troops are generally composed of Brahmins; and it is well known that, excepting a cow and a Brahmin, nothing, throughout his vast dominions, is secure from rapine.

The puerility of their superstitions, the multiplicity of their self-inflicted atonements, as they are thought, for crimes, and the affected mystery of their devotions, tend doubtless to perpetuate this system. Every religion abundant in human ceremonies, has been proportionably deficient in its moral influence. The cow is sacred—abstinence from animal food the most important of religious or moral requirements. To touch the flesh of the cow in the way of food, is regarded as the highest pollution, and involves a forfeiture of caste, even in the case of those who have been involuntarily guilty. Tippoo Saib is therefore

said to have forcibly converted a great many of his Hindoo subjects to the Mussulman religion, by sprinkling them with cow broth; by which means they were for ever rendered unclean in the eyes of their countrymen, and were glad to seek an asylum from reproach, by embracing the religion of that tyrant. It may be matter of conjecture whether the Indian has borrowed this veneration of the cow from the ancient Egyptian system, or the Egyptian from the Indian; but the similarity between them will be instantly perceived, and some Indian festivals to this animal are said strikingly to accord with the rites of Apis, as described by historians.

Their self-inflicted penances also at once encourage bad morals and false religion, while they, in particular cases, heap up the sum of human misery and wretchedness to an intolerable degree. We have seen how the Brahmin will expose, and even give up his own life, in the pursuit of vengeance, or the accomplishment of some favorite scheme. This prodigality of life and suffering has always distinguished their devotions, being considered not only as meritorious, but as capable of procuring a supernatural power for the deluded devotees. Suicide is also in various instances regarded as laudable. The immolation of widows on the funeral pile of their husbands, and the wretched victims of the car of Juggernaut, are well-known examples. A modern poet has well said of

The Brahmin, kindling on his own bare head

The sacred fire.—

If sufferings Scripture no where recommends,
Devised by self to answer selfish ends,
Give saintship, then all Europe must agree,
Ten starveling hermits suffer less than he.

The Brahmins formerly made a greater mystery of their doctrines than is now attempted. In all their intercourse with strangers, there was nothing they shunned so much as communicating their tenets in philosophy and religion. When, therefore, the celebrated Akber, the wisest of all the princes of the Mahomedan dynasty in India, was anxious to become acquainted with their doctrines, he found all his efforts unavailing, until, as the abbé Raynal tells us, he at last adopted the expedient of imposing on a celebrated Brahmin at Benares, a youth of the name of Feizi, by persuading the Brahmin that Feizi belonged to the Brahminical cast. The youth was joyfully received, and instructed in all the mysteries of Sanscrit literature; when the time, however, approached that he should depart, and communicate to Akber the secrets which he had gained, he felt himself detained by a violent attachment to the Brahmin's daughter: the ancient sage threw no obstructions in the way of their mutual passion; he even offered his daughter in marriage to Feizi. The young man, thinking it ungenerous any longer to deceive his benefactor and instructor, now fell down on his knees, and confessed the imposture which had been practised. The Brahmin, without uttering a word of reproach, drew a dagger, and was on the point of plunging it into his own breast, when Feizi prevented him, protesting that he would do whatever he required of him; upon this, the Brahmin

VOL. IV.

imposed a solemn oath, that he should never translate the vedas, nor divulge the information which he had obtained.

Of late, it has been found impracticable to preserve the vedas or sacred books from European inquisitiveness and research; yet to peruse, and to make them intelligible to others, have been found very different tasks.

Some considerable attainments in the exact sciences, and in poetry, must not be denied to the ancient Brahmins. The origin of our modern system of arithmetical notation has been shown to be erit, and the translations lately made from the *Beja Ganita*, and *Lilavati*, prove that Algebra was early and extensively cultivated by the Hindoos. These works contain specimens of indeterminate analysis, in which the subjects are treated in a manner entirely different from those in the early Greek treatise of Diophantus. It cannot therefore be doubted, that the entire process was of eastern invention. In their poetry the imagination luxuriates in all the flowers, and fruits, and balmy breezes, of oriental scenery. It is scenery, however, not human feeling that is described; the passions and senses, and not the heart, that are addressed. Sir William Jones has given a specimen of these amatory poems in his translation of the songs of the Jayadeva, which relate to the two brightest lights of love in the heaven of India. These dramatic compositions and fables have always formed principal branches of oriental literature. In the whole compass of that literature nothing can be found that deserves the name of history, or even of geographical knowledge. It has long been remarked, says a sensible modern writer, that science and literature are in a progressive state of decay among the natives of India, the number of learned men being not only diminished, but the circle of learning, even among those who devote themselves to it, greatly contracted. The abstract sciences are abandoned, polite literature neglected, and no branch of learning cultivated but what is connected with peculiar religious sects and doctrines, or with the astrology of the people. The immediate consequence of this state of things is the disuse, and even actual loss, of many valuable books; and it has been feared by many, that unless government interfered with a fostering hand, the revival of letters among the natives would become hopeless, from want of books, and of persons qualified to explain them.

Modern researches into their sacred books and institutions have exhibited the occupations and duties of the Brahmins as divisible into these seven; 1. The study and illustration of the Vedas; 2. Of the other Sastras, or every secular branch of science; 3. The general instruction of others; 4. The performance of the yajirya, or jag, a peculiarly holy sacrifice; 5. The pūjā, or ordinary worship of the gods; 6. The giving of dāna, or alms; and 7. receiving them either personally, or on the behalf of particular deities. Four of these duties being according to the D'herma Sastra, or moral code, religious, and three civil, or connected with the subsistence of this tribe. Ten other ancient subdivisions of the class have been specified; viz. 1. The Devas, who sacrificed for themselves, and were learners

of religion; 2. Munis, who were teachers, but did not perform sacrifices; 3. Devoijas, both active and passive agents in all Bráhmical duties; 4. Rájás; 5. Vaisyas; 6. Sádras, performing the duties required from the caste, whose names they respectively bore; 7. Bidálas or mendicants; 8. Paslins or reprobates, neglecting all rules; 9. Mléch'has or infidels adopting foreign customs; and 10. Chandálas or outcasts who eat any thing. A further division of this last class was derived from the countries whence they originally sprung. All these distinctions seem now to be lost, and the whole of the Brahmins in Bengal are supposed to be derived from five priests, invited from Cányacubja by Adisúra, king of Gaur, who reigned about three centuries before Christ. Ballála Sena, who reigned in the twelfth century, settled the question of precedence between the 156 families which had at that period sprung from these colonists, and the distinctions then fixed, remain to this day.

The Sāstras present four states or degrees, called āsrama, through which every brahmin should pass, and which are designed to occupy him during the four distinct periods of youth, manhood, age, and final infirmity. These are named Brahmāchārya or Brahmāchāryon, Grihastha, Vānaprastha and Brahmājyāni. The first a sort of noviciate, continues till marriage; the second terminates at the age of fifty; the third is devoted to the strictest religious contemplation; and the last is considered as the highest pitch of perfection, attainable by man; consisting in a complete abstraction from human passions, and absorption in divine meditation. The forms and duties of these states are pointed out in the Institutes of Menu, and the sacred books. From these we learn, that when the father of a family perceives the symptoms of age coming fast upon him, and sees the child of his child, he is to abandon human society, and the food to which he had been accustomed, to retire either alone, or accompanied by his wife, to a lonely wood, where he is to light his consecrated fire, to make his oblations, to gain a complete ascendancy over his organs of sense and action, to live on that food only which holy sages are accustomed to eat—green herbs, roots, and fruit; to perform the five great sacraments, introducing them with prescribed and appropriate ceremonies. Here he is also to wear a black antelope's hide, or a vesture of bark, to bathe evening and morning, to suffer the hairs of his head, his beard, and his nails to grow, without the unhallowed intrusion of a barber or his razor, or nail-knippers, the abomination of abominations. By abstinence, he is to take care that he has a surplus even of his simple fare, to make offerings, and give alms to those that visit his hermitage. He is to be patient under sufferings, universally benevolent, with a mind devoutly fixed on the Supreme Being; and, above all, he must be constantly engaged in reading the Vedas; to be a perpetual giver, but no receiver, of gifts; and to be especially tender and affectionate towards all the forms of animated nature, however disgusting and filthy. It is also peculiarly enjoined upon him,

as the very perfection of saintly virtue, to slide backwards and forwards on the ground; to stand a whole day on tiptoe; to continue in perpetual motion, rising and sliding alternately; and at sunrise, at noon, and sunset, to visit the waters and bathe. In the hot season he is to expose himself to five fires, four blazing around him, and the sun above him. In the rain he is to stand uncovered, without even a mantle, and where the clouds pour their heaviest torrents, there he is patiently to bear all their fury; in the coldest season he is to immerse his cloaths, that they may be always wet and comfortless; and with all this he is to increase, by degrees, the austerity of his devotion. A number of other and similar cruel absurdities complete the tragedy of Hindoo piety; and the Brahmin, who has been able thus heroically to shake off his body, that is, by a series of inflictions, every one of which bears the character of suicide, to terminate his life, rises to exaltation in the Divine presence.

Whether the extent of Hindostan, and its remoteness from the scene of European politics and frequent conquest, have favored the permanency of this system, or, whatever may be the causes, the fact is clear that altogether the same and singularly unchangeable it has remained for several thousands of years. India, in fact, was entirely undisturbed by the inroads of conquerors till the period of the Mahomedan invasion. We say nothing of the fabulous exploits of Bacchus; and Alexander the Great scarcely made any impression upon it. The shock which it received from the Mussulman invaders was certainly considerable: they swayed the sceptre, which in their hands was a rod of iron, over the greatest part of Hindostan, and left no art unemployed, which the most bigotted and cruel policy could devise, to establish Islamism on the ruins of the Brahminical institutions. Thus, doubtless, were those institutions in some measure affected, and they have since been considerably modified by European intercourse. Yet is there a character of indomitable tyranny and permanency about this system as a whole, which no human power or influence has materially shaken. Conquest, to the degree it has operated on other countries, and changed the customs and manners of the subdued into those of the subjugating power, has never permanently triumphed here. Other religions have never finally displaced the dark and cruel sway of this; it remains, we trust, for the happier intercourse of Great Britain with those regions, when her dreams of conquest shall disturb her or them no more, and when her only immortal system of religion shall have fully developed itself in her own character, to be the final means of overthrowing this gigantic mass of superstition and folly.

BRAID, *v. n.* & *adj.* Goth. *brad*; Swed. *bragd*, from Goth. and Swed. *bregda*, to change, *auga bragd*, a turn of the eye. A sudden movement; a strait and rapid turn; a nod, a wink, or the habit of winking. Shakspeare uses the adjective in the sense of violence as well as celebrity. The Ency. Met. gives it a far more extended meaning; according to that work, to braid is to break, pull, or tear; to leap or spring;

to make an irruption, sally, assault, onset, insurrection, revolt. But the illustrations adduced do not bear out the applications.

For veray wo, out of his wit, he *braide*,
He n'iste not what he spake. *Chau. Cant. Tales.*
And when he saw how stille that I lay,
He was agast and wold have fled away,
Til at the last out of my swough I *brayde*. *Id.*

Wher is this false tyrant, this Neroun ?
For fere, almost out of his wit he *brayde*,
And to his goddess pitiouly he preide
For succour. *Id.*

But when, as I did out of sleep *abray*,
I found her not where I her left whyleare,
But thought she wandered was, or gone astray.
Spenser.

DIANA. Since Frenchmen are so *braide*,
Marry that will, I live and die a maid.
Shakspeare.

BRAD, or } Islan. *bregda*; Ang.-Sax.
BREID, v. n. } *bredan*; Teut. *briden*; from
BRAIDED, adj. } Goth. *bry*, a point, a knitting-needle. To knit, to plait, to wreath.

The single twyned cordes may no such stresse endure
As cables *brayded* threfould may, together wrethed
sure. *Surrey.*

Listen where thou art sitting,
Under the glossy, cool, translucent wave,
In twisted *braids* of lillies knitting
The 'oose train of thy amber-dropping hair.
Milton.

Close the serpent sly,
Insinuating, wove with gordian twine
His *braided* train, and of his fatal guile
Gave proof unheeded. *Id.*

Osier wands, lying loosely, may each of them be
easily dissociated from the rest; but, when *braided* into
a basket, they cohere strongly. *Boyle.*

A ribband did the *braided* tresses bind,
The rest was loose, and wantoned in the wind.
Dryden.

No longer shall thy comely tresses break
In flowing ringlets on thy snowy neck,
Or sit behind thy head, an ample round,
In graceful *braids*, with various ribbon bound.
Prior.

Since in *braided* gold her foot is bound,
And a long trailing manteau sweeps the ground,
Her shoe disdains the street. *Gay.*

All the shadowy tribes of mind,
In *braided* dance their numbers joined,
And all the bright uncounted powers,
Who feed on heaven's ambrosial flowers.
Collins' Ode on the Poetical Character.

Who late so free as Spanish girls were seen
(Ere war uprose in his volcanic rage),
With *braided* tresses bounding o'er the green,
While on the gay dance shone night's lover-loving
queen ? *Byron.*

BRAIDWOOD (Thomas), a native of Edinburgh, is said to have been the first of our countrymen who attempted the task of giving general instruction to the deaf and dumb. This, however, had been previously practised in a partial way by Dr. John Wallis, Henry Baker, and others. In 1760 Mr. Braidwood first commenced his great undertaking, and removed, in 1783, from Edinburgh to Hackney, where, in conjunction with his son-in-law, he continued for many years to pursue his profession. He died in 1806. See DEAF and DUMB.

BRAIL, v. & n. Fr. *bresle, brêle, breuiller*, to reef; a brace line in a ship. Brails are small ropes, reeved through blocks, which are seized on either side the ties, a little off upon the yard; so that they come down before the sails of a ship, and are fastened at the skirt of a sail to the crenegles. Their use is, when the sail is furled across, to haul up its bunt, that it may the more readily be taken up or let fall. The operation of drawing the sails together, by means of these ropes, is called *brailing* them up, or *hauling* them up, in the brails.

The main-sail, by the squall so lately rent,
In streaming pendants flying is unbent;
With *brails* refixed, another soon prepared,
Ascending spreads aloud beneath the yard.
Falconer's Shipwreck, Can. ii.

With ruin pregnant now the clouds impend,
And storm and cataract tumultuous blend.
Deep on her side the reeling vessel lies;
Brail up the mizen quick ! the master cries.
Id. Can. ii.

BRAIN, v. & n. } Goth. *huarn*; Swedish
BRAIN'ISH, } *hierna*; Old Eng. *harne*;
BRAIN'LESS, } Belgic, *brein*; Ang. Sax.
BRAIN'PAN, } *bragin*; Teut. *pregin*; cor-
BRAIN'SICK, } responding with *Περικρα-*
BRAIN'SICKLY, } *nov.* The soft substance
BRAIN'SICKNESS, } within the skull. That
BRAIN'WORM, } collection of vessels and
organs in the head from which sense and motion
arise; the part in which the understanding is
placed; therefore metonymically taken for the
understanding. To *brain*, is to dash out the
brains; to kill by beating out the brains.
Brainish, is hot-headed, furious, answering to
cerebrosus in Latin. *Brainless* signifies mental
imbecility; and *brainsick*, is to be diseased in the
understanding; addleheaded, giddy, thought-
less.

O Thought ! that wrote al that I met,
And in the tresorie it set
Of my *braine*; now, shal men yse,
If any vertue in the be.

Chaucer's House of Fame.

The fear whereof oh how doth it torment
His troubled mind with more than hellish paine !
And to his feigning fansie represent
Sights never scene, and thousand shadowes vaine,
To breake his sleepe, and waste his ydle *braine* :
Thou that hast never loved cannot beleeve
Least part of the evils which poore lovers grieve.
Spenser's Hymns,

In his lawless fit,
Behind the arras hearing something stir,
He whips his rapier out, and cries, a rat !
And, in his *brainish* apprehension, kills
The unseen good old man. *Shakspeare.*

Nor once deject the courage of our minds,
Because Cassandra's mad ; her *brainsick* raptures
Cannot distaste the goodness of a quarrel. *Id.*

Why, worthy Thane,
You do unbend your noble strength to think
So *brainsickly* of things. *Id.*

Why, as I told thee, 'tis a custom with him in the
afternoon to sleep; there thou mayest *brain* him. *Id.*

If the dull *brainless* Ajax come safe off,
We'll dress him up in voices. *Id.*
My son Edgar! had he a hand to write this, a heart
and *brain* to breed it in ! *Id.*

If I be served such another trick, I'll have my *brains* taken out, and buttered, and give them to a dog for a new year's gift. *Id. Merry Wives of Windsor.*

Some *brainless* men have, by great travel and labour, brought to pass, that the church is now ashamed of nothing more than of saints *Hooker.*

In the upper region serving the animal faculties, the chief organ is the *brain*, which is a soft, marrowish, and white substance, ingenerated of the purest part of seed and spirits, included by many skins, and seated within the skull or *brain-pan*, and it is the most noble organ under heaven, the dwelling-house and seat of the soul; the habitation of wisdom, memory, judgment, reason, and in which man is most like unto God; and therefore nature hath covered it with a skull of hard bone, and two skins or membranes, whereof the one is called *dura mater*, or *meninx*; and the other *pia mater*. *Burton's Anat. Mel.*

That man proportionably hath the largest *brain*, I did, I confess, somewhat doubt, and conceived it might have failed in birds, especially such as having little bodies, have yet large craniums, and seem to contain much *brain*, as snipes and woodcocks; but, upon trial, I find it very true. *Brown's Vulgar Errors.*

The *brain* is divided into *cerebrum* and *cerebellum*. *Cerebrum* is that part of the *brain* which possesses all the upper and forepart of the cranium, being separated from the *cerebellum* by the second process of the *dura mater*, under which the *cerebellum* is situated. The substance of the *brain* is distinguished into outer and inner; the former is called *corticalis*, *cinerea*, or *glandulosa*; the latter, *medullaris*, *alba*, or *nervæ*. *Cheselden.*

This *brainworm*, against all the laws of dispute, will needs deal with them here. *Milton's Colastestion.*

A man is first a geometrician in his *brain* before he be such in his hand. *Hale.*

With those huge bellows in his hands, he blows New fire into my head; my *brainpan* glows. *Dryden.*

Outlaws of nature,

Fit to be shot and *brained*, without a process,

To stop infection; that's their proper death. *Id.*

In a gushing stream

The tears rushed forth from her o'erclouded *brain*,
Like mountain mists at length dissolved in rain. *Byron.*

BRAIN. In the article *ANATOMY* both a general and particular description will be found of this organ, its investments, and its connexion with the whole sentient system; and, under the word *PHYSIOLOGY*, the functions of the brain and nerves will be more largely dwelt upon; it is our design in the present article to trace more minutely than is done in anatomy the gradual growth and development of the brain, to give the chemical analysis of the matter by which it is formed, to remark on the difference in size and complication that obtains between the human brain and the brain of inferior animals, and to advert to some hypotheses that have been offered to solve the very difficult problem of sentient, perceptive, and motive agency.

Until within the few past years, the brain has generally been regarded as the origin and source of the spinal marrow and nerves; but were this the case, say some of our more modern physiologists, the brain itself, or, as some term it distinctively, the cranial brain, would be found the first formed in the fœtus, which it is not; and it is very important, they say, to observe that the spinal marrow, or, more properly speaking, the spinal chord, is very large in the inferior classes

of animals, while the brain is comparatively much smaller. It would appear, indeed, according to the observations of those physiologists who have given this subject their minutest attention, that 'the spinal chord is itself produced from the ramifications of the sympathetic ganglia; that the semilunar ganglion is the first part of the nervous system to assume an organised state; and that the subordinate ganglia, the spinal marrow, and, lastly, the brain, come successively into existence, and gradually arrive at their full development.'

The mode in which this gradual increment comes to be effected is exceedingly curious and interesting; it would appear that a mere gelatinous membranous substance constitutes the first germ of both nervous and encephalic formation, and that successive deposits are made of those materials which in the event come to be true cerebral substance, in a mode somewhat allied to the gradual formation of bony substance (see *BONE*) upon the membranous and cartilaginous matrix, which always precedes true bone. The vegetable fibres, originating from a certain quantity of grayish substance deposited in the sap of plants, is likewise a formation of a somewhat similar kind; but on this subject we shall have to enlarge, when treating on the nervous system, more particularly. See *Dr. Copland's Notes to his edition of Richerand's Physiology.*

About the third or fourth week from conception, a grayish-white fluid may be detected in the cavities of the head and spine, and there is a gradual development both upwards and downwards of the spinal chord; and the brain evidently, we are told, results from its prolongation upward and forwards, so as to form the two eminences, at the base of the brain, called olivary and pyramidal. Tiedeman, from whom we now quote, states that all the superior part of the spinal marrow is at this time open, or, more properly speaking, forms a broad gutter, which at once comprehends the third ventricle, the aqueductus sylvii, the fourth ventricle, and the calamus scriptorius. This gutter is uninterruptedly continuous with the canal which traverses the whole length of the marrow.

The *cerebellum*, according to this author, evidently originates from the spinal marrow; from the lateral parts of which arises on each side a small flattened chord. These two, at first so distinct and separate that they may be readily parted without laceration, afterwards unite so as to form the roof of the fourth ventricle. Then, only, the brain, viewed from above, ceases to represent a gutter; and the lamina and branches of the *cerebellum* are formed at a much later period.

The mass which supports the tubercula quadrigemina equally shows itself, in its origin, under the form of two small thin membranes, which arise from the olivary chords of the spinal marrow; and which, when they cease to be distinct, represent a vault covering a large ventricle, whose successive contraction gives rise to the aqueductus sylvii.

The pyramidal choros of the spinal marrow, which take a direction below upward, and from behind forward, after having produced two swellings or ganglia, the optic thalami and corpora striata, each terminates by a lamina, which, bent

from before backward, and from the side towards the superior and internal part, forms the commencement of the hemisphere of the brain. These membranes, and their hemispheres, are so small at the second month that they scarcely cover the corpora striata. In proportion as they increase they extend backward, and cover at the third month the optic thalami; at the fourth the tubercula quadrigemina; and, at the sixth or seventh, the cerebellum. The lateral ventricles result from their inversion.

The medullary fibres of the pyramidal chords, previously to the formation of the tuber annulare, are immediately continuous with those of the crura cerebri; whence the eye may readily trace them in the optic thalami, and corpora striata, and see them afterwards spreading and radiating in the hemispheres.

The parietes of the hemispheres gradually increase in thickness in proportion as new strata of cerebral substance are deposited on their surface; and convolutions are not decidedly seen till towards the close of pregnancy.

All these combined facts clearly demonstrate, in the opinion of many physiologists of the present day, that the brain and cerebellum proceed from the spinal marrow; or that, to employ a modern expression, they are an efflorescence of it. In running through the scale of animals, ample confirmation, it is said, may be found of the assertions here advanced. The structure of the encephalon and spinal marrow becomes complicated in proportion as we ascend from fishes to reptiles, birds, and mammalia; as we ascend through these four classes we find the brain gradually to increase in volume and complication, until it arrives at its largest and most complicated structure in the human species;—that is, largest, in proportion to the spinal chord from which, according to the above view, it proceeds;—and it is necessary to recollect this relative or proportionate circumstance to which we now allude, inasmuch as that position is not absolutely true which states man to have the largest brain of any animal, in proportion to the size of his body. We shall here avail ourselves of the labors of Mr. Lawrence, who has been at great pains to collect information on this interesting point.

‘It has been asserted,’ says Mr. L. ‘from remote times, that the brain of man is larger than that of any animal; and I know of no exception to this assertion of Aristotle and Pliny, besides the elephant, unless the larger cetacea should be as well supplied with brain, in proportion to their size, as the smaller. Certainly all the larger animals, with which we are more commonly acquainted, have brains absolutely smaller, and considerably so, than that of man. This, indeed, may easily be shown by a comparison of skulls; by contrasting the compressed, narrow, elongated, crania of brutes, hidden behind their enormous jaws and face, with the length, breadth, and ample vault of the human ‘cerebri tabernaculum,’ whose capacious globular expanse surmounts and covers the inconsiderable receptacles of the senses and alimentary apparatus.’

In later times the subject has been investigated in a different way; by comparing the proportion which the mass of the brain bears to the whole

body. The result of this comparison in the more common and domestic animals was deemed so satisfactory, that, without prosecuting the enquiry further, a general proposition was laid down, that man has the largest brain in proportion to his body. More modern physiologists, however, in following up this comparative view in a great number of animals, have been considerably perplexed at discovering many exceptions to the general position. They found that several mammalia, as the dolphin, seals, some quadrumana, and some animals of the mouse kind, equal the human subject, and that some small birds even exceed him, in this respect.

As these latter observations entirely overturned the conclusions which had been before generally admitted, Soemmerring has furnished us with another point of comparison, viz. that of the ratio which the mass of brain bears to the bulk of the nerves. Let us divide the brain into two parts; that which is immediately connected with the sensorial extremities of the nerves, which receives their impressions, and is therefore devoted to those common wants and purposes which we partake with animals. The second division will include the rest of the brain, which may be considered as the seat of the mental phenomena.

In proportion, then, as any animal possesses a larger share of the latter and more noble part, that is, in proportion as the organ of reflection exceeds that of the external senses, may we expect to find the powers of the mind more diversified and more fully developed. In this point of view man is decidedly pre-eminent; although in his senses and common animal properties he holds only a middle rank, here he surpasses all other animals that have been hitherto investigated: he is the first of living beings. ‘All the simiæ’ (says Soemmerring), come after him; for although the proportion of their brain to the body, particularly in the small species with prehensile tails, is equal to that of man, their very large eyes, ears, tongue, and jaws, require a much larger mass of brain than the corresponding parts in the human subject; and if you remove this, the ratio of the brain to the body is much diminished.

‘Animals of various kinds seem to me,’ continues this able physiologist, ‘to possess a larger or smaller quantity of this superabundant portion of brain, according to the degree of their sagacity and docility. The largest brain of a horse which I possess, weighs one pound seven ounces; the smallest human brain that I have met with in an adult, two pounds five ounces and a quarter. But the nerves in the basis of the horse’s brain are ten times larger than in the other instance, although the brain itself weighs less by four ounces and a quarter.

‘But we are not hastily to conclude that the human species have smaller nerves than any other animals. In order that my ideas may be better understood, I shall state the following imaginary case. Suppose the ball of the eye to require 600 nervous fibrils in one instance, and in another, half the size, 300; further, that the animal with 600 fibrils possesses a brain of seven, and that with 300 a brain of only five drachms. To the latter we ought to ascribe the larger brain, and a more ample capacity of registering the impres-

sions made on the organ of vision. For, allowing one dram of encephalon to 100 fibrils, the brain which is absolutely the least, will have an overplus of two drams, while the larger has only one. That the eye which is supplied with a double quantity of fibrils, may be a more perfect organ of sense, will be readily admitted; but that point is not connected with the present question.

From what has been above intimated, it will be inferred that the human brain greatly differs from that of other animals, not merely in relative magnitude, but in its degree of complication; it is a remarkable fact, that no parts are found in the brain of animals which man does not possess; while many of those found in the human subject are either less in the inferior animals, or entirely wanting; but the most striking character of the human brain, as justly remarked by Lawrence, is the prodigious development of the cerebral hemispheres, to which no animal, whatever ratio its whole encephalon may bear to its body, affords any parallel. It approaches most nearly to the spherical figure, has more numerous and deeper convolutions, and the medullary is in greater proportion to the cortical substance. The sandy or earthy matter of the pineal gland in the adult brain is almost confined to the human subject; its absence being an anomaly in structure with us, its presence being perhaps equally anomalous in the brute creation. A curious exception, however, to that relative magnitude of the cerebrum compared with the spinal marrow which is generally found in man, is observed in the dolphin; this last animal has a brain of a breadth of twice its length; a proportion of which there is no other instance in the animal kingdom.

The following table has been constructed for representing the weight of the brain, compared with the body, in different animals:—

In man from . . .	$\frac{1}{32}$ to $\frac{1}{33}$ part.
Several Simiæ . . .	$\frac{1}{2}$
Dog	$\frac{1}{101}$
Elephant	$\frac{1}{365}$
Sparrow	$\frac{1}{25}$
Canary-bird	$\frac{1}{14}$
Goose	$\frac{1}{369}$
Turtle (smallest) . . .	$\frac{1}{3688}$

The chemical composition of the brain seems quite peculiar. It is composed, according to the experiments of Vauquelin, who has given the subject much attention, of first, two fatty matters; secondly, albumen; thirdly, osmazome, a substance first so named by Thenard, being a peculiar animal principle obtained from raw muscular fibre; fourthly, several saline ingredients; fifthly, phosphorus; sixthly, sulphur.

The following are the proportions given by Vauquelin:—

Water	80.00
White fatty matter . .	4.53
Red fatty matter . . .	0.70
Albumen	7.00
Osmazome	1.12
Phosphorus	1.50
Acids, salts, and sulphur	5.15

100.

The above is the result of trials made on the cerebrum, or hemispheres of the brain; the human cerebellum gave the same results. In the medulla oblongata and spinal chord the same constituent principles are found, but the proportions are somewhat different; the fatty matter being here in greater abundance, and there being less albumen, osmazome, and water.

The gray substance of a calf's brain was found to contain albumen insoluble in water 10.0, an unctuous incrustable fat, osmazome, phosphate of soda, phosphate of lime, phosphate of magnesia, hydrochlorate of soda, and traces of iron 15.0 to 10.0; water 75 to 80.

The white substance of the brain, form the same animal, was found to contain more fatty matter than the gray; it presented traces of silica. The cerebellum of the calf gave the same products as the cineritious substance.

The brain of a bullock contained also phosphate of ammonia, a more solid albumen, a reddish colored fat, and a crystallisable fat. The composition of the brain of the stag was similar.

We have spoken of the medulla of the brain and spine, in accommodation to the terminology which still continues to be employed in physiological science, but it is the opinion of many, especially among the moderns, that the encephalic mass is altogether of a fibrous structure; and we have already adduced suggestions with respect to the *modus generandi* of this fibrous tissue. Mr. Bauer has made some very minute microscopic experiments on the texture of the brain; and he finds 'abundance of fibres in every part of it; indeed, it appears that the whole mass is a tissue of fibres which seem to consist entirely of an accumulation of globules, whose union is of so delicate a nature that the slightest touch, even the mere suction in water, deranges and reduces them to that mass of globules of which the brain appears to be composed when examined with less accuracy, or under less favorable circumstances.'

It remains for us now briefly to notice the principal theories which have been broached on the mode in which is manifested those various kinds of power, that are clearly connected in their full display with the integrity of either a part or the whole of the encephalic mass. We say, briefly notice, for the full discussion of these very interesting topics, and the interest of which is almost daily increasing, would be quite inconsistent with the limits we have prescribed to the present article. For more ample information we refer the reader to *PHYSIOLOGY, MEDICINE, and PHRENOLOGY*.

In order to appreciate properly the views which have been taken by different speculators on the nature of encephalic power, it will be right for the reader to revert to what has been advanced on the origin and gradual development of the sentient organisation: it would appear, as we have above intimated, that the primordial germ of both nerve and brain, is a membranous matrix, upon which is gradually deposited the material that eventually constitutes the true nervous substance; it would appear, further, that in all kinds and grades of animate existence the process from the first is of a similar nature; but

that this process stops at certain points, according to the formative energy of the animal: thus, where only percipient excitability is required, the mere ganglionic system of nervous structure is perfected; where strength and volition are about to be manifested, a more complete development of nerve is effected; while in the vertebral animals, and in the mammalia, the spinal chord becomes formed, and expands itself out into cranial brain, of a greater or less complicated formation, until the point or acme is gained, and man starts out from among other animals, allied to them in one sense, but opposed in others; since, with certain kinds of perceptions inferior vastly to some of the brute creation, he is, on the other hand, not only superior, but actually and widely different from all, in the superinduction of reflective intelligence and the endowment of moral faculties: at this point, indeed, physiology stops, and resigns the power and propriety of further research into the hands of the metaphysician, the moralist, and the theologian.

Bichat, carrying his views into the gradations and distinctions now assumed, suggested that the nervous system involves two leading points, and that the functions of the living frame are divisible into animal and organic life; the first being exercised mainly through the medium of the brain, properly so called, and its appendages; the second having to do with the ganglia of the great sympathetic nerve; (See ANATOMY, PHYSIOLOGY, and NERVE). Neither of these functions, however, is absolutely exclusive in the opinion of our physiologist; since there is a connexion of the nerves from the brain, with the sympathetic or ganglionic system; and, of course, of the latter with the former. But, in the main, the ganglionic system is supposed to influence the more organic and involuntary functions—the encephalic the voluntary and intellectual. There is this further difference, in Bichat's opinion, between the manifestations of the one and the other, that animal life has a centre and source which is the brain, while the organic system is so constructed as that each ganglion has a separate and somewhat independent power.

Thus those animated existences, which are so low in the scale of being as to be without brain, which have only ganglia, possess in a manner no totality of existence, no uniting bond of the whole system; and it is further urged in favor of this division between organic and animal vitality, that in proportion to the possession of intellect is the development of the brain, and diminution of the ganglionic order of nerves. It has even been said, that ideots among the human species, are found with the visceral ganglia of the sympathetic nerve more than usually conspicuous.

Dr. Wilson Philip has propounded principles somewhat similar to those of Bichat. Dr. Philip, however, does not so decidedly separate the two systems; but states the difference between voluntary and involuntary power to consist in this, that the former is transmitted immediately from a particular portion of the brain to the moving organ, while the latter originates from every part of the encephalon, and that here the nervous influence traverses the great chain of the sympathetic ganglions.

Le Gallois, too, differs from Bichat, in respect to the nature and extent of influence exercised by the brain over organic life. So far from the sympathetic system being independent of the brain and spinal chord, he conceives that it receives from them the most powerful influence. Respiration, however, with its dependent functions, does not, according to Le Gallois, proceed from the brain, but from a circumscribed part of the medulla oblongata, near the occipital opening, towards the origin of the eighth pair of nerves.

From the experiments of Flourens, it has been inferred, that the sensation of sight and sound, or the power of calling them into action, resides in the cerebral lobes, and that these are the organs and parts for the concentration and distinctness of all other sensations. Volition too is conceived to have especial connexion with these parts of the encephalon, as far as the act of the will is excited by memory, or regulated by judgment. For loco motion, the integrity of the cerebellum is requisite; for, let the brain remain, the animal will see, hear, and indicate volition; but, if the cerebellum be removed, he will never find the balance necessary for loco motion; the cerebellum seeming therefore to regulate these movements; and while it does so, the spinal chord combines the muscular contraction, so as to be the agent of producing motion in the joints. The mandates of the will are supposed to be immediately issued from the very top of the medulla oblongata, at the point where the tubercula quadrigemina joins it. It is concluded upon the whole, that the cerebral mass contains distinct organs for the *senses*, for the *sensations*, and for the *movements*; but that the power of feeling, willing, and perceiving, constitute but *one* faculty, residing but in *one* organ.

We have now to notice a theory which goes upon the presumption of a plurality of faculties and organs, and which conceives the cerebral lobes to be the residence as it were of separate and distinct faculties. As the inferences to which we have hitherto referred, have been deduced principally from experiments on animals, so the conclusions of those individuals, to whose speculations we now allude, are derived, according to their own showing, from anatomical and physiological investigation on the peculiarities and mode of increment in the cerebral organisation; and from actual observation on the form both of the brain and the cranium. The division of the nervous system in this theory is in some measure similar to that proposed by Bichat, as it divides the whole mass into two great classes, viz., vegetable or organic, and phrenic or mental; and Dr. Spurzheim, who is one of the founders of the theory, and who has published a detailed exposition of it, expressly states, that he considers the nerves of mere organic existence, to be independent on those of phrenic life; but that they communicate with each other so as to constitute a totality of existence in all classes of beings in which these two orders of nervous masses are simultaneously existent.

But the great peculiarity of the system of Gall and Spurzheim is this; that it assumes in the gradual evolution of the cerebral organisation a

termination, not into an organ of perception, volition, judgment, &c. merely, but into a compound of many distinct apparatuses, 'each of which has particular functions, which being taken together constitute phrenic life;' that this encephalic succession and increment, being synchronous with the process of ossification in the cranium, the form and magnitude of the latter is greatly regulated by the directions into which the formative power of the individual directs the development of the cerebral masses; and that consequently the shape and size of the head will indicate, not only the general measure of mental faculty with which such individual is endowed; but that its forms and varieties in infancy may be taken as indices of the particular faculties, and functions, and powers, and propensities, about to be manifested. A double claim is thus preferred by the physiologists in question; they contend that their physiological tenets are substantiated by cranioscopic investigation; and that he who runs may read the truth of their positions.

It was not to be expected in the nature of things, that doctrines like these, which interfere materially with the notions hitherto generally received on the nature of intellectual power, should be given to the world without exciting much and varied opposition; and accordingly we have found that the assumptions of Gall and Spurzheim have been assailed in every possible shape both of serious argument and contemptuous ridicule; but it is the duty of encyclopædists at least, to state the pros and cons of disputed points, uninfluenced by *a priori* feelings: and to this duty, on this point, we should now proceed, but that the investigation would lead us far beyond our proposed limits. We refer, then, to the word PHRENOLOGY for the amplification and discussion of the organological tenets, using the freedom, however, of objecting to the term, inasmuch as it seems both too presumptive and too restrictive—too presumptive in implying or taking for granted that this is the true science of mind; and too restrictive, because the phrenic or mental part of the argument does not comprehend its whole scope and bearing. The system of Gall and Spurzheim, when taken in its full stretch of latitude, constitutes in some sort a new system of neurology in general; and it is partly, indeed, on this account, that we think the present not the proper place for discussing its merits.

We conclude by saying, that, whatever truth may be found in any of the views above adverted to, none of them have given us 'the whole truth.' There is still much that is mysterious, and at present totally inexplicable, in the complicated organisation of the encephalon and its appendages; and, indeed, some of these peculiarities, as we shall afterwards have occasion to show, are not only unexplained by, but are seemingly at variance with, the inferences that have been deduced by the experimenter, and the doctrines that have been propounded by the systematist.

BRAINTREE, a market town of Essex, near Bocking, called Rains, in Doomsday book. It carries on a manufacture of baize and straw plaiting. It lies eleven miles north-east of Chelmsford, and forty north-east of London.

BRAINTREE, a town of the United States of America, in Massachusetts. Great quantities of granite stones are sent to Boston from this town for sale. It stands at the bottom of a shallow bay, eight miles east by south from Boston.

BRAIT', *adj.* Fr. *brute*; Lat. *rudus*; unpollished; rude.

BRAITHWAITE (John), an enterprising mechanic, who employed the diving-bell most successfully in recovering shipwrecked property. In 1783 he descended into the Royal George, sunk off Spithead, and brought up the sheet-anchor and many of her guns. From the Hartwell East Indiaman, lost near one of the Cape de Verd islands, he obtained, in 1783, dollars to the value of £38,000, 7000 pigs of lead, and 360 boxes of tin; and from the wreck of the Abergavenny East Indiaman, off the isle of Portland, property estimated at £105,000. He died in 1818.

BRAKE. Swed. *brack*; Teut. *breche*; Belgic, *broecke*; Ang.-Sax. *breac*. That which crushes, as a machine to crush flax; that which restrains, holds in, curbs or tames; like a bit for young horses. It is used for the handle of a pump, Lat. *brachium*, because it is an instrument to force or compel.

In her right hand (which to and fro did shake),
She bore a scourge, with many a knotted ring,
And in her left, a snaffle bit, or *brake*,
Bebost with gold, and many a gingling ring.

Gascoigne. The Steel Glass.

Like as the *brake* within the rider's hand
Doth strain the horse, nye wood with grief of paine,
Not used before to come in such a band.

Earl of Surrey.

He is fallen into some *brake*, some wench has tied him by the legs. *Shirley's Opportunity.*

He thought it sufficient to correct the multitude with sharp words, and *brake* out into this choleric speech. *Knolles.*

BRAKE', } Dan. *brægne*; Scot. *bracken*; Ar-BRA'KY. } moric, *bruhaug*; Swed. *bræcke*, signifies to burn or heat; for which purpose fern is still used. Dan. *brak*; Belgic, *bruig*, Swed. *brack*, from the verb to break. A thickset of brambles or fern; brushwood. Eraky, is thorny, prickly, rough.

The buck in *brake* his winter coat he flinges.

Earl of Surrey.

Of all the seeds, that in my youth was sowne,
Was none but *brakes* and brambles to be mowne.

Spenser's Shepheard's Calendar.

If I'm traduced by tongues, which neither know
My faculties nor person; let me say
'Tis but the fate of place, and the rough *brake*
That virtue must go through. *Shaksp.*

Redeem arts from their rough and *braky* seats,
where they lie hid and overgrown with thorns, to a pure open light, where they may take the eye, and may be taken by the hand. *Ben Jonson.*

But further way found none, so thick entwined,
As one continued *brake*, the undergrowth
Of shrubs and tangling bushes had perplexed
All path of man or beast that passed that way.

Milton.

In every bush and *brake*, where hap may find
The serpent sleeping. *Id.*

Full little thought of him the gentle knight,
Who, flying death, had there concealed his flight;
In *brakes* and brambles hid, and shunning mortal
sight. *Dryden's Fables.*

A dog of this town used daily to fetch meat, and to carry the same unto a blind mastiff, that lay in a *brake* without the town. *Curew.*

See how they tread

The *brakes* and up yon furrow drive along.

Somerville's Chase.

Thus, at the slint of even, the weary bird
Leaves the wide air, and in some lonely *brake*
Covers down and dozes till the dawn of day,
Then claps her well-fledged wings and bears away.
Blair's Grave.

BRAMA. See BRAHMA.

BRAMA, in ichthyology, the trivial name of a species of cyprinus

BRAMAH (Joseph), a most superior and ingenious mechanic, was born, in 1749, at Stainborough, in Yorkshire. He was employed in early life in agriculture, and received a very common education; but a lameness in one of his legs compelling him to relinquish that pursuit, he was bound apprentice to a carpenter. Previously to this he had made himself two violincellos of tolerable execution, and a violin out of a solid block of wood. On the expiration of his apprenticeship he was employed in London as a cabinet-maker, and soon enabled to set up for himself; but the improvements which he made in the construction of water-closets, proved the foundation of his fortune. He afterwards undertook the manufacture of pumps and pipes, on new principles; but obtained still more decided notice by the fabrication of locks, which yet bear his name. He next directed his attention to hydraulic machines, and, by varying the form of the piston and cylinder, produced a rotative motion, for which he procured a patent. His next object was the application of the hydrostatic paradox, or the uniform pressure of fluids in every direction, as a mechanical agent. For this he took out a patent in 1796, and tore up 300 trees in Holt forest by it without any other means. In 1807 the bank of England engaged Mr. Bramah to construct a machine for more expeditiously printing the numbers and date lines on their notes, an object which he accomplished in a month, and his practice has ever since been acted upon. See NOTES, BANK. For some time prior to his death, he was employed in the erection of machinery on the side of the Thames, for sawing stones and deals, upon the principle of his hydro-mechanical invention. He was taken off by a severe cold, occasioned by over-exertion, in 1815. He published 1. A Dissertation on the Construction of Locks, 8vo; 2. Letter on the Subject of the Cause of Boulton and Watt against Hornblower and Maberley, for an Infringement of a Patent.

BRAMBANAN, or PRAMBANAN, a village of Java, at the base of a range of mountains in the district of Mataram, celebrated for its many remains of Hindoo antiquities. Temples, images, and inscriptions, are here scattered over a surface extending several miles each way. The most remarkable of these is called the Thousand Temples, and consists of a square group of buildings, measuring, each side, about 250 paces. In the centre formerly stood one large temple, surrounded by smaller ones. Various other structures, with these, consist of hewn basalt or trap, without mortar, the stones being retained in their places by projecting grooves. They were pro-

bably built about the latter end of the thirteenth century, by the Hindoos of the Coromandel Coast. Those who have examined these and similar structures on that island, consider them to have been dedicated to the worship of Buddha, a reformation of the bloodier rites of Rahuadema and Durga. See BUDDHA.

BRAMBAS, a name given by the natives of Guinea, and some other parts of Africa, to a peculiar species of lemon tree. The leaves are of a deep green, and very fragrant when rubbed between the hands. The fruit is very small, and has a remarkably thin skin. *Phil. Trans.* No. 108.

BRAMBER, a borough town, or rather village, in the county of Sussex, giving its name to the rape in which it is situated. It adjoins the borough of Steyning. A small stream flows near the town, and the ruins of a strong and extensive castle are still perceptible.

BRAMBLE, } *Goth. bramber; Swed.*
BRAM'BL'D, } *brombar; Teut. brom-*
BRAM'BLBERRIES. } *beer; Ang.-Sax. brambel; brier berry; Teut. bram, a prickly. The blackberry bush.*

Forth was I ledde, not as I wont afore,

When choise I had to choose my wandering way,

But whether luck and love's unbridled lore

Would lead me forth on Fancies bitte to play:

'The bush my bed, the *bramble* was my bowre,

'The woods can witnesse many a wofull stowe.'

Spenser's Shepheard's Calendar.

The *bramble* bush, where hyrdes of every kinde

To the waters' fall their tunes attemper right. *Spenser.*

There is a man haunts the forest, that abuses our young plants with carving Rosalind on their barks; hangs odes upon hawthorns, and elegies on *brambles*; all, forsooth, deifying the name of Rosalind.

Shakespeare.

Content with food which nature freely bred,

On wildings and on strawberries they fed:

Cornels and *brambleberries* gave the rest,

And falling acorns furnished out a feast. *Dryden.*

Thy younglings, Cuddy, are but just awake,

No thrushes shrill the *bramble* bush forsake. *Gay.*

The flowering thorn, self-taught to wind,

The hazel's stubborn stem entwined,

And *bramble* twigs were wrathed around,

And rough furze crept along the ground. *Beattie.*

BRAMBLE-NET, or HALLIER, is a net for catching birds of several sizes: the great meshes must be four inches square; those of the least size are three inches square, and those of the biggest five. In the depth they should not be above three or four inches; but in length they may be enlarged at pleasure. The shortest are eighteen feet long.

BRAMER (Leonard), history painter, born at Delft, in 1598, learned painting under Rembrandt, and imitated the manner of his master in small. In 1614 he went to Rome for improvement, but could never divest himself of the Flemish gout. Yet he had a fine taste for design; his expression is generally good, and in some of his compositions truly noble. His coloring is very peculiar in the tints, being remarkably thin in many parts, so as barely to cover the pannel; yet, by his skilful management of the chiaro-scuro, it appears bright, bold, and full of lustre; particularly in the vases, which have a rich and fine relief.

He had accustomed himself to paint with a very thin body of color, to give his pictures a greater transparence. His works are rarely to be met with out of Italy, where he painted most; but they draw considerable prices, when entire. Three of his most capital pictures are, the Raising of Lazarus, the Denial of St. Peter; both preserved at Rome; and a small picture on copper, representing the story of Pyramus and Thisbe.

BRAMHALL (Dr. John), archbishop of Armagh, was born of an ancient family at Pontefract, about A. D. 1593. He was invited over to Ireland by the lord-deputy Wentworth; and soon after obtained the archdeaconry of Meath. In 1634 he was made bishop of Londonderry, which see he improved very much; and obtained several acts to be passed for abolishing fee farms, recovering impropriations, &c. by which he regained to the church £30,000 or £40,000 a year. In the convocation he prevailed upon the church of Ireland to unite with that of England, by adopting the thirty-nine articles; but could only prevail on them to accept of some of the canons. Articles of treason were exhibited against him in the Irish parliament; and at the treaty of Uxbridge, in 1644, the English parliament made it a preliminary article, that bishop Bramhall, with archbishop Laud, &c. should be excepted from the general pardon. He went abroad; but, on the Restoration, was appointed archbishop of Armagh, primate of Ireland, &c. and was chosen speaker of the Irish house of Lords. He died in 1663; and was the author of several works, which have been collected in one volume, folio.

BRAMIA, in botany; class didynamia; order angiospermia. Their generic characters are, CAL. five-leaved; STAM. four, two long; PIST. style filiform; STIG. simple; PERICARP. capsule conical, one-celled; SEEDS, numerous. Species, only one. A native of the East Indies.

BRAMICIDE, the crime of killing a Brahmin, reputed, in the East Indies, one of the five most heinous sins.

BRAMINS, see BRAHMINS.

BRAMPOUR, or BURHAMPORE. See BURHAMPTON.

BRAMPTON, a market town of Cumberland, nine miles north-east from Carlisle, and 311 north from London. It is a very ancient town, and was formerly a Roman station of considerable note in the second and third centuries. A ruined fortification is near it, which Camden thinks is on the site of the ancient Bremetunacum. It stands on the Irthing, and is still the capital of the barony of Gillsland, belonging to the earl of Carlisle; the town courts are held here twice a-year. Two miles distant is Naworth castle, the seat of the earls of Carlisle, built in the reign of Henry III. It has a good market on Tuesday, and two fairs, on the second Wednesday after Whitsunday, and the second Wednesday in September, noted for the sale of black cattle and sheep.

BRAN', } Fr. *bran*; Ital. *brano*; Armoric
BRAN'NY. } and Welsh, *brann*. Somner thinks it is from the Ang.-Sax. *brun*, brown. Thomson intimates that it is from *bray*, to pound, to grind. It signifies the husks of corn when ground.

But I ne cannot bould it to the *brén*.

Chaucer's Canterbury Tales.

From me do back receive the flower of all,

And leave me but the *bran*.

Shakspeare.

The citizens were driven to great distress for want of victuals; bread they made of the coarsest *bran*, moulded in cloths; for otherwise it would not cleave together.

Hayward.

Then water him, and drinking what he can,

Encourage him to thirst again with *bran*.

Dryden.

BRAN contains a portion of the farinaceous matter of wheat. It is less glutinous than the finer flour, and is supposed to have a detergent quality. Infusions of bran are employed with this intention externally, and sometimes likewise taken inwardly. Among the ancients, bran was used as an erotic. Bran boiled, purges scurf, dandriff, and cleanses the hands in lieu of soap. The dyers reckon it among the not-coloring drugs; and use it for making what they call the sour waters, with which they prepare their several dyes. Bran is also used as a medicine for horses.

BRANCAS LAURAGUAIS (duke de), member of the Academy of Sciences at Paris, was distinguished for his skill in chemistry, and became the associate of Lavoisier, Berthollet, Chaptal, &c. We owe to this nobleman the discovery of the composition of the diamond, and some very important improvements in the manufacture of porcelain. He died in October 1824, aged ninety-one.

BRANCH', v. & n.

BRANCH'ER,

BRANCH'ING,

BRANCH'LESS,

BRANCH'Y.

Fr. *branche*; Armoric,

brank; Gr. *βραχίον*; Lat.

brachium. From ranken,

recken (Ang.-Sax. *ræ-*

can, *gerecan*) to extend,

to reach. From the German, *ragen*, says Wachter, to project. To branch is to extend; to spread out, as from the trunk of a tree; to separate or diverge. Branch is a limb of a tree; an arm of the sea; the adjunct of a subject; that which springs out of it; either a collateral or a constituent part of it; any member or part of the whole; any distinct article; any section or subdivision.

In which were oaks great, streight as a line,

Under the which the gras so freshe of hew

Was newly sprong; and an eight fote, or nine,

Every tre well fro his fellow grew,

With *braunches* brode, laden with leves new

That sprongen out agen the sonnè shene,—

Some very rede, and some a glad light grene.

Chaucer. The Flouré and the Leafe.

Whence is it, that the floweret of the field doth fade,

And lyeth buried long in winter's bale;

Yet soone as spring his mantle hath displayde,

It flowereth fresh as it would never faile.

But thing of earth that is of most availle,

As vertue's *branch* and beantie's bud,

Reliven not for any good.

O heavie herse!

The *branch* once dead, the bud eke needes must quaille.

O careful verse! *Spenser's Shepheard's Calendar.*

They were trained together in their childhoods, and there rooted betwixt them such an affection, which cannot choose but *branch* now.

Shakspeare.

Why grow the *branches*, when the root is gone?

Why wither not the leaves that want their sap? *Id.*

If I lose mine honour,

I lose myself; better I were not your's,

Than yours so *branchless*.

Id

Great Anthony! Spain's well beseeching pride,
That mighty *branch* of emperours and kings! *Crashaw.*

His blood, which disperseth itself by the *branches*
of veins, may be resembled to waters carried by brooks.

Raleigh.

If, from a main river, any *branch* be separated and
divided, then, where that *branch* doth first bound itself
with new banks, there is that part of the river, where
the *branch* forsaketh the main stream, called the head
of the river. *Id.*

The swift stag from under ground
Bore up his *branching* head. *Milton.*

In robe of lily white she was arrayed,
That from her shoulder to her heel down raught,
The train whereof loose far behind her strayed,
*Branch*ed with gold and pearl, most richly wrought.

Spenser.

The spirits of things animate are all continued
within themselves, and are *branched* into canals, as
blood is; and the spirits have not only *branches*, but
certain cells or seats, where the principal spirits do
reside. *Bacon.*

Straight as a line in beauteous order stood
Of oaks unshorn a venerable wood;
Fresh was the grass beneath, and every tree
At distance planted, in a due degree,
Their *branching* arms in air, with equal space,
Stretched to their neighbours with a long embrace.

Dryden.

In the several *branches* of justice and charity, com-
prehended in those general rules, of loving our neigh-
bour as ourselves, and of doing to others as we would
have them do to us, there is nothing but what is most
fit and reasonable. *Tillotson.*

The Alps at the one end, and the long range of
Apennines that passes through the body of it, *branch*
out on all sides, into several different divisions.

ddison.

What carriage can bear away all the various, rude,
and unwieldy loppings of a *branchy* tree at once?

Watts.

If their child be not such a speedy spreader and
brancher, like the vine, yet he may yield, with a little
longer expectation, as useful, and more sober, fruit
than the other. *Wotton.*

And all in sight doth rise a birchen tree,
Which learning near her little dome did strow,
Whilom a twig of small regard to see,
Tho' now so wide its waving *branches* flow.

Shenstone's School-Mistress.

Gray-haired with anguish like these blasted pines,
Wrecks of a single winter, barkless, *branchless*,
A blighted trunk upon a cursed root.

Byron's Manfred.

BRANCH, in botany, an arm of a tree, or a part
which, sprouting out from the trunk, helps to
form the head or crown thereof. Branches do
not spring out of the mere surface of the trunk,
but are deeply rooted therein, so as not only to
penetrate the cortical, but also the woody sub-
stance, and even the pith. The constituent parts
therefore of a branch are the same as of the trunk,
viz. skin, bark, wood, and pith. See BOTANY.

BRANCHIÆ, in medicine, glandular tumors
in the fauces, secreting saliva, resembling two
almonds.

BRANCHERY, in the anatomy of vegetables,
the vascular parts of divers fruits, as apples,
pears, plumbs, and berries.

BRANCHIÆ, *βραγχία*; in the anatomy of
fishes, the gills, or parts corresponding to the

lungs of land animals. All fishes, except the
cetaceous ones, and the pteromyzium, which have
lungs, are furnished with these organs of respi-
ration. See ZOOLOGY.

BRANCHIDÆ, in antiquity, priests of the
temple of Apollo, at Didymus in Ionia. They
opened the temple to Xerxes, who plundered it
of its riches; after which, thinking themselves
not safe in Greece, they fled to Sogdiana, on the
other side of the Caspian Sea, where they built a
city. Alexander the Great having conquered
Darius king of Persia, and being informed of
their treachery, put them all to the sword, and
razed their city; thus punishing the impiety of
the fathers on their posterity.

BRANCHIONUS, in zoology a genus of
vermes; order infusoria. The body is contrac-
tile, and covered with a shell. These animals
inhabit the stagnant water, where, from their
minuteness, they appear to the naked eye like
white specks.

BRANCHIOSTEGI, in ichthyology, one of
the general classes of fishes; the characters of
which are, that the rays of the fins are of a bony
substance, and no bones or ossicula at the branchiæ.
This class includes the following genera: mormyrus, ostracion, tetrodon; syngnathus, pegasus; centriscus, balistes, cyclopterus, and lophius.

BRAND (John), an English antiquary of
some eminence, was born at Newcastle-on-Tyne
in 1743, of mean parentage. After serving an
apprenticeship to a shoemaker, he obtained,
however, the means of prosecuting his studies
at Oxford; entered into orders, and was pre-
sented to the curacy of Cramlington. He con-
tinued here till 1784, when the duke of Northum-
berland gave him the rectory of St. Mary at Hill,
London; and he was chosen the same year se-
cretary of the Antiquarian Society. He died in
1806 at Somerset-house. His publications are,
Observations on Popular Antiquities, including
Bourne's *Antiquitates Vulgares*, with copious
Additions, 1777, an enlarged edition of which
curious work was published after his death, in
2 vols. 4to.; and *The History and Antiquities of
the Town and County of Newcastle*, 1789, 2 vols.
4to. A curious and valuable library of his, of
which there is a catalogue published in two parts,
was sold by auction in 1807 and 1808.

BRAND', *v.*, & *n.* } Goth. Swed. Ang.-
BRAND-NEW. } Sax. Dan. Teut. Belgic,
brand; from Goth. *brann*. Brand-new, from Goth.
bruna. All from burn, which see. A thunder-
bolt, a burning coal, lighted stick, mark of burn-
ing, a burnished sword.—Met. Infamy.

Eftsoones he perced through his chaufed chest
With thrilling point of deadly yron *brand*,
And launcht his lordly hart: with death opprest
He roared aloud, whiles life forsooke his stubborn
brest. *Spenser.*

Then the aire still flitting, but yet firmly bounded
On everie side with pyles of flaming *brands*,
Never consumed nor quencht with mortal *brands*. *Id.*

Have I caught thee?

He that parts us shall bring a *brand* from heaven,
And fire us hence. *Shakspeare.*

Have I lived thus long a wife, a true one,
Never yet *brinded* with suspicion? *Id.*

The king was after *branded*, by Perkin's proclamation, for an execrable breaker of the rights of holy church. *Bacon.*

Clerks convict should be burned in the hand, both because they might taste of some corporal punishment, and that they might carry a *brand* of infamy. *Id.*

They looking back, all the eastern side beheld
Of paradise, so late their happy seat,
Waved over by that flaming *brand*; the gate
With dreadful faces thronged, and fiery arms. *Milton.*

My loss of honour's great enough,
Thou needst not *brand* it with a scoff. *Butler's Hudibras.*

Where did his wit on learning fix a *brand*,
And rail at arts he did not understand? *Dryden.*

Brand not their actions with so foul a name;
Pity, at least, what we are forced to blame. *Id.*

The sire omnipotent prepares the *brand*,
By Vulcan wrought, and arms his potent hand. *Graville.*

Our Punick faith
Is infamous, and *branded* to a proverb. *Addison.*

The memory of Licinius was *branded* with infamy, his statues thrown down, and by a hasty edict, of such mischievous tendency that it was almost immediately corrected, all his laws, and all the judicial proceedings of his reign, were at once abolished. *Gibbon.*

I'm naked, famished, faint, my *brand* is broken.
Maturin's Betram.

And now the matadores around him play,
Shake the red cloak and poise the ready *brand*. *Byron.*

BRANDARIS, in conchology, a species of *murex*, common in the Mediterranean, somewhat ovate, and surrounded with spines; beak moderately subulate and straight.

BRANDBURG, MARK, or MARQUISATE of, an important State in Prussia, and may be considered the foundation of the monarchy, as it is at present constituted. It is bounded by the north by Mecklenburg and Pomerania, a part of Saxony, Anhalt and Magdeburg on the south, on the east by the grand duchy of Posen, and on the west by Brunswick and Hanover. Its extent from east to west is computed at 200 miles; and from south to north upwards of 100. It is computed to contain 17,198 English square miles, and its population about a million and a quarter. It is divided into the Electoral and the New Mark; to each of which several smaller territories have at several times been annexed, arising principally by the articles of peace at the conclusion of various wars with neighbouring or more distant nations.

The Suevi were the aboriginal inhabitants of Brandenburg, and were succeeded by the Slavonians, with whom Charlemagne and his successors were frequently at war. Henry I. having subdued them in the early part of the tenth century, introduced Christianity here, we are told, and erected the Margraviate. It was conferred on a Saxon count, with the title of Lord Warden of the Marshes or Borders, and first became hereditary in the family of Albert, count of Ascania, about the year 1100. Charles IV. on the extinction of this race, assigned the electorate to his second son Sigismund, who ascended the imperial throne of Germany in 1413, and sold it

to Frederic, Burgrave of Nuremberg, the ancestor of the present reigning family. Minor divisions of the territory afterwards took place among his grandsons, until Frederic William, surnamed the Great, compelled the king of Poland, in 1656, to acknowledge Prussia independent; and made large accessions to the ancient domains of his house. It now became identified with the history of Prussia. A part of this ancient province, however, was once more divided from the rest, when the Old Mark was ceded to Buonaparte in 1807, and incorporated with the department of the Elbe, in the kingdom of Westphalia, created for his brother Jerome. It was of course restored at the general peace of 1814.

The principal rivers of Brandenburg are the Elbe and the Oder; in addition to which there are several smaller,—the Havel, the Spree, the Wartha, &c., with several canals to unite their streams. Few countries are better supplied with water, both for the purposes of irrigation, and the transfer of goods: conveniences which are extended over the whole surface of this extensive country.

There are many mountains and sandy tracts, but it is on the whole a productive country in corn, flax, hemp, hops, and tobacco; it is also rich in wood, wool, and iron. Buck wheat and rye are the chief crops. The forests furnish the important article of fuel, both for domestic use, and for the glass and iron works; together with large quantities of timber for house and ship building. The principal minerals are, iron ore, a useful kind of clay, porcelain earth, alum, salt-petre, and amber. The culture of silk is carried on with success, and is in a state of increase. The rearing of cattle and sheep forms an important branch of employment, improved breeds of both having been lately introduced. The horses are small; but the black cattle are excellent in some districts.

The manufactures are those of cotton, linen, woollen, salt, leather, porcelain, and iron; jewellery, and various metallic articles; paper and hats. The chief towns are Berlin, Potsdam, Brandenburg, Frankfurt on the Oder, Stendal, Prenzlau, Custring, and Perleberg. The inhabitants are principally Lutherans, the remainder Calvinists. Of the latter number are the French settlers, who fled hither in great numbers after the revocation of the edict of Nantes, and by their skill and industry greatly promoted the manufactures of the country. The number of the families of these colonists, about the middle of the last century, was in the Electoral Mark 7500, and in the New Mark 2600. The arts and sciences are more cultivated here than in any other part of the monarchy. The total population of Brandenburg amounted, in 1783, to 987,224 without the military, and, 1801, including the military, to 1,100,000.

BRANDEBURG, the capital of the preceding electorate or province, is situated in the Middle Mark, on the banks of the river Havel, which divides it into the old and new towns. The banks of the river are lined with houses built upon piles. The town contains one broad hand-streets, a cathedral, and seven other churches, with 12,000 or 13,000 inhabitants. Frederick II. demolished the castle, and carried away all that

was characteristic of the former residence of his family, to Potsdam. Here are manufactories of linen, woollen, and cotton, and several noted flour mills, which supply Berlin with flour. It stands about thirty miles west of that city. There are also about 300 acres of vineyards in this neighbourhood.

BRANDENBURG, CONFESSION OF. A formulary or confession of faith, drawn up in the city of Brandenburg, by order of the elector, with a view to reconcile the tenets of Luther with those of Calvin, and to put an end to the disputes occasioned by the confession of Augsburg.

BRANDING, in old law, in the face or hand, a punishment inflicted by law on various offences, by burning with a hot iron, after the offender has been once admitted to benefit of clergy.

BRANDISH, v. & n. *Span, blandir; Ital. brandire; Fr. brandir, brandiller.* See *brand*. To flourish or wave like a sword. Junius thinks that brandish was first applied to the motion of a brand; and then generally to denote, to wave; to shake; to flourish; met to make a show. Brander, to shine or glisten with a vibrating trembling, or soft motion.—*Cotgrave, as quoted in the Ency. Met.*

Brave Macbeth,
Disdaining fortune, with his *brandished* steel,
Like valour's minion, carved out his passage.
Shakspeare.

She *brandished* o'er her head his sword,
And vowed they should not break her word,
She had given him quarter, and her blood
Or theirs should make that quarter good;
For she was bound by law of arms
To see him safe from further harms.

Butler's Hudibras.

He said, and *brandishing* at once his blade,
With eager pace pursued the flaming shade.

Dryden.

He who shall employ all the force of his reason
only in *brandishing* of syllogisms, will discover very little.

Locke.

Let me march their leader, not their prince,
And at the head of your renowned Cydonians
Brandish this sword. *Smith.*

Two shining spears are *brandished* in his hands,
Thus armed he animates his drooping bands—
Revives their ardour, turns their steps from flight,
And wakes anew the dying flames of fight.

Pope's Iliad.

BRAND'LING, a worm so named from its *brindled* color.

The dew-worm, which some also call the lob-worm, and the *brandling*, are the chief. *Wulton.*

BRANDOLINUS (Aurelius), surnamed Lip-pus, from his being blear-eyed, was born at Florence in the fifteenth century, and esteemed a great orator, poet, and musician. Matthias Corvinus, king of Hungary, invited him to teach oratory in his dominions, which he did many years at Buda and Strigonia, with great success. On his return to Florence he took orders, and preached to the most crowded audiences. He died at Rome of the plague, in 1498. He wrote several works which were esteemed, particularly, 1. A Commentary on St. Paul's Epistles. 2. A Treatise de Lege. 3. Two Books of Christian Paradoxes. 4. Three books De Ratione Scri-

bendi. 5. A Dialogue de humanæ vitæ conditione, et tollenda corporum aegritudine; dedicated to king Matthias. And 6. The Scripture Histories in Heroic Verse.

BRANDON, a market town of Suffolk, five miles north-west from Thetford, and seventy-eight N. N. E. from London. It is pleasantly situate on the Little Ouse, and has a good harbour. The river, over which there is a bridge, is navigable from Lynn to Thetford; and, a mile below, is a ferry for conveying goods to and from the Isle of Ely. The Fens commence near this town, which formerly gave title to the dukes of Suffolk, and now gives the title of duke to the family of Hamilton, in Scotland. The church is handsome, and the town has a considerable trade in malt, corn, coals, timber, iron, bricks, gun-flints, &c. In the neighbourhood are extensive rabbit-warrens.

BRAND SUNDAY, Dimanche des Branlons, in French ecclesiastical writers, denotes the first Sunday in Lent; so called on account of an ancient practice in the Lyonnais, where the peasants, on the night of this day, walked about their orchards, gardens, &c. with lighted torches, or fire-brands in their hands; in which plight they visited every tree, and, addressing them as to them one after another, threatened that if they did not bear fruit well the ensuing season, they should be cut down to the ground and burnt. This is evidently a relict of Paganism; the same custom having been practised by the ancient Romans in February.

BRANDT (Gerard), a learned protestant divine, born at Amsterdam in 1626, and successively minister in several places of the Netherlands. He wrote several works, which are much esteemed; particularly, The History of the Reformation of the Netherlands, 4 vols. 4to; and the Life of Admiral Ruyter; he died at Rotterdam in 1685.

BRANDY. Teut. *brande wein*; Dut. *brandewyn*; Swedish *brann-win*; Ger. *brand-wine*. Brand burned, and wine, corrupted into y, in English, says the Ency. Met. literally burnt wine; a spirit distilled from wine.

Buy any *brand-wine*, buy any *brand-wine*.

Beaumont and Fletcher.

The Dutch their *wine*, and all their *brandy* lose.

Waller.

Restored the fainting high and mighty

With *brandy-wine* and aqua-vitæ:

And made them stoutly overcome

With bacrack, hockamore, and mum.

Butler's Hudibras.

If your master lodgeth at inns, every dram of *brandy* extraordinary that you drink, raiseth his character. *Swift's Footman.*

It has been a common saying, A hair of the same dog; and thought that *brandy-wine* is a common relief to such. *Wise-man.*

BRANDY is extracted from other liquors, as well as wine, by distillation. It has even been distilled with considerable success of late, from potatoes. See **DISTILLATION**. French brandy is esteemed the best in Europe. It is made wherever wine is made; and the strong heavy wines are preferred for the still. The best French brandies exported, are those of Bour-

deaux, Rochelle, Cogniac, Charenton, Nantz, the isle of Rhé, Orleans, and the ci-devant provinces of Poitou, Touraine, Anjou, Burgundy, and Champagne. See also *ALCOHOL*.

BRANDYWINE, a township of Chester county, Pennsylvania, United States.

BRANDYWINE CREEK, a creek of North America, which falls into Christiana creek from the northward, at Wilmington, in the state of Delaware, about twenty-five miles from its north and north-west sources in Chester county, Pennsylvania. This creek is famous for a battle, fought on the 11th of September, 1777, between the British and the Americans, in which the latter were defeated. Philadelphia was taken possession of in consequence, by general Howe, on the 26th.

BRANFORD, a town of the United States, in New-Haven county, Connecticut; seated on a small stream that runs into Long-island sound. It is about eight miles south-east by east from New-Haven, and 191 from Philadelphia.

BRAN'GLE, } From *bewrangle*. *Wran-*
BRAN'GLER, } gle was originally *wrongle*,
BRAN'GLING, } a diminutive of *wrong*, the
BRAN'GLEMENT, } past participle of *wring*,
to twist, to distort, to misrepresent. *Bewrangle*, *berangle*, *brangle*, presents a common course of corruption.—Ency. Met. To brangle is to squabble. A brangler is one prone to litigious contests, to brawls and quarrels.

This is '*durus sermo*,' says some *brangling* parishioner, that fetches up his poor minister every term for trifles. *Bp. Hall*.

When polite conversing shall be improved, company will be no longer pestered with dull story-tellers, nor *brangling* disputers. *Swift*.

The payment of tithes is subject to many frauds, *brangles*, and other difficulties, not only from papists and dissenters, but even from those who profess themselves Protestants. *Id*.

BRANK'. Armoric, *brank*, *brac*, *barac*, said anciently to have been the general Celtic name for grain. It now signifies buck wheat.

BRANK', probably from *branca*, a barbarous Latin word of the middle ages, corrupted from *brachium*, and signifies a foot or paw.

BRANK, an instrument used in Staffordshire, for correcting scolding women. It is a sort of head-piece, which opens and encloses the head, while an iron, sharp as a chissel, enters the mouth, and subdues the more dreadful weapon within. Thus harnessed, the offender is led in triumph through the streets. Dr. Plott, in his history of Staffordshire, gives a minute description and figure of the instrument, which is there called a scolding bridle; and tells us, he looks upon it 'as much to be preferred to the ducking-stool, which not only endangers the health of the party, but also gives the tongue liberty betwixt every dip; to neither of which this is at all liable.' The Dr. illustrated the margin of a copy of his own work, now in the British Museum with the following quotation from Chaucer:

But as for my daughter Julian
I would she were well bolted with a *bridle*,
That leaves her work to play the clack,
And lets her wheel stand idle.

For it serves not for she ministers.

Farriers nor furriers,

Coblers nor button makers

To descant on the Bible.

BRANKER, or **BRANCKER**, (Thomas), an eminent mathematician of the seventeenth century, was born in Devonshire, in 1636, and studied at Oxford, where he took his degree of M.A. in 1658. His skill in mathematics and chemistry recommended him to Lord Brereton, who gave him the rectory of Tilston. He was afterwards appointed master of the well-endowed school of Macclesfield; where he died in 1676, aged forty. He wrote a Latin work *De Sphærâ*; Oxford, 1662; and a translation of Rhonius's *Algebra*: London 4to. 1668.

BRANKSEA, or **BROWNSEA**, an island about three miles in circumference, in Pool harbour; and situate amongst strong currents. Queen Elizabeth erected a fort here. Long. 1° 57' W., lat. 50° 41' N.

BRAN'SEL. Fr. *brangler*, or *bransler*, a brawl or dance.

Bransels, ballads, virelayes, and verses vain.

Spenser.

BRANTETH WELL, a mineral spring in Dumfriesshire, which, though situated several yards deep in an extensive moss, contains a very strong sulphureous water, more powerful than that of Moffat, and used with success in scorbutic and scrophulous cases.

BRASAVOLUS (Antonius Musa), M.D. and professor of natural philosophy, at Ferrara, flourished in the middle of the sixteenth century. He wrote, 1. *Commentaries on Hippocrates' Aphorisms*: 2. *Examen omnium simplicium, quorum usus est in publicis officinis*: printed at Rome, 1536, and Lyons, 1544, 8vo. A treatise on Venereal Disease; and several other medical works. He used the form of a dialogue, between himself and the apothecary. His style is clear and simple.

BRASAVOLUS (Jerom), the son of Antonius Musa, was also a physician and medical author. He wrote, *An Exposition of the first Book of Hippocrates*; Ferrara, 4to, 1595: and a treatise *De officiis Medicis*.

BRASENIA, in botany, a genus of plants; class, polyandria decagynia: CAL. perianth one-leaved, six-parted: COR. none: STAM. filaments from eighteen to twenty-five, erect, attached to the receptacle, shorter than the calyx: ANTH. erect: PIST. styles erect, bent inwards towards the top: STIG. obtuse: PERICARP. oblong, the outer side flat, the inner gibbous, fleshy, one-celled, without valves: SEEDS two or three, oval.

BRASIDAS, a celebrated general of the Lacedemonians, who flourished A. A. C. 424. He defeated the Athenians by land and sea, took many places, and rendered his country formidable to all the neighbouring states. He conquered the Athenians on their attempting to surprise Amphipolis, but died of the wounds received in that battle. He is celebrated for the heroic declaration: 'Whatever the honor of the state requires, I will perform or die;' and he fulfilled his promise. Plutarch (Apothegm), records, that having caught a mouse among some

figs, he let it go after having bitten his fingers, observing to those who attended on the occasion; 'That there is no creature so contemptible as not to be able to free itself from a foe, if it exerts all the power it possesses.' Public honors were decreed to his mother for the speech uttered by her on the occasion of his death; and a monument was erected to Brasidas at the expense of the public.

BRASIER, from brass, in domestic architecture. A metal pan for burning charcoal, &c.; the Greeks and Romans having no chimneys in their apartments, they used pans, in which they placed lighted coals for the purpose of warming them. These were made of different metals, but most commonly of brass, and are, therefore, called brasiers. Caylus has published some ancient brasiers, which are supported by a tripod. A number of them were found in the ruins of Herculaneum and Pompeii, of which the greatest part have been engraved in the third volume of the *Bronzes found at Herculaneum*. In 1761 a square pan, or bronze grate, was discovered, in a temple of Herculaneum, like those used in Italy for heating the large apartments. It is as large as a middling sized table, and placed upon lion's paws. The borders are inlaid with foliage worked in copper, bronze, and silver. At the bottom was an iron grating, very thick, supported or walled up with bricks above and below, that the coals might not touch the under part of the grating, nor fall through at the bottom. This fine example was taken out in pieces. They use no other manner in Italy at present to heat the apartments, than by the means of pans, which are proportioned to the size of the rooms, and ornamented according to the opulence of the proprietors. In most palaces they are of silver: the greatest number are of copper, and the most common form is a basin, supported by a border of wood, plated with copper, which rises from three to four feet. In ancient churches they used a pan mounted on wheels to warm the priests and assistants.

BRASIL, an immense territory on the east of South America, including, with Guiana, all the Portuguese dominions in America. Though originally confined to a small line of coast south of the Amazons, it now comprehends all the country between 4° of north and 34° of south latitude, and from the 35th to the 72d degree of west longitude; being bounded on the north by Colombia, French Guiana, and the Atlantic Ocean; on the east and south-east by the Atlantic; and on the west by Peru, Colombia, and the United Provinces. The mean length of Brasil is 1800 miles, and its medium breadth, from east to west, 1700. Its greatest breadth is towards the north; on approaching the southern extremity, the ocean and the western boundary closely approximate. The area of Brasil is stated at 3,060,000 square miles, or 19,584,000,000 acres; and the whole population at not above 3,000,000, or one person for every square mile. But then it must be remembered, that by far the greater part of the country is occupied with vast deserts or impenetrable woods.

In our article *SOUTH AMERICA*, par. 125—142 inclusive, the reader will find the leading features

of this country, geographical, commercial, and political, described, with a sketch of its history since its first discovery in the fifteenth century. We shall here, therefore, add only an enlarged description of the aboriginal tribes, and some topographical particulars supplied by recent travellers.

Brasil, when first visited from the western world, was still more a desert than at present. Its vast plains were entirely covered with woods; and its subterraneous treasures known only by the grains of gold dust, occasionally washed down the rivers. A multitude of scattered tribes wandered over its wide extent, without agriculture, arts, or government, and exhibiting man in almost the rudest state of social life in which he ever has been found.

The physical constitution of the natives is represented as having been at this time robust, and their general health as excellent. Air, continual moderate exercise, and a simple diet, preserved them from most of the diseases to which Europeans were subject; and the color of their skin was not darker than that of the southern European nations. Persons with any bodily defect were rarely seen among them; their rapid migration and its consequent hardships quickly disposed of those when they did appear, and those only whose constitution was originally sound and entire, were enabled to arrive to manhood. In one respect, they are described as the rudest of all the American tribes. They had no clothing whatever, even on those parts of the body which modesty most forbids to be exposed. They also removed all hairs from their body, even those of the eye-brow and eye-lid, the women only retaining a portion of that which grows on the head. All the early efforts of Europeans could not persuade them to make use of clothes. Even those who had been taken prisoners and enslaved, if compelled by severe chastisement to put on some articles of European dress, would, as soon as they were set at liberty for the night, throw them off as a burden. Still were they very attentive to the adornment of their persons in their own way. They painted them with various colors, and often entirely covered them with ornaments of feathers, bones, and shells. The men generally painted all their bodies, except the face, black, at least for a ground color; and drew upon this layers of various ornamental stripes. Necklaces and bracelets, of bone or polished wood, hung round the shoulders and breasts of both sexes; and in war, or at their feasts, they arrayed themselves in their best. Of the two sexes, it is said the males were by far the most vain in their attire, and monopolised all the plumes. The women were treated as inferior beings, and most of the labor devolved on them. They used the same species of ornaments, when they could obtain them, as the men, and showed a great avidity for every material of which necklaces could be formed.

The whole country was at this time divided into small communities, perpetually engaged in the most ferocious warfare. Neither plunder nor increase of territory seemed to be the object of these conflicts, but a sort of implacable hatred, which nothing but the torture or destruction of

their enemies could appease; and each instance of savage cruelty was indelibly recorded in the minds of whole tribes. The love of military glory seemed to enter largely into their motives to war, but this was subordinate to the thirst of vengeance, and the desire of doing execution. To accomplish this in all its gratifying details, they avoided to meet their enemies in the field, and never courted single combats, but principally conducted their wars by surprise and ambush; chose the dead hour of midnight to fall upon their enemies; and sought every mode of destroying them, without exposing themselves. Still when the most formidable perils met them, they faced them with intrepidity, and endured with the greatest constancy the horrors to which these savage wars exposed them. 'When one of their expeditions was determined upon, the old men arranged the time and mode of procedure; they gave the signal for setting out, and were followed by the rest, with the most rapturous acclamations. Having laid up provision sufficient to last for a considerable time, they proceeded by the most unfrequented paths, in profound silence, till they arrived at the hostile frontiers. There they left the women, children, and all those who were unfit for service; and the chosen warriors of the nation proceeded to the scene of action. When they approached the village on which the attack was to be made, they concealed themselves more carefully than ever. Taking their station in the thickest woods, they watched the opportunity of finding the enemy completely unprepared. The time favorable for this purpose was of course the night, when the enemy were buried in sleep, and unconscious of impending danger. Notwithstanding dreadful and continually repeated examples, these nations had never adopted the obvious precaution of stationing a sentinel to warn them of an approaching enemy. The attack, therefore, proved generally successful; the inhabitants were roused from profound slumber by the yells of their destroying foe. A scene then ensued, the horrors of which no pen can describe. The victims, unprepared, unarmed, defenceless, fell unresisting into the hands of their enraged and unrelenting enemies. In vain did their cries rise to heaven; vain was all supplication; neither age nor sex afforded shelter from the utmost excesses of cruelty; and the victors exhausted themselves in inventing new forms of inhumanity; they devour in their fury portions of the mangled victims, while they reserve the survivors for a more lingering fate. The number of prisoners taken was, indeed, the criterion by which their warlike exploits were chiefly valued. The arrival of a numerous band doomed to destruction, secures them a joyful reception from that part of the community who had been left at home, and who were eagerly waiting their return. These unhappy men were reserved for a festival, the most horrible and the most disgraceful to human nature. To devour the flesh of their enemies, amid savage pomp and acclamation, was considered as the utmost height of human triumph. They did not, however, proceed immediately; nor did they, unless to a small extent, in the first frenzy of battle, feed on the bodies of enemies slain on the field. They reserved the

living captives for an august solemnity, at which the whole nation was called to assist. Previous to this awful day, the prisoner was treated with every mark of kindness and favor. His wants were liberally supplied; he was allowed to accompany them in the exercises of hunting and fishing; and the person to whom he belonged hesitated not to give him one of his own nearest relations as a wife, during the short period that he had yet to live. All this previous kindness, however, seemed to be bestowed only to render his fate, when it arrived, more dreadful. Immediately previous even to the fatal moment, several days were devoted to feasting and profuse conviviality, in which the captive was permitted to share. All his study, then, was to show the most entire indifference to his approaching fate, and the proudest defiance to the enemies among whom he was seated. He was the gayest of the company; he boasted aloud of his warlike exploits, and particularly of such as had been performed against those by whom he was surrounded. He was then fixed on a scaffold, and, by a whimsical indulgence, a number of stones were placed beside him, with which he was allowed to do all the mischief in his power. Then the person who was to execute his doom stepped forth. This office was considered as peculiarly honorable, and was assigned to the most distinguished character in the nation. This person comes in his most splendid war dress, waving with varied colored plumes, and with a large club in his hand. He then addresses the captive: 'Here am I, that have killed many of thy nation, and will kill thee;' to which the other replies, 'You do well, I have slain a multitude of your countrymen, and have devoured them; you do well, but my death will be revenged.' After this mutual defiance, the fatal blow is instantly struck; and after the necessary preparations, the inhuman feast begins, amid universal delight and triumph. The bones are carefully preserved, and are fashioned into various ornaments of necklaces, bracelets, and musical instruments. The heads are also preserved, and piled up in a corner, to be shown to every stranger, as testimonies of their prowess and success.

Their ignorance of iron left them very imperfect manufacturers of arms, yet considerable ingenuity was displayed in a sort of club called *tacape*, formed of Brasil wood, a species of black ebony, very weighty, round at the extremity, and sharp at the sides. It was six feet long, and about an inch thick. They had also ingenious shields made of skins, broad, flat, and round. For missile weapons, they had arrows, composed of the same kind of wood with their clubs. The strings were made of a particular species of grass, and twisted so strongly, that a traveller declares, a horse might draw by them. Their arrows were six feet long; the head and point formed of black wood, the middle of common wood, and these different pieces were very neatly joined with thin bark of trees. They had two pennons, each a foot long, neatly tied with cotton thread. These were pointed, either with bone, with hard and dried canes in the form of a lancet, or with the tail of the ray fish, which has a strongly poisonous quality. They had also a

certain species of military ensigns, and drew a warlike music from flutes made of their enemies bones!

One account of a battle in an open field has come down to us through a French traveller, who was an eye witness of it, and has given the following curious and lively description of the scene: 'Having been myself a spectator,' says M. Lery, 'I can speak with truth. Another Frenchman and I, though in danger, had we been taken or killed, of being eaten by the Margajas, had once the curiosity to accompany our savages, then about 4000 in number, in a skirmish which happened on the sea coast; and we saw these barbarians combating with such fury, that people mad or out of their senses could not do worse. First, when our people had perceived the enemy at about half a quarter of a league's distance, they took to howling in such a manner, that though it had thundered in heaven we should not have heard it. According as they approached, redoubling their cries, sounding their drums, stretching their arms, throwing out dreadful threats, and showing to each other the bones of the prisoners whom they had eaten, and even their teeth strung together hung round their neck: it was horrible to see their countenance; but it was much worse when they came near each other; for, when at the distance of two or three hundred paces, they saluted each other with great showers of arrows; and by the first discharge, you would have seen the air entirely loaded with them. Those whom they struck, tore them from their body with wonderful courage, broke them, bit them with their teeth, and failed not to make head in spite of their wounds; upon which, we must observe, that these Indians are so furious in their wars, that so long as they can stir legs or arms, they cease not to combat, without retreating or turning their backs. When they were joined in battle, you might then see them wielding, in their two hands, wooden clubs, and charging so furiously, that he who met the head of his enemy, not only threw him on the ground, but felled him as butchers do oxen. You will ask what my companion and I did during this rough skirmish? To conceal nothing, I answer, that satisfied with our first folly, which was to risk ourselves with these barbarians, and keeping in the rear, we were only occupied in viewing the blows. But though I had seen men at arms in France, both on foot and horseback, I must say, that the polished movements, and glittering armour of our Frenchmen, never gave me so much pleasure as I had then in seeing the savages combat. Besides their leaps, their hissings, and their skilful thrusts, it was a wonderful spectacle to see flying in the air so many arrows, with their great pennons of plumes, red, blue, green, carnation, and other colors, amid the rays of the sun, which made them glitter, and to see also so many helmets, bracelets, and other ornaments, made of these natural plumes, with which the combatants are covered.

'After the combat had lasted about three hours, and that there had been a good number killed and wounded on both sides, our Topinamboux having at last gained the victory, made prisoners of more than thirty Margajas, men and

women, whom they carried away into their country: and although we two Frenchmen had done nothing but hold our naked swords in our hands, and fire some pistol shots in the air to encourage our men, we saw that it was impossible to do them a greater pleasure than to go to war with them; for they esteemed us so much afterwards, that in the villages which we frequented, the old men always testified more friendship for us.

'The prisoners having been placed in the middle of the victorious band, bound, in order to secure them the better, we returned to our river of Janeiro, in the neighbourhood of which these savages inhabited. As we had gone twelve or fifteen leagues, ask not, if, in passing through the villages of our allies, they came not out to meet us, dancing, leaping, and clapping their hands to applaud and caress us. The poor prisoners were obliged, according to their custom, when they were near the houses, to sing and say to the women, 'here is the food which you love so much coming to you.' To conclude, when we were arrived before our isle, my companion and I went into a bark, and the savages went away, each to their residence.'

The Brasilians had an original mode of fortifying their villages. Before an interior enclosure, composed of a strong palisade, was thrown up a wall of loose stones, and the houses were pierced with holes, through which arrows could pass. A Portuguese force which attacked one of these forts, found its reduction extremely difficult; they were obliged to entrench themselves, in consequence of the furious sallies of the Indians, and wait the arrival of succours from the metropolis. And it was not until they had covered themselves with hurdles of canes, which secured them against arrows, that they at last forced the walls, and subdued the town.

Their rude agriculture was, from the extreme fertility of the soil, sufficient to maintain them in abundance. A day's work, it is said, often produced as much as would supply a native with food during the year. The principal objects of cultivation were the manioc, and other roots resembling it, which, after being dried and reduced to powder, were boiled into a thick substance that bore a considerable resemblance to bread. In war, or on a hunting excursion, they boiled it till it became hard, and it could thus be kept for a considerable time. These people had also a fermented liquor, in which they indulged with great avidity. The preparation was made in a manner truly savage. The roots having been softened by fire, the women seated themselves round the vessel containing them, put the different pieces successively into their mouth, and applying to the malt-mill of nature, their teeth, chewed, and then spit them into another vessel. This delicious pulp was afterwards boiled a second time, and being poured into earthen vessels, speedily fermented, and produced that liquor, which formed their favorite beverage.

The Brasilians have been said to have no idea of a Divinity, no expectation of a future state of rewards or punishments, nor a single tradition respecting the origin of the human race; an opinion which seems to have arisen solely from

their having no temples or sacrifices, and none of the ordinary pageantry of religious belief. It appears that they were always impressed with the belief of beings and powers superior to man. A traveller (M. Lery), who represents them as entirely devoid of religious ideas, mentions in one place his having heard their songs, in which, after lamenting the death of their ancestors, they console themselves with the hope of a future and joyful meeting beyond the lofty mountains. Others, on the contrary, they say, are shut up in gloomy abodes, where the Aignans, or evil spirits, torment them without intermission. They were not even entirely destitute of a priesthood; some offices of which were performed by their jugglers or conjurors, who are supposed to possess superhuman powers, and to hold intercourse with invisible beings. At their dances, which were considered as religious ceremonies, several of these jugglers always presided, and, during the intervals of dancing, carried about wooden poles stuck round with fruits, and having a hollow filled with tobacco, which being set fire to, the juggler breathed upon all present, pretending that through this medium the spirit infused into them force and vigor. These conjurors were also believed to have the power of foreseeing, and even of producing future events. In cases of disease, their aid was, therefore, particularly sought, and they were courted and caressed by all who labored under any distress. When the event did not correspond with the expectation of the votary, the failure, it is said, was attributed to the conjuror, and he suffered often severe vengeance. The great agencies of nature were also habitually worshipped. Thunder, whose effects are peculiarly striking in this climate, had attracted, in a remarkable degree, their adoration. They endowed it with mind, and viewed it, not only like other nations, as a formidable, but also as a beneficent power. To it they considered themselves as indebted for whatever they knew of the science of agriculture. The sun and moon had also attracted their attention. At certain periods, they raised their hands to them in a suppliant manner, with gestures and cries expressive of the profoundest veneration. By the race of evil beings, called Aignans, they often fancied themselves to be beaten and scourged with the utmost severity. Mr. Henderson represents them as believing in a creator of all, whom they denominated Tupan, and an evil spirit, called Anhauga, together with the immortality of the soul.

‘They consist,’ he adds, ‘of a vast number of nations, more or less numerous, and generally divided into tribes or hordes, wandering about in a state of nudity. The principal part of their time is employed in hunting, gathering honey, and such fruits as nature spontaneously produces. No state of government is found amongst them; each tribe has its elective captain, who directs them only on occasion of assaults, and in forming ambuscades against an enemy. Each nation has its peculiar idiom; but there is one exists among them, called the general lingua, which is the Tupinamba. At this day many tribes retain their ancient custom of perforating their faces, and using pieces of wood as ornaments. In con-

tracting marriages, the degree of relationship is not respected. Polygamy is admitted amongst particular individuals only, in a very few nations. Divorcements are generally very rare among them. They are acquainted with no liberal art, and have a great antipathy to civilisation. Thousands of instances have occurred, in which they have preferred fleeing from it back again into the woods, in pursuit of their former rude habits. Their inherent indolence is conspicuous, and they have but little consideration in life beyond the acquirement of their daily sustenance. Such as live upon the banks of auriferous rivers or lands, and come in contact with the Portuguese, will give pieces of gold for trifling articles of European manufacture, particularly knives. Few Indians are seen in any of the sea-port towns of the Brasil. Some are employed in the bay of Rio de Janeiro, rowing boats in the service of the government. They appear to keep themselves quite distinct, and do not mix with any other class of people. They are not tall, but their early occupation of hunting has given to their limbs much strength and agility. A fine proportion of form is their general characteristic, and they possess great muscular power. Their features are regular, and there is an universal resemblance between them and the various tribes. They are of a copper color, with strong, lank, black hair, which is permitted to hang over their ears, necks, and foreheads, adding something to the sombre aspect of their countenances, which are sad even to an extreme. There is nothing ferocious in their physiognomy; on the contrary, they seem very inoffensive. I never saw them indulge in any gaiety, rarely laughing, and speaking seldom. They are expert rowers; and, on a transient cessation from their labor, exhibit no disposition to hold converse with each other, nor curiosity or interest in the objects and bustle around them.’ We may add to this sketch, that of a late traveller in Brasil, M. Koster, which was principally drawn from information collected in the northern parts of the country. It principally relates to such as have in part renounced their roving habits, we should remark, and are become in some measure domiciliated with the European conquerors of their coasts.

The Indians are in general a quiet and inoffensive people; they have not much fidelity; but although they desert, they will not injure those whom they have served. Their lives are certainly not passed in a pleasant manner under the eye of a director, by whom they are imperiously treated, consequently it is not surprising that they should do all in their power to leave their villages and be free from an immediate superior; but even when they have escaped from the irksome dominion of the director, they never settle in one place. The Indian scarcely ever plants for himself, or, if he does, rarely waits the crop: he sells his maize, or mandioc, for half its value before it is fit to be gathered, and removes to some other district. His favorite pursuits are fishing and hunting; a lake or rivulet will alone induce him to be stationary for any length of time. He has a sort of independent feeling, which makes him spurn at any thing like a wish to deprive him of his own free agency; to the

director he submits because it is out of his power to resist. An Indian can never be persuaded to address the master to whom he may have hired himself by the term of *Senhor*, though it is made use of by the whites in speaking to each other, and by all other free people in the country; but the negroes also use it in speaking to their masters, therefore the Indian will not; he addresses his temporary master by the term of *amo* or *patram*, protector or patron. The reluctance to use the term of *senhor* may perhaps have commenced with the immediate descendants of those who were in slavery, and thus the objection may have become traditional. They may refuse to give by courtesy what was once required from them by law; however, if it began in this manner, it is not now continued for the same reason, as none of those with whom I conversed, and they were very many, appeared to know that their ancestors had been obliged to work as slaves.

'The instances of murder committed by Indians are rare. They are pilferers rather than thieves. When they can they eat immoderately; but if it is necessary they can live upon a very trifling quantity of food, to which their idleness often reduces them. They are much addicted to liquor, and will dance in a ring, singing some of the monotonous ditties of their own language, and drink for nights and days without ceasing. Their dances are not indecent, as those of Africa. The Mulattoes consider themselves superior to the Indians, and even the Creole blacks look down upon them: 'He is as paltry as an Indian,' is a common expression among the lower orders in Brasil. They are viley indifferent regarding the conduct of their wives and daughters: lying, and other vices attached to savage life, belong to them. Affection seems to have little hold upon them; they appear to be less anxious for the life and welfare of their children than any other cast of men who inhabit that country. The women, however, do not, among these semi-barbarians, perform the principal drudgery; if the husband is at home he fetches water from the rivulet, and fuel from the wood; he builds the hut whilst his wife takes shelter in some neighbour's shed: but if they travel, she has her young children to carry, the pots, the baskets, and the excavated gourds; whilst the husband takes his wallet of goat-skin and his hammock rolled up upon his back, his fishing net, and his arms, and walks in the rear. The children are washed on the day of their birth in the nearest brook or pool of water. Both the men and women are cleanly in many of their habits, and particularly in those relating to their persons; but in some other matters their customs are extremely disgusting; the same knife is used for all purposes, and with little preparatory cleaning is employed in services of descriptions widely opposite. They do not reject any kind of food, and devour it almost without being cooked; rats, and other small vermin, snakes and alligators, are all acceptable.

'The instinct, for I know not what else to call it, which the Indians possess above other men, in finding their way across a wood to a certain spot on the opposite side, without path or apparent mark, is most surprising; they trace footsteps over the dry leaves which lie scattered under the trees. The letter-carriers from one province to

another are mostly Indians; for from habit they endure great fatigue, and will walk day after day, with little rest, for months together. I have met them with their wallets, made of goat skin, upon their shoulders, walking at a regular pace, which is not altered by rough or smooth. Though a horse may outstrip one of these men for the first few days, still, if the journey continues long, the Indian will in the end arrive before him. If a criminal has eluded the diligence of the police-officers, Indians are sent in pursuit of him as a last resource. It is well known that they will not take him alive; each man who sees the offender fires, for they do not wish to have any contention. Nor is it possible for the magistrate to fix upon the individual of the party who shot the criminal; for if any of them are asked who killed him, the answer invariably is, 'os homens,' the men.

'It is usually said that a party of Indians will fight tolerably well, but that two or three will take to their heels at the first alarm. Some of them, however, are resolute, and sufficiently courageous; but the general character is usually supposed to be cowardly, inconstant, devoid of acute feelings, as forgetful of favors as of injuries, obstinate in trifles, regardless of matters of importance. The character of the negro is more decided; it is worse, but it is also better. From the black race the worst of men may be formed; but they are capable likewise of great and good actions. The Indians seem to be without energy or exertion; devoid of great good or great evil. Much may, at the same time, be said in their favor; they have been unjustly dealt with, they have been trampled upon, and afterwards treated as children; they have been always subjected to those who consider themselves their superiors, and this desire to govern them has even been carried to the direction of their domestic arrangements. But no,—if they are a race of acute beings capable of energy, of being deeply interested upon any subject, they would do more than they have done. The priesthood is open to them, but they do not take advantage of it. I never saw an Indian mechanic in any of the towns; there is no instance of a wealthy Indian; rich mulattoes and negroes are by no means rare. I have had many dealings with them as guides and carriers, and subsequently as laborers, and have no reason to complain, for I was never injured by any of them; but neither did I receive any particular good service, excepting in the instance of Julio. For guides and carriers they are well adapted, as their usual habits lead them to the rambling life which these employments encourage. As laborers, I found that they had usually a great inclination to overreach; but their schemes were badly made, and, consequently, easily discovered. I never could depend upon them for any length of time, and to advance money or clothing to them is a certain loss. If I had any labor which was to be performed by a given time, the overseer would always reckon upon his mulatto and negro free people; but did not mention in the list of persons who were to work, any of the Indians whom I was then employing; and, on my speaking of them, he answered, 'An Indian is only to be mentioned for the present day;' meaning, that no reliance is to be placed upon them.

'Like most of the aboriginal inhabitants of the western hemisphere, these people are of a copper color. They are short, and stoutly made; but their limbs, though large, have not the appearance of possessing great strength, they have no show of muscle. The face is disproportionately broad, the nose flat, the mouth wide, the eye deep and small, the hair black, coarse, and lank; none of the men have whiskers, and their beards are not thick. The women, when they are young, have by no means an unpleasant appearance; but they soon fall off, and become ugly; their figures are seldom well shaped. Deformity is rare among the Indians; I do not recollect to have seen an individual of this race who had been born defective; and the well-informed persons with whom I conversed, were of opinion that the Indians are more fortunate in this respect than any other race with whom they were acquainted.'

The author of the *Etat Present du Portugal* says, there are twelve cities in Brasil, sixty-six towns, many villages; one archbishop, four bishops, and about 430,000 inhabitants, more than one-sixth of whom are Portuguese. So various are the accounts of its population.

Mr. Lindley, a recent traveller in Brasil, has given the following table of latitude and longitude, which he states himself to have obtained from Portuguese manuscript charts made after a new survey.

	Latitude.	Longitude.

Mr. Henderson in his late *Topographical Account of Brasil*, represents it as divided into the following twenty-two provinces, including those on the north bank of the river Maranon.

Maritime Provinces.

- | | |
|-----------------------|------------------------|
| 1. Guiana. | 9. Bahia. |
| 2. Para. | 10. Porto Seguro. |
| 3. Maranham. | 11. Espirito Santo. |
| 4. Seará. | 12. Rio de Janeiro. |
| 5. Rio Grande, North. | 13. St. Paulo. |
| 6. Paraiba. | 14. St. Catherina. |
| 7. Pernambuco. | 15. Rio Grande, South. |
| 8. Seregipe d'El Rey. | |

Interior Provinces.

- | | |
|-------------------|-------------------|
| 16. Matto Grosso. | 20. Piahy. |
| 17. Paraná. | 21. Minas Geraes. |
| 18. Uruguay. | 22. Goyaz. |
| 19. Solimoes | |

The actual government of the country, however, appears to be conducted on a more general division. Portuguese Guiana is on the north side of the Maranon, and the rest of this territory is divided into the twelve governments we have specified in our article *SOUTH AMERICA*, referred to above, which are sometimes also called *Capitanias*, though to one or two only is the term government applied.

In the latter part of the seventeenth century opened a brilliant era for Brasil, in the discovery of her gold mines. The home government being at this time engaged in war for the security of her own independence, at first neglected them, but in 1699 this was compensated by the activity of some enterprising individuals, who discovered and began to work several mines in the back settlements. The gold was abundant, and of easy extraction; and it soon appeared, that a vast source of treasure had been opened to the nation. The court of Lisbon now therefore resolved to take cognisance of the operations which were going on. It ordained, that, on the discovery of a mine, immediate notice should be given to the government; and that a fifth part of the produce should always be paid into the treasury. Other mines were now soon discovered; and the produce was so copious, that the king's fifth amounted to £480,000, and consequently the whole produce to more than two millions. At this rate it continued from 1728 to 1734. It then began gradually to diminish, till the whole produce sunk so low that the royal fifth did not amount to more than £257,400. The government, besides this original tax, imposed a duty of 2 per cent. on its conveyance to Europe, which yielded nearly £16,000, to which might be added the seignorage on the coinage of gold, amounting to nearly £80,000; which raised the whole revenue derived from this source to £353,400.

Thirty years after, this discovery was followed by another still more unexpected. The miners often met with little shining stones, which they threw away as useless with the sand and gravel. An overseer suspecting that these might be of some value, transmitted a specimen to the governor. They were immediately sent to Lisbon; and that court directed its ambassador in Holland, to have them examined by the lapidaries of that country, then reputed the most skillful in Europe. On repeated examinations, they were pronounced to be genuine and valuable diamonds. When this important intelligence reached Brasil, the stones were collected and sent over to Europe in such quantities as greatly to diminish their value. The court of Lisbon, on this, adopted its long system of rigorous monopoly. They vested the trade in an exclusive company, and even this body was restricted from employing more than 600 slaves; a restriction which was afterwards taken off, and its place supplied by a moderate tax on every slave employed. At length the government, envying the profits of the company, took the trade into its own hand:

all restrictions upon the collection of the diamonds were now removed; but it was enacted, that every person who found one should deliver it to one of the crown agents at a fixed price; out of which was deducted, as in the case of gold, the tax of a fifth. A series of the most rigorous precautions were employed, to prevent unlawful trade and embezzlement, both in the colonists employed in collecting the diamonds, and in the officers of the crown. The whole average sum produced to the government at a recent period by the mines of Brasil was £148,500 per annum. They are purchased by British and Dutch lapidaries, who cut and bring them into a proper state for the market. The gold is found in deep valleys or the channels of rivers. Frequent excavations occur, made by the gold washers, some of them fifty or a hundred feet wide, and eighteen or twenty feet deep. At other times the gold appears at little greater depth than the roots of the grass. For the most part it is found in a stratum of rounded pebbles and gravel, called *cascalhao*, which generally rests upon the solid rock. This stratum is covered with soil of different depths, and is very thin and uneven. At the gold washings of Santa Rita, visited by Mr. Mawe, it was nowhere more than two feet thick, and in many parts not more than seven or eight inches. The incumbent soil is removed at great labor and expense, being dug out and carried away in bowls, and the stratum of *cascalhao*, in which is contained the gold, is removed to a convenient place where there is water for washing it. The process by which the ore is separated from the earth in which it is embedded is different, according as water can be more or less easily procured. It is in general extremely simple, and is minutely described by Mr. Mawe, who was allowed to inspect the different gold washings established throughout the country. 'Where water,' he says, 'of sufficiently high level can be commanded, the ground is cut in steps, each twenty or thirty feet wide, two or three broad, and about one deep. Near the bottom a trench is cut to the depth of two or three feet. On each step stand six or eight negroes, who, as the water flows gently from above, keeps the earth continually in motion with shovels, until the whole is reduced to liquid mud, and washed below. The particles of gold contained in this earth descend to the trench, where, by reason of their specific gravity, they quickly precipitate. Workmen are continually employed at the trench to remove the stones and clear away the surface, which operation is much assisted by the current of water which falls into it. After five days washing, the precipitation in the trench is carried to some convenient stream, to undergo a second clearance. For this purpose wooden bowls are provided, of a funnel shape, about two feet wide at the mouth, and five or six inches deep, called *gamellas*. Each workman, standing in the stream, takes into his bowl five or six pounds weight of the sediment, which generally consists of heavy matter, such as oxide of iron, pyrites, ferruginous quartz, &c. of a dark carbonaceous hue. They admit certain quantities of water into the bowls, which they move about so dexterously, that the precious metal,

separating from the inferior and lighter substances, settles to the bottom and sides of the vessel. They then rinse their bowl in a larger vessel of clean water, leaving the gold in it, and begin again. The washing of each bowlful occupies from five to eight or nine minutes; the gold produced is extremely variable in quantity, and in the size of its particles; some of which are so minute that they float, while others are found as large as peas, and not unfrequently much larger. This operation is superintended by overseers, as the result is of considerable importance.

At Villa Rica, which was also visited by Mr. Mawe, he found the bed of *cascalhao* on the margin of the river, and workmen employed in cutting away the bank to the depth of about ten feet, before they could reach the vein containing the metal which was incumbent on the rock. The substance they had to cut through was a stiff clay, so strong, that though falls of water were let down upon it, and negroes were constantly employed in working it with hoes of various kinds, it was with difficulty removed. Nor was this the only impediment they had to struggle with; for, by the constant precipitation of mud from higher grounds, the *cascalhao* was five feet below the bed of the river; in consequence of which, all the pits which were sunk were immediately filled with water, which had to be drained away by means of machinery. The mode adopted at this place for washing the earth from the ore is thus described: 'Two planks, about ten or twelve inches broad, and about twelve or fifteen feet in length, are laid in the ground, forming an inclined plane, sloping one inch in twelve; two other planks of similar dimensions, are fixed in the same direction at the lower end, forming a second inclined plane, with a fall of six inches from the former. On their sides are boards placed edgeways, and staked down to the ground, so as to form long shallow troughs, the bottoms of which are covered with hides tanned with the hair on, having the hairy side outwards, or, in defect of these, with rough balse. Down these troughs is conveyed the water containing the oxide of iron and the lighter particle of gold; the latter substance precipitating in its course is entangled by the hair. Every half hour the hides are taken up, and carried to a tank near at hand, formed of four walls, say five feet long, four broad, and four deep, and containing about two feet depth of water. The hides are stretched over this tank and well beaten, then dipped and beaten repeatedly, until all the gold is disentangled, after which they are carried back and replaced in the troughs. The tanks are locked up at night and well secured. The sediment taken from them being light, is easily washed away by the hand, in the manner before described, leaving only the black oxide of iron, called *esmeril*, and the gold, which is so fine that mercury is used to separate it.

There is a great want of machinery and contrivance in these establishments, for expediting the various operations. Not even a cart or a wheelbarrow is in use. Every thing to be removed is carried on the heads of the poor negroes, in *gamellas* or bowls, who have in many instances to climb up steep ascents with their burdens.

where inclined planes might be used with great advantage, and might be formed with little trouble. Pumps, also, which would materially abridge the trouble of certain operations, could be erected with great advantage here, and the tedious process of washing the gold in bowls might be shortened by the use of the most simple hydrau-
 lical machines. In breaking down the substances which contain gold, mills might be constructed, by which all the metal contained in the ore could be more certainly extracted, and at far less labor and expense. There is even a deficiency of proper iron implements for the poor miners, and the impolitic tax of nearly 100 per cent. imposed on this necessary article, discourages both its importation and its production.

After the gold dust is separated from the substances with which it is combined, it is brought to the nearest mint, where it first pays a tax of one-fifth to the prince. It is afterwards subjected to the process of amalgamation with mercury, which being finished, the metal is sent to the assay-master, who, being satisfied of its weight and fineness, affixes to it the authority of public stamp, as a certificate of its worth, after which it is delivered to the owner for circulation. Those who bring gold dust to the mint experience very little delay before it is returned to them in the form of ingots. The gold is of different degrees of fineness. Mr. Mawe mentions that he has seen some of the bars so low as sixteen carats, and others as fine as twenty-three and a half carats, which is within half a carat of what is denominated pure gold. The standard is twenty-two, and, in whatever proportion the gold exceeds this, it receives a premium according to its fineness.

The district of Cerro do Frio, or of the Cold Mountains, in which the diamond works are established, consists of a range of rugged mountains, that have a northerly and southerly direction, and are generally allowed to be among the highest in Brasil. In these mountains, at the distance of about 300 miles in the interior, Mr. Mawe found the thermometer in the morning at 62°, and in the course of the day it rose to 70° and 74°, so that judging by the temperature, these mountains, which are situated about 18° south latitude, cannot be above the height of 4000 or 5000 feet above the level of the sea. The tract of country termed the diamond ground extends about fifty miles from north to south, and about twenty-five from east to west. Nearly in the middle of it, in a barren country, stands the town of Tejuco, which contains about 6000 inhabitants. The diamond works, by which the town is chiefly supported, are in the neighbourhood. The principal establishment is situated on the river Jijitonhonha, which falls into the Rio Grande; there are others situated on the Rio Velho, a branch of the Francisco, and on the Rio Pardo, as well as on various other small streams, which have their rise in this elevated country. The Rio Pardo though small and insignificant in its appearance, has produced as large a quantity of the most precious gems as any river in the district. The river Jijitonhonha, which is formed by the junction of several streams, is about as wide as the Thames at

Windsor, and is in general from nine to ten feet deep. When Mr. Mawe visited these works, they were working at a curve of the river, from which the stream was diverted by a canal cut across the tongue of land, round which it winded, the former course of the river being stopped just below the head of the canal, by an embankment across its channel, formed of several thousand bags of sand. This is an undertaking of considerable magnitude; for the river being both wide and deep, and occasionally subject to overflows, the embankment must be made so strong as to resist the pressure of the water, admitting it to rise to the height of four or five feet. After this operation, the water is drained away from all the deeper parts of the channel by means of large caissons or chain-pumps, which are worked by a water-wheel. The channel being in this manner laid dry, the mud is carried away, and the cascalhao is dug up and removed to a convenient place for washing. So little skill was displayed by the superintendents of the works in the contrivance of useful machinery, that until lately the task of removing the cascalhao was performed by the unassisted labor of negroes. Two inclined planes are now in use, about 200 yards in length, along which two carts are drawn by means of a large water-wheel, so contrived, that by the same operation one of these descends empty on one inclined plane, while the other loaded with cascalhao is drawn to the top of the other inclined plane, where having emptied itself, it descends in its turn. A mile higher up the river the cascalhao is removed by other engines, similar to those which are used in the mining county of Derbyshire, and there are also railways constructed over some parts of the uneven ground. The want of timber is an obstacle to the general introduction of machinery, as also the prejudices of the workmen, who are afraid that the use of these engines is part of a plan for entirely superseding manual labor. The cascalhao, after it is removed from the river, out of the channel of which it is dug, is laid down in heaps, containing apparently from five to fifteen tons each, and they generally calculate on being able to dig up as much cascalhao during the dry season as will afford full employment to the workmen during the rainy months. The stratum which contains the diamonds consists of the same materials as that which contains the gold. On many parts of the margin of the river large masses of rounded pebbles are found cemented by oxide of iron, which sometimes envelope both gold and diamonds. In all establishments of this nature an abundant supply of water is indispensable, and this necessary article is accordingly distributed through every part of the works by means of aqueducts constructed with great ingenuity and skill. Mr. Mawe gives the following account of the method of working for diamonds. 'A shed is erected,' he says, 'in the form of a parallelogram, twenty-five or thirty yards long, and about fifteen wide, consisting of upright posts, which support a roof thatched with long grass. Down the middle of the area of this shed a current of water is conveyed through a canal, covered with strong planks, on which the cascalhao is laid two or three feet thick. On the other

side of the area is a flooring of planks, from four to five yards long, embedded in clay, extending the whole length of the shed, and having a slope from the canal, of three or four inches to a yard. This flooring is divided into about twenty compartments or troughs, each about three feet wide, by means of planks placed upon their edge. The upper ends of all these troughs (here called canoes) communicate with the canal, and are so formed that water is admitted into them between two planks that are about an inch separate. Through this opening the current falls about six inches into the trough, and may be directed to any part of it, or stopped at pleasure by means of a small quantity of clay. For instance, sometimes water is required only from one corner of the aperture, then the remaining part is stopped; sometimes it is wanted from the centre, then the extremes are stopped; and sometimes only a gentle rill is wanted, then the clay is applied accordingly. Along the lower ends of the trough, a small channel is dug to carry off the water.

On the heap of *cascalhao*, at equal distances, are placed three high chairs for the officers or overseers. After they are seated, the negroes enter the troughs, each provided with a rake of a peculiar form and short handle, with which he rakes into the trough about fifty or eighty lbs. weight of *cascalhao*. The water being then let in upon it, the *cascalhao* is spread abroad, and continually raked up to the head of the trough, so as to be kept in constant motion. This operation is performed for the space of a quarter of an hour; the water then begins to run clearer, having washed the earthy particles away, the gravel-like matter is raked up to the end of the trough: after the current flows away quite clear, the largest stones are thrown out, and afterwards those of inferior size, then the whole is examined with great care for diamonds. When a negro finds one, he immediately stands upright and claps his hands, then extends them, holding the gem between his fore-finger and thumb; an overseer receives it from him, and deposits it in a gamella or bowl, suspended from the centre of the structure half full of water. In this vessel all the diamonds found in the course of the day are placed, and at the close of work are taken out and delivered to the principal officer, who, after they have been weighed, registers the particulars in a book kept for that purpose.

When a negro is so fortunate as to find a diamond of the weight of an octavo (seventeen carats and a half), much ceremony takes place; he is crowned with a wreath of flowers, and carried in procession to the administrator, who gives him his freedom, by paying his owner for it. He also receives a present of new clothes, and is permitted to work on his own account. When a stone of eight or ten carats is found, the negro receives two new shirts, a complete new suit, with a hat and a handsome knife. For smaller stones of trivial amount, proportionate premiums are given. During my stay at Tejuco, a stone of sixteen carats and a half was found; it was pleasing to see the anxious desire manifested by the officers that it might prove heavy enough to entitle the poor negro to his freedom, and when, on being delivered and weighed, it proved only a

carat short of the requisite weight, all seemed to sympathise in his disappointment.

Precautions are adopted to prevent the negroes from embezzling diamonds. Although they work in a bent position, and cannot therefore observe whether they are watched by the overseers, they may nevertheless omit gathering some of the diamonds which they may see, and placing them in a corner of the trough, afterwards contrive to secrete them. To prevent this, they are frequently changed while the operations are going on, and at the word of command given by the overseers, they must instantly move into each other's troughs, so as to prevent the possibility of collusion. If a negro be suspected of swallowing a diamond, he is confined within the bare walls of a strong room, where strong purgative doses are administered to him, in order to ascertain the fact. If he proves guilty, he is liable to personal chastisement, or to imprisonment, a much lighter punishment than would be inflicted on any white man for the same offence. The officers of the establishment are liberally paid, and they live in a style of elegance which no one would expect to find in so remote a place.

The diamonds are generally found in the flat pieces of ground on the margin of the rivers, and these generally prove equally rich throughout their whole extent; so that the superintendents of the works are enabled to estimate, with the utmost accuracy, the value of an unwashed place, from the produce which they have derived from the adjoining ground. The intendant frequently made such an observation as the following:— 'That piece of ground (speaking of an unworked flat by the side of the river), will yield me 10,000 carats of diamonds whenever we shall be required to get them in the regular course of working, or when, on any particular occasion, an order from government arrives, demanding an extraordinary and immediate supply.'

The surest indications of diamonds are bright bean-like iron ore, a slaty flint-like substance, approaching Lydian stone, of fine texture, black oxide of iron in great quantities, rounded bits of blue quartz, yellow crystal, and other materials, entirely different from any thing known to be produced in the adjacent mountains. On the banks of the Rio Pardo, the accompanying substances are somewhat different. No bean-like iron ore is found with diamonds; but a considerable quantity of flinty slate-like Lydian stone, in various shapes and sizes, and a very small black oxide of iron. The earthy matter is also much finer.

The washings on the river Jijitonhonha, and on the other rivers, have been established for many years, and great quantities of diamonds have been procured, some of them of the finest quality. They vary in size. Some are so small that four or five are required to weigh one grain, and sixteen or twenty are consequently necessary to make a carat. It is seldom that, in the course of a year, more than two or three stones of from seventeen to twenty carats are found, and not once in two years do the whole washings produce a stone of thirty carats. During the five days in which Mr. Mawe remained at the works, the whole quantity found amounted to only forty

carats; the largest of which was only four carats, and of a light green color. The diamond works in this district have been established for nearly forty years, and in time they must be completely explored. In this event, however, it is calculated that the country in the neighbourhood, and many parts also of that inhabited by the Indians will be found to yield this precious produce in equal abundance. Mr. Mawe estimated the average produce of the diamond district at 20,000 to 25,000 carats annually. 'The expenses of these works,' he says, 'during a period of five years, from 1801 to 1806 inclusive, amounted to £204,000, and the diamonds sent to the treasury of Rio Janeiro, during the same period, weighed 115,675 carats. The value of the gold found in the same time amounted to £17,300 sterling; from which it appears that the diamonds actually cost government 33s. 9d. per carat. These years were esteemed singularly productive. The mines in general do not yield to government more than 20,000 carats annually.'

The brilliant accounts of the gold and diamonds of Brasil, would naturally induce us to expect that the appearance and comforts of the people must correspond. Those who reside in the mining districts are said also to maintain this delusion, by assuming all possible state when they visit Rio de Janeiro. Viewed however at home, and in the centre of their riches, society assumes a different aspect. Their property consists simply of slaves, and the rude instruments necessary for working the mines. Mr. Mawe gives us a faithful transcript of the impressions made upon his mind in these scenes. Their dwellings he described as scarcely deserving the name of houses, for they are, in fact, the most wretched wicker and mud hovels that can be conceived, consisting of a few apartments joined together without regularity. A hole left for a frame, or a miserable door, serves for a window. The cracks in the walls are frequent, and rarely or never repaired. The floors, composed of clay, are rendered filthy by the habits of the inhabitants, with whom the pigs not unfrequently divide the right of possession. Some of their dwellings built upon posts, have stables underneath. These are superior to the former, but the disagreeable effects produced by the want of cleanliness, are, in this case, increased by the effluvia of the animals, which Mr. M. says he has frequently found to be intolerable.

Their furniture corresponds with their houses. The beds are merely coarse cotton cases filled with dry grass, or the leaves of Indian corn; there are seldom more than two in a house; many of the family sleeping on mats or hides laid on the floor. One or two tables, with a couple of chairs, and a few stools or benches, supply the place of all other furniture; add to these a few coffee-cups, a coffee-pot, and a drinking-cup (generally of silver), and in some instances a wash-hand basin of the same materials, and you have a catalogue of the household goods. Nothing can be more frugal than the whole economy of their tables, and their dress. The children generally go naked, and the youths have merely a jacket and cotton trowsers. The men, when at home, wear a capot or mantle wrapped about them,

and wooden clogs; but when they go abroad they appear in all their splendor, which forms as great a contrast to their domestic attire, as the gaudy butterfly to the chrysalis from which it springs. Nor is more attention paid to the dress of the females. 'In short,' says Mr. Mawe, 'in all those departments of domestic economy, which to the middle classes of other civilised nations are objects of expense, the Brasilians exercise the most rigid parsimony. At first I was inclined to attribute this disposition to a love of money, which prompted them to avoid all extravagance; but, on closer observation, I was surprised to find that it originated in necessity. They generally run in debt for the few articles they have to purchase, and thus find it difficult to maintain their negroes. If they purchase a mule, it is at one or two year's credit, and, of course, at double its ordinary price.'

Few of the numerous miners, it seems, are wealthy, or even comfortable, and a still greater number are wretchedly poor. Many of the mercantile classes enjoy superior comforts; but the indolence of the farmers, and the wretched state of cultivation, render the condition of most of those who spend their time in that pursuit equally miserable with that of the miners.

Of the inhabitants of what are called fazendas, or cattle estates, M. Koster observes, 'Unlike the Peones of the country in the vicinity of the River Plate, the Sertanejo has about him his wife and family, and lives in comparative comfort. The cottages are small, and built of mud, but afford quite sufficient shelter in so fine a climate; they are covered with tiles, where these are to be had, or, as is more general, with the leaves of the carnauba. Hammocks usually supply the place of beds, and are by far more comfortable, and these are likewise frequently used as chairs. Most of the better sort of cottages contain a table, but the usual practice is for the family to squat down upon a mat in a circle, with the bowls, dishes, or gourds in the centre, thus to eat their meals on the floor. Knives and forks are not much known, and are not at all made use of by the lower orders. It is the custom in every house, from the highest to the lowest, as in former times; and, indeed, the same practice prevailed over all the parts of the country which I visited; for a silver basin, or one of earthenware, or a cuia, and a fringed cambric towel, or one that is made of the coarse cotton-cloth of the country, to be handed round, that all who are going to sit down to eat, may wash their hands; and the same ceremony, or rather necessary piece of cleanliness, takes place after the meal is finished. Of the gourds, great use is made in domestic arrangements; they are cut in two, and the pulp is scooped out, then the rind is dried, and these rude vessels serve almost every purpose of earthenware; water is carried in them, &c. and they are likewise used as measures. They vary from six inches in circumference to about three feet, and are usually rather of an oval shape. The gourd, when whole, is called cubaça, and the half of the rind is called cuia. It is a creeping plant, and grows spontaneously in many parts, but in others, the people plant it among the mandioc.

'The conversation of the Sertanejos usually turns upon the state of their cattle, or of women, and occasionally accounts of adventures which took place at Recife, or some other town. The dress of the men, when at home, is only a shirt and drawers. The women have a more slovenly look, as their only dress is a shift and petticoat, no stockings, and oftentimes no shoes; but when they leave home, which is very seldom, an addition is made of a large piece of white cloth, either of their own, or of European manufacture, and this is thrown over the head and shoulders; a pair of shoes are then likewise put on. They are good horsewomen, and the high Portuguese saddle serves the purpose of a side-saddle very completely. Their employment consists in household arrangements entirely, for the men even milk the cows and goats, the women spin and work with the needle. No females of free-birth are ever seen employed in any kind of labor in the open air, excepting in that of occasionally fetching wood or water, if the men are not at home. The children generally run about naked till a certain age, but this is often seen even in Recife; to the age of six or seven years, boys are allowed to run about without any clothing.'

Mr. Henderson thus describes the devotions of the people within a few miles of Rio de Janeiro. 'It was Sunday, and the tocsin had already sounded the signal for mass, and was gradually assembling its votaries. Many of the females, as in Scotland, walked without shoes and stockings. A spring amongst some rocks, served as a purifying fountain, whence they issued in silk stockings and embroidered shoes, ascending the hill into the veranda, sat down on the floor, beat their bosoms, and with other brief ceremonies concluded the devotional exercise. The padre sat down to gamble at cards, and some of the females danced not ungracefully with their castanets.'

In all parts of the country which Mr. Mawe visited he observed the same indolent slovenly habits. The people seemed to feel no confidence in anything they possessed, and to be always on the 'make-shift.'

To counteract the irresistible temptation to smuggling, held out in the mining and diamond districts, the most severe laws are enacted, and the whole country, from the gold washings to the coast, and throughout the diamond district, is subjected to a vexatious military police. On all the roads there are stations at which an officer is placed with twenty horse soldiers under him, who are continually patrolling; and whenever they observe a stray passenger, instantly ride up to him, questioning him strictly as to his business and the purposes of his journey; and to all their questions he must give satisfactory answers before he is allowed to pass. They are authorised to detain all travellers, without distinction, and to subject them to the strictest search, provided they suspect them of concealing gold or diamonds. Travellers, on the other hand, with their mules, are required to stop at all the military posts, or registers, which are established on the different roads, to deliver their passports to a soldier for the inspection of the commander, who, if he judge the account given of the pro-

perty to be correct, suffers them to proceed; but if any ground of suspicion occur, the mules are unloaded, and the contents of all the parcels are scrutinised with the utmost rigor. If diamonds or gold are found among the goods, the travellers, with all their mules, are instantly detained in some of the strong cells with which the registers are provided, until they can be remanded to the proper tribunals, where they are either condemned to perpetual banishment to the African colonies, or to hopeless captivity at home. There is no doubt, however, that a contraband trade is carried on both in gold and diamonds to a great extent; it is impossible on any other principle to account for the eagerness displayed by the inhabitants of Tejuco to hire out their negroes to serve in the diamond works.

The roads in the interior are frequently bad; although there are some which have been made at great expense, and which are tolerably good. The road from the coast to St. Paul's, which passes over lofty mountains, is carried through deep and impassable woods, and frequently a path is cut through the solid rock. Mr. Mawe, who travelled this route, commends the public spirit of those who planned such an undertaking, which must have been executed at vast expence, and in opposition to many difficulties. The usual mode of travelling is by mules, by whom the coffee, sugar, cotton and grain of the country are transported to the coast, in exchange for salt, iron, woollens, cottons, common and finer earthenware, and glass. By this means also in the houses of the interior all sorts of English manufacture are to be found.

The islands off the coast of Brasil are of small importance. The chief is St. Catherine's, separated from the province of that name by a channel, in some places not above a league in width. The sea breeze, blowing regularly here every afternoon, renders the climate of the island very agreeable. It is mountainous, the hills being separated by pleasant valleys, which are better cultivated than most parts of Brasil, and the oranges grown here are thought superior to any in America. The chief town is Desterro, situated on a small bay on the west coast. St. Francisco, with a town of the same name, is farther north, about six leagues in length, and merely separated from the continent by a narrow channel. St. Vincente, another small island, situated in a bay opposite the city of St. Paul's, is five or six leagues long, and contains the town and port of Santos, which may be considered as the port of St. Paul's.

BRASIL WOOD. See CESALPINIA.

BRASILETTO, the same with Brasil wood.

BRASILIANs, the inhabitants of Brasil. See BRASIL.

BRASILIAN STONE, a species of stone found in Brasil, which is flexible. 'No quality,' says Dr. Hutton, in his description of one of these stones, 'is more inconsistent with the character of a stone than flexibility. A flexible stone, therefore, presents an idea, which naturally strikes us with surprise. For though, among mineral bodies, we find flexible substances of the stony kind, such as mica, mountain leather, and amianthus, these minerals owe their flexibility either

to their thinness, or to the fibrous structure of their parts. Therefore, when a stone of any considerable thickness is said to have flexibility, we are led to think it something very extraordinary. Such, however, is the stone from Brasil, of which the Baron de Dietrich read a description in the Royal Academy of Sciences, in Jan. 1784. There is a specimen of a stone which corresponds with that description, inserted in the Journal de Physique for 1784, which belonged to the late Lord Gardenstone. The length of the stone, which I have examined, is twelve inches, the breadth about five, and the thickness half an inch. When this is supported by the two ends, in a horizontal position, the middle part bends by its own weight, more than a quarter of an inch from the straight line. The Doctor adds, that the stone 'has a certain flexibility to which neither the terms ductile nor elastic will properly apply. The flexibility of this stone is so easy, compared with the rigidity of its substance, and its elasticity so small compared with its flexibility, that there must be in this body some mechanical structure by which this unnatural degree of flexibility is produced, i. e. a flexibility which is not inherent in the general substance of the body. Now the substance of this stone being chiefly quartz, the most rigid and inflexible of all materials, and the stone, at the same time, bending in such an easy manner, there is reason to conclude that this rises from no principle of flexibility in the general substance of the stone, but from some species of articulation in the structure of it, or among its constituent parts, which, while it preserves the component particles in one entire mass, suffers the parts to move a certain space in relation to each other.' Dr. Hutton then gives an account of different examinations he made by the microscope, by splitting, and by the blow-pipe; from which he concludes that the 'particles of quartz, which have little cohesion, are bound together by thin plates of transparent mica; and these connecting plates being flexible, this allows a certain motion of the rigid particles among themselves, without the fracture or general separation of the stone.'

BRASILIANUS, in entomology, a species of cerambyx: thorax ferruginous: wing-cases pointed, testaceous, with three little glabrous yellow lines. Inhabiting Brasil. Also a species of scarabæus, found in dung in Brasil. Color deep black: shield of the head emarginate: wing-cases striated.

BRASILIANUS, in ornithology, a species of caprimulgus: color blackish, with small white and yellow spots: varied beneath with black and white. This is the Brazilian goat-sucker of Latham.

BRASILIENSIS, in entomology, a species of cicada, with two horns on the thorax. Inhabiting Brasil. Also a sort of gryllus, inhabiting Europe.

BRASILIENSIS, in zoology, a species of rana, of a yellowish ash-color, with waved red spots: glabrous beneath. Inhabiting Brasil.

BRASLAV, or **BRACLAW**, a town of Russia in Europe, in the government of Wilna, situated on the borders of a large lake in Courland. Previous to 1795 it belonged to the palatinate of Wilna. Seventy-six miles N.N.E. of Wilna, and 296 north-east of Warsaw.

BRASMA, a name given by Dioscorides, and other ancient botanists, to a decayed or light kind of black pepper. This was no peculiar species of pepper, but, as John Bauhine has well observed, it was the same with the pepper we now frequently meet with, which has decayed upon the plant.

BRASS',	} Persian, <i>braj</i> , <i>burinj</i> ; Anglo-Saxon, <i>bræs</i> ; Swed. <i>brent æs</i> ; Goth. <i>bratz</i> ; Fr. <i>brasier</i> ; Sp. <i>brasero</i> ; from Goth. BRASS'PANED, and Swed. <i>brasa</i> , <i>βρα-</i> ζω, to burn. A hard yellow metal, purified BRAS'EN. copper, a worker in brass, assumed countenance, impudence, effrontery.

BRASS'FOUNDER,	
BRASS'PANED,	
BRASS'VISAOED,	

More firme and durable than Steele or *brasse*,
Or the hard diamond, which them both doth passe.
Spenser

All which, not if an hundred tongues to tell,
And hundred mouthes, and voice of *brasse* I had,
And endlesse memorie that mote excell,
In order as they came could I recount them well.
Id.

Enough to press a royal merchant down,
And pluck commiseration of his state
From *brassy* bosoms, and rough hearts of flint.
Shakspeare.

There is a fellow somewhat near the door, he
should be a *brasier* by his face. *Id.*
Men's evil manners live in *brass*, their virtues
Men write in water. *Id.*

Brass is made of copper and calaminaris.
Bacon.

Let others mold the running mass
Of metals, and inform the breathing *brass*.
Dryden.

It is thought they had no chimneys, but were
warmed with coals on *brasiers*. *Arbuthnot.*

Yet he was fierce as a forest boar,
Whose spoils upon his back he wore,
As thick as Ajax' seven-fold shield,
Which o'er his *brazen* arms he held :
But *brass* was feeble to resist
The fury of his armed fist ;
Nor could the hardest iron hold out
Against his blows but they would through't.
Butler's Hudibras.

From his proud ear, the prince impetuous springs ;
On earth he leaps ; his *brazen* armour rings.
Pope's Iliad.

His front with tenfold plates of *brass*,
Secured, shame never yet could pass,
Nor on the surface of his skin
Blush for that guilt which dwells within.
Churchill.

At eve, within yon studious nook
I ope my *brassen*boxed book,
Portrayed with many a holy dead
Of martyrs crowned with heavenly meed.
Warton.

But I do hate him, as I hate the devil,
Or that *brass-eiased* monster barbarism.
Ben Jonson.

———— A foundry was established at Adrianople ; the metal was prepared ; and, at the end of three months, Urban produced a piece of *brass* ordnance of stupendous and almost incredible magnitude ; a measure of twelve palms is assigned to the bore ; and the stone bullet weighed above six hundred pounds.

Gibbon.

BRASS, or, as the French call it, yellow copper, is made of copper and zinc, as well as copper and tin. See CHEMISTRY. The first formation of brass, as we are assured by Scripture, was prior to the flood, and discovered in the seventh generation from Adam. (Gen. iv.) But the use of it was not, as is generally believed, and the Arundelian marbles assert, previous to the knowledge of iron. They were both first known in the same generation, and probably wrought by the same discoverer. The knowledge of them must have been equally carried over the world afterwards, with the spreading of the colonies of the Noachide. An acquaintance with the one of them was absolutely necessary to the colonists, in clearing away the wood, and erecting houses for their habitations. The ancient Britons, though acquainted from the remotest periods with the use of both these metals, remained long ignorant that they were to be obtained in the island. Before this discovery they imported all their iron and brass. And when they had at length detected the former in their own hills, they continued to import the latter. In the earliest ages the weapons of warriors were invariably framed of this factitious metal ; and the Arundelian marbles, for that reason, mistakenly date the first discovery of iron two centuries below the Trojan war. Every military nation is studious of brightness in its arms ; and the Britons, particularly, gloried in that of theirs. For this reason the nations still fabricated their arms of brass, even long after the Arundelian era for the discovery of iron ; and the Britons continued to import it, though they had found iron to be a native of the country, and could have supplied themselves with a sufficient quantity. Mr. Whitaker, in his History of Manchester, supposes, that when the Britons derived their iron and brass from the continent, they purchased the latter at an easier expense than the former. The Gauls had many large brass works in Britain, but seem to have had very few iron forges. And this would naturally induce the Belgæ to be less diligent in their enquiry after the veins of copper and calamine at home, than for the courses of the iron ore ; though the one was equally discoverable in the island as the other, and lay equally within the Belgic regions of it. Brass being thus cheaper than iron, they necessarily formed with it some domestic as well as military implements. Such were common among the Gauls ; and were familiar to the Britons, either imported, as some actually were, or manufactured at home, as others assuredly were. The Britons had certain brass foundries, and minted money, and fabricated weapons of brass. In this condition of the works the Romans entered the Island. And seeing so great a demand among the natives for this article, they would speedily instruct them to discover the materials of it among themselves.

This must unavoidably have resulted from the conquest of the Romans. The power of surprising their new subjects with so unexpected a discovery would naturally stimulate the pride of the Roman intellect ; and the desire of obliging themselves with so cheap a supply of that useful metal, stationary as they were in that kingdom, would also equally actuate their selfishness. The veins of copper and calamine would be easily found out by an experienced enquirer after them ; and the former metal is therefore distinguished among the Welsh only by the Roman appellation of cyprium, koppr, or copper. Many new foundries of brass appear now to have been established. Two have been discovered in the county of Essex, and within a narrow portion of it, at Efield and Danbury. And a third was placed upon Easterly Moor in Yorkshire, twelve miles to the north-west of York, and in the neighbourhood of Isurium or Aldborough.

The brass of the ancients was generally an alloy of copper and tin ; a small portion of the latter gives to copper great hardness, and makes it capable of much greater resistance ; but tin in larger quantities produces an increased brittleness : its elasticity is however now very great, and it is called bell-metal. A still greater proportion of tin forms it into an alloy for the mirrors of telescopes. The alloy of copper with zinc is distinguished by the beautiful color it affords. Pinchbeck has but a small proportion of zinc : common brass has more, and prince's metal, as it is called, a still greater proportion of zinc. Copper mixed with a very large proportion of zinc is used for white metal buttons, &c.

If we take the weight of an atom of copper at 8, tin 7.35, and zinc 4 ; the following Table will exhibit the proportions of the alloys, expressed in atoms, and their proportions by weight, the third column pointing out the color and character of the resulting compound. CZ and T represent the atoms of the metals respectively.

COMPOUNDS OF ZINC WITH COPPER.

Atoms	Proportions by Weight.	Character and Color of the Compounds.
C+Z	1 to 2	The best proportions for common brass.
C+2Z	1 to 1	The alloy called prince's metal, of a beautiful gold color.
C+3Z	2 to 3	Of a paler yellow, very little malleable.
C+4Z	1 to 2	Still of a lighter color, and not malleable.
C+5Z	2 to 5	Yellowish white & brittle.
C+6Z	1 to 3	Very brittle, nearly white.
2C+Z	4 to 1	A very malleable brass used in watch-work.
3C+Z	6 to 1	An alloy much harder than copper and inclining to its color.

COMPOUNDS OF TIN WITH COPPER.

Atoms.	Proportions by Weight.	Character and Color of the Compounds.
T+C	11 to 12	A very brittle and rather white alloy.
2T+C	11 to 6	Still more brittle and more white.
3T+C	11 to 4	Very white, used for speculums.
4T+C	11 to 3	Coarse-grained and too brittle for any purpose.
T+2C	11 to 24	A yellowish alloy, very hard and sonorous.
T+3C	11 to 36	Bell metal.
T+4C	11 to 48	A very hard alloy used for some culinary vessels.
T+5C	11 to 60	Softer but not malleable.
T+6C	11 to 72	Still increases in softness and of a yellower color.
T+7C	11 to 84	Used for some purposes in machinery.
T+8C	11 to 96	An alloy used for cannon.
T+9C	11 to 108	More common for cannon and machinery, and used for bronze statues.

Brass is made nowhere more extensively or better than in England, where the materials are found of the first quality, and in great abundance. The operation is very simple: after the short process of calcination, the native calamine is ground in a mill, and mixed at the same time with about a fourth part of charcoal. The whole is now put into large cylindrical crucibles, with alternate layers of copper, cut in small pieces, or in the form of shot. Powdered charcoal is then thrown over the mixture, when the crucibles are covered and luted up. The furnace has the form of a cone, with the base downwards, and the apex cut off horizontally. The crucibles are placed upon a perforated iron plate, at the bottom, with a sufficient quantity of fuel thrown round them, and a perforated cover, made of bricks or clay, is fitted to the mouth, which serves as a register to regulate the heat. After about ten or fifteen hours, the copper is supposed to be sufficiently penetrated with the zinc, and the heat is increased in order to fuse the whole down into one mass, when the crucibles are removed, and the melted brass poured into moulds, and manufactured in the same way as copper plate. If the materials are good, a single fusion is sufficient to make good malleable brass; but the finest sorts undergo a second operation with fresh calamine and charcoal. Though the process in all places is nearly the same, there are considerable variations in the proportion and choice of the ingredients. In Great Britain, the proportions in weight are about forty parts of copper, and sixty of calamine, with a sufficient quantity of charcoal; in

France, thirty-five of copper, thirty-five of old brass, forty of calamine, and from twenty to twenty-five of charcoal; in Sweden, forty of copper, thirty of old brass, and sixty of calamine. In Saxony, the cadmia, or sublimed oxide of zinc, is used instead of the native calamine; and the proportions are thirty parts of copper, from forty to forty-five of cadmia, with double the quantity of charcoal.

BRASS, OR BRAZEN. See BRAZEN.

BRASS COLOR, a color prepared by the braziers and colormen to imitate brass. There are two sorts of it; the red brass or bronze, and the yellow or gilt brass; the latter is made only of the very smallest and brightest copper filings; with the former they mix some red ochre, finely pulverised; they are both used with varnish. To make a fine brass that will not take any rust or verdigris, it must be dried with a chafing dish of coals as soon as it is applied. The finest brass color is made with powder brass imported from Germany, diluted into a varnish, made and used after the following manner: the varnish is composed of 1 lb. 4 oz. of spirit of wine, 2 oz. of gum lac, and 2 oz. of sandarac; these two last drugs are pulverised separately, and afterwards put to dissolve in spirit of wine, taking care to fill the bottle but half full. The varnish being made, mix the quantity to be used with the pulverised brass, and apply it with a small brush to what is to be colored. But too much must not be mixed at once, because the varnish being very apt to dry, there would not be time to employ it all soon enough; it is therefore better to make the mixture at several times. In this manner figures of plaster are colored, and look as well as if they were of cast brass.

BRASS, CORINTHIAN, famous in antiquity, is a mixture of gold, silver, and copper. L. Mummius having sacked and burnt the city of Corinth, A. A. C. 146, it is said this metal was formed from the immense quantities of gold, silver, and copper, wherewith that city abounded, thus melted and run together by the violence of the conflagration. Very little is known, however, of this metal. Its era of being in use must have been very short, as we are told by Pliny that the art of making it had been utterly lost in his time.

BRASS LEAF is made of copper, beaten out into very thin plates, and afterwards rendered yellow. The German artists, particularly those of Nuremberg and Augsburg, are said to possess the best method of giving to these thin plates of copper a fine golden color, by simply exposing them to the fumes of zinc, without any real mixture of it with the metal. These plates are cut into little pieces, and then beaten out fine like leaves of gold; after which they are put into books of coarse paper, and sold at a low price for the vulgar kinds of gilding. The parings or shreds of these very thin yellow leaves being well ground on a marble plate, are reduced to a powder similar to gold; which serves to cover, by means of gum water or some other glutinous fluid, the surface of various mouldings or pieces of curious workmanship, giving them the appearance of real bronze, and even of fine gold, at a very trifling expense, because the gold color of this metallic powder may be easily raised and

improved by stirring it on a wide earthen basin over a slow fire.

BRASS LUMPS, a common name given by miners to the globular pyrites. See **PYRITES**.

BRASS THRICE CALCINED, in the glass trade, is a preparation which serves the glassmen to give many very beautiful colors to their metal. To prepare it, place thin plates of brass on tiles on the leet of the furnace near the occis; let it stand to be calcined there for four days, and it will become a black powder sticking together in lumps. Powder this, sift it fine, and recalcine it it four or five days more; it will not then stick together, but remain a loose powder, of a russet color. This is to be calcined a third time in the same manner; but great care must be taken in the third calcination, that it be not overdone nor underdone; the way to be certain when it is right is, to try it several times in glass while melting. If it makes it, when well purified, to swell, boil, and rise, it is properly calcined; if not, it requires longer time. This makes, according to the different proportions in which it is used, a sea-green, an emerald green, or a turquoise color. Brass, by long calcination alone, and without any mixture, affords a fine blue or green color for glass; but they have a method of calcining it also with powdered brimstone, so as to make it afford a red, a yellow, or a chalcedony color, according to the quantity and other variations in using it. The method of making the calcination is this: cut thin plates of brass into small pieces with shears, and lay them stratum super stratum, with alternate beds of powdered sulphur, in a crucible; calcine this for twenty-four hours in a strong fire; then powder and sift the whole; and finally expose the powder upon tiles for twelve days to a reverberating furnace; at the end of this time, powder it fine, and keep it for use. The glass-makers have also a method of procuring a red powder from brass, by a more simple calcination, which serves them for many colors. The method is this: they put small and thin plates of brass into the arches of the glass furnaces, and leave them there until they are sufficiently calcined, which the heat in that place, not being enough to melt them, does in great perfection. The calcined matter powdered, is of a dusky red, and requires no farther preparation.

BRASSA, one of the Shetland isles, lying in the sound of that name. Long. $0^{\circ} 10' W.$, lat. $60^{\circ} 10' N.$

BRASSA SOUND, an extensive sound, on the coast of Shetland, in which 1000 vessels might be commodiously moored. It abounds with herrings. The Dutch have sometimes had 2000 busses in it in one summer.

BRASSE, in ichthyology, a species of perca.

BRASSICA, cabbage: a genus of the siliquosa order, and tetradynamia class of plants; ranking under the siliquosae; in the natural method. The calyx is erect and converging; the seeds are globular; the gland between the shorter stamina and the pistillum, and between the longer ones and the calyx. There are twelve principal species, viz. 1. *B. alpina*, with the radical leaves egg-shaped, and erect petals. 2. *B. arvensis*, with scalloped leaves embracing the stem; the highest heart-shaped; and most entire. 3. *B.*

campestris, with a slender root and stem, leaves uniform, heart-shaped, and sessile. 4. *B. Chinensis*, with very entire oval leaves; the floral leaves lanceolated, and embracing the stem; the calyxes longer than the claw of the petals. 5. *B. eruca*, with lyrate leaves, shaggy stem, and smooth capsules. 6. *B. erucastrum*, with runcinate leaves, a hispid stem, and polished capsules. In these two species, and the vesicaria, the style is ensiform: in all the rest it is obtuse. 7. *B. napus*, with the root stem spindle-shaped. 8. *B. oleracea*, with the radical stem growing columnar and fleshy. 9. *B. orientalis*, with heart-shaped smooth leaves, embracing the stem, and four cornered capsules. 10. *B. rapa*, with the radical stem growing orbicular, depressed, and fleshy. 11. *B. vesicaria*, with runcinate leaves, and hispid capsules covered with a tumid calyx. 12. *B. violacea*, with lanceolated, egg-shaped, smooth, undivided, and dentated leaves.

The *campestris* never varies. It grows naturally on the sea-shore, in the south of England, &c. It has a perennial branching stalk, in which it differs from all the other species. In very severe winters, when the other sorts are destroyed, this is a necessary plant, for the most severe frosts do not injure it. The flower-stalks grow from the end of the branches, and spread horizontally; but those arising from the centre of the plants grow erect, and seldom put out branches. The cauliflower has been much more improved in Britain than in any other part of Europe. In France they rarely have cauliflowers till Michaelmas, and Holland is generally supplied with them from Britain. In many parts of Germany there were none of them cultivated till within a few years past, and most parts of Europe are supplied with seeds from Britain. The *Chinensis*, which is generally known by the title of rape or cole seed, is much cultivated in the Isle of Ely, and some other parts of England, for its seed, from which rape oil is drawn; and it has also been cultivated of late years in other places for feeding cattle, to great advantage. The cole-seed, when cultivated for feeding cattle, should be sown about the middle of June. The ground should be prepared as for turnips. The quantity of seeds for an acre is from six to eight pounds, and as the price is not great, so it is better to allow eight pounds; for if the plants are too close in any part, they may be easily thinned in hoeing, which must be performed as for turnips, with this difference only, of leaving these much nearer together; for as they have fibrous roots and slender stalks, so they do not require near so much room. These plants should have a second hoeing about five or six weeks after the first, which, if well performed in dry weather, will entirely destroy the weeds, so they will require no farther culture. Where there is not an immediate want of food, these plants had better be kept as a reserve for hard weather, or spring-feed, when there may be a scarcity of other green food. If the heads are cut off, and the stalks left in the ground, they will shoot again early in the spring, and produce a good second crop in April; which may be either fed off, or permitted to run to seeds, as is the practice where this is cultivated for the seeds; but if

the first is fed down, there should be care taken that the cattle do not destroy their stems, or pull them out of the ground. As this plant is so hardy as not to be destroyed by frost, so it is of great service in hard weather for feeding ewes; for when the ground is so hard frozen that turnips cannot be taken up, these plants may be cut off for a constant supply. This will afford late food after the turnips are run to seed; and if it is afterwards permitted to stand for seed, one acre will produce as much as, at a moderate computation, will sell for £5 clear of all charges. Partridges, pheasants, turkeys, and most other fowls, are very fond of this plant; so that wherever it is cultivated, if there are any birds in the neighbourhood, they will constantly lie among these plants. The seeds are sown in gardens for winter and spring salads, this being one of the small salad herbs.

The common white, red, flat, and long-sided cabbages, are chiefly cultivated for autumn and winter use; the seeds must be sown the beginning or middle of April, in beds of good fresh earth; and when the young plants have about eight leaves, they should be pricked out into shady borders, about three or four inches square, that they may acquire strength, and not grow long-shanked. About the middle of June they must be transplanted, where they are to remain. If they are planted for a full crop in a clear spot of ground, the distance from row to row should be three feet and a half, and in the rows two feet and a half asunder: if the season should prove dry when they are transplanted, they must be watered every other evening until they have taken fresh root. Afterwards, as the plants advance in height, the earth should be drawn about the stems with a hoe, which will keep it moist about their roots, and greatly strengthen the plants. These cabbages will some of them be fit for use soon after Michaelmas, and will continue until the end of February, if they are not destroyed by bad weather: to prevent which the gardeners near London pull up their cabbages in November, and trench their ground up in ridges, laying their cabbages against the ridges as close as possible on one side, burying their stems in the ground: in this manner they let them remain till after Christmas, when they cut them for the market; and although the outer part be decayed (as is often the case in very wet or hard winters), yet if the cabbages were large and hard when laid, the inside will remain sound.

The Russian cabbage was formerly in much greater esteem than at present, it being now only to be found in particular gentlemen's gardens, who cultivate it for their own use. This must be sown late in the spring, and managed as those before directed, only that these must be sooner planted out, and must have an open clear spot of ground, and require much less distance every way, as it is but a very small hard cabbage. This sort will not continue long before they will break and run up to seed. The early and sugar-loaf cabbages are usually sown for summer use, and are what the gardeners about London commonly call Michaelmas cabbages. The season for sowing these is about the end

of July, or beginning of August, in an open spot of ground; and when the plants have got eight leaves, they must be put into beds at about three or four inches distant every way, that they may grow strong and short-shanked; and towards the end of October they should be planted out; the distance that these require is, three feet row from row, and two and a half asunder in the rows. The ground must be kept clean from weeds, and the earth drawn up about the plants. If they are of the early kind, they will turn in their leaves in May; when the gardeners near London, to obtain them a little sooner, tie in their leaves close with a slender osier twig to blanch their middle; by which means they have them at least a fortnight sooner than they could have if they were left untied.

The early cabbage being the first, we should plant the fewer of them, and a greater quantity of the sugar-loaf kind, which comes after them; for the early kind will not supply the kitchen long, generally cabbaging apace, and soon growing hard and bursting open; but the sugar-loaf kind is slow in cabbaging; and being hollow, continues long. It may be planted out in February, and will succeed as well as if planted earlier; with this difference only, that they will be later before they cabbage. Some plants of the early kind should be reserved in a well sheltered spot of ground to supply a defect; for in mild winters many of the plants are apt to run to seed, especially when they are sown too early, and in severe winters they are often destroyed. The Savoy cabbages are propagated for winter use, being generally esteemed the better when pinched by the frost. They must be sown about the end of April, and treated after the manner of the common white cabbage; only they may be planted closer; two feet and a half square will be sufficient. These are always much better in an open situation, clear from trees and hedges; for in those places they are apt to be eaten by caterpillars, &c. especially if the autumn prove dry.

The broccoli may also be treated in the same manner, but need not be planted above one foot asunder in rows of two feet wide; these are never eaten till the frost has rendered them tender, being otherwise tough and bitter. The seeds of the broccoli, of which there are several varieties, viz. the Roman or purple, the Neapolitan or white, and the black broccoli, with some others (but the Roman is preferred to them all), should be sown about the end of May or beginning of June; and when the plants are grown to have eight leaves, transplant them into beds like the common cabbage; and towards the end of July they will be fit to plant out; which should be done into some well-sheltered spot of ground, but not under the drip of trees; about a foot and a half distant, in rows of two feet wide. The soil ought to be rather light than heavy; if they succeed well (as they will unless the winter prove extremely hard), they will begin to show small heads of a purple color, about the end of December, and will continue eatable till mid-April. The brown or black broccoli is by many persons greatly esteemed, though it does not deserve a place where the Roman broccoli can be

obtained, which is much sweeter, and will continue longer in season. But the brown sort is much hardier, so that it will thrive in the coldest situations, where the Roman broccoli is sometimes destroyed. The brown sort should be sown in the middle of May, and managed like the common cabbage, and should be planted about two feet and a half asunder. As they grow very tall, they should have the earth drawn up to their stems as they advance in height. They do not form heads so perfect as the Roman broccoli; the stems and hearts of the plants are the parts which are eaten. The Roman broccoli, if well managed, will have large heads, which appear in the centre of the plants like clusters of buds. These heads should be cut before they run up to seed, with about four or five inches of the stem; the skin of these stems should be stripped off before they are boiled. After the first heads are cut off, there will be a great number of side shoots produced from the stems, which will have small heads to them, but are full as well-flavored as the large. The Naples broccoli has white heads very like those of the cauliflower, and eats so like it as not to be distinguished from it. Besides this first crop of broccoli, which is usually sown in the end of May, it will be proper to sow another crop the beginning of July, which will come in to supply the table the latter end of March, and the beginning of April; and being very young, will be extremely tender and sweet. To preserve good seeds of this kind of broccoli, a few of the largest heads of the first crop should be let remain to run up to seed, and all the under shoots should be constantly stripped off, leaving only the main stem to flower and seed. If this be duly observed, and no other sort of cabbage permitted to seed near them, the seeds will be as good as those procured from abroad, and the sort may be preserved in perfection many years.

The curled colewort, or Siberian broccoli, is now generally esteemed, being extremely hardy, and always sweeter in severe winters than in mild seasons. This may be propagated by sowing the seeds in the beginning of July; and when the plants are strong enough they should be planted in rows about a foot and a half asunder, and ten inches distance in the rows. These will be fit for use after Christmas, and continue good until April. The musk cabbage may be propagated in the same manner as the common cabbage, and should be allowed the same distance: it will be fit for use in October, November, and December; but if the winter proves hard, they will be destroyed much sooner than the common sort. The common colewort, or Dorsetshire kale, is now almost lost near London, where their markets are usually supplied with cabbage plants instead of them. The best method to cultivate this plant in the fields is, to sow the seeds about the beginning of July, choosing a moist season, which will bring up the plants in about ten days or a fortnight; the quantity of seed for an acre of land is 9lbs; when the plants have five or six leaves they should be hoed, as for turnips, cutting down all the weeds, and also thinning the plants where they are too thick: but they should be kept thicker than turnips, because they are

more in danger of being destroyed by the fly: this work should be performed in dry weather, that the weeds may be killed. About six weeks after, the plants should have a second hoeing, which, if carefully performed in dry weather, will entirely destroy the weeds, and make the ground clean, so that they will require no farther culture. In spring they may be either drawn up and carried out to feed the cattle, or the cattle may be turned in to feed upon them: but the former method is to be preferred, because there will be little waste; whereas when the cattle are turned in amongst the plants, they will tread down and destroy more than they eat, especially if they are not fenced off by hurdles. The two last sorts are varieties fit only for a botanic garden, being of no use. They are annual plants, and perish when they have perfected their seeds. The best method to save the seeds of all the sorts of cabbages is, about the end of November, to pull up some of the best cabbages, and carry them to some shed, where they should be hung up three days by their stalks, that the water may drain from between their leaves. Then plant them in some border near a hedge or pale, quite down to the middle of the cabbage, leaving only the upper part of the cabbage above ground, observing to raise the earth above it, so that it may stand a little above the level of the ground: especially if the ground is wet, they will require to be raised pretty much above the surface. If the winter should prove very hard, lay a little straw lightly upon them, to secure them from the frost, taking it off as often as the weather proves mild, lest by keeping them too close they should rot. In spring they will shoot out strongly and divide into a great number of small branches. Therefore support their stems, to prevent their being broken off by the wind: and if the weather should be very hot and dry when they are in flower, refresh them with water once a-week all over the branches, which will greatly promote their seeding, and preserve them from mildew. When the pods begin to turn brown, cut off the extreme part of every shoot with the pods, which will strengthen the seeds; for these seeds which grow near the top of the shoots, are very subject to run to seed before they cabbage. When the seeds begin to ripen, be particularly careful that the birds do not destroy it. The best method to prevent this, is to get a quantity of birdlime, and daub over a parcel of slender twigs, which should be fastened at each end to stronger sticks, and placed near the upper part of the seed in different places, so that the birds may alight upon them, and be fastened thereto; where they should be allowed to remain, to terrify the rest. When the seed is fully ripe, cut it off; and after drying, thresh it out, and preserve it in bags for use. In planting cabbages for seed, never plant more than one sort in a place, or near one another: for example, never plant red and white cabbages near each other, nor Savoy with white or red cabbages; for they will, by the commixture of their farina, produce a mixture of kinds. See BOTANY. It is owing to this neglect, that the gardeners rarely save any good red cabbage seed in Britain, but are obliged to procure fresh seeds from abroad; whereas if they would plant red

cabbages by themselves for seed, and not suffer any other to be near them, they might continue the kind as good in Britain as in any other part of the world.

BRASSICÆ, in entomology, a species of chrysomela, found on the cabbage in Germany. Color deep black, wing-cases pale and testaceous, with a black band and margin of the same color. Also a species of staphylinus, a native of Europe. Color ferruginous, head and body black, wing-cases punctated, antennæ hairy. Also a species of phalæna and aphidæ, the pediculus of Frisch.

BRASSICARIA, a species of phalæna noctua, inhabiting South America, the wings of which are indented and marked with a gold spot, posterior pair white. Also a species of the musca genus, the musca cylindrica of Degeer.

BRASSICAVIT, **BRASSICOURT**, or **BRACHICAVIT**, in the menage, is a horse whose fore legs are naturally bended arch-wise: so called by way of distinction from an arched horse whose legs are bowed by hard labor.

BRASSOS, a river of Mexico, which, rising in the province of Cohahuila, in 34° N. lat. and 105° W. long., enters the province of Texas, and discharges itself into the gulf of Mexico, in 28° 40' N. lat. after a course of 700 miles. Where the road crosses it, it is 300 yards wide, and navigable for large keels. It rises and falls 100 feet. Like those of most of the rivers of Mexico, its waters are red; its banks are well timbered, and the soil around is rich.

BRAST. Ang.-Sax. burstan; particip. adj. (from burst). To burst, to break out; burst, broken.

A col fox, full of sleigh iniquitee,
That in the grove had wonned yeres three,
By high imagination forecast,—
The same night, thorought the hegges *brast*
Into the yerd ther Chaunteclere the faire
Was wont, and eke his wives, to reaire.

Chaucer's Canterbury Tales.

She loveth Arcite so,
That when that he was absent any throwe,
Anone hire thought hire herte *brast* a two.

Chaucer's Annelida and False Arcite.

There creature never past,
That back returned without heavenly grace,
But dreadful furies which their chains have *brast*,
And damned sprights sent forth to make ill men
agast.

Spenser.

Foiled, bleeding, breathless, furious to the last,
Full in the centre stands the bull at bay,
Mid wounds, and clinging darts, and lances *brast*,
And foes disabled in the brutal fray.

Byron's Child of Harolde.

BRAT, *n. s.* its etymology is uncertain; **bratt**, in Saxon, signifies a blanket; Goth. *berat*, or *brat*, one signifies a child, the other a rag or fragment. The Metropolitan says, 'it is the past participle of the Ang.-Sax. bred-an; anything nourished, cherished, fostered; warmed as in a blanket: hence its application to very young children. A brat is a term of contempt also for a child. The Saxon bratt corresponds with our words shift and sham. It signifies also a covering. Brat, in Welch, is a clout, or rag.

——— For ne had they but a shete

Which that they may wrappen hem in a-night,
And a *bratt* to walken in by day-light,—

They wold hem sell, and spend it on this craft,
They cannot stinten, till no thing be laft.

Chaucer's Canterbury Tales.

He leads them like a thing
Made by some other deity than nature,
That shapes man better; and they follow him,
Against us *brats*, with no less confidence,
Than boys pursuing summer butterflies.

Shakspeare.

This *brat* is none of mine:
Hence with it, and, together with the dam,
Commit them to the fire.

Id.

The friends, that got the *brats* were poisoned too;
In this sad case what could our vermin do?

Roscommon.

Jupiter summoned all the birds and beasts before
him, with their *brats* and little ones, to see which of
them had the prettiest children.

L'Estrange.

The two late conspiracies were the *brats* and offspring of two contrary factions.

South.

I shall live to see the invisible lady, to whom I
was obliged, and whom I never beheld since she was
a *brat* in hanging sleeves.

Swift.

I give command to kill or save,
Can grant ten thousand pounds a year,
And make a beggar's *brat* a peer.

Id.

BRATHYS, in botany, a genus of plants, class polyandria, order monogynia. Gen. char. cal. perianth five-leaved: cor. petals five: STAM. filaments many; anthers twin: PIST. styles five; stigmas capitate: PER. capsule ovate: SEEDS very many. There are several species, all of which are thick shrubs.

BRATHWAYTE (Richard), an English poet, was born in 1588, at Warcop near Appleby. He became, at sixteen, a commoner of Oriel College, Oxford, whence he removed to Cambridge. He was afterwards deputy-lieutenant for Westmoreland, captain of a company, and justice of the peace. He died at Appleton in Yorkshire, in 1673. His works are, The Golden Fleece, with other Poems, 8vo; Essays on the Five Senses, 8vo; The Poet's Willow, or the Pasionate Shepherd, 8vo; Nature's Embassy, or the Wild Man's Measures, 8vo; The Prodigal's Tears, 8vo; Time's Curtain Drawn, divers Poems, 8vo; The English Gentleman, 4to; The English Gentlewoman, 4to; The Arcadian Princess, 8vo; Discourse of Detraction, 12mo; Itinerarium Barnabii, or Drunken Barnaby's Journey; Time's Treasury, 4to; Poem to Charles II. on his Restoration, 4to; Regicidium, a tragedy, 8vo; Survey of History, or a Nursery for Gentry, 4to; A Certain Lecture, 12mo; Spiritual Spicery, or Tracts of Devotion, &c. &c.

BRATTLEBOROUGH, a post town of the United States, in Windham county, Vermont, agreeably situated on the south-west side of West river; about five miles above its confluence with the Connecticut. It is thirty-seven miles east of Bennington, and 312 from Philadelphia.

BRAVE, *v., n. & adj.* } Goth. *brage*; excellent; Isl. *brage*,
BRAVING, *n.* } a hero; Goth. *brahe*;
BRAVELY, } Swed. *braf*; Belgic
BRAVENESS, } *braaf*; Dan. and
BRAVERY, } Teut. *brav*; French
BRAVA'DO, } *brave*; It. Sp. Port.
BRAVO.

bravo; Arm. *brao*; Irish, *bra*; Scot. *brave*. Gal-

lant, courageous, excellent, fine, adorned, and courageous in the same sense that *probus* produces prowess. Bravado, Ital. *bravado*; *bravazzo*, a pretender to bravery; affected courage. Brave, bravery, and bravado, are used indiscriminately and in many instances to express ostentatious bragging; a bragging, boastful, ostentatious display of finery, of dress, of pride, of power, of courage, of daring. A brave, and to brave, are still so used; while brave the adjective, and bravery the noun, are employed to express simply courage.—*Ency. Met.*

What brave exploit, what peril hardly wrought,
What puissant conquest, what adventurous pain,
May please her best, and grace unto him gaine.

Spenser.

Streight forth issued a knight all armed to prooffe,
And bravely mounted to his most mishap:
Who staying nought to question from aloofe,
Man fierce at me, that fire glaunst from his horse's
hoofe.

Id.

Where all the *bravery* that eye may see,
And all the happiness that heart desire,
Is to be found.

Id.

Sweet rose! whose hue angry and brave
Bids the rash gazer wipe his eye;
Thy root is ever in its grave,

And thou must die.

Herbert.

Let not old age disgrace my high desire,
O heavenly soul in human shape contained!

Old wood inflamed doth yield the bravest fire,
When younger doth in smoke his virtue spend.

Sidney.

Never could man, with more unmanlike *bravery*,
use his tongue to her disgrace, which lately had sung
sonnets of her praises.

Id.

Rings put upon his fingers,
And brave attendants near him, when he wakes;
Would not the beggar then forget himself?

Shakespeare.

He upbraids Iago, that he made him
Brave me upon the watch.

Id.

My nobles leave me, and my state is *braved*,
Even at my gates, with ranks of foreign powers.

Shakespeare.

What dost thou gape and wonder at? Admire him
for his *brave* apparel, horses, dogs, fine houses, man-
nors, orchards, gardens, walks! Why? a fool may
be possessed of this as well as he; and he that ac-
counts him a better man, a nobleman for having of it,
is a fool himself.

Burton's Anat. Mill.

For a *bravery* upon this occasion of power, they
crowned their new king in the cathedral church of
Dublin.

Bacon.

An Egyptian soothsayer made Antonius believe,
that his genius, which otherways was *brave* and con-
fident, was, in the presence of Octavius Cæsar, poor
and cowardly.

Id.

Let princes choose ministers more sensible of duty
than of rising, and such as love business rather upon
conscience than upon *bravery*.

Id.

If there be iron ore, and mills, iron is a *brave*
commodity where wood aboundeth.

Id.

There are those that make it a point of *bravery* to
bid defiance to the oracles of divine revelation.

L'Estrange.

But who is this, what thing of sea or land?

Female of sex it seems,

That so bedecked, ornate and gay.

VOL. IV.

Comes this way sailing

Like a stately ship

Of Tarsus bound for the isles

Of Javan or Gadire,

With all her *bravery* on, and tackle trim,

Sails filled and streamers weaving,

Courted by all the winds that hold her play.

Milton's Samson's Agonistes.

———— With all his force,

He *bravely* charged, and for a while

Forced their whole body to recoil.

Butler's Hudibras.

No fire, nor foe, nor fate, nor night,

The Trojan hero did affright,

Who *bravely* twice renewed the fight. *Denham.*

The ills of love, not those of fate, I fear;

These I can *brave*, but those I cannot bear.

Id.

Like a rock unmoved, a rock that *braves*

The raging tempest, and the rising waves. *Id.*

Ye Greeks! be men! the charge of battle bear;

Your *brave* associates, and yourselves revere!

Let glorious acts more glorious acts inspire,

And catch from breast to breast the noble fire!

On valour's side the odds of combat lie,

The *brave* live glorious, or lamented die;

The wretch who trembles in the field of fame,

Meets death, and worse than death—eternal shame!

Pope's Iliad.

The *brave* do never shun the light,

Just are their thoughts, and open are their tempers;

Freely without disguise they love or hate.

Rouse's Fair Penitent.

For boldness, like the *bravoes* and banditti, is sel-
dom employed, but upon desperate services.

Government of the Tongue.

No *bravoes* here profess the bloody trade,

Nor is the church the murderer's refuge made.

Gay.

Cowards are cruel, but the *brave*

Love mercy, and delight to save.

Id.

Spain, to make good the *bravado*.

Names it the invincible Armado. *Anonymous.*

It denotes no great *bravery* of mind, to do that out
of a desire of fame, which we could not be prompted
to by a generous passion for the glory of him that
made us.

Spectator.

Juba, to all the *bravery* of a hero,

Adds softest love, and more than female sweetness.

Addison.

Unmoved he hears the general call,

And *bravely* tramples on them all.

Churchill's Duellist.

By nature cautious as he's *brave*.

To honour only he's a slave. *Id.*

The *brave* unfortunate are our best acquaintance,

They show us virtues may be much distressed,

And give us their example how to suffer.

Francis's Eugenia.

BRAULS, in commerce, Indian cloths with
blue and white stripes. They are otherwise
called turbants, because they serve to cover those
ornaments of the head, particularly on the coast
of Africa.

BRAUNA, BRAUNAU, BRAUNAU, or BRA-
NAT, a town of Germany, in Bavaria, seated on
the river Inn. It has a strong fortress; notwith-
standing which, it was taken by the Austrians in
1743.

BRAVO, one of the Cape de Verd islands,
on the coast of Africa, settled by Portuguese,
remarkable for its excellent wines. The land is

2 K

very high, and consists of mountains which look like pyramids. It abounds in Indian corn, gourds, water melons, potatoes, horses, and hogs. There is also plenty of fish on the coast, and the island produces salt-petre.

BRAURON, a town of Attica, where Diana had a temple. The goddess had three festivals called Brauronia, celebrated once every fifth year by ten men, who were called *ιεροποιοι*. They sacrificed a goat to the goddess, and it was usual to sing one of the books of Homer's Iliad. The most remarkable that attended were young virgins in yellow gowns, consecrated to Diana. They were about ten years of age, and not under five, and therefore their consecration was called *δεκατηναι*, from *δεκα*, *decem*; and sometimes *αρκεναι*, as the virgins themselves bore the name of *αρκοι*, *bears*, from this circumstance. There was a bear in one of the villages of Attica, so tame, that he ate with the inhabitants, and played harmlessly with them. This familiarity lasted long, till a young virgin treated the animal too roughly, and was killed by it. The virgin's brother killed the bear, and the country was soon after visited by a pestilence. The oracle was consulted, and the plague removed by consecrating virgins to the service of Diana. This was so faithfully observed, that no woman in Athens was ever married before a previous consecration to the goddess. The statue of Diana of Taurus, which had been brought into Greece by Iphigenia, was preserved in the town of Brauron. Xerxes carried it away when he invaded Greece.

BRAWL', *v. & n.* } Fr. *braillier*; Belgic,
BRAWLER, } *brallén*; to roar. It is
BRAWLING. } contracted, says the Metropolitana, from *brabble*. To riot, to bully, to affect bravery, to wrangle, to rail, in a loud and noisy manner.

He findeth that controversies thereby are made but *brauls*; and therefore wisheth, that, in some lawful assembly of churches, all these strifes may be decided.

Hooker.

Never since that middle summer's spring
Met we on hill, in dale, forest, or mead,
But with thy *brauls* thou hast disturbed our sport.

Shakspeare.

As he lay along
Under an oak, whose antique root peeps out
Upon the brook that *brauls* along this wood.

Id.

His divisions, as the times do *brawl*,
Are in three heads; one power against the French,
And one against Glendower.

Id.

She troubled was, alas! that it might be,
With tedious *brawlings* of her parents dear.

Sidney.

Here comes a man of comfort, whose advice
Hath often stilled my *brauling* discontent.

Shakspeare.

How now! Sir John! what, are you *brauling* here?
Does this become you, peace, your time, your business?

Id. Henry IV.

Their battering cannon charged to the mouths,
Till their soul-fearing clamours have *brauled* down
The flinty ribs of this contemptuous city.

Id.

That bonum is an animal,
Made good with stout polemic *brawl*.

Hudibras.

In council she gives licence to her tongue,
Loquacious, *brauling*, ever in the wrong. Dryden.
Leave all noisy contests, all immodest clamours,
brauling language, and especially all personal scandal and scurrility, to the meanest part of the vulgar world. Watts.

BRAWL'. Fr. *branle*; Span. *brando*; It. *brando*, *branla*; Scot. *brangel*, from Lat. *vibrando*. A kind of dance.

And thence did Venus learn to lead

The Idalian *braules*, and so to tread

As if the wind, not she, did walke;

Nor prest a flower, nor bowed a stalke.

Ben Jonson. The Vision of Delight.
Master, will you win your love with a French *brawl*.
Old Play.

Tis a French *brawl*, an apish imitation,

Of what you really perform in battle.

Massing. Picture.

My grave iord-keeper led the *brauls*

The seal and maces danced before him.

Gray. A long Story.

BRAWN', } Latin, *aprugna*; Teut.
BRAWN'ED, } *eburn*; see BOAR. *βορύνω*;
BRAWN'ER, } Lat. *brachium*. Boars' flesh.
BRAWN'INESS, } Muscular, nervous, fleshy,
BRAWN'Y, } strong.
BRAWN'FALLEN.

The best age for the boar is from two to five years, at which time it is best to geld him, or sell him for *brauen*. Mortimer.

His limmes gret, his *braunes* hard and stronge,
His shoulders broad, his armes round and longe.

Chaucer.

I'll hide my silver beard in a gold beaver,

And in my vantbrace put this withered *brauen*.

Shakspeare.

I had purpose]

Once more to hew thy target from thy *brauen*. Id.
Her wonted joys thenceforth and court she shuns,
And still within her mind the footman runs,
His brazen calves, his *brauny* thighs (the face
She slights), his feet shaped for a smoother race.

Marvell.

The *brauny* fool, who did his figure boast,
In that presuming confidence was lost. Dryden.

The native energy

Turns all into the substance of the tree,
Starves and destroys the fruit, is only made
For *brauny* bulk, and for a barren shade. Id.

But most their looks on the black monarch bend,
His rising muscles and his *brauen* commend;
His double biting ax, and beamy spear,
Each asking a gigantic force to rear.

Id.

The boisterous hands are then of use, when I
With this directing head, those hands apply;
Brawn without brain is thine. Id.

At Christmas time be careful of your fame,
See the old tenants' table be the same;
Then if you would send up the *brauner* head,
Sweet rosemary and bays around it spread.

King.

This *brawnness*, and insensibility of mind, is the
best armour against the common evils and accidents
of life. Locke.

So learned Taliacotius from

The *brauny* part of porter's bum

Cut supplemental noses, which

Would last as long as parent breech. Butler.

BRAWN is applied to the flesh of a boar when souced or pickled; for which end the boar should be old; because the older he is, the more horny will the brawn be. The method of preparing brawn is as follows: the boar being killed,

it is the fitches only, without the legs, that are made brawn; the bones of which are to be taken out, and then the flesh sprinkled with salt, and laid in a tray, that the blood may drain off: then it is to be salted a little, and rolled up as hard as possible. The length of the collar of brawn should be as much as one side of the boar will bear, so that when rolled up it will be nine or ten inches diameter. The collar thus rolled up, is boiled in a copper, or large kettle, till it is so tender, that a straw can be run through it; then it is set aside, till it is thoroughly cold, and put into the following pickle: to every gallon of water, put a handful or two of salt, and as much wheat-bran: boil them together, then drain the bran as clear as you can from the liquor; and when the liquor is quite cold, put the brawn into it.

BRAXY, or **BRACKS**, a disease incident to sheep, supposed to arise from excess of blood. It attacks them in autumn, and the most lusty and vigorous of the flock fall a prey to it. It kills in two hours from the time it is first observed. It is computed that one-fourth die of it. Dr. Anderson's prescription, tobacco oil, has been applied with success as a remedy; and bleeding in summer has been found an effectual preventive.

BRAY', *s.* From Fr. *braye*, in fortification also *bas enceinte*.

BRAY', *v. a.* Fr. *broyer*; Arm. *brew*; W. *briuw*. See To **BREAK**. To beat in a mortar, to pound, to grind.

I'll burst him; I will *bray*

His bones as in a mortar. *Chapman.*

Except you would *bray* *Christendom* in a mortar, and mould it into a new paste, there is no possibility of a holy war. *Bacon.*

BRAY', *v. & n.* } Goth. *braca*, Swed. *brä-*
BRAY'ER, } *ga*, correspond with *βραχω*;
BRAY'ING. } but Span. *borricarc*, French
braire, are from *borrico*, a jack ass; to roar, to cry like an ass: applied to any sudden or violent action or motion, to an uproar; thus to any noise or clamour.

And Christe's people proudly curse
With brode boke and *braying* bell,
And put pennies in their purse,
Thei wol sell bothe heaven and nei.

Chaucer's Canterbury Tales.

Then doe the salvage beasts begin to play
Their pleasant friskes, and loath their wonted food.
The Lyons rore, the tygers loudly *bray*;
The raging buls re-bellow through the woods.

Spenser.

The whiles a most delicious harmony,
In full strange notes, was sweetly heard to sound,
That the rare sweetness of the melody
The feeble senses wholly did confound,
And the fraile soule in depe delight nigh drowned;
And when they ceast, shrill trumpets loud did *bray*,
That their report did far away rebound;
And when they ceast, it gan againe to play;
The whiles the maskers marched forth in trim array.

Id.

Boisterous untuned drums,
And harsh resounding trumpets dreadful *bray*.

Shakspeare.

What, shall our feasts be kept with slaughtered men?

Shall *braying* trumpets, and loud churlish drums,
Clamours of hell, be measures to our pomp? *Id.*

Arms on armour clashing, *brayed*
Horrible discord.

Milton.

Laugh, and they

Return it louder than an ass can *bray*. *Dryden.*
'Egad if he should hear the lion roar, he'd cudgel him into an ass, and to his primitive *braying*.

Congreve.

Hold! cried the queen; a cat-call each shall win;
Equal your merits, equal is your din!
But that this well-disputed game may end,
Sound forth, my *brayers*! and the welkin rend.

Pope.

But at each word what shouts of praise!

Good gods! how natural he *brays*. *Gay's Fables.*

BRAY', Welch *bre*; Gael. *brigh*; from the Celtic *briga*, a mountain or high place, probably, says Todd, from broco, the upper part of a hill being in some places, called broo and brae. Ground raised as a fortification; a bank of earth. Order was given that bulwarks, *brays*, and walls, should be raised in his castles, and strong holds on the sea side.

Lord Herbert.

But when to climb the other hill they gan,

Old Aladine came fiercely to their aid;

On that steep *bray* Lord Guelpho would not then

Hazard his folk, but there his soldiers staid.

Fairf; Tasso.

BRAY, a port town of Ireland, in the county of Wicklow, and province of Leinster, seated on St. George's channel, ten miles south of Dublin, and thirteen north of Wicklow.

BRAY, a town in Berkshire, on the Thames, a mile from Maidenhead; famous in song for its changeable vicar, who, having been twice a papist and twice a protestant, in the reigns of Henry VIII. Edward VI. Mary, and Elizabeth, was accused of being a turn-coat; but replied that he always stuck fast to his principle, which was, to live and die vicar of Bray. 'He had seen,' says the quaint Fuller, 'some martyrs burned, two miles off, at Windsor, and found the fire too hot for his tender temper.'

BRAY (Sir Reginald), a celebrated architect and politician, was the second son of Sir Richard Bray, one of the privy council to king Henry VI. Sir Reginald was instrumental in the advancement of king Henry VII. to the throne of England; and was greatly in favor with him. His skill in architecture appears from Henry VII's chapel at Westminster, and the chapel of St. George at Windsor, as he had a principal concern in building the former, and finishing the latter, to which he was also a liberal benefactor. In the middle of the south aisle is a spacious chapel built by him, and still called by his name. He died in 1501; and was interred in this chapel, probably under the stone where Dr. Waterland lies; for on opening the vault of that gentleman, who died in 1740, a leaden coffin of ancient form was found, which, by other appearances, was judged to be that of Sir Reginald, and was, by order of the dean, immediately arched over.

BRAY (Thomas), D. D., a learned divine, was born at Marton, in Shropshire, in 1656, and educated at Oxford. He was vicar of Over-Whitacre in Warwickshire; and in 1690 rector of Sheldon, where he composed his Catechetical Lectures; which procured him such reputation, that Dr. Compton, bishop of London, pitched

upon him as a proper person to model the infant church of Maryland; and for that purpose he was invested with the office of commissary. He now engaged in several noble undertakings. He procured sums to be raised for purchasing small libraries for the use of the poor ministers in several parts of the plantations; and to promote this design published Bibliotheca Parochialis, or a scheme of such theological and other heads as seem requisite to be perused by the clergy, &c. and Apostolical Charity, its Nature and Excellency considered. He endeavoured to get a fund established for the propagation of the gospel, especially among the Indians; and by his means a patent was obtained for erecting the corporation called The Society for Propagating the Gospel. He also wrote, 1. Martyrology, or Papal Usurpation, in 1 vol. fol.; 2. Directorium Missionarium; and other works. He died in 1730.

BRA'ZE,	} See BRASS. To burn, to give a burnt or brown color. To braze is to work in brass; to solder with brass. Brazen is poetically applied to sounds issuing from brazen instruments. Metaphorically, to whatever is hardened, obdurate, shameless, bullying and impudent.
BRA'ZEN, <i>adj.</i>	
BRA'ZEN BROWED,	
BRA'ZENFACE,	
BRA'ZENFACED,	
BRA'ZENLY,	
BRA'ZENNESS,	
BRAZEN-VAULTED.	

Trumpeters,
With *brazen* din blast you the city's ear,
Make mingle with your rattling tambourines.

Shakspeare.

If damned custom hath not *brazed* it so,
That it is proof and bulwark against sense. *Id.*

You do, if you suspect me in any dishonesty—
Well said, *brazenface*; hold it out. *Id.*

What a *brazenfaced* varlet art thou, to deny thou knowest me? Is it two days ago, since I tript up thy heels, and beat thee before the king. *Id. King Lear.*

I have so often blushed to acknowledge him, that now I'm *brazed* to it. *Id.*

—; nor unknown
The serpent, subtlest beast of all the field;
Of huge extent sometimes, with *brazen* eyes
And hairy mane terrific, though to thee
Not noxious, but obedient to thy call. *Milton.*

Quick-witted, *brazenfaced*, with fluent tongues,
Patient of labours, and dissembling wrongs. *Dryden.*

A bough his *brazen* helmet did sustain;
His heavier arms lay scattered on the plain. *Id.*

If the nut be not to be cast in brass, but only hail a worm *brazed* into it, this niceness is not so absolutely necessary, because that worm is first turned up, and bowed into the grooves of the spindle; and you may try that before it is *brazed* in the nut. *Moron.*

When I reprimanded him for his tricks, he would talk saucily, lie, and *brazen* it out, as if he had done nothing amiss. *Arbutnot.*

Pert Infidelity is Wit's cockade,
To grace the *brazen* brow that braves the skies,
By loss of being dreadfully secure.
Young's Infidel Reclaimed.

Much yet remains unsung. The rage intense
Of *brazen-vaulted* skies, of iron fields,
Where drought and famine starve the blasted year.
Thomson.

Would honest Tom G— get rid of a scold,
The torture, the plague of his life!

Pray tell him to take Down his lion of gold,
And hang up his *brazenfaced* wife.

Cunningham, to the Landlord of the Golden Lion.

BRAZEN DISH, among miners, is the standard by which the other dishes are gauged, and is kept in the king's hall.

BRAZEN SEA, in Jewish antiquity, one of the sacred utensils in the temple of Solomon. See JERUSALEM, TEMPLE OF.

BRAZIER, an artificer who makes and deals in all kinds of brass ware. This trade, as exercised in Britain, may be reckoned a branch of the smithery, though the braziers seldom keep forges, except for brazing or soldering, and tinning the insides of their vessels, which they work up out of copper and brass prepared rough to their hands. Many carry on the sale trade to a great extent, dealing in all sorts of iron and steel, as well as in copper and brass goods. They have also dealt much in what is called French plate, a sort of white metal, silvered and polished to such a degree that it is not easily distinguished from real silver.

BRAZIL. See BRASIL.

BRAZIL, an American wood commonly supposed to have been thus denominated, because first brought from Brasil: though Huet shows it had been known by that name many years before the discovery of that country: and the best sort comes from Fernambuc. It is used by turners, and takes a polish; but chiefly in dyeing, though it gives but a spurious red.—*Chambers.*

He loketh as a sparrowhawk with his eyen,
Him nedeth not his color for to dien
With *brazil*, ne with grain of Portugall.

Chaucer's Canterbury Tales.

BRAZING, the soldering two pieces of iron together by melting thin plates of brass between the pieces that are to be joined. If the work be very fine, as when two leaves of a broken saw are to be brazed together, they cover it with pulverised borax, melted with water, that it may incorporate with the brass powder, which is added to it: the piece is then exposed to the fire without touching the coals, and heated till the brass runs.

BRAZING is also the joining two pieces of iron together by beating them hot, the one upon the other, which is used for large pieces by farriers, &c.

BRAZZA, a large island of the Adriatic, belonging to Austria, opposite to the town of Spalatro in Dalmatia. It is about thirty miles long, and from six to nine broad, containing twenty small towns and villages, with 15,000 inhabitants. Large rocky tracts occupy the more elevated parts, and great labor and expense are necessary to bring any part of the ground into tillage; yet the inhabitants are constantly increasing their cultivated land, and their vintage, and diminishing the woods. The wine is accounted the best in Dalmatia; other vegetable productions are figs, oil, saffron, and almonds. Their corn is principally imported. Brazza has long been famous for its kids and lambs, which acquire a superior delicacy of taste; but the island is subject to drought, and fresh water is

generally scarce. The cheese of Brazza is in great repute. Bees and silk are also cultivated with success; and from the berries of the lentisk the poor peasants make a coarse oil. It belonged formerly to the republic of Venice, but was ceded by the peace of Campo Formio to Austria.

BREACH. Goth. *brican*; Ang.-Sax. *brecan*, *brecan*, to break. See *To BREAK*. Fr. *breche*. A gap; a rupture; a fracas; violation of contract, engagement, duty; dissention, separation, infringement, infraction, injury.

But the heedful boatman strongly forth did stretch
His brawny arms, and all his body strain;

That the utmost sandy *breach* they shortly fetch,
While the dread danger does behind remain.

Spenser.

That oath would sure contain them greatly, or the
breach of it bring them to shorter vengeance. *Id.*

This tempest

Dashing the garment of this peace, aboded
The sudden *breach* on't. *Shakspeare.*

O you kind gods!

Cure this great *breach* in his abused nature. *Id.*
What are those *breaches* of the law of nature and
nations, which do forfeit all right in a nation to go-
vern? *Bacon.*

Some to the *breach* against their foes
Their wooden saints in vain oppose. *Marvell.*

He was the first that e'er did teach
To make, and how to stop a *breach*, *Butler.*

Breach of duty towards our neighbours, still in-
volves in it a *breach* of duty towards God. *South.*

The laws of the gospel are the only standing rules
of morality; and the penalties affixed by God to the
breach of those laws, the only guards that can effec-
tually restrain men within the true bounds of decency
and virtue. *Rogers.*

It would have been long before the jealousies and
breaches between the armies would have been com-
posed. *Clarendon.*

This *breach* upon kingly power was without preced-
ent. *Id.*

Till mad with rage upon the *breach* he fired,
Slew friends and foes, and in the smoke retired.

Dryden.

The wall was blown up in two places; by which
breach the Turks seeking to have entered, made
bloody fight. *Knolles.*

But they were strictly enjoined not to commit the
first hostilities, which might be understood as a *breach*
of a treaty; and such was the implicit obedience of the
Roman general, that they retreated, with exemplary
patience, under a shower of Persian arrows, till they
had clearly acquired a just title to an honourable and
legitimate victory. *Gibbon.*

BREACH, in fortification, is made by the canon
or mines of the besiegers, in order to make
an attack upon the place. To make the attack
more difficult, the besieged sow the *breach* with
crow-feet, or stop it with chevaux de frize. A
practicable *breach* is that where the men may
mount and make a lodgment, and ought to be
fifteen or twenty fathoms wide. The besiegers
make their way to it by covering themselves with
gabions, earth-bags, &c.

BREAD, } Islandic *braud*; Swed.
BREADEN, } *brod*; Ang.-Sax. *brood*,
BREAD-CHIPPER, } *brod*; Dan. *brød*; Teut.
BREAD-CORN. } *brod*, *brot*; Belg. *brood*;
Heb. *barout*; *βρωτος*; Heb. Syr. Sansc. Pers.

bar; Teut. *berc*; Arm. *bara*; Welch *bara*; Irish
bar; appear to have the same origin with our
bear, to bring forth, and signify, like the Latin
fruges, edible produce. Thus also Lat. *far*, is
from *fero*; Sax. *pic brod*, pigs' bread, was an
acorn; and Teut. *souzbread*, denotes, as with us,
the root of the cyclamen. Goth. *baigga*, was a
modification of the verb to bear; and *brac*,
barac, is said to have been anciently the ge-
neral name among Europeans for corn. Tooke,
however, sets aside all this learned labor and
conjecture. Bread, he affirms, is brayed grain;
bread being the past participle of *bray*, Fr.
braier, to pound or beat to pieces. Mr. Todd
remarks, 'It is full as probable, I think, that the
Saxon *brood*, whence our bread, is from the
verb *bredan*, to nourish. Who is right! It is
sometimes easier to tell what a thing is, than
whence it is.' By bread we are to understand
food in general, victuals; but particularly now
what is made of brayed or ground corn.

Them that are sick we commande and exorte by
our Lord Jesu Christ, that they worke with quietness,
and eate their oune bread. *Bible, 1551.*

Men loven of propre kind newefangelnesse,
As briddes don, that men in cages breed,
For though thou night and day take of him hede,
And strew his cage faire and soft as silke,
And give hem suger, honey, *brod* and milke,
Yet, right anon as that is done is up,
He with his feet wol spurnen down his cup,
And to the wood he wol, and wormes ete,
So newefangel ben they of hire mete.

Chaucer's Canterbury Tales.

Ne doth she give them other thing to eat
But bread and water, or like feeble thing.

Spenser.

No abuse, Hal, on my honour; no abuse.—Not
to dispraise me, and call me pantler, and bread-
chipper, and I know not what? *Shakspeare.*

God is pleased to try our patience by the ingrat-
itude of those who, having eaten of our bread, have
lift up themselves against us.

* * King Charles, Johnson says, but he knew
better. Was Charles the author of the
Eikon?

In the sweat of thy face shalt thou eat bread
Till thou return unto the ground; for thou
Out of the ground wast taken; know thy birth,
For dust thou art, and shalt to dust return.

Milton.

He consulted with the oracle of his *breadden* god,
which because it answered not, he cast it into the fire.

Hall.

Shall they pretend to say that bread is bread,
If we affirm it as a God indeed?
Or there's no purgatory for the dead? *Marvell.*

If pretenders were not supported by the simplicity
of the inquisitive fools, the trade would not find them
bread. *L'Estrange.*

This dowager, on whom my tale I found,
A simple sober life in patience led,
And had but just enough to buy her bread.

Dryden.

How few
Like thee reserve their raiment for the naked,
Reach out their bread to feed the crying orphan,
Or mix the pitying tears with those that weep.

Rouse's Jane Shore

When I submit to such indignities,
Make me a citizen, a senator of Rome ;
To sell my country, with my voice, for *bread*.

Philips.

I neither have been bred a scholar, a soldier, nor
to any kind of business ; this creates uneasiness in
my mind, fearing I shall in time want *bread*.

Spectator.

Mankind have found the means to make grain into
bread, the lightest and properest aliment for human
bodies.

Arbutnot.

Bread, that decaying man with strength supplies ;
And generous wine, which thoughtful sorrow flies.

Pope.

There was not one drop of beer in the town ; the
bread and *bread-corn*, sufficed not for six days.

Hayward.

When it is ripe, they gather it, and, bruising it
among *bread-corn*, they put it up into a vessel, and
keep it as food for their slaves.

Broome.

At my request mortality is fed
From heaven's high storehouse with celestial *bread*.

Elizabeth Rowe.

The same care and toil that raise a dish of peas
at Christmas, would give *bread* to a family during six
months.

Hume.

BREAD. The manufacture of bread in this country has attained a high degree of perfection, especially in that part of the process which depends on manual labor ; but we are still far behind our continental neighbours in the chemical manipulations ; and, what is somewhat singular, the bakers who pursue their useful avocations in the north of England, appear better acquainted with the art than the tradesmen of our own metropolis. We need hardly add, that there is no subject of more home importance in domestic economy, than the preparation of farinaceous food for this purpose.

Prior to any very particular examination of the mode of making bread, it may, however, be advisable to notice the chemical constituents of which it is formed. Wheat grown in this country contains from 18 to 24 per cent. of gluten, the remainder being principally starch. The wheat of the south of Europe, generally contains a larger quantity of gluten, and is, therefore, more excellent for the manufacture of macaroni, vermicelli, and other preparations requiring a glutinous paste. The excess of gluten in wheat-flour compared with other grain, renders it peculiarly fit for making bread ; for the carbonic acid, extricated during the fermentation of the paste, is retained in consequence of its adhesiveness, and forms a spongy and light loaf.

100 parts of barley contain upon an average 80 parts of starch, 6 of gluten, and 7 of sugar, the remaining 7 parts being husk.

From 100 parts of rye, Sir Humphery Davy, obtained 61 parts of starch, and 5 of gluten.

From 100 parts of oats he procured 59 of starch, 6 of gluten, and 2 of sugar.

100 parts of peas afford about 50 of starch, 3 of sugar, 4 of gluten, and a small portion of extractive matter.

100 parts of potatoes yield, upon an average, 20 parts of starch ; they may be considered, in general, as containing from one-fourth to one-fifth their weight of nutritive matter.

As to the proportion of these three constituents,

they differ so much in different kinds of wheat-flour, that nothing precise on the subject can be determined. The greater the proportion of gluten, the better in all cases is the flour. When the wheat has not fully ripened, or when it has been exposed to rain, while lying on the field, the gluten cannot easily be separated from the starch by the process above described ; nor does it form an elastic adhesive mass ; but a friable substance, distantly resembling the fibrous matter of potatoes. Hence the goodness of the flour may be determined by the state of the gluten.

Flour owes its property of making dough with water to gluten. Dough, in fact, is only a viscous and elastic tissue of gluten, the small cavities of which are filled with starch, albumen, and sugar. Hence it may be conceived that it is also to the gluten that dough is indebted for the property of rising by its mixture with barm or leaven. The yeast, by acting on the sugar of the flour, gives rise successively to the spirituous and the acid fermentations, and consequently to alcohol, acetic acid, and carbonic acid gas. This gas has a tendency to fly off, which is opposed by the gluten ; but the latter giving way, becomes extended like a membrane, and forms numberless small cavities, which impart to the bread lightness and a white color, and prevent it from being close or heavy. Hence it follows, first, that in panification, too much care cannot be taken to mix the barm well with the paste ; for whenever they are not intimately mixed, the bread will be necessarily heavy : Secondly, that the dough will be so much the longer in rising, and be more capable of rising, and the bread will be so much the whiter and lighter, as the flour contains more gluten ; bakers are well aware of this, and therefore, when they would judge whether flour is good or bad, they make it into dough, which they extend by pulling it in contrary directions, and the longer it can be drawn, the better the flour is ; it is for this reason that wheaten flour, independently of its being more nutritive, is preferred to the flour of the other cereal grains : Thirdly, that by kneading either pure starch, or starch that is mixed with parenchyma, such as the flour of manioc (an American shrub, from the root of which a kind of bread is made called cassavi), a mass will result which will never rise, even by the addition of matters fit for developing fermentation, and which will make only a very close heavy bread.

We may now notice the mode of preparing bread as practised by the London bakers. A sack of flour being sifted into the kneading trough, to make it lie loose ; six pounds of salt, and two pounds of alum, are separately dissolved in hot water, and the whole (in the quantity of a pail-full), being cooled to about 90° Fahrenheit, is mixed with two quarts of yeast. When this mixture has been well stirred, it is strained through a cloth or sieve, and is then poured into a cavity made in the flour. The whole is now mixed up into a dough, and a small quantity of flour being sprinkled over it, it is covered up with cloths, and the trough-lid is shut down, the better to retain the heat. The fermentation now goes on, and the mass becomes enlarged in bulk. In the course of two or three hours, another pail-

ful. of warm water is well mixed with the sponge, and it is again covered up for about four hours. At the end of this time, it is to be kneaded for more than an hour, with three pails full of warm water. It is now returned to the trough in pieces, sprinkled with dry flour, and at the end of four hours more, it is again kneaded for half an hour, and divided into loaves.

The most wholesome bread that has yet been made is decidedly the most economical. It is made of wheat-flour, mealy potatoes, the common culinary salt, and water. The component parts of the culinary salt are used separately, viz. soda and muriatic acid, in the following manner: first rub four drachms of carbonate of soda, reduced to a fine powder, with six pounds of flour, then, with six pounds of the pulp of steamed or boiled potatoes, mix three drachms of muriatic acid, diluted with a pint of water: when well blended add the flour with the carbonate of soda, and as much water as may be necessary to form it into a proper consistence; then knead it for about three minutes, form it into a loaf, and put it within the heat of the fire, covered with a wet cloth, for an hour, when it will be fit to put into the oven. The acid and soda, uniting in the mass, form the culinary salt, and during the union a considerable quantity of fixed air is disengaged, producing the good effects of fermentation without any of its bad. This process continues during the time the mass is before the fire; and, in order to prevent the surface from becoming so dry as to prevent the expansion of the loaf, it is necessary to cover it with a wet cloth. A greater quantity of the carbonate of soda being employed than is necessary to neutralise the acid, the bread may be considered much more wholesome than if common salt had been employed; the excess of the carbonate of soda acts by correcting acid matter in the stomach, and thus promoting digestion. For invalids whose stomachs do not properly digest the food they take, and for weakly children, this is of great importance. If, however, any person should object to an excess of soda, which certainly renders the bread darker, the same quantity of muriatic acid may be employed.

The bread thus made, notwithstanding the great proportion of potatoes, is more nutritious than the fermented bread of bakers, on account of the saccharine matter, and the whole of the gelatine of the flour, being preserved. This is proved by the strong jelly it affords on boiling it in water. Bread prepared in this manner has now kept perfectly sweet and good a fortnight, and will, no doubt, keep good many months.

French bread is usually considered as a desideratum at the tables of the opulent, and as some part of the process pursued by our Gallic neighbours might with advantage be adopted by the English baker, we furnish our readers with the most approved mode of bread-making in Paris.

The ingredients of their best bread are wheaten flour, water, yeast, and salt. 150 lbs. of flour require about eighty-five pints of water, three pints of yeast, and a proportion of salt which varies considerably according to the fancy of the baker, and the degree of dryness which is to be given to the bread in the oven. The manufacture

commences by diluting the yeast with about an equal quantity of warm water, and then stirring in one pound of flour for every pint of liquor. The whole being well incorporated, it is put into a wooden bowl, and set in a warm place for about seven hours, in order to ferment. At the end of this period, the mass (our English bakers call it sponge) is put into a large wooden trough, and mixed with one-seventh of the whole quantity of flour, the whole of the salt, and with water in the proportion of one pint to two pounds of flour. The dough is now brought into a warm situation, and allowed to remain quiet for four hours, that the fermentation may be established throughout the whole. The salt somewhat retards the progress of this action, but at the same time has the advantage of rendering it more gentle and uniform. The next step is to mingle two-sevenths of the flour, and three-fourths of its weight of water, with the dough, in the same manner as before; after which it is to be allowed two hours to ferment. Now commences the kneading and hard manual labor of the process, during which the remaining four-sevenths of the flour, and half as many pints of water as there are pounds of flour, are to be thoroughly mingled with the fermented dough. At first the mass is very adhesive and clings to the fingers, but it becomes less so the longer the kneading is continued; and when the hand on being withdrawn leaves its perfect impression in the dough, none of it adhering to the fingers, this laborious part of the business is completed. The dough is now immediately divided by weight into loaf-pieces, each of which is once more separately kneaded, and then made up into the proper form. The loaves as they are made are placed on a wooden table, and piled on each other two tiers high, and covered with a blanket to promote the last rising or fermentation, which soon commences, and is judged to have proceeded sufficiently far when a somewhat penetrating acidulous odor of carbonic acid is perceived. The oven is in the meantime heated, and when the temperature is such that a little flour spread at its mouth is browned, but not burnt, the loaves are deposited within, the mouth is closed up with an iron door, and at the proper time (varying according to the size of the loaves) the bread is withdrawn, is replaced on the table, and again covered with a blanket, in order to cool as slowly as possible; the ashes and adhering flour are then removed with a brush, and the bread is ready for sale.

Rice will serve the purpose of making very good bread, and the method practised in Carolina is as follows:—the grain is first washed by putting it in a vessel and pouring water upon it, then stirring it, and changing the water until it is sufficiently cleansed. The water is then poured off, and the rice placed in an inclined position to drain. After being sufficiently drained, it is put, while damp, for the greater facility of pulverisation, into a mortar, and beaten to powder. It is then completely dried, and passed through a common kitchen hair-sieve. The rice flour, thus obtained, is kneaded with a small proportion of Indian corn-meal, and boiled into a thickish consistence; or it is sometimes mixed with boiled potatoes, and a small quantity of leaven

and salt is added to the mass. When the fermentation has been sufficiently excited, the dough is put into pans and placed in an oven to be baked. By this process, a light wholesome bread is made, which is not only pleasing to the eye, but agreeable to the taste.

M. Parmentier obtained well fermented bread, of a good color and taste, from a mixture of raw potatoe pulp, with mealy wheat, or potatoe-meal, with the addition of yeast and salt. Upon the whole he recommends, after various trials, the mixture of potatoes, in times of scarcity, with the flour of wheat, instead of employing rye, barley, or oats, which has frequently been done. When grain is altogether wanting, he recommends the use of bread made from a mixture of the viscid powder of potatoes and their pulp, fermented with leaven or honey. The meal of this root, diluted with hot water, acquires a tenacious and gluey consistence. This meal, however, gives a gray color to bread made by mixing it with the flour of wheat; but a mixture of the pulp of potatoes with the flour of wheat, does not produce brown-colored bread. M. Parmentier made bread very much resembling that of wheat, by mixing four ounces of amylaceous powder of potatoes, one dram of mucilage extracted from barley, one dram of the bran of rye, $1\frac{1}{2}$ dram of glutinous matter dried and powdered. M. Parmentier also recommends the use of the horse-chestnut for the purpose of making wholesome bread. With this view he advises taking off the skin, and pressing out the juice, and reducing the fruit into a paste, which being diluted with water, and strained through a sieve, will yield a milky-colored liquor, that, on being left to stand, deposits a fine powder. This powder, when dried, has neither smell nor taste, and is very fit for aliment; the mass from which it is procured retaining the bitterness of the fruit. The roots of the briony, he says, treated in the same manner, yield a similar white powder. By the same treatment, fine, white, insipid, inodorous powder may be procured from the roots of the iris, gladiolus, ranunculus, arum, dracunculus, mandragora, colchicum, filipendula, and helleborus, plants which grow spontaneously, and in great abundance.

To preserve yeast through the winter, it may be beat up with a whisk until it appears thin and even; then spread it in thin coats upon plates, coating each over again as they dry, until half an inch in thickness, when they may be taken off the plates, broken into small pieces, and kept for use in bottles, closely stopped.

If there be a cheese-press or screw-press at hand, the yeast may be preserved by a simpler method. Fill a canvas bag with the yeast, and submit it to the action of the press, which will squeeze out all the moisture, when the residue may be well packed in paper, so as to keep it from the air, and from moisture. The following mode of making yeast is both easy and expeditious:—Boil one pound of good flour, a quarter of a pound of brown sugar, and a little salt, in two gallons of water for an hour. When milk-warm, bottle it, and cork it close. It will be fit for use in twenty-four hours. One pint of this will make eighteen pounds of bread.

The mode of ascertaining the temperature of the oven, prior to the introduction of the dough, is merely to observe whether the soot burns from the side of the oven most distant from the fire, and when that is the case, the bread will be baked in the most advantageous way. This plan, however, is liable to many objections, and the writer of the present article is preparing a simple apparatus which will mark with precision the precise temperature of the oven without opening the door. This, however, will be described under the article OVEN.

One of the principal objections to the baking of animal food, arises from the confined vapor which forms in the nearly close chamber of the oven. To prevent the mephitic vapor, which is thus imprisoned, from communicating an unpleasant savor to the meat, it has been common to perforate the oven, and as such to ensure a current of air. A complete apparatus for roasting, valuable in an economical point of view, may not unaptly find a place under this head.

This is principally effected by casting the heat entirely upon the object roasting, instead of sending three-fourths of the heat up a capacious chimney, and expending the greatest part of the remainder upon the cook, and the walls and furniture of the kitchen.

The roaster above alluded to, is made of sheet iron, of the strength of about one pound to the square foot. Its form is that of a parallelopipedon, about twenty-five inches high, twenty-two long, and eighteen in breadth. The fire is put under it, but one course of bricks is placed immediately over the fire, and above this a cavity of five inches deep, between the brick roof and the oven bottom. The flame of the fire passes a little to the right and left, and rises perpendicularly up the sides of the roaster, freely communicating with the top of the same. By this means the flame and hot vapor will be hottest at the top of the oven, because of its greater levity, and its not being allowed to escape at this point, according to the common practice. After the hot vapor has bestowed its heat on the superior part, it now descends and enters on each side the cavity under the oven, whence it passes up the back of the same, which back forms one side of the smoke chimney. This arrangement is sufficient for distributing all the disposable heat equally on every side of the roaster. We shall next point out the contrivance for disposing of the smell above alluded to:—The door of the oven is cased with wood a piece of thick paper steeped in a solution of alum, and smeared with clay, being placed between the wood and the iron, to prevent the wood from being charred. The door extends below the bottom of the oven about three inches. This, when the door is open, exposes a plate three inches deep, and the width of the oven, and which constitutes the front of the cavity under the oven. At one side of this plate is a hole at the entrance of the tube, which extends to the other end of the cavity, where it is bent, and returns on the other side of the cavity, and opens into another cavity, formed by a double plate, which constitutes the iron part of the door. The first entrance of this tube corresponds with

an opening at the bottom of the door, so that when the door is shut, cold air can enter the tube. In its passage it becomes heated, and then enters the oven at the top, from the cavity in the door. It now passes over the meat, and escapes through a tube in the back plate, which extends so high as to reach above the smoke damper. By this means the roaster is constantly cleared of any disagreeable vapor, by a force equal to the draft of the chimney.

Loaves are heaviest when just taken out of the oven; they gradually lose part of their weight, at least if not kept in a damp place, or wrapt round with a wet cloth. Thus Mr. Tillet found that a loaf of four pounds, after being kept for a week, wanted $\frac{3}{125}$, or nearly $\frac{1}{15}$ of its natural weight.

When bread is newly taken out of the oven, it has a peculiar, and rather pleasant smell, which it loses by keeping, unless its moisture be preserved by wrapping it round with a wet cloth; as it does also the peculiar taste by which new bread is distinguished. This shows us that the bread undergoes chemical changes; but what these changes are, or what the peculiar substance is to which the odor of bread is owing, is not known.

The laws which relate to the manufacture of bread underwent an entire alteration in the year 1822, and by an act passed 3 George IV. they are allowed to sell bread by weight in loaves of any given number of pounds avoirdupois, without reference to the quarter or half quarter, as heretofore. They are, however, to be furnished with weights and scales, placed in such a situation, that the purchaser may ascertain for himself the weight of the loaf purchased.

BREAD, EARTH. In the German Ephemerides for 1764 we have the following account of a kind of bread made of earth. In the lordship of Moscow, in the Upper Lusatia, a sort of white earth is found, of which the poor, urged by the calamities of the wars which raged in those parts, made bread. It is taken out of a hill where they formerly worked at salt-petre. When the sun has somewhat warmed this earth it cracks, and small white globules proceed from it as meal; it does not ferment alone, but only when mixed with meal. Mr. Sarlitz, a Saxon gentleman, informed us that he has seen persons who in a great measure lived upon it for some time. He assures us that he procured bread to be made of this earth alone, and of different mixtures of earth and meals; and that he even kept some of this bread by him upwards of six years: he further says, a Spaniard told him that this earth is also found near Girona in Catalonia.

BREAD FRUIT. See **ATROCARPUS**.

BREADTH, } Ang.-Sax. bræd, brad.

BREADTH'LESS, } broad, from the Goth. *brads*.
Formerly breadth was written brede. Wicliffe writes it breed, from the verb bradan, to broaden, to expand, to dilate; the measure of any plain superficies from side to side.

— And whan this Troilus,

It sawe he gan to taken of it hede,

Avising of the length and brede.

Chaucer's Troilus and Cresside.

Within the temple of mighty Mars the Rede,
All painted was the wall, in length and brede,
Like to the estres of the grisly place
That highte the gret temple of Mars in Trace,
In thilke colde and frosty region,
Ther as Mars hath his sovberine mansion.

Chaucer's Canterbury Tales.

There is, in Ticinum, a church that hath windows only from above; it is in length an hundred feet, in breadth twenty, and in height near nity; having a door in the midst. *Bacon.*

The river Ganges, according unto latter relation, if not in length, yet in breadth and depth, may excel it. *Brown.*

Then all approach the slain with vast surprise,
Admire on what a breadth of earth he lies. *Dryden.*
In our Gothic cathedrals, the narrowness of the arch makes it rise in height; the lowness opens it in breadth. *Addison.*

From Cyrene to the ocean, the coast of Africa extends above fifteen hundred miles; yet so closely is it pressed between the Mediterranean and the Sahara, or Sandy Desert, that its breadth seldom exceeds four-score or an hundred miles. *Gibbon.*

The term of latitude is *breadthless* line.

More's Song of the Soul.

BREAK', v. & n. } The three principal significations attached to this word, **BREAK'ER,** } **BREAK'ING,** } are distinctly marked **BREAK'ANT, v. & n.** } by the synonymous **BREAK'NECK, n. & adj.** } terms in other languages, from which it may have been derived. These significations are, To fracture, to change, and to manage. Thus, to part by force, to rive, split, or burst asunder, to crush, to ruin; we refer to the Goth. *braka*, Heb. *berek*, Arabic and Persian *bruga*, Eolian *βρυγρω*, Teut. *brechen*, Belgic *brecken*, Ang.-Sax. *brecan*, Swed. *braka*, Isl. *braka*, Irish *bracam*, Welsh *brigu*, Arm. *brica*, *frica*, Lat. *frago*, *frango*. The class of words which illustrate the second meaning; namely to change, to assume a different form or appearance, to falsify, is the following: Goth. *briga*, *brigda*; Ang.-Sax. *brægdan*, Swed. *brigda tru*, to break faith; Scot. *break*, to deceive; Isl. *brigda bit*, to change color or countenance. The third sense; namely, to accustom, to habituate, to tame, is marked by the Goth. *braka*, Ang.-Sax. *brecan*, Teut. *brancha*, *brechen*.

The Encyclopædia Metropolitana, has happily distinguished many of the shades of metaphorical and literal application of which this word is susceptible; concluding that it is of 'most universal application to any separation, particularly when made with suddenness, violence or injury.' The following is the catalogue of meanings annexed to a somewhat meagre exhibition of etymological lore:

To make or cause a rupture or breach; a disruption, or breaking apart; an eruption or breaking out; an irruption or breaking in.

To separate, (Met.), to disjoin, to dispart, to force apart; to dis sever, to interrupt, to intercept.

To break down; to suppress, to subdue, to subject, to crush, to tame, to overpower, to bring or reduce to obedience, to poverty, to decay.

To break, or infringe, to violate; implying deceit. Adultery in old writers is called spouse-breach.

To break one's mind, is to break it open; to open it, to disclose it.

To break the fast, or to breakfast: is to separate the times of fasting; to break in upon fasting, interrupting its progress by a termination.

To break, is to effect a change, either by violence, by insinuation, by a single act, or by a series of acts; by power or by subtlety, and the change may be simple difference, or complete destruction.

Right as the hunter, in the regne of Trace,
That standeth at a gappe with a spere,
Whan hunted is the lion or the bere,
And hereth him come, rushing in the greves,
And *breking* bothe the boughes and the leves,
And thinketh, there cometh my mortal enemy;
Withouten faile, he must be dedd or I;
For eyther I mote sleu him at the gappe,
Or he mote sleu me, if that me mishappe.

Chaucer's Canterbury Tales.

To all which cruell tyranny, they say,
He is provokt, and stir'd up, day and night
By his bad wife that hight Adicie,
Who counsels him, through confidence of might,
To *breake* all bonds of law and rules of right.

Spenser.

What boots it to *break* a colt, and to let him straight
run loose at random?

Id.

Why then thou can'st not *break* her to the lute.
Why, no; for she hath *broke* the lute to me.

Shakespeare.

Lovers *break* not hours,
Unless it be to come before their time. *Id.*
Parden this fault, and by my soul I swear,
I never more will *break* an oath with thee. *Id.*
Break their talk, mistress Quickly; my kinsman
shall speak for himself. *Id.*

O father abbot!

An old man *broken* with the storms of state,
Is come to lay his weary bones among ye;
Give him a little earth for charity. *Id.*

—— I must

Forsake the court; to do't, or no, is certain
To me a *breakneck*. *Id.*

So fed before he's *broke*, he'll bear
Too great a stomach patiently to feel
The lashing whip, or chew the curbing steel.

May.

Did not our worthies of the house,
Before they *broke* the peace, *break* vows?

Hudibras.

When any new thing shall be propounded, no counsellor should suddenly deliver any positive opinion, but only hear it, and, at the most, but to *break* it, at first, that it may be the better understood at the next meeting.

Bacon.

Upon the *breaking* and shivering of a great state,
you may be sure to have wars. *Id.*

The *breaking* of that parliament,
Broke him; as that dishonest victory,
At Chæroneæ, fatal to liberty,
Killed with report that old man eloquent.

Milton.

—— As when a scout
Through dark and desert ways with peril gone
All night, at last, by *break* of cheerful dawn,
Obtains the brow of some high-climbing hill,
Which to his eye discovers unaware
The goodly prospect of some foreign land. *Id.*

Your only way with me to *break*
Your mind is *breaking* of your neck,
For as when merchants *break*, o'erthrown,
Like nine-pins they strike others down,
So that would *break* my heart, which done
My tempting fortune is your own.

Butler's Hudibras.

Unhappy man! to *break* the pious laws
Of nature, pleading in his children's cause. *Dryden.*

I, who much desired to know
Of whence she was, yet fearful how to *break*,
My mind, adventured humbly thus to speak. *Id.*

Think not my sense of virtue is so small;
I'll rather leap down first, and *break* your fall. *Id.*

She held my hand, the destined blow to *break*,
Then from her rosy lips began to speak. *Id.*

As soon as Phœbus' rays inspect us,
First, Sir, I read, and then I *breakfast*. *Prior.*

I'll brave her to her face;
I'll give my anger its free course against her:
Thou shalt see, Phoenix, how I'll *break* her pride. *Philips.*

And now, as near approaching as the sound
Of human voice the listening ear may wound,
Amidst the rocks he hears a hollow roar,
Of murmuring surges *breaking* on the shore.

Pope's Odyssey.

Laws are like cobwebs, which may catch small
flies, but let wasps and hornets *break* through. *Swift.*

Adieu, adieu! my native shore
Fades o'er the waters blue;
The night-winds sigh, the *breakers* roar,
And shrieks the wild seamew.
Yon sun that sets upon the sea,
We follow in his fight;
Farewell a while to him and thee,
My native land—good night! *Byron.*

BREAKERS, in maritime affairs, are distinguished both by their appearance and sound, as they cover that part of the sea with a perpetual foam; and produce a hoarse and terrible roaring, very different from what the waves usually have in a deeper bottom. When a ship is unhappily driven among breakers, it is hardly possible to save her, as every billow that heaves her upward serves to dash her down with additional force when it breaks over the rocks or sands beneath it.

BREAKING OF HORSES. See MENAGE.

BREAK-WATER, see CHERBOURG and PLYMOUTH.

BREAM', n. s. Swed. *bressem*, Belgic *braessem*, Teut. *brachsem*, *bresm*, Fr. *breme*, barbarous Latin, *brama*, *abramis*. Bright or brightsome seems to have been the meaning of the Gothic. A fish of the carp kind.

A broad *bream*, to please some curious taste,
While yet alive in boiling water cast,
Vexed with unwonted heat, boils, flings about.

Waller.

BREAM, in ichthyology, the cyprinus brama of Linnæus. See CYPRINUS.

BREAM, to burn off the filth, such as grass, ooze, shells, or sea-weed, from a ship's bottom, that has gathered to it in a voyage, or by lying long in a harbour. It is performed by holding kindled furze, faggots, or the like, to the bottom, so that the flame incorporating with the pitch, sulphur, &c. that had formerly covered it, immediately loosens and throws off whatever filth may have adhered to the planks. After this, the bottom is covered anew with a composition of sul-

phur, tallow, &c. which not only makes it smooth and slippery, so as to divide the fluid more readily, but also poisons and destroys; those worms which eat through the planks in the course of a voyage. Breaming may be performed either when the ship lies a-ground after the tide has ebbed from her, or by docking, or by careening.

BREAST', *v. & n.* } Goth. *brist*, Swed. *bröst*, Tent. *bruste*, Bel. *brorst*, Ang.-Sax. *bræost*, Per. *bār*, The thorax, the heart. To breast is to oppose the breast to anything; to face, to

front. Another term for bosom, especially that of the female yielding nourishment to her offspring. It is metaphorically applied to the mind; to the heart and conscience; to the seat of the passions; sometimes to the lungs, in the case of a singer.

They pluck the fatherless from the breast. *Job*, xxiv. 9.

Therewith the fire of jalousie, up sterte
Within his *breast*, and hent him by the herte
So woody, that he like was (to behold)
The box-tree, or the ashen dead and cold.

Chaucer's Canterbury Tales.

For though thin husband armed be in maille,
The armes of thy crabbed eloquence
Shall pierce his *breast*, and eke his aventaille:
In jalousie, I rede eke, thou him binde,
And thou shalt make him crouch as doth a quaille. *Id.*

Hire gilded heres with a goldin threde
Thounnden were, untressid as she laie:
And nakid from the *breast* unto the hede
Men might her see. *Id. Assemblée of Foules.*

By which she well perceiving what was done,
Gan teare her hayre, and all her garments rent,
And beat her *breast*, and piteously herself torment. *Spenser.*

The river itself gave way unto her, so that she was
straight *breast-high*. *Sidney.*

What stronger *breastplate* than a heart untainted?
Thrice is he armed, that hath his quarrel just. *Shakespeare.*

The threaten sails
Draw the huge bottoms through the furrowed sea,
Breasting the lofty surge. *Id. Henry V.*

'Gainst shield, helm, *breastplate*, and, instead of
those,
Five sharp smooth stones from the next brook he
chose. *Cowley.*

Margarita first possessed,
If I remember well, my *breast*. *Id.*
Sir John Astley cast up *breastworks*, and made a
redoubt for the defence of his men. *Clarendon.*

I, not by wants, or fears, or age oppress,
Stem the wild torrent with a dauntless *breast*. *Dryden.*

Needless was written law, where, none oppress,
The law of man was written in his *breast*. *Id. Ovid.*

Lay madam Partlet basking in the sun,
Breasthigh in sand. *Id. Fables.*

No traitress! angry Love replies,
She's hid somewhere about thy *breast*;
A place nor God nor man denies
For Venus' dove the proper nest. *Prior.*

Soft on her fragrant *breast* the babe she laid
Hushed to repose, and with a smile surveyed. *Pope's Iliad.*

The belly shall be eminent, by shadowing the
flank, and under the *breastbone*. *Peacham.*

This venerable champion will come into the field,
armed only with a pocket-pistol, before his old rusty
breastplate could be scoured, and his cracked head-
piece mended. *Smyth.*

Our ladies have still faces, and our men hearts;
why may we not hope for the same achievements
from the influence of this *breast-knot*? *Addison's Fanny.*

The charmer's opening eye kind hope reveals,
Kind hope her consort's *breast* callevining feels. *Savage.*

Flame from one *breast*, and thence on Britain shine,
What love, what praise, O Walpole! then is thine. *Id. Epistles.*

The hardy Swiss

Breasts the keen air, and carols as he goes. *Goldsmith.*

His understanding 'scapes the common cloud
Of fumes arising from a boiling *breast*.

Young's Virtue's Apology.
Thou bitter pledge! thou mournful token!

Though painful, welcome to my *breast*!
Still, still, preserve that love unbroken,
Or break the heart to which thou'rt prest! *Byron.*

BREASTS, MAMMÆ, in anatomy. See ANA-
TOMY, Index.

BREAST, SMITING THE, is an expression of
penitence. In the Romish church, the priest
beats his breast in rehearsing the general confes-
sion at the beginning of the mass.

BREAST-HOOKS, in ship building, are thick
pieces of timber incurvated into the form of
knees. They are placed at different heights
directly across the stem, so as to unite it with
the bows on each side. The breast-hooks are
strongly connected to the stem and hawse-pieces
by tree-nails, and by bolts driven from without
through the planks and hawse-pieces, and the
whole thickness of the breast-hooks, upon whose
inside those bolts are forelocked or clinched
upon rings. They are usually about one third
thicker, and twice as long, as the knees of the
decks they support.

BREAST-PAIN, in the menage, called by
the Italians *grandezza di petto*, is a distemper
in horses proceeding from superfluity of blood
and other gross humors, which, being dissolved
by some extreme and disorderly heat, resort
downward to the breast, and pain them extremely.
The signs of the breast-pain are, a stiff, stagger-
ing, and weak going with his fore legs, besides,
that he can hardly, if at all, bow his head to the
ground.

BREAST-PLATE, in Jewish antiquity, a part of
the sacerdotal vestments anciently worn by the
high priest. It was a folded piece of the same
rich embroidered stuff of which the ephod was
made, set with twelve precious stones, on each
of which was engraven the name of one of the
tribes. They were set in four rows, three in
each row; and were divided from each other by
the little golden squares or partitions in which
they were set. This breast-plate was fastened at
the four corners; those on the top to each
shoulder by a golden hook or ring at the end of
a wreathed chain; and those below, to the girdle
of the ephod, by two strings or ribbons, which
had, likewise, two rings and hooks. This orna-
ment was never to be severed from the priestly
garment; and it was called the memorial, to put

the high-priest in mind how dear those tribes ought to be to him, whose names he wore on his breast. It is also called the breast-plate of judgment, because it had the divine oracle of Urim and Thummim annexed to it. See URIM and THUMMIM.

BREAST-PLATE, in the menage, the strap of leather that runs from one side of the saddle to the other, over the horse's breast, in order to keep the saddle tight, and hinder it from sliding backwards.

BREAST-PLATES, for armour, are said to have been, originally, made of hides, or hemp twisted into small cords, but afterwards of brass, iron, or other metals; which were sometimes so exquisitely hardened, as to be proof against the greatest force. See ARMOUR.

BREAST-WORK OF A SHIP, a sort of ballustrade or fencer, composed of rails or mouldings, and often decorated with sculpture; it terminates the quarter-deck and poop at the fore-ends, and encloses the fore-castle both before and behind.

BREATHE, v.	} <i>Αηθ</i> ; Goth. and Teut. <i>athem</i> ; Ang.-Sax. <i>orath</i> , <i>brath</i> ; <i>athian</i> , <i>brethian</i> ; air of life; air drawn in and thrown out of the lungs; to draw breath; to rest. Goth. <i>brydda</i> ; Swed. <i>brada</i> ; Welch <i>brathu</i> ; to puncture; to pierce; to open a vein; to give vent. To breathe, then, is to inspire or inhale; to expire or exhale; to take breath; to give breath: to send forth; to emit; to eject: to utter privately: an odor; a perfume; a vow; a prayer; relaxation.
BREATH, n.	
BRE'ATHER,	
BRE'ATHING,	
BREATH'FUL,	
BREATH'LESS,	
BREATH'LESSNESS,	} <i>rest</i> .
BRE'ATHINGTIME.	

————— and eke, hire *breth* I trowe
 Surmounteth all odours that er I founde
 In swetenesse. *Chaucer's Court of Love.*

She colde was; and withouten sentement,
 For ought he wote, for *brethe* yet felt he none.
 And this was him a pregnant argument
 That she was forth out of this world agone.
Id. Troilus and Creseide.

The *breath* came slowly thence, unwilling leaving
 So sweet a lodge; but when she once intended
 To feast the air with words, the heart deceiving,
 More fast it thronged so to be expended;
 And at each word a hundred loves attended,
 Playing i' th' *breath*, more sweete than is that firing,
 Where that Arabian onely bird, expiring
 Lives by her death, by losse of *breath* more fresh
 respiring. *Spenser.*

At other times he casts to sue the chace
 Of swift wild beasts, or run on foot a race,
 To' enlarge his *breath*, large *breath* in arms most
 needful,
 Or else by wrestling, to wax strong and heedful. *Id.*

He presently followed the victory so hot upon the
 Scots, that he suffered them not to *breathe*, or gather
 themselves together again. *Id. State of Ireland.*

Thy greyhounds are as swift as *breathed* stags.
Shakspeare.

I remember when the fight was done,
 When I was dry with rage and extreme toil,
Breathless, and faint, leaning upon my sword,
 Came there a certain lord. *Id. Henry IV.*

Let him *breathe*, between the heavens and earth,
 A private man in Athens. *Id. Antony and Cleopatra.*

She shows a body rather than a life,
 A statue rather than a *breather*. *Id. ib.*

Kneeling before this ruin of sweet life,
 And *breathing* to this *breathless* excellence
 The incense of a vow, a holy vow. *Id. King John.*
 Give me some *breath*, some little pause, dear lord,
 Before I positively speak. *Id. Richard III.*

As bodily respiration without intermission or im-
 pediment doth concur with all our actions, so may
 that *breathing* of soul which preserveth our spiritual
 life, and ventilateth that holy frame within us, well
 conspire with all other occupations. *Barrow.*

Rest, that gives all men life, gave him his death,
 And too much *breathing* put him out of *breath*.
Milton.

His altar *breathes*
 Ambrosial odours, and ambrosial flowers.
Id. Paradise Lost.

Me thinks I heare the soldiers and busie officers
 when they were rolling that other weighty stone (for
 such we probably conceive) to the mouth of the
 vault with much toyle and sweat, and *breathlessness*,
 how they bragged of the surrenesse of the place, and
 unremovableness of that load.

Hall. On the Resurrection.
 I would be young, be handsome, be beloved,
 Could I but *breathe* myself into Adrastus. *Dryden.*
 You menace me, and court me, in a *breath*;
 Your Cupid looks as dreadfully as death. *Id.*
 Spaniard, take *breath*, some respite I'll afford;
 My cause is more advantage than your sword. *Id.*
 No man has more contempt than I of *breath*,
 But whence hast thou the power to give me death? *Id.*

The ready cure to cool the raging pain,
 Is underneath the foot to *breathe* a vein.
Id. Virgil.

While to high heaven his pious *breathings* turned,
 Weeping he hoped, and sacrificing mourned. *Prior:*
 The artful youth proceed to form the quire;
 They *breathe* the flute, or strike the vocal wire. *Id.*
 Where he vital *breathes* there must be joy.
Thomson.

Delightful task! to rear the tender thought,
 To teach the young idea how to shoot;
 To pour the fresh instruction o'er the mind;
 To *breathe* the enlivening spirit, and to fix
 The generous purpose in the glowing breast. *Id.*

Here, by the stream, if I the night outwear,
 Thus spent already, how shall nature bear
 The dews descending, and nocturnal air;
 Or chilly vapours, *breathing* from the flood
 When morning rises. *Pope's Odyssey.*
 Formed to make pleaders laugh, his nonserse
 thunders,

And on low juries *breathes* contagious blunders.
Savage's Miscellanies.
 Nature is dumb on this important point,
 Or Hope precarious in low whisper *breathes*.

Young's Christian's Triumph.
 He ought, says this great political doctor (Machia-
 vel), to consider peace only as a *breathing-time*, which
 gives him leisure to contrive, and furnishes ability to
 execute military plans. *Burke.*

The fourth day came, but not a *breath* of air,
 And ocean slumbered like an unweaned child.

Byron.
 But still her lips refused to send—'Farewell!'
 For in that word—that fatal word—howe'er
 We promise—hope—believe—there *breathes* despair.
Id. Corsair.

BREBEUF (William de), a French poet, born at Thoiry, in 1618. He was chiefly distinguished by a translation of Lucan, which, though abounding in bombast and false brilliances, was long admired; and procured great promises of advancement to the author, from cardinal Mazarine, who died, however, without fulfilling them. But the best of his works is the *First Book of Lucan Travestied*, which is an ingenious satire upon the great, and upon the meanness and servility of those who submit to flatter them. He is said to have had a fever that lasted above twenty years. He died in 1661, aged forty-three.

BRECCIA, in mineralogy, an Italian term, used to denote such compound stones as are composed of agglutinated fragments of considerable size.

BRECHIN, a town and royal burgh in the county of Forfar, Scotland, situated on the declivity of a hill, which rises from the north bank of the Esk, about eighty-four miles north of Edinburgh. It unites with Aberdeen, Montrose, Aberbrothick, and Inverbervie, in sending one member to the parliament of Great Britain. It has a small manufacture of linen and sail-cloth, a large brewery, and about 6000 inhabitants. It is principally noted in history in connexion with a convent of Culdees. A bishop's see was founded here about the middle of the twelfth century, and endowed by David I. Some remains of the cathedral still appear, and the west end is occupied by a parish church. At a small distance stands one of those singular round towers whose use has so long baffled the conjectures of antiquaries. The towers appear to have been peculiar to North Britain and Ireland: in the latter they are common: in the former but two, we believe, now exist. That at Brechin stood originally detached from other buildings. It is at present joined near the bottom by a low additional aisle to the church, which takes in about a sixth of its circumference. From this aisle there is an entrance into it of modern date, approachable by a few steps, for the use of the ringers; two handsome bells were formerly placed in it, which were approached by means of six ladders placed on wooden semicircular floors; but the bells have lately given place to an excellent town clock. The height from the ground to the roof is eighty feet; the inner diameter, within a few feet of the bottom, is eight feet; the thickness of the wall at that part, seven feet two inches; so that the whole diameter is fifteen feet two inches; the circumference very near forty-eight feet; the inner diameter at top is eight feet seven inches; the thickness of the walls four feet six inches; the circumference thirty-eight feet eight inches; which proportion gives the building an elegant appearance; the top is roofed with an octagonal spire twenty-three feet high, which makes the whole 103. The castle of Brechin was built on an eminence, a little south of this town; it underwent a long siege in 1303; and was gallantly defended against the English under Edward III.; and, notwithstanding all the efforts of that potent prince, the brave governor, Sir Thomas Maule, ancestor of the present Maule family, of Panmure, held out this small fortress for twenty days,

till he was slain by a stone from an engine on the 20th of August, when the place was instantly surrendered. Brechin is also remarkable for a battle fought near it, in the rebellion of 1452, on account of the murder of the earl of Douglas. The victory fell to the royalists under the earl of Huntly.

BRECKNOCK, the county town and capital of the county of Brecknock (Aber-Honday, Welch,) seated at the confluence of the rivers Honday and Uske, over which there are four bridges. This place consists of three principal irregular streets, in the most spacious of which are the town-hall and the market-place. The collegiate church, founded on the ruins of a Dominican priory, is now falling into decay. Here are three parish churches, four places of worship for dissenters, and some manufactories of cloth, hats, and cotton-stockings. The castle is said to have been built by Bernard de Newmarsh, a favorite of William Rufus, who also encircled the town with walls. It was nearly destroyed in Oliver Cromwell's time. The arsenal, a handsome brick building, stands in that part of the town called the Watton, on the road side, being ninety-nine feet long, thirty-five broad, and two stories high. The tower contains an armoury for 15,000 stands of arms, and 1500 swords, arranged in the manner of the arms at the tower of London. The priory walk is very pleasant. To the east of the town is a lake well stored with fish, called Brecknock Mere. It sends one member to parliament, and is governed by two bailiffs, fifteen aldermen, two chamberlains, two constables, a town-clerk, and other officers. Market days, Wednesday, Friday, and Saturday. It is 171 miles W. N. W. from London. There are several traces of Roman camps in the neighbourhood.

BRECKNOCK, a county of South Wales, is bounded by Radnor on the north, Cardigan and Carmarthen on the west, Hereford and Monmouth on the east, and by Monmouth and Glamorgan on the south. It is about thirty-five miles long, thirty broad, and about 100 in circumference, containing nearly 512,000 acres of land, of which 232,000 acres are in a state of cultivation, and 185,000 acres are waste, unfit for culture. It contains six hundreds, viz. Builth, Crickhowel, Devynnock, Merthyr, Penkelly, and Talgarth; has four market-towns, Brecon, Builth, Crickhowel, and Hay; and sixty-two parishes. This is one of the most mountainous counties of Wales, containing the Vann, or Brecknock-Bereon, reckoned the loftiest mountain in South-Wales. The air in the valleys is always temperate; the soil on the hills stony; but the streams descending thence into the vales, render them fruitful. Its principal rivers are the Wye, which separates it from Radnor, and the Uske, which rises from the Black Mountain on the border of Carmarthenshire, and, flowing through a beautiful valley to the south-east angle, passes the town of Brecon. Its chief productions are copper, lead, iron, corn, cattle, fish, and otter's fur, and manufactories of cloth and stockings. The whole county, indeed, is replete with every article of subsistence, with which the different markets and fairs are well supplied. A canal

from Brecon to Llanelly, eighteen miles long, and nine feet wide, was opened in 1800, and is navigable for barges of twenty-five tons burden. Coal and lime stone are found in large quantities. At Llanelly, and near the borders of Glamorgan, there have been lately established several extensive iron works. The exports are a species of woollen cloth (which is carried to be milled and dyed in England), wool, worsted, stockings, timber, iron, cattle, sheep, pigs, butter and cheese. It returns two members to parliament; one for the county, and one for Brecknock, the county-town.

BREDA, a strong fortified town of the Netherlands, the capital of a lordship of that name in Dutch Brabant. It is of a triangular shape, having a gate at each angle. It lies on the river Merck, near the influx of the Aa, and thus has a good communication with the sea. Its position, in the midst of a marsh, contributes so much to its defence, that the adjoining country can be laid under water by means of sluices which communicate with the river. It has also a castle, constructed by William, prince of Orange, afterwards king of England; the ramparts are lined with trees. The great church is remarkable for its tower, which was burnt down in 1696, but since rebuilt; the height of the spire is 362 feet. The interior contains several monuments of the ancient lords of Breda. The town-house is a noble building. This was formerly a place of considerable commerce, and had extensive cloth manufactories; but there now only remain a few manufactures of carpets, stockings, and hats. There are also several breweries.

Breda suffered severely in the wars of the sixteenth century, between Spain and the Dutch. Before the breaking out of these commotions, the lordship belonged to the family of Nassau-Orange; but in 1567 they were seized by the duke of Alva. The garrison delivered up the town to the states-general in 1577, but it was wrested from them in 1581. Here, in May 1590, prince Maurice of Nassau began that series of operations which ended in the liberation of Holland. He sent into Breda a party of chosen men, concealed in a boat loaded with turf, who admitted the other besiegers, and the town was given up. It was retaken by the Spaniards, under Spinola in 1625, after a close blockade, and a siege of six months. They kept possession of it till 1637, when it was finally retaken by the Dutch. Our Charles II. resided here when invited to the throne of his father, in 1660, and issued a celebrated declaration, to which he adhered as it accorded with his convenience. In 1667 was held at Breda a celebrated congress, which ended in treaties of peace between Charles II. of England on the one side, and Louis XIV. of France, Frederick III. of Denmark, and the states-general on the other. A second congress was summoned here in 1747, but never took place, the negotiations having been removed to Aix-la-Chapelle. In February 1793 the French became masters of the town and fortress, after five days blockade and a slight bombardment, but gave it up on the 4th April of the same year. In September 1794 they made preparations for a second attack, but the place held out till the entire conquest of Holland. In December 1813,

when the prince of Orange had been recalled to Holland, general Bechendorff's corps, of the Russian army, marched in the direction of Breda, and, on the tenth, the French garrison sallied out to make an attack on that force; upon which the loyal burgesses rose en masse, shut the gates, and prevented them again entering the place. It is twenty-two miles S.S.E. of Rotterdam, and forty-eight south of Amsterdam.

BREDA (Alexander Van), an eminent painter of Antwerp, much esteemed for his landscapes, fairs, views of particular scenes in Italy, and varieties of animals and figures.

BREDA (John Van), the son of Alexander, was born at Antwerp in 1683. Having the advantage of the example and directions of his father, he continued with him till he was eighteen years of age. Among the various capital paintings, then in the possession of John De Wit, at Antwerp, Breda fixed upon those of Velvet Brueghel, which he copied with extraordinary success; and was employed for nine years in copying the pictures of several other great masters. After this he went to London with Rysbrach, the sculptor, where he rose into great esteem. After residing some years in England, he returned to Antwerp, loaded with riches, the honorable testimonies of English liberality, as well as of his own merit. In 1746 Louis XV. arriving in that city, purchased four of his pictures. He had as much fire in his composition, and perhaps more genius than Brueghel; his figures are generally well placed, his ground skilfully broken; every small figure has its particular character, and occupies its proper place. In short, he is a painter of such a rank, that the value of his works must always increase. He died in 1750.

BREDE. See BRAID.

BREDEMEYER, in botany, a genus of plants: class diadelphia, order octandria: cal. three-leaved: cor. papilionaceous; drupe, nut two-celled. One species, *B. floribunda*, a shrub with small, white, paniced flower, native of the Caraccas.

BREECH, *v. & n.* } Goth. *brek*; a division, a fork; Swedish }
BREECH'ES, *n.* }
BREECH'ING, *n.* } *brek*; Teut. *bruehe*; Ang.-Sax. *brac*; Welch *breg*; Irish *bristig*; the division of the legs, the backside, the hinder part. The part broken in two, or divided, as the thighs from the body. Breech is the part, and breeches that which covers it. Goth. *bræken*, *brokes*; Ang.-Sax. *broc*, *bræc*, *braccæ*; Armoric *braghis*; Irish *brigis*; Scot. *breck*; Welch *bryccan*; Ital. *bracca*, Lat. *bracca*; Fr. *brayes*. To breech is to put on the breeches. To furnish a tight or close covering for the hinder or lower part of anything, as to breech a gun, breeching for a horse. Breeches are, in modern times, the exclusive prerogative of the superior gender.—*Met.* The emblem of masculine authority; not unfrequently usurped by the gentler sex. But see our first example:

Then the eyes of them both were opened, and they knew that they were naked, and they sewed figge-tree leaves together, and made them breeches.

Bible, (Geneva) Gen. iii

— Next, his white lere

Of cloth of lake fin and clere,

A *breeche* and eke a sherte;

And next his sherte an haketon;

Chaucer's Canterbury Tales.

Thou woldest have me kisse thine old *breech*,

And swere it were a relike of a saint. *Id.*

Petruchio is coming in a new hat, and an old jerkin, and a pair of old *breeches* thrice turned.

Shakespeare's Taming of the Shrew.

Ah! that thy father had been so resolved!—

—That thou might'st still have worn the petticoat,

And ne'er had stolen the *breech* from Lancaster. *Id.*

When the king's pardon was offered by a herald, a lewd boy turned towards him his naked *breech*, and used words suitable to that gesture. *Hayward.*

The storks devour snakes and other serpents; which, when they begin to creep out at their *breeches*, they will presently clap them close to a wall, to keep them in. *Grew's Museum.*

The wife of Xanthus was domineering, as if her fortune and her extraction, had entitled her to the *breeches*. *L'Estrange.*

If the Delphick Sibyls or oracular speeches

(As learned men say), came out of their *breeches*,

Why might not our horses since words are but wind,

Have the spirit of prophecy likewise behind.

Marvell.

But Hudibras gave him a twitch

As quick as lightning in the *breech*,

Just in the place where honour's lodged,

As wise philosophers have judged;

Because a kick in that place more

Hurts honour than deep wounds before.

Butler's Hudibras.

His *breeches* were of rugged woollen,

And had been at the siege of Bullen. *Butler.*

So cannons, when they mount vast pitches,

Are tumbled back upon their *breeches*. *Anonymous.*

Rough satires, sly remarks, ill-natured speeches, are always aimed at poets that wear *breeches*.

Prior.

Give him a single coat to make, he'd do't;

A vest or *breeches*, singly; but the brute

Could ne'er contrive all three to make a suit. *King.*

BREECHES, a garment reaching from the waist to the knees. The Greeks wore their knees and legs bare, but the more barbarous nations of antiquity covered them with vestments, which were called *αλαφύρις*. These vestments were also worn by the Scythians, the Aramaspi, the Amazons, the Phrygians, Syrians, &c. Among the Greeks this garment indicated slavery, and thence foreigners, or slaves brought from other countries, were always represented so clothed by their artists. The nations of the north, as the Dacians, the Parthians, the Sarmatians, &c. usually wore them, as may be seen by the sculptures on the Trajan column. They were also worn by the Gauls; and that part which was under the Roman dominion was called Gallia Præcata from this circumstance. We find mention made of *breeches* among the ancient Getæ, Sarmatæ, Gauls, Germans, and Britons. They afterwards got footing in Italy; some pretend as early as the time of Augustus; but that emperor's *breeches*, mentioned by Suetonius, were only swaths tied over his thighs. *Breeches*, however, were at last received into Italy, and grew so highly in fashion, that it was thought necessary, under Honorius and Arca-

dus, to restrain them by law, and expel the braccari, or breeches-makers, out of the city; it being thought unworthy of a nation that commanded the world to wear the apparel of barbarians.

BREECHINGS, in the sea language, the ropes with which the great guns are lashed to the ships' side; so called, because made to pass round the breech of the gun.

BREED, *v. & n.* } Aug-Sax. brytian, bre-
BREED'ER, } dan; Teut. *bueren*, from
BREED'ING, } Goth. *bera*. See *TO BLAR*,
BREED'BATE. } *TO BRING*, BROOD, and
BRAT. To occasion, to cause, to produce, generate, bring forth, to increase, to cherish, to bring up, to educate. A breed is a cast, a kind; a subdivision of species; a family, a generation. A hatch, a number produced at once; progeny, offspring. A breeder is that which produces any thing, a prolific female, and one that takes care to raise a peculiar species of any thing. Breedbate, one of those incendiaries in social life that makes, or seizes occasions for quarrelling. Breeding is elliptically used for good-breeding, well-bred, well trained in good society.

— Ah, noble knight! what worthy meede

Can wretched lady, quitt, from woful state,

Yield you in lieu of this your gracious deed?

Your vertue selfe her own reward shall breed,

Even immortal prayse and glory wyde,

Which I your vassall, by your prowess freed,

Shall through the world make to be notifye.

Spenser.

Thereat he roared for exceeding pain.

That to have heard, great horror would have bred.

Farrie Queene.

What hurt ill company, and overmuch liberty, breedeth in youth. *Ascham's Schoolmaster.*

It was wisely observed by Quintillian, who was an excellent tutor for young gentlemen, that we ourselves, with ill breeding our children, are the authors of their evil nature. *Jer. Taylor.*

Mr. Harding, and the worthiest divine Christendom hath bred for the space of some hundreds of years, were brought up together in the same university. *Hooker.*

Time is the nurse and breeder of all good. *Shakspeare.*

I bring you witnesses,

Twice fifteen thousand hearts of England's breed. *Id.*

I am a gentleman of blood and breeding.

Shakspeare's King Lear.

If thou wilt lend this money, lend it not

As to thy friend; for when did friendship take

A breed of barren metal of his friend?

Shakspeare's Merchant of Venice.

Get thee to a nunnery; why would'st thou be a breeder of sinners? *Id. Hamlet.*

Here is the babe, as loathsome as a toad,

Amongst the fairest breeders of our time.

Id. Titus Andronicus.

My son Edgar! had he a hand to write this? a heart and brain to breed it in? *Id. King Lear.*

An honest, willing, kind fellow, as ever servant shall come in house withal; and, I warrant you, no telltale, nor no breedbate.

Id. Merry Wives of Windsor.

Where they most breed and haunt, I have observed
The air is delicate. *Id. Much Ado.*

But could youth last, and love still breed;

Had joys no date, and age no need;

Then these delights my mind might move

To live with thee, and be thy love. *Raleigh's*

Hail, foreign wonder!
Whom certain these rough shades did never breed.
Milton.

Why was my *breeding* ordered and prescribed,
As of a person separate to God,
Designed for great exploits? *Id. Agonistes.*
Whoe'er thou art, whose forward ears are bent
On state affairs, to guide the government;
Hear first what Socrates of old hath said
To the loved youth whom he at Athens bred.
Dryden.

Rode fair Ascanius on a fiery steed,
Queen Dido's gift, and of the Tyrian breed. *Id.*
Ah wretched me! by fates averse decreed
To bring thee forth with pain, with care to breed. *Id.*
None fiercer in Numidia bred,
With Carthage were in triumph led. *Roscommon.*
Infectious streams of crowding sins began,
And through the spurious breed and guilty nation
ran. *Id.*
She lays them in the sand, where they lie till they
are hatched; sometimes above an hundred at a breed.
Greiv.

A cousin of his last wife's was proposed; but John
would have no more of her breed.

Arbutnot's History of J. Bull.
Yet, if a friend a night or two should need her,
He'd recommend her as a special breeder. *Popc.*
As men of *breeding*, sometimes men of wit,
To avoid great errors, must the less commit. *Id.*
In the choice of swine, choose such to breed of as
are of long large bodies. *Mortimer.*

Bred up in grief, can pleasure be our theme?
Our endless anguish does not nature claim?
Reason and sorrow are to us the same. *Prior.*
Lucina, it seems, was *breeding*, as she did nothing
but entertain the company with a discourse upon the
difficulty of reckoning to a day. *Spectator.*
How plain I ken whence love his rise begun,
Sure he was born some bloody butcher's son,
Bred up in shambles; where our younglings slain,
Erst taught him mischief and to sport with pain.
Gay.

BREEDING, in a moral sense, denotes a person's behaviour in the external offices of social life. In this sense we say well-bred, ill-bred, a man of breeding, &c. Good breeding is hard to define; none can understand the theory but those who have the practice. Good breeding amounts to much the same with what is otherwise called politeness, amongst the ancient Romans urbanity. It is so nearly allied to virtue, that it will often lead a man into it; although, it must be owned, there are too many instances of its failing to produce this happy effect. Chesterfield, with all his good breeding, was a very bad moralist. Shaftesbury compares the well-bred man with the real philosopher: both characters aim at what is excellent, aspire to a just taste, and keep in view the model of what is beautiful and becoming. Horace seems to have united both characters:

Quid verum atque decens curo et rogo, et omnis in hoc sum.

BREEDING OF FISH. See POND.

BREED OF HORSE. See HORSE.

BREEDING-STONE, in mineralogy, a sort of mass of pebbles, joined by a sparry cement; frequent in divers parts of Hertfordshire.

BREEF CARDS, a kind of false cards, either a little longer or broader than the rest, whereby they may be felt and distinguished.

BREENBERG (Bartholomew), an excellent painter, born at Utrecht in 1620; and best known by his Christian name Italsed, Bartolomeo, he having spent the early part of his life in Rome. His pictures were held in the highest estimation. He excelled in landscapes, which he enriched with historical subjects. The figures and animals were drawn in a masterly manner. He also etched from his own designs a set of twenty-four Views and Landscapes, ornamented with Ruins. He died in 1660, aged forty.

BREEZE', } Ang.-Sax. briose; Belgic,
BREE', } brems; Ital. brissio; Welsh,
BRIZE. } bruth; from Goth. bry, brodde,
a point or sting. The gad-fly.

Till that a *brize* a scorned little creature,
Through his fairie hide his angrie sting did threaten
And vent so sore, that all his goodly feature,
And all his plenteous pasture nought him pleased.
Spenser.

Cleopatra,
The breeze upon her like a cow in June,
Hoists sail, and flies.

Shakspeare: Antony and Cleopatra.
The learned write, the insect breeze
Is but the mongrel prince of bees. *Hudibras.*
A fierce loud buzzing breeze, their stings draw blood,
And drive the cattle gadding through the wood.
Dryden.

BREEZE', } Goth. byr; Dan. bæ; Belg.
BREEZY, } breeze; Fr. brise; Ital. brezza;
BREEZELESS. } Port. brizo. A gentle gale; a
light wind; a wafting air, from the verb to bear.

Our general prepared to be in readiness, to take
the first advantage of the coming of a breeze of wind.
Sir Francis Drake. The World Encompassed.

We find that these hottest regions of the world,
scated under the equinoctial line, or near it, are so
refreshed with a daily gale of easterly wind, which
the Spaniards call breeze, that doth ever more blow
stronger in the heat of the day. *Raleigh.*

The torrid zone was by our predecessors held to be
uninhabitable, but by our modern travellers found to
be most temperate, bedewed with frequent rains, and
moistening show'ers, the *brise* and cooling blasts in
some parts, as Acosta describes, most pleasant and
fertile. *Burton's Anat. Mel.*

From land a gentle breeze arose by night,
Serenely shone the stars, the moon was bright,
And the sea trembled with her silver light.

Dryden.
The seer, while zephyrs curl the swelling deep,
Basks on the breezy shore, in grateful sleep,
His oozy limbs. *Pope.*

Gradual sinks the breeze
Into a perfect calm; that not a breath
Is heard to quiver through the closing wood.

Thomson.
The breezy call of incense-breathing morn,
The swallow twittering from the straw-built shed,
The cock's shrill clarion, or the echoing horn,
No more shall rouse them from their lowly bed.
Gray's Elegy.

The billows on the ocean,
The breezes idly roaming,
The clouds uncertain motion,
They are but types of woman. *Burns.*

Embarked, the sail unfurled, the light breeze blew—
How much had Conrad's memory to review.
Byron's Corsair.

BREEZE. Fr. *braise*; Ital. *bragia*. Cinders, burnt coals. See **BRASIER**.

BREEZE, in brick-making, small ashes and cinders sometimes madeuse of instead of coals, for the burning of bricks. But as this does not so well answer the end, the use of it was prohibited by 12 Geo. I. cap. 35, but allowed by 3 Geo. II. cap. 22, and 10 Geo. III. cap. 49.

BREEZE, a shifting wind that blows from sea or land for certain hours in the day or night; common in Africa and some parts of the East and West Indies. Breezes differ from etesiae, or trade winds, as the former are diurnal, or have their periods each day; and the latter are annual, and blow at a distance from land. The sea breezes rule by day, and the land breezes by night, being constant as the seasons of the year, or course of the sun, on which they seem to depend: not but that they appear sooner or later, stronger or weaker, in some places than in others; and vary the alternative according to the several latitudes, situations, and soils, &c. of the countries where they are found. See **WIND**.

BRENTZ, or **BERGENTZ**, a district and town of Suabia, in Germany, situated at the east end of the lake of Constance, six miles south of Lindau. The whole tract, according to M. Hassel, contains 84,000 inhabitants, exporting a considerable quantity of timber and cattle. To the south is a noted pass into Italy, called Bregentzer Clause. It is also the name of the river on which the town stands. It was taken possession of by a column of the French army, under General Kellerman, in July 1796.

BREGMA, in anatomy, the same with **SINAPI**, or the forehead. The bregma consists chiefly of two bones, hence also called *bregmatis ossa*, or *ossa parietalia*. It properly denotes the middle and fore part of the head, situated over the forehead, and extending on both sides to the temples. The origin of the word is obscure, and has been much controverted.

BREHAR, one of the Scilly islands, lying thirty miles almost directly west of the Land's End in Cornwall. It is the roughest and most mountainous of them all, and not many years ago there were only two families in it. There are several barrows edged with stone, in which they buried considerable persons in ancient times; besides many monuments of the Druids. Some are of opinion, that this with the rest made but one island, which is the reason why so many antiquities are now found in most of them.

BREHONS were the provincial judges among the ancient Irish, by whom justice was administered, and controversies decided. These sages are by some writers said to have been a distinct tribe, having competent lands allowed them in inheritance; by others to have been hereditary magistrates, attached to various tribes. Their decisions were generally made in the open air, on the tops of hills; where particular spots are frequently called to this day Brehon chairs. In criminal cases the Brehon had the eleventh part of all the fines; which could not but be considerable at a time when murders, rapes, rob-

beries, and the like offences, were only subject to pecuniary commutations. Brehonicae leges, or Brehon laws, were the general rules of law observed by the Brehons. Several fragments of the leges Brehonicae are still extant in public and private libraries. The most complete collection is that now or lately belonging to the duke of Chandos; containing twenty-two sheets and a half closely written, full of abbreviated words, and not very legible. By the statute of Kilkenny, made under Edward III., it is enacted that no English subject shall submit to a trial by the Brehon law. Notwithstanding which, many were still under a necessity of submitting to various modifications of it, until the whole kingdom was settled by king James I. Why Spenser and some modern writers should stigmatise these laws as most wicked, because murder was compounded by bribery, we are at a loss to conceive. The principle of pecuniary compensation for all crimes pervading equally the Anglo-Saxon laws, and those of all the German nations: not to mention that at this time enlightened England awards a man only pecuniary damages for the greatest moral injury that can be inflicted on his family.

BREIRACH, a mountain of Aberdeenshire, Scotland, at the south-west extremity of the county, having six springs, called the Wells of Dee, 4000 feet above the level of the ocean; they form themselves into a copious stream, which falls over a precipice; and are thus the sources of the river DEE, which see. Its whole height is about 4220 feet.

BREME. Goth. *brin*; Ang.-Sax. *brem*. Rage, or fume; cruel, sharp, severe, furious, fierce, stormy.

And anon,
He was ware of Arcite and Palamon,
That foughten breme. *Chaucer's Cant. Tales.*

And when the shining sun laugheth once,
You deemest the spring come at once:
But eft, when you count you freed from fear,
Comes the *breme* winter, with chamfred brows,
Full of wrinkles and frosty furrows. *Spenser.*

BREMEN, a duchy of Germany, in the kingdom of Hanover, lying between the Weser and the Elbe; of which the former separates it from the duchy of Oldenburg, and the latter from that of Holstein. The air is cold; and the whole country low and flat, but the soil, like that of many of our fenny districts, very rich and productive in corn, hemp, flax, and pasturage. Excellent buck-wheat and sheep-walks are found on the Geestland, or central part of the duchy, which is accounted the least fertile. The manufactures are ropes, linen, and sail-cloth; and there are also a few ship-building yards. It formerly belonged to Sweden, but was afterwards conquered by Denmark, who sold it to the king of Great Britain, as elector of Hanover, in 1716. In winter it is subject to inundations. At Christmas, 1617, some thousands of cattle were lost, and several hundred people; and the country was so covered with water, that it cost immense sums to repair the dykes. The sovereignty is said to have cost the electorate 800,000 rix-dollars.

BREMEN, a large, populous, and strong town, the capital of the preceding duchy, with an archbishop's see. The whole territory belonging to it contains seventy-five square miles, and a population of 48,500 individuals. The river Weser runs through it, and divides it into the old and new town. The harbour is six miles nearer the sea, at a place called Elsfiel. On an average, 200 Bremen ships pass through the Sound yearly, and about 900 great and small enter the port from all quarters, yet the annual revenue is not above 100,000 dollars, it is said, or £17,000 sterling. Only boats can approach the town, which is in general well built. The town-house, the exchange, and the cathedral, are the buildings principally worth notice. There is also an academy here, founded in 1529. In September 1739, while the inhabitants were asleep, the powder magazine was fired by lightning; and all the houses were shaken, as if there had been a violent earthquake. This town is governed by its own magistrates, and is divided into quarters, each of which has a burgo-master. The religion is partly Lutheran, and partly Calvinistic, the latter predominating. It has a considerable trade in its own manufacture of cotton and woollen stuffs, sugar, dye-stuffs, &c. with France, England, Spain, and Portugal; and in return imports provisions, with which it supplies Westphalia, and the countries about Hanover. It has also some profitable fisheries, and a trade in blubber. The French took possession of Bremen in 1806, and annexed it to the empire, as the head of the department of the mouths of the Weser, in 1810. It recovered its independence in 1813. It is fifty-four miles south-west of Hamburg, and ninety-five north-west of Brunswick.

BREN',
BRENT',
BREN'ING,
BREN'INGLY. } From Sax. *brennen*, to
burn. Burnt.—Obsolete.

The fires *brenne* upon the auter elere,
While Emelie was thus in her priere.

Chaucer's Canterbury Tales.

And after all this—to sleu me utterly,
Love hath his fiery dart so *brenningly*
Ystiked thurgh my trewe, careful hert,
That shapen was my deth erst than my shert.

Id.

What flames, quod he, when I thee present see
In danger rather to be dant then *brent*. *Spenser.*

BRENNAGE, **BRENNAGIUM**, or **BRENNATIUM**, in authors of the middle age, a kind of tribute paid in lieu of bran, or bran itself, which the tenants were obliged to furnish for the support of the lord's hounds.

BRENNER (Henry), was born at Kronoby, in West Bothnia, in 1669, and received his education at Upsal. In 1687, being appointed to attend the Swedish envoy to the court of Persia, he acquired the language of that country, so that Sarug Khan, the Persian ambassador, when about to depart for Stockholm, took him into his suite as an interpreter. War however having broken out between Charles XII. and the czar, the latter caused Brenner to be arrested on the road at Moscow in 1700, and kept him in confinement till the peace of Nystadt. In 1722

he returned to Stockholm, and was appointed royal librarian, a situation which he enjoyed till his death in 1732. He translated from the Armenian the history of that country, by Moses Armenus Choronensis, a work he printed at Stockholm, on his return in 1723. His other works are: Observations on the Expedition of the Czar Peter the Great against the Persians, and an Accurate Chart of the Caspian Sea, the River Daxia (supposed to be the ancient Iaxartes), &c. This chart was inserted, without acknowledgment, in the *Memorabilia Orientalis Partis Asiae*.

BRENNUS, a celebrated captain among the Gauls, who, about A.A.C. 388, entered Italy with a powerful army; made great conquests there; defeated the Romans; and sacked Rome. The capitol alone was defended; and Camillus, coming to its relief, drove the Gauls not only out of Rome, but out of all Italy. See **ROME**.

BRENT Sir Nathaniel, LL.D. was born at Little Woolford, Warwickshire, in 1573; and educated at Oxford, where he took his degrees. In 1613 he travelled abroad, and on his return married the daughter and heiress of Dr. Abbot, bishop of Salisbury, and niece of archbishop Abbot; who sent him to Venice in 1617, to procure a copy of the history of the Council of Trent, from the joint authors, fathers Paul and Fulgentio; which he translated from Italian into English. He received several promotions from the archbishop, and was knighted by king Charles I. In 1646, when Oxford surrendered to the parliament, he was restored to his warden-ship of Merton College, and appointed chief visitor of that university. He died at London in 1652, aged seventy-nine.

BRENTA, in ornithology, the Brent goose, a species of anas, with a black neck and a white collar round it. It has been usually confounded with the barnacle, and supposed to differ from it only in sex; but this is erroneous. It is somewhat larger than the barnacle, and is longer bodied.

BRENTFORD, a town of Middlesex, on the Thames, seven miles from London, on the great road to the west. It is divided into the old and new town, in which last are the church, and the market-house where the county elections are held. It consists almost entirely of a single long street, well stocked with public houses, and has a weekly corn market. Here are also one of the largest and most respectable distilleries in the kingdom and several malting-houses. The little river Brent is here joined by the Grand Junction Canal. At Brentford, Edmund Ironside, in the year 1016, attacked and defeated the Danes under Canute, in 1642 Charles I. after the battle of Edgehill, drove two regiments of the parliamentary forces from hence, with the loss of 500 men. Half a mile onwards to the west is Sion House, a nunnery founded in 1414, by Henry V. After the suppression of religious houses, it was granted by Edward VI. to the duke of Somerset, who built a magnificent edifice on the site, now the property of the duke of Northumberland. Here Lady Jane Grey resided, when she accepted the offer of the crown.

BRENTUS, in zoology, a genus of insects;

order coleoptera. Antennæ moniliform, inserted beyond the middle of the snout; head projecting; snout cylindrical and long. Species eleven; found on the shores of the Atlantic.

BREQUIGNY (Lewis-George Oudard de Feudrix), was born in the country of Caux in 1715, and died in 1795. He became a member of the French Academy, and of that of inscriptions, and was sent to England to collect materials respecting the French history. Access was given him to the Tower records, and the British Museum, by which he was enabled to throw considerable light upon many important historical points. His principal works are—1. A History of the Revolutions of Genoa, 3 vols. 12mo. 2. An edition of Strabo. 3. Lives of the Ancient Greek Orators, with a translation of several of their Discourses, 2 vols. 12mo. 4. Diplomata, Chartæ ad res Franciscas Spectantia, 4to. 5. Chronological Tables, &c. 5 vols. folio. 6. Ordonnances des Rois de France de la Troisième Race, 6 vols.

BREREWOOD (Edward), a very learned English mathematician and antiquary, the son of Robert Brerewood a tradesman, who was thrice mayor of Chester; was born in that city in 1565. He was educated in Chester; and admitted, in 1581, of Brazen-nose College, Oxford. In 1596 he became the first professor of astronomy in Gresham College in London, where he led a very retired life. He died there of a fever, Nov. 4th 1613. He never published any thing during his life, but after his death came out the following works. 1. De Ponderibus et Pretiis Veterum Nummorum. 2. Enquiries Touching the Diversities of Languages and Religion through the chief parts of the World. 3. Elementa Logicæ in Gratiam Studiosæ Juventutis in Acad. Oxon. 4. Tractatus Quidam Logici. 5, 6. Two Treatises on the Sabbath. 7. Tractatus duo, Quorum Primus est de Meteoris, Secundus de Oculo. 8. Commentarii in Ethica Aristotelis. 9. Patriarchal Government of the Ancient Church.

BRESCIA, the capital of the district Bresciano, an ancient and large city of Italy with a bishop's see and a good citadel. The cathedral is also a noble edifice of white stone. Brescia is seated on an agreeable plain on the river Garza, which runs through it. Its walls are also washed by the Mella on the west, and the Navilio on the east. It contains about 50,000 inhabitants. They manufacture silk, linen, and hardwares, and make oil from linseed. During the French domination in Italy, it formed the chief town of the department of the Mella. It has been remarkable for its calamities. It was burnt by the Goths in the year 412, and not long after was entirely ruined by Attila. Its re-construction did not take place till after the year 452. It passed subsequently under the dominion of the Lombards and the Emperors, and in A. D. 936 Otto I. declared it a free city of the empire. It soon after became a prey to the factions of the Guelphs and Gibellines. In 1478 and 1524 it was visited by a destructive pestilence; in 1550 by the small-pox, which carried off 12,000 persons in the space of five months; in 1577 and 1630 by destructive epidemics; and on 18th August 1769 a dreadful explosion of gunpowder took

place, occasioned by the lightning falling on a magazine in the neighbourhood of the gate of St. Nazario, which levelled several churches, and nearly eighty houses. It lies thirty miles south-east of Bergamo and 106 west of Venice.

BRESCIANO, a province of Italy formerly in the territory of Venice, now part of the Lombardo-Venetian Kingdom; bounded on the north by the Grisons and the bishopric of Trent, on the east by the lake Garda, the Veronese, and the duchy of Mantua, on the south by Mantua and the Cremonese, and on the west by the Cremasco, the Bergamasco, and the Valteline. It is watered by several rivers, which render it very fertile; is full of towns and villages, and has not less perhaps than 500,000 inhabitants. The towns of most note are Brescia, Breno, Chiari, Salò, and Verola-Alghise. The Brescian dialect of the Italian is considerably intermixed with French. Northward the country is mountainous, but in the south it is spread out in fertile plains, producing sometimes in one season, grain, flax, and millet. The great fertility has been attributed to the extent of irrigation, the rivers Chiese, Oglio, Mella, and Susa, intersecting the country in a variety of directions, and branching out into canals. The inhabitants have also the character of being very industrious. The most celebrated production is the wine called the vino di santo, or vino santo, which, after the lapse of some years, becomes of a beautiful golden color, and acquires an exquisite taste. Here also are manufactures of earthenware, paper, iron, copper, and fire-arms, and considerable quantities of silk are procured. At Gardona, about ten miles from Brescia, is a cannon foundry, and fishing is here an important occupation. The sands of the Adda and Oglio are said to yield particles of gold. Near the lake of Isco are found topazes and garnets, and at Trompia, in the same valley, extensive iron mines; this part of the country likewise contains jasper, copper, alabaster, &c.

BRESILIA, in ornithology, a species of tanager, in the order of passeræ.

BRESLAU, or **BRESLAW**, a small duchy of lower Silesia, in Germany, lying between those of Wohlau, Oels, Brieg, Schwiednitz, and Liegnitz. It is every where level and flat; is an excellent corn and pasture country, abounding with herds of cattle and flocks of sheep; but destitute of wood, except in one district. Both the property and jurisdiction belong to the king of Prussia. It contains 950 square miles, and 178,000 inhabitants; being divided into the circles of Breslau, Namslau, and Neumarkt.

BRESLAU, or **BRESLAW**, the chief town of the duchy, and of all Silesia, is situated at the conflux of the Oder and Ohlau. It is divided into the new and old town; and including the suburbs, is of great extent. It is a bishop's see, having many large regular squares, broad streets, and stately public and private edifices; surrounded with walls and other fortifications, having six gates. There are twenty-six churches, besides convents belonging to the Catholics; eight of the Lutheran, and one of the Calvinist persuasion. The cathedral church of St. John, containing seventeen chapels, is built on an island, outside of the town. The Jews have likewise two synagogues and a school. the bishop

a stately palace, and the Lutherans two gymnasiums. The catholic university is a noble structure, and the exchange magnificent; the former was instituted by the emperor Leopold in 1702, and contains sometimes 400 students. This city is the third in rank, next to Berlin and Königsburg, in the whole Prussian dominions. Its trade and manufactures are very considerable. The staple article is linen; but Turkish yarn, silk, printed cottons, calicoes, chintz, and woollen stuffs, are also largely dealt in. It was taken by Prussia in 1741, and retaken by the Austrians in 1757; but the king of Prussia recovered it again the same year, and gained a signal victory over the Austrians at Leuthen, a village not far from the capital. It was again invested by the Austrians in 1760, and endured a three days bombardment. In December, 1806, it underwent another siege and bombardment by the Bavarians and their allies; to whom, after the destruction of the entire suburbs, it was surrendered and capitulated on the 7th of the ensuing January. Breslaw is 130 miles east of Dresden, and 165 north of Vienna.

BRESSAY, or BRASSA, one of the Shetland islands about four miles long and two broad, lying to the east of the coast of Shetland. It consists of 366 merks of land, and has a good harbour in Brassy Sound, where Greenland whale ships and Dutch herring vessels rendezvous. On the north is a deep bay, called Aith's Voe. The island is appropriated to pasture, and the inhabitants, who amount to several hundreds, are devoted to fishing and agriculture. Here are the remains of several chapels, and ancient forts. At the north entrance of the sound is a sunken rock, called the Unicorn, from a ship of that name, wrecked on it about the year 1568.

BREST', *n. s.* in architecture. That member of a column, called also the torus, or tore.

BREST SUMMERS. The pieces in the outward parts of any timber building, and in the middle floors, into which the girders are framed.

BREST, a maritime town of France, in the department of Cape Finisterre, and *ci-devant* province of Brittany, seated on the declivity of a hill, on the side of its port, which is one of the best in Europe. One of its chief advantages is that vessels can leave it with almost any wind. It contains a noble naval arsenal and dock-yard, which the authorities are very jealous of exhibiting to strangers. The craggy and narrow entrance, into the port, called the Goulet, is guarded by a strong castle seated on a rock, which cannot be attempted on the sea side; and is defended on the land side by a ditch and other fortifications. There are several sunken rocks near the entrance; on the most dangerous of which, the *Mingan*, the Republican, a French ship of the line, was wrecked in 1794: foreign vessels, indeed, always require a pilot here. The streets of the town are narrow and ill-contrived, and the inland trade is small. An attempt was made to seize Brest, in 1694, by a British fleet and army, under lord Berkley, who were repulsed after a desperate conflict, with the loss of 400 seamen, 200 soldiers, and the gallant general Tahmache. But he more successfully managed to blockade this port during the greater part of that war. It is 48 leagues west of Rennes, and 41 west of Paris.

BRET, *n. s.* A fish of the turbot kind, also burt or brut.

BERT is a name given on the coasts of Lincolnshire to the turbot, a fish extremely plentiful there, and taken in vast numbers. They are caught in a net, trailed by two horses, the one going up to the middle of his body in water, the other on shore.

BRETACHLÆ, in writers of the middle age, denote wooden towers or castles, wherewith towns or camps were defended.

BRETAGNE, a *ci-devant* province of France, now formed into five departments, viz. North Coast, Finisterre, Ille and Vilaine, Lower Loire, and Morbihan. See BRITANY.

BRETESSE, in heraldry, denotes a line embattled on both sides.

BRETEUIL, a town of France, in the department of the Lower Seine, seated on the river Iton, fifteen miles south-west of Evreux. Long. 1° 0' E., lat. 48° 56' N.

BRETHIREN, *n. s.* The plural of brother. See BROTHER.

All these sects are *brethren* to each other in faction, ignorance, iniquity, perverseness, pride. *Swift.*

BRETHREN AND CLERKS OF THE COMMON LIFE, a denomination assumed by a religious fraternity towards the end of the fifteenth century. They lived under the rule of St. Augustin, and were eminently useful in promoting the cause of religion and learning. Their society was first formed, in the fourteenth century, by Gerard de Groote, a native of Deventer; but did not flourish till it obtained the approbation of the council of Constance. It became very respectable in Holland, the Lower Germany, and the adjacent provinces. It was divided into two classes; the lettered brethren or clerks, and the illiterate: they lived in separate habitations, but maintained the closest fraternal union. The former applied to the study of polite literature, and the education of youth; whilst the latter were employed in manual labor, and the mechanic arts. They are frequently called Beghards and Lollards, by way of reproach.

BRETHREN AND SISTERS OF THE FREE SPIRIT, in ecclesiastical history, an appellation assumed by a sect which sprang up towards the close of the thirteenth century, and gained many adherents in Italy, France, and Germany. They took their denomination from the words of St. Paul, Rom. viii. 2, 14, and maintained that the true children of God were invested with perfect freedom from the jurisdiction of the law. They were enthusiasts to a degree of distraction, both in their principles and practice. In their aspect, apparel, and manner of living, they resembled the Beghards, and were sometimes called after them. Some of their professed principles resembled those of the Pantheists; for they held, that all things flowed by emanation from God; that rational souls were portions of the Deity; that the universe was God; and that, by the power of contemplation, they were united to the Deity, and acquired, hereby, a glorious and sublime liberty, both from the sinful lusts and the common instincts of nature: hence they concluded, that the person, who was thus absorbed in the abyss of the Deity, became a part of the God-

head, and was the son of God, in the same sense and manner that Christ was, and freed from the obligation of all laws human and divine. They treated with contempt Christian ordinances, and all external acts of religion, as unsuitable to the state of perfection at which they were arrived. Some of them were honest but deluded enthusiasts; and endured the torments inflicted on them by the inquisitors with astonishing heroism and triumph. Others proceeded to the most extravagant licentiousness of conduct, maintaining that the divine man, or believer, could not sin, let his conduct be ever so atrocious. Many edicts were published against them; but, notwithstanding the severities they suffered, they continued till about the middle of the fifteenth century. They were called by several names, such as Schwestriones, Picards, Adamites, and Tur-lupins.

BRETHREN, WHITE, *fratres albat*, were the followers of a priest from the Alps, about the beginning of the fourteenth century, who was arrayed in a white garment; and, as they were also clothed in white linen, they were distinguished by this title. Their leader carried about a cross, like a standard, and his apparent sanctity and devotion drew together a number of followers. This enthusiast practised many acts of mortification and penance, endeavoured to persuade the European nations to renew the holy war, and pretended that he was favored with divine visions. Boniface IX. ordered him to be apprehended and committed to the flames, upon which his followers dispersed.

BRETON, CAPE, an island near the eastern continent of North America, lying between 45° and 47° N. lat. It is separated from Nova Scotia by a narrow strait called Canso, and is about 100 miles in length, and fifty in average breadth. It is surrounded with little sharp-pointed rocks, separated from each other by the waves, above which some of their tops are visible. All its harbours are open to the east turning towards the south. On the other parts of the coast there are but a few anchoring places for small vessels, in creeks, or between islets. Except in the hill parts, the surface of the country has but little solidity, being everywhere covered with a light moss and water. The dampness of the soil is exhaled in fogs, without rendering the air unwholesome. In other respects the climate is cold; owing either to the prodigious quantity of lakes, which cover above half the island, and remain long frozen, or to the number of forests, that totally intercept the rays of the sun; which are also obscured by perpetual clouds.

Though some fishermen had long resorted to this island every summer, not above twenty or thirty had ever fixed there. The French, who took possession of it in August 1713, were properly the first inhabitants. They changed its name into that of *Isle Royale*, and fixed upon fort Dauphin for their principal settlement. This harbour was two leagues in circumference. The ships came to the very shore, and were sheltered from winds. Forests, affording oak sufficient to fortify and build a large city, were near at hand; the ground appeared less

barren than in other parts, and the fish were more plentiful. The harbour might have been rendered impregnable at a trifling expense; but the difficulty of approaching it (a circumstance that had at first made a stronger impression than the advantages resulting from it) occasioned it to be abandoned, after great labor had been bestowed upon the undertaking. They then turned their views to Louisbourg, the access to which was easier; and convenience was thus preferred to security: the fortification of Louisbourg, however, was not begun till 1720. In 1714 some fishermen, who till then had lived in Newfoundland, settled in this island. It was expected that their number would soon have been increased by the Acadians, who were at liberty, from the treaties that had been granted them, to remove with all their effects, and even to dispose of their estates; but these hopes were disappointed. The Acadians chose rather to retain their possessions under the dominion of Britain, than to give them up for any precarious advantage they might derive from their attachment to France. Their place was supplied by some distressed adventurers from Europe, who came over, from time to time, to Cape Breton, and the number of inhabitants gradually increased to 4000. They were settled at Louisbourg, Port Dauphin, Port Toulouse, Nerucka, and on all the coasts where they found a proper beach for drying the cod. The inhabitants never applied themselves to agriculture, the soil being unfit for it. They often sowed corn, but it seldom came to maturity; and when it did thrive so much as to be worth reaping, it had degenerated so considerably, that it was not fit for seed next spring. They have only continued to plant a few pot-herbs, that are tolerably well tasted, but must be renewed every year from abroad. The poorness and scarcity of pastures have likewise prevented the increase of cattle. In a word the soil of Cape Breton seemed calculated to invite none but fishermen and soldiers. Though the island was entirely covered with forests before it was inhabited, its woods have scarcely ever been an object of trade. A great quantity, however, of soft wood was found there fit for firing, and some that might be used for timber; but the oak has always been scarce, and the fir never yielded much resin. The peltry trade was a very inconsiderable object. It consisted only in the skins of a few lynxes, elks, musk rats, wild cats, bears, otters, and foxes, both of a red and silver-gray color. Some of these were procured from a colony of Indians, who had settled on the island with the French, and never could raise more than sixty men able to bear arms. The rest came from St. John's or the neighbouring continent. Greater advantages might possibly have been derived from the coal mines which abound in the island. They lie in a horizontal direction; and, being only six or eight feet below the surface, may be worked without digging deep, or draining off the waters. Notwithstanding the prodigious demand for this coal from New England, from 1745 to 1749, these mines would probably have been forsaken had not the ships which were sent out to the French islands wanted ballast. In one of these mines a fire has been kindled,

which could never yet be extinguished. The people of Cape Breton did not send all their fish to Europe. They sent part of it to the French southern islands, on board twenty or twenty-five ships from seventy to 140 tons burden. Besides the cod, which made at least half their cargo, they exported to the other colonies timber, planks, thin oak boards, salted salmon, and mackarel, train oil and sea coal. All these were paid for in sugar and coffee, but chiefly in rum and molasses. The island could not consume all these commodities. Canada took off but a small part of the overplus; it was chiefly brought to the people of New England, who gave in exchange fruits, vegetables, wood, brick, and cattle. This trade of exchanging was allowed; but a smuggling trade was added to it, carried on in flour, and salt fish.

This island, the key of Canada, was attacked by the English, in 1745; and the event is of so singular a nature, that it deserves a particular detail. The plan of this first invasion was laid at Boston, and New England bore the expense of it. A merchant named Pepperel, who had excited, encouraged, and directed the enterprise, was entrusted with the command of an army of 6000 men, which had been levied for this expedition. Though these forces, convoyed by a squadron from Jamaica, brought the first news to Cape Breton of the danger that threatened it, and the advantage of a surprise would have secured the landing without opposition, the success of the undertaking was still precarious. These inexperienced troops stood in need of the assistance of some fortunate incident, with which they were indeed favored in a singular manner. The construction and repairs of the fortifications had always been left to the care of the garrison of Louisbourg, and the soldiers were eager to be employed in these works, as the means of procuring them a comfortable subsistence. But, obtaining no pay, they had lived in open rebellion for six months, when the British appeared before the place. This was the time to conciliate both parties, and to unite in the common cause. The soldiers made the first advances; but their commanders mistrusted a generosity of which they themselves were incapable. They believed that the soldiers were only desirous of sallying out, that they might have an opportunity of deserting; and their own officers kept them in a manner prisoners, till a defence so ill managed had reduced them to the necessity of capitulating. The whole island shared the fate of Louisbourg, its only bulwark. This valuable possession, restored to France by the treaty of Aix-la-Chapelle, was again attacked by the British in 1758. On the 2d of June, a fleet of twenty-three ships of the line and eighteen frigates carrying 16,000 well-disciplined troops, anchored in Gabarus bay, within half a league of Louisbourg. As it was evident it would be to no purpose to land at a great distance, because it would be impossible to bring up the artillery and other necessities for a considerable siege, it had been attempted to render the landing impracticable near the town. In the prudent precautions that had been taken, the besiegers saw the dangers and difficulties they had to expect; but, far from being deterred

by them, they had recourse to stratagem, and while by extending their line they threatened and commanded the whole coast, they landed by force of arms at the creek of Cormorant. This place was naturally weak. The French had fortified it with a good parapet planted with cannon. Behind this rampart they had posted 2000 excellent soldiers and some Indians. In front they had made a close hedge with branches of trees, which would have been very difficult to penetrate, even if it had not been defended. This pallisade, which concealed all the preparations for defence, appeared at a distance to be nothing more than a verdant plain; and would have preserved the colony, had the assailants been suffered to complete their landing, and to advance with the confidence that they had but few obstacles to surmount. Had this been the case, overpowered at once by the fire of the artillery and the small arms, they must infallibly have perished on the shore or in the hurry of re-embarking, especially as the sea was then very rough; which would have defeated the whole project. But all the prudent precautions that had been taken by the French, were rendered abortive by their own impetuosity. The English had scarcely begun to move towards the shore, when their enemies, by their brisk and hasty fire at their boats, and still more by the premature removal of the boughs that masked the forces, (which they ought to have concealed), led them to guess at the danger they were going to run into. They immediately turned back, and saw no other place to effect their landing but a rock, which had been always deemed inaccessible. General Wolfe, though much taken up in re-embarking his troops, and sending off the boats, gave the signal to major Scott to repair thither. That officer immediately removed to the spot with his men. His own boat coming up first, and sinking at the very instant he was stepping out, he climbed up the rock alone. He hoped to meet with 100 of his men, who had been sent thither some time before. He found only ten. With these few, however, he gained the summit of the rock. Ten Indians and sixty Frenchmen killed two of his men, and mortally wounded three. In spite of his weakness he stood his ground under cover of a thicket, till his brave countrymen, regardless of the boisterous waves and the fire of the cannon, came up to him, and put him in full possession of that important post, the only one that could secure their landing. The French, as soon as they saw that the enemy had got a firm footing on land, betook themselves to the only remaining refuge, and shut themselves up in Louisbourg. The fortifications were in a bad condition, because the sea sand, which they had been obliged to use, is by no means fit for works of masonry. The revetments of the several curtains were entirely crumbled away. There was only one casement, and a small magazine, that were bomb-proof. The garrison which was to defend the place consisted only of 2900 men. Notwithstanding all these disadvantages, the besieged determined to make an obstinate resistance. They were confirmed in their resolution by the courage of a woman. Madame de Drucourt was continually upon the ramparts, with her purse in

her hand; and firing herself three guns every day, seemed to dispute with the governor, her husband, the glory of his office. The besieged were not dismayed at the ill success of their several sallies, or the masterly operations concerted by admiral Boscawen and general Amherst. It was but at the eve of an assault, which it was impossible to sustain, that they talked of surrendering. They made an honorable capitulation; and the conqueror showed the respect due to his brave enemies, and did not sully his glory by any act of barbarity or avarice. The possession was confirmed to Great Britain by the peace in 1763; since which, the fortifications have been blown up and the town of Louisbourg dismantled.

Cape Breton was considered to belong to Nova Scotia, in respect to matters of government, till the year 1784, when it was erected into a separate government, by the name of Sidney. It contains about 1000 inhabitants, who have a lieutenant-governor, appointed by the king. It lies between 45° 28' and 47° N. lat. and 59° 44' and 61° 29' W. long., and is 135 miles east of Halifax.

BREVE, in law, is any writ directed to the chancellor, judges, sheriffs, or other officers, whereby a person is summoned, or attached, to answer in the king's court, &c.

BREVE, *n. s.* in music. A note or character of time, equivalent to two measures or minims. It is in the form of a diamond or square, without any tail.

BREVE DE RECTO, is a writ of right or licence, for a person ejected, to sue for the possession of the estate detained from him.

BREVE PERQUIRERE, the purchasing of a writ or licence for trial in the kings courts; whence comes the present use of paying 6s. 8d. fine to the king in suit, for money due on bond, where the debt is £40, and 10s. where it is £100, &c.

BREVET, *Fr.* denoted the grant of some favor or donation from the king; partly answering to our warrant, and partly to letters patent. It was particularly applied to the commission of a subaltern officer, being only written on parchment, and without seal.

BREVET RANK is a rank in the army higher than that for which pay is received. Also a term used to express general promotion, by which a given number of officers are raised from the rank of captain, upwards, without any additional pay, until they reach the rank of major-general; when, by a late regulation, they become entitled to a quarterly allowance.

BREVIARIUM. See BREVIARY.

BREVIARY, *Fr.* *breviaire*; *Lat.* *brevis*, *bre'viate*, *bre'vio*, *bre'vium*, *bre'vitas*. *BRE'VIATURE*, *An* abridgment, epitome; a *BRE'VITY*, *compendium*; the substance of something larger; abbreviation; conciseness, shortness; contraction into few words. The book containing the daily service of the church of Rome is called a breviary.

Cresconius, an African bishop, has given us an abridgment, or *brevariary* thereof. *Ayliffe*.

It is obvious to the shallowest discourses, that the whole counsel of God, as far as it is incumbent for man to know, is comprised in one *brevia* of evangelical truth. *Decay of Piety*.

Virgil, studying *brevis*, and having the command of his own language, could bring those words into a narrow compass, which a translator cannot render; without circumlocutions. *Dryden*.

This argument is stated by St. John with his usual elegant *brevis* and simplicity; 'Beloved, if God so loved us, we ought to love one another.' *Porteus*.

BREVIARY, BREVIARIUM, in Roman antiquity, a book first introduced by Augustus, containing an account of the application of the public money.

BREVIARY, in the Romish church, is composed of matins, lauds, first, third, sixth, and ninth vespers, and the compline or post communion. It is general, and may be useful in all places; but on its model various others have been built, appropriated to dioceses, and different orders of religious. The institution of the breviary is not very ancient; there have been inserted in it the lives of the saints, full of ridiculous stories, which gave occasion to several reformations of it, by several councils, particularly those of Trent and Cologne; by several popes, particularly Pius V. Clement VIII. and Urban VIII. and also by several cardinals and bishops, each lopping off some extravagancies, and bringing it much nearer to the simplicity of the primitive offices. Originally, every body was obliged to recite the breviary every day; but by degrees the obligation was reduced to the clergy only, who were enjoined under penalty of mortal sin and ecclesiastical censures, to recite it at home, when they cannot attend in public. In the fourteenth century, there was particular reserve granted in favor of bishops, who were allowed on extraordinary occasions, to pass three days without rehearsing the breviary. The office was originally called *cursum*, and afterwards *brevarium*; which imports that the old office was abridged; or rather, that this collection is a kind of abridgment of all the prayers. The breviaries now in use are innumerable; the difference between them consists principally in the number and order of psalms, hymns, paternosters, ave-maries, creeds, magnificates, &c. &c.

BREVIARY of the Greeks is the same in almost all churches and monasteries that follow the Greek rites; the Greeks divide the psalter into twenty parts. In general, the Greek breviary consists of two parts; the one containing the office for the evening, the other that of the morning, divided into matins, lauds, first, third, sixth, and ninth vespers, and the compline; that is, of seven different hours, on account of that saying of David, *Septies in die laudem dixi tibi*.

BREVIATOR, an officer under the eastern empire, whose business it was to write and translate briefs. At Rome those are styled *breviators*, or *abbreviators*, who dictate and draw up the pope's briefs.

BREVIUS A ROTULIS LIBERANDIS, a writ to a sheriff, to deliver to his successor the county, with the appurtenances, and the rolls, writs, and other things belonging to his office.

BREVICORNIS, in entomology, a species of cerambyx; thorax green; wing-cases obscure; antennæ short, and black. Found in Sierra Leone. Also a species of *neocyda*: head and thorax fuscous; the wing-cases very minute; an-

tennæ, short and thick ; inhabiting Guinea. Also a species of cimex, of a dull cupreous color : antennæ, very short and compressed : the anterior thighs dentated. Also a species of tipula, of a black glossy color. A native of Europe. Also a species of monocolus, that inhabits marshes overflowed by the sea : hairs of the tail very short. The antennæ in the male are hooked, in the female forked at the tips.

BREYTER, *n. s.* A particular size of letter used in printing ; so called, probably, from being originally used in printing a breviary.

BREVITY is particularly used in speaking of style or composition. It is by some called brachylogia and brevilouquence ; sometimes laconismus. Tacitus and Persius are remarkable for the brevity of their style. There are two kinds of brevity, one arising from dryness, poverty, and narrowness of genius ; the other from judgment and reflection ; which latter alone is laudable. Brevity is so essential to a tale, a song, an epigram, and a public speech, that without it they become dull. Rhetoricians make brevity one of the principal marks or conditions of eloquence ; but the rules they prescribe for attaining it are difficult to apply, so as still to keep the due medium between too much and too little. It is the selection of comprehensive words which Quintilian admires so much in Sallust ; and the imitation of which, by other writers, has caused so much obscurity.

BREVIUM CUSTOS. See **CUSTOS**.

BREUSCH, a river of France in the department of the Lower Rhine, and ci-devant province of Alsace. It divides into two branches, one of which receives the Mosley, and by means of a canal, four miles long, made by Louis XIV. runs into the Ill above Strasburg ; the other runs through Strasburg, and falls into the Ill below it.

BREW', *v. & n.* } Goth. *brigga* ; Dan. *brige* ; Swed. *brigga* ; Ang.-Sax. *brīwan* ; Teut. and Belgic *bracen* ; Russ. *barw* ; Welsh *braga*. The word seems to be cognate with the Saxon *brug* ; Scotch and Irish *brochan* ; Welsh *brechan* ; a farinaceous mixture. Fr. *brasser* ; barbarous Lat. *bracho*, *braxo*, may be from *brac*, *barac*, grain. The idea is mixture and fermentation. To infuse grain into water ; but more principally for the purpose of making fermented liquor. It is applied chiefly to making of beer, our forefathers tell us, by the simple ingredients of malt, hops, and pure water : in modern times it is quite another thing : there is an animal can explain what we mean, a kind of tolerated unlicensed poisoner, called a brewer's druggist. The verb is metaphorically applied to preparing or exciting civil commotions and plots ; to the raising any heating, boiling, commixture of the passions. Pope uses it as descriptive of the operations of nature in producing storm and tempest.

In all the town, n'as *brewhouse* ne *taverne*,
That he ne visited with his *solas*,
Ther as that any *gaillard* toptower was.

Chaucer's Canterbury Tales.

I keep his house, and wash, wriung, *brew*, bake,

scour, dress meat, and make the beds, and do all myself. *Shakspeare.*

Take away these chalices ; go, *brew* me a pottle of sack finely. *Id.*

Here is neither bush nor shrub to bear off any weather at all, and another storm *brewing*. *Id.*

When *brewers* mar their malt with water. *Id.*

Go, *brew* a pottle of sack finely.

— With eggs, sir ? —

— Simple of itself : I'll no pullet-sperm in my *breuage*. *Id.*

A *brewing* of new beer set by old beer, maketh it work again. *Bacon.*

We have drinks also *brewed* with several herbs, and roots, and spices. *Id.*

Trial would be made of the like *brew* with potatoe roots, or burr roots, or the pith of artichokes, which are nourishing meats. *Id.*

In our *brewhouses*, *bakehouses*, and *kitchens*, are made divers drinks, breads, and meats. *Id.*

Mercy guard me !

Hence with thy *brewed* enchantments, foul deceiver. *Milton.*

I found it to be the most malicious and frantick surmise, and the most contrary to his nature, that, I think, had ever been *brewed* from the beginning of the world, howsoever countenanced by a libellous pamphlet of a fugitive physician, even in print. *Wotton.*

Or *brew* fierce tempests on the watery main

Or o'er the globe distil the kindly rain. *Pope.*

Men every day eat and drink, though I think no man can demonstrate out of Euclid, or Apollonius, that his baker, or *brewer*, or cook, has not conveyed poison into his meat or drink. *Billotson.*

Why dost thou glory in thy strength of beer,
Firm-cork'd, and mellow'd till the twentieth year,
Brew'd, or when Phœbus warms the fleecy sign,
Or when his languid rays in Scorpio shine. *Gay.*

O where is wisdom, when, by this o'erpower'd,
The state is censured, and the maid deflower'd ?
And wilt thou still, O squire ! *brew* ale so strong ?
Hear, then, the dictates of prophetic song. *Id.*

BREWER (Antony), a dramatic poet, who flourished in the reign of king Charles I. and appears to have been held in high estimation by the wits of that time, as may be gathered from an elegant compliment paid to him in a poem called Steps to Parnassus, wherein he is supposed to have a magic power to call the muses to his assistance, and is even set on an equality with the immortal Shakspeare. There are great disputes as to the number of his works. Those which have been ascribed to him with any certainty are, 1. The Country Girl, a comedy. 2. The Lovesick King. And, 3. Lingua : respecting which Winstanly records a remarkable anecdote. He tells us, that, when this play was acted at Cambridge, Oliver Cromwell, then a youth, acted a part in it, and entered warmly into the ideal character. The substance of the piece is a contention among the senses for a crown, which Lingua had laid for them to find. The part allotted to young Cromwell, was that of Tactus or Touch ; who, having obtained the contested coronet, makes this spirited declamation :

Roses and bays, pack hence ; this crown and robe
My brows and body circles and invests :
How gallantly it fits me ! sure the slave
Measured my head who wrought this coronet, —

They lie, that say complexions cannot change !
My blood's ennobled, and I am transformed
Unto the sacred temper of a king.
Methinks I hear my noble parasites
Styling me Cæsar, or Great Alexander,
Licking my feet, &c.

It is ascribing too much, however, to such a trifling circumstance, to suppose, as some have done, that this speech first fired Cromwell's soul with ambition, and excited him from the possession of an imaginary crown to stretch his views to that of a real one.

BREWERIA, in botany, a genus of plants : class pentandria, order monogynia. Natural order campanaceæ, Linn. Convolvulaceæ, Juss. Br. CAL. five deep segments : cor. funnel-shaped, plaited : STYL. deeply divided : STIG.

B R E W I N G.

BREWING, as we have already shown (see our article **ALE**), has from a remote period, and in various countries, been practised as a domestic art ; sometimes conducted by the male, and at other times by the female, portion of the household. The honor of its invention, indeed, has been assigned to an Egyptian lady. And in its domestic application to the supplying an English family with the beverage of our forefathers, good ale, it has, in the article adverted to, engaged a considerable portion of our attention. We there observed that the brewing of all kinds of malt liquor is conducted by the same general process : the only difference in the results arising, in the first instance, from the different kinds of malt employed, the quantity of that essential article used—and, we may here add, the scale upon which the operations are conducted. That is, the extensive consumption of malt liquor in this country, by the middling and poorer classes, has rendered 'the brewery,' as it is called, especially in and about London, the most opulent, perhaps, of all trades ; enormous capitals have been devoted to its cultivation and monopoly ; and while this system has its evils, of which we shall be free to speak presently, it has on the other hand been the means of encouraging the application of science to every part of this process, and a far better beverage is thus doubtless produced to the public than could be brewed on any small scale. We here allude particularly to the brewing of porter, which has never succeeded in small establishments : and which, as brewed by all the respectable London houses, has for many years past very steadily retained its nutritious character and peculiar flavor. We shall endeavour in this paper to state, 1. The commercial history of this art, and its present state ; 2. The different kinds of grain employed in brewing ; 3. The process of brewing porter more particularly ; and give, lastly, a practical description of a London porter brewery.

1. *Of the commercial history of brewing.*—In the barley-country of Egypt we have found the first private brewers ; the keepers of taverns and places of public refreshment were without doubt the first brewers of malt liquors for sale ; among

capitate : CAP. two cells, valvular : SEEDS two in each cell. These are diffuse herbs, not milky ; their leaves undivided ; flowers axillary, mostly solitary. They are all natives of New Holland, and are described by Mr. Brown.

BREWERS.—There are companies of brewers in most capital cities ; that of London was incorporated in 1427 by Henry VI. and that of Paris was still older. The brewers of Edinburgh are not a corporation.

BREWERS-HAVEN, a good harbour at the north end of the island of Chiloé, on the coast of Chili, in South America, lying on the South Sea. The Dutch landed forces here in 1643, designing to get possession of some part of Chili ; but they were driven from thence by the Spaniards and the natives. Long. 82° 0' W., lat. 42° 0' S.

our Anglo-Saxon ancestors we find a law forbidding a priest to eat or drink at ceapealethelum, or places where ale was sold ; Tindal speaks of the 'dutie of the bruer to serve his brethren faithfully ;' and Stowe, 1414, of one William Murle, a rich maultman, or bruer of Dunstable, who had his two horses traped with golde following him, and a pair of gilt spurs in his bosome ; but the 'common brewer' of the metropolis, and our large towns and their neighbourhoods, is an individual of comparatively modern times. He is a wholesale beer-merchant, restricted by law from dealing in it by retail : and he divides the brewing of all beer sold with the brewing publican. The latter class of brewers, very few of whom are found in London, amounted a short time since to about 24,000, while the common brewers (not retailers) amounted to 1400 only in number. Yet the quantity of business conducted by the latter is far greater : the London brewers alone, it is said, holding at this time nearly one-third of the entire brewing business of the whole country. And it is remarkable how greatly this business in the metropolis has been drawn of late into the hands of eight or ten gigantic capitalists. Within the Bills of Mortality thirty years ago, there were from forty to fifty public breweries carrying on a trade of from 10,000 to 100,000 barrels annually, on capitals of from £30,000 to £50,000 and upwards : the proprietors being persons of the highest respectability, and more generally than at present the owners or mortgagees of the leases of public houses. Sometimes the leases of victualling houses contained a positive stipulation that the porter or ale drank in the house should be supplied by particular brewers.—*Exam. of C. Barclay, Esq. before the Committee of the House of Commons on the Police of the Metropolis.*

We have lately seen a list of eighty-six London breweries who sent out 4000 barrels and upwards from May, 1786, to May 1787. It was the custom at that time to publish an annual account of the business done by the first twelve houses, none of whom sent out less than 30,000 barrels. Three or four years ago Mr. Barclay presented to the House of

Commons an account of the quantity of beer brewed by the largest houses in the porter trade (including some that sent out but 6000 and 9000 barrels), who in 1807 amounted to eighteen; in 1813 to fifteen; in 1816 to fourteen. Latterly there have been but ten of these great houses, of whom the annual account is published. Yet these accounts compared prove that an increase of one-seventh more of the business of 1807 was executed in 1816 by the smaller number of firms.

In the neighbourhood of London, and in the country, several causes have contributed, during this period, to throw the leases of public-houses into the hands of brewers. The better state of the roads and means of conveyance have prolonged all the first stages out of town: magistrates have thought it incumbent on them to lessen the number of public-houses; and those improvements in the style of building have taken place on every line of road which have a natural tendency to abolish the small public-house, or pot house. Hence while the small breweries in London have been absorbed in the larger ones, the smaller public houses in the neighbourhood have also been merging themselves in the larger, and have become desirable as a property (which Lord Mansfield has declared them to be), have become in many instances a property far beyond the means of the parties who usually enter into the business of a publican. It would not therefore, be difficult to find twenty names in London and its vicinity, who divide amongst them more than one-half of the whole brewing business of England.

Such a change has, of course, added enormously to the pecuniary consideration and influence of the large brewers of the metropolis, and to the extension of the monopoly of serving public houses in one particular direction principally; or to the concentration of the far larger part of the trade in the hands of a few overwhelming capitalists. That particular direction which the monopoly in question has taken in London, of late years, is to purchase the publican, not the public-house; and by means of the 'weight' which, according to the language of the Police Report, these gigantic firms obtain 'with the magistracy,' to influence the discretion hitherto vested in magistrates with regard to the granting of public-house licences. The London brewers have unequivocally disavowed any attempt at bribing or remunerating magistrates for their conduct in this respect, and have, perhaps, successfully rebutted the charge of any deterioration in the article they brew, as compared with that of former years. That they possess, however, the influence in question, a Committee of the House of Commons has affirmed there can be 'no doubt:' the range of each house is as well understood in the London trade, and can be as little interfered with practically, as a gentleman's manor; plans of ground newly laid out for building, are said to be diligently taken, and forwarded to head-quarters, that a new public house in the regular interest of the district, may be duly planted, and that no diversion of interest may take place: here then is to be found the nucleus of the monopoly

system. The licences annually obey the mysterious influence of the great houses, and all that part of the trade which is worth purchasing is bound to them by loans to the publican. The members of these firms then may truly declare that they take no leases of premises as heretofore, and wholly abstain from binding the publican by written stipulations for supplying him with beer; but Mr. Barelay admits that at least one-half of the number of houses in his trade are confined houses, (three-eighths by loan of money). Messrs. Whitbread's have but three-sevenths of their trade stated to be free, i. e. three-sevenths of the number of their houses, bad and good, profitable, doubtful, and unprofitable customers, taken together. Messrs. Truman and Hanbury about the same proportion. One material fact, however, does not appear in the evidence that furnishes us with these calculations, i. e. the quantity of business that is free. The fair presumption of the case is that these gentlemen do not lend their assistance to the profligate and idle, or on the least productive houses; but to the industrious and attentive to business, and with some hope of a suitable return. But the statement given in evidence before the police committee numbers one house with another; that which disposes of twenty butts per month, and that which disposes of two or three; that to which it is reckoned prudent to afford a loan of £2000 or £3000 with that which possesses a beer licence, (and therefore receives only a few barrels annually), to sell gin! It is quite clear, from this view of the subject, that nineteen-twentieths of the business of these houses may be restricted to certain brewers by the loan of essential capital, while the given proportions of their literal number are correctly stated to be free.

The evils of this system have been long felt; undue influence in many cases of granting valuable licences, and direct bribery in some, have been demonstrated to exist. Beer is an article of as great importance to the common people as cheese or butter, and but little inferior to that of bread. 'Of all the drinks known to man, the most suitable to those who labor appears to be that which proceeds from grain malted. At any rate, it has always been in use in England, to the climate of which it is peculiarly adapted; a climate not so cold as to require ardent spirits; and not so hot as to render it at all difficult to keep beer for almost any length of time. There is, too, this great convenience: that liquor of various degrees of strength is to be drawn from the same material. The quantities may be large or small, suited to the means and the wants of the party. In short, it is the drink of the country.' On various grounds some remedy for the system is doubtlessly required, and government, we know, is heartily disposed to remedy it. A late experiment, in the retail brewery bill, has been tried; but must on the whole, be regarded as a failure. Few respectable persons have embarked in the new breweries; the monopoly system flourishes as vigorously as ever; public-house property, as it is called, is as valuable. The fact is, that nothing short of affording new licences for public-houses

(under due restrictions) will fairly open this trade; and it should be rendered imperative on magistrates to grant them. For, of course, while the present influence over these respectable parties remains, they will use their 'discretion' accordingly: they will discourage the multiplication of public-houses just where they are not brought into the trade of a certain great house; they will evince, as heretofore, a perfectly calculable willingness to grant a licence where the right firm is to supply the beer consumed; and we cannot but remark of late, how invariably among the new buildings on the outskirts of London, the new public-house takes its stand in trim array. It is always ready first; opening its accommodating doors in unformed and unpaved streets; and exhibiting the gilded name, perhaps, of some honorable member of the legislature, whose agent is duly planted there, kindly to anticipate the wants of the poor. Mr. Grey Bennett, we believe, projected an alteration of the kind suggested, in 1822; but the influence of the London brewery first compelled him to introduce a clause, exempting 'the cities of London and Westminster;' and, for the benefit of the member representing the same, we suppose, 'the borough of Southwark; and the eastern half hundred of Brixton, in the county of Surrey;' the great country brewers then very properly remonstrated on being selected as the only victims of the change, and the measure was quashed. The magnitude of the London brewing trade will appear by the fact, that in the year ending 5th July, 1823, the twelve principal porter, and the first six ale, brewers in London, paid to the excise for duties on strong beer £706,038. 17s. 8d.; add to this the table-beer duty, and those of malt and hops consumed, which will amount to as much more, and these eighteen houses will be found to have paid nearly a million and a half of money into the exchequer in twelve months, a fact unparalleled, we presume, in any other business in the world.

2. *Of the different kinds of grain used in brewing.*

—Brewing, as conducted in this country, where it has been cultivated with the greatest success, is an art superinduced upon another, i.e. upon that of malting, and ordinarily means the conversion of malted barley into beer of some kind. But other grain has been used, malting and brewing are both subservient to the important operations of the distillery, and from grain unmalting (particularly barley) good beer has been brewed. We must refer to the articles **DISTILLATION** and **MALTING** for what is peculiar to those processes.

Unmalted barley was recommended as an ingredient in the vinous fermentation, or to be used mixed with malt, by Dr. Irvine, so far back as 1785; and Dr. Thomson of Edinburgh, perhaps the most philosophical writer on this subject, has lately adopted the general reasoning of Dr. Irvine. The latter observes, that not only is saccharine matter susceptible of fermentation, but the farinaceous and mucilaginous parts of vegetables also contribute in producing this effect. In their pure state they can neither be changed into vinous liquors nor into vinegar;

but, when combined with a small portion of sweet matter, they all ferment together, and may either change wholly into vinous liquor, or wholly into vinegar, according to the proportion of saccharine matter combined with them. If the latter greatly predominates, the farinaceous parts are entirely changed into the same vinous fluid with the sweet part; if the quantity is very small, the whole becomes vinegar, and has little appearance of ever having been in the vinous state. Thus a quantity of meal from wheat, barley, or oats, whose greatest part is farinaceous, when mixed with a portion of saccharine matter, it falls into the vinous fermentation, and the quantity of inebriating spirit produced is much greater than the saccharine matter alone would have afforded. Certainly, however, continues he, the powers of vegetable life are no way concerned, or necessary to it. It is not during the growth only of the seed that this change can be effected; but a quantity of the sweet matter produced by the growth of the seed, mixed with a quantity of the same seed ground into powder, and the whole mixed with a proper quantity of water, will all become sweet, and fall afterwards into the vinous fermentation, and be changed into spirit in the same manner as if the whole had been previously altered by the vegetation of the seed. Were it not for this property of the farina, great loss would be frequently sustained by the farmers in unfavorable seasons; grain that has once begun to grow, and whose vegetation has been stopped, can never be made to grow again. Such grain can never undergo any farther malting; when grain has been made to grow in this improper manner, it can hardly be supposed that the change into saccharine matter is perfect or complete. It therefore would be less proper for the vinous fermentation, and would furnish a smaller quantity of spirit than grain which had been perfectly malted. This grain, however, when mixed with a quantity of perfect malt, and fermented, furnishes as much spirit as if the whole had been in the state of malt. The persons in this trade even prefer it to an equal quantity of malt; for, in good seasons, when no such half malted or half spoiled grain can be got, they take good grain, reduce it to meal, and mix it with their malt, and are satisfied that they obtain more spirits in this way than from an equal quantity of good malt.

'The writer of this article,' says Dr. Thomson, in the supplement to the *Encyclopædia Britannica*, 'has several times tried the experiment of making ale from unmalted barley, and found it perfectly practicable. Several precautions, however, are necessary in order to succeed. The water let upon the ground barley in the mash-tun must be considerably below the boiling temperature. For barley meal is much more apt to set than malt, that is, to form a stiff paste, from which no wort will separate. The addition of a portion of the chaff of oats serves very much to prevent this setting of the goods, and facilitates considerably the separation of the wort. Care must likewise be taken to prevent the heat from escaping during the mashing, and the mashing must be continued longer than usual

For it is during the mashing that the starch of the barley is converted into a saccharine matter. This change seems to be owing merely to the chemical combination of a portion of water with the starch of the barley; just as happens when common starch is converted into sugar, by boiling it with very dilute sulphuric acid, or any other acid. This method of brewing from raw grain answers admirably for small beer. In our trials, he adds, the raw barley did not answer so well for making strong ale as for small beer. The ale was perfectly transparent, and we kept it for several years without its running into acidity. But it had a peculiar flavor by no means agreeable. Probably a little practice might have enabled us to get rid of this flavor, in which case, raw grain would answer, in every respect, as well for brewing as malt does.' He further states, that some years ago it was used to a considerable extent by several brewers of small beer in Edinburgh, and their beer was considered as greatly preferable to small beer brewed in the usual manner. But the practice was stopped by a decision of the Court of Exchequer.

The malt distiller always adds to the malted grain, which he ferments, a certain quantity of unmalted corn, nearly ground to powder, and the proportion of unmalted corn has even been gradually so much increased, as to exceed considerably that of the malted grain. This mixture ground to meal is infused with water at a heat considerably lower than that of the water used by the brewers, and much more agitation is resorted to, to mix it completely. The wort is drawn off and cooled in the usual way, and fresh water poured on to exhaust the grain. When the wort is formed it is not so transparent as that from malt, but its taste is nearly as sweet. It would appear, therefore, as Dr. Irvine supposes, that the starch in the raw grain undergoes a certain change during the mashing, and is brought towards the state of saccharine matter gradually, but completely at last.

Far greater facility, however, certainly attends the using of malt alone: the old and rooted opinion is, that the complete germination of the barley in malting is indispensably necessary to fermentation; and the legislature, we see, is determinately hostile to any mixture of unmalted grain, as opening a door to fraud on the revenue. We therefore return to the consideration of the present practice, only observing that here, as in the numerous other restrictions upon the manufactures connected with the excise laws, is another proof of the wretched policy of excessive taxation.

As well as barley, wheat, Indian corn, and oats, as we have intimated in a previous article, have been malted; and it is remarkable that when the seeds of the zea mais, or Indian corn, are used for brewing in America, they prepare it by an actual burial in the earth, to revive the germination to a certain stage in the natural way: when it is dug up and kiln-dried after the man-

ner of malt. See *Philosophical Transactions*, XII. 1065.

The hordeum vulgare, or barley generally cultivated in England and the south of Scotland, has become, principally from its use in the brewery, the most valuable grain of the country, with the exception of wheat. The Scotch barley (*hordeum hexastichum*), called bear and big, is evidently of the same species, but a more hardy plant, and less kindly for malting. While the grains of barley are much larger, the skin which covers them is thinner, and this skin or cuticle is wholly unprofitable to the maltster and brewer. The thickness of it is said to vary according to the heat of the climate in which it is cultivated, being always thinner in the warmer climate. Thus the cuticle of the Isle of Thanet barley is thinner than that of Norfolk barley, and that of Norfolk barley thinner than that of Berwickshire and Scotland. But if Norfolk barley be sown in Scotland for several successive years, its cuticle is said to become thicker.

The specific gravity of barley has been found in 100 different trials, to vary from 1.333 to 1.250, and that of big from 1.265 to 1.227. The average weight of a Winchester bushel of barley is 50.7 lbs. avoirdupois, and the average weight of a bushel of big 46.383 lbs. The heaviest weighing about 52.265 lbs. per bushel, and the heaviest big 48.586 lbs. The average weight of a grain of barley is 0.6688 grain, or very nearly two-thirds of a grain; the average weight of a grain of big 0.5613 grain. The average length of a grain of barley, from many thousand measurements, 0.345 inch, and that of a grain of big 0.3245 inch. 'So that the average of both,' says an able contemporary, 'would give us very nearly the third of an inch, which it ought to do, according to the origin of our measures, as commonly stated.'

The celebrated Einhoft having carefully analysed the barley-kernel, found in 3840 parts

Of Volatile matter . . .	430
Husk or cuticle . . .	720
Meal	2690
	<hr/>
	3840

From 3840 parts of barley-meal, he obtained :

Volatile matter	360
Albumen	44
Saccharine matter	200
Mucilage	176
Phosphate of lime with mucilage,	9
Gluten	135
Husk, with some gluten and starch,	260
Starch, not quite free from gluten,	2580
Loss	76
	<hr/>
	3840

We are indebted to Dr. Thomson's own able investigations of this subject for the following table :

TABLE OF PROPERTIES OF ENGLISH BARLEY AND SCOTCH BIG COMPARED.

GRAIN.	WEIGHT.		Specific Gravity.	SIZE.		SHAPE.		EQUALITY OF SIZE.															
	In lbs. Avoirdup.			Average Weight of a Corn in grains in Troy.	Average Bulk of a Corn in Cubic Inches.	Average Length in Inches.	Average Breadth in Inches.	Average Thickness in Inches.	Weight of a Corn in Grains.			Length in Inches.			Breadth in Inches.			Thickness in Inches.

Dr. Thomson was, with Drs. Hope and Coventry, of Edinburgh, commissioned by government, a few years since, to investigate the relative qualities of the Scotch and English barley.

Having traced the brewing of ALE (see that article) through its different stages, we proceed here to treat

3. *Of the process of the London Porter Brewery.*—Porter brewing has its five successive stages of grinding, or bruising the malt, mashing, boiling, cooling, fermenting, and cleansing; differing in no respect from those of ale, except in the coloring matter employed, and the largeness of the scale on which it is generally conducted.

The origin of this beverage, which has been pronounced by scientific men 'the most perfect of all malt liquors,' is thus given by the editor of the *Picture of London*: 'Prior to the year 1722 the malt liquors in general use were ale, beer, and twopenny, and it was customary for the drinkers of malt liquor to call for a pint or tankard of half-and-half, i. e. half of ale and half of beer; half of ale and half of twopenny; or half of beer and half of twopenny. In course of time it also became the practice to call for a pint or tankard of three threads, meaning a third of ale, beer, and twopenny, and thus the publican had the trouble to go to three casks, and turn three cocks for a pint of liquor. To avoid this trouble and waste, a brewer of the name of Harwood, conceived the idea of making a liquor which should partake of the united flavors of ale, beer, and twopenny. He did so, and succeeded, calling it entire, or entire butt beer, meaning that it was drawn entirely from one cask or butt, and, being a hearty nourishing liquor, it was very suitable for porters and other working people. Hence it obtained its name of porter.'

At one time brown or highly-dried malt only was used in the porter brewery, for the sake of giving the liquor both color and flavor; but malt highly dried being found to contain, from that circumstance, less saccharine or fermentable matter, the paler malt of Hertfordshire has been of late years used, and a patent coloring made from malt and water, or a very dark patent malt, mashed in small quantities, has been added, to give the porter hue. But the proportion of pale and brown malt used in different houses varies. One of the best brewers in London uses nearly two parts pale malt, and one part brown.

Mr. Combrune has thus exhibited the changes of color malt undergoes at different temperatures.

Degrees of heat, Fah.

- 124 Cream colored malt.
- 129 Light yellow do.
- 134 Amber color do.
- 138 High amber color.
- 143 Pale brown do.
- 152 High brown do.
- 157 Brown, inclining to black.
- 162 High brown, speckled with black.
- 167 Blackish brown.
- 171 Color of burnt coffee.
- 176 Black malt.

This table is perhaps not much to be depended on, as the experiments were made in an earthenware pan, placed over a charcoal fire, in which a thermometer was placed half way between the upper surface of the malt and the bottom of the pan; when it is clear that the bottom of the pan must have possessed a much higher temperature than that part of the malt where the thermometer was fixed, and by the stirring of the malt, the whole must have been gradually brought into contact with the heated pan. But Dr. Thomson astonishes us by the assertion, that he has 'taken malt dried at the temperature of 175°, put it into a garden-pot filled with soil, and seen it vegetate apparently as well as raw grain placed in the same situation. It is quite clear that the grain in question was not malted perfectly; the operation of the kiln being known to stop vegetation, which in good malt, as we understand the matter, was never yet renewed.'

The first operation of the brewery upon a large scale is the proper grinding or rather splitting up of the malt; for it is to be made into a coarse grit, and not into a powder. This is effected by introducing the malt between mill-stones, in the manner in which corn is ground, but the stones are set to a greater distance so as not to crush the grain fine, while at the same time they do not permit the smaller grains to escape without being crushed. To prevent this, the ground malt is made to pass through a screen, which separates the uncut grains, and these are broken by being introduced between a pair of iron cylinders. Sometimes the malt is altogether crushed between cylinders, and in this case it is impossible that any grains can escape unbroken. The cuticle of the grain is thus rendered pervious to the water, and the pressure of the cylinder compresses the flour so as to prevent the water from acting on it readily in mashing.

Some breweries use a steel mill, similar to those used for coffee grinding; a mill of this sort ten or twelve inches in diameter, performing 150 revolutions in a minute, will grind six or eight quarters of malt per hour. It cuts the grains in the same manner as the mill-stones; but the malt passing very quickly through the steel mill, the divided parts of the corn are not rubbed to flour, as between the mill-stones. The malt being ground it is suffered to lie for some time in a bin, or cool room, to mellow, as it is called. Brown malt is suffered to mellow from three to four or five days, before it is used, but pale malt only one or two days. Grist thus exposed to the air, it is said, requires less mashing, and the strength of the malt is more perfectly obtained.

Mashing in the large way, is performed in a circular wooden, or cast-iron vessel, called the mash tun, shallow in proportion to its extent, and furnished with a false bottom, perforated with holes. Between the real and false bottom are two side openings, which are generally a few inches asunder, to one is fixed a pipe, for the purpose of conveying hot water into the tun, and to the other another for drawing the liquor out of it. By this means the water rises up through the grist until a proper quantity is introduced,

when the mashing begins. This sometimes is performed by long oars, poles, or iron rakes, mingling the fluid with the farinaceous matter, until they are completely incorporated: but the scale on which the London breweries are conducted has long rendered obsolete all these manipular contrivances, and introduced regular mashing machines. A strong iron screw fixed in the centre of the mash tun is furnished with radii (two or more), also of iron, and armed with vertical iron spikes or teeth, a few inches asunder, in the manner of a double comb. Horses, or a steam-engine, furnish the moving power. The iron radii, which at first rest on the false bottom, are made slowly to revolve upon the central screw, in consequence of which, in proportion as they revolve, they also ascend through the contents of the tun to the surface; then, inverting the circular method, they descend again in the course of a few revolutions to the bottom, mingling in their alternate motions, the grist and the water. After mashing, the tun is generally covered to prevent the escape of heat, and the whole remains untouched, until the insoluble parts separate from the liquor: the drawing-off-pipe is then opened, and the clear liquor runs away.

We need not occupy this part of our work with a repetition of the cautions given on the subject of mashing in the article already often adverted to, on ALE: but only remark here, that this liquor, or wort, as it is now called, of the first mashing, being always by far the richest in saccharine will require and reward the greatest care in obtaining it. To do justice to the malt, a second and even a third mashing is taken; and in some breweries the water employed for the last is simply made to penetrate through the grist by means of a broad shute, of a triangular form, narrow under the cock of the copper, and spreading from ten to fifteen feet wide over the mash tun edge, so as to throw the water over the mash lightly. Thus the mashed grist is very little disturbed, and the water applied drives before it the infusion of the second mash, contained in the grist, through the mash, until, by occupying its space, it extracts a greater strength from the malt, than the ordinary mode of mashing would. The gravity of the worts must regulate, of course, the quantity of liquor employed (for technically all water is liquor in the brewhouse) so as to retain the average density of the two or three worts taken together, according to the length or quantity of beer intended to be brewed. Mashing thus conducted by machinery, generally is completed in about from thirty to forty-five minutes. The temperature and gravities in respectable establishments are carefully noted at stated times in the brewing-book.

Cloudy worts indicate a too high temperature. If the heat of the water is not above 185° , there is nothing to fear; in practice, however, it seldom exceeds 160° or 170° . At 198° most worts are cloudy. See ALE. In regard to porter brewing, it may be observed, that the higher the color of the malt, the less is its tendency to set, because high dried malt contains a less portion of undecomposed starch than pale or amber malt; of course we may mash with water of a higher tem-

perature. Though it has often been discussed, it seems practically of little consequence, whether rain, river, or spring water, be employed in the larger brewing operations. Mr. Accum analysed that used by Messrs. Truman and Co. and found it to possess all the characters of pump water; the reader, as he says, need not be reminded that the beer brewed at that establishment is inferior to none.

For heating the water and *boiling* the wort, large establishments use a copper crowned with a hemispherical dome; surrounded by a pan which will contain a succeeding wort, or the water for a succeeding mash. The liquor is generally boiled by steam in the following way:—From the centre of the dome rises a perpendicular pipe, and from the upper extremity of this pipe four inclined pipes descend, the lower extremities of which terminate near the bottom of the pan, and consequently in the water or wort contained therein. By this contrivance, the steam which rises from the copper must bubble up through the fluid in the pan, and speedily heat it. The advantages of this contrivance are, that, the instant the copper is emptied, a fresh supply of fluid can be let in to cover the bottom of it, in order to prevent the intense heat of the fire injuring the vessel; while the successive fluids are heated by one fire.

As to *hopping*, we need only here observe, that the quantity of hops is regulated by the strength of the wort, and the time the beer is intended to keep. Generally from $1\frac{1}{2}$ to $1\frac{3}{4}$ lb. or even 2 lbs. of hops are boiled with every bushel of malt; but, for strong ale or porter, the quantity is sometimes higher. After the first boiling with hops, the liquor is let off, and the wort is conveyed into the jack or hop-back, furnished generally with a cast-iron floor full of holes, so as to drain the wort from the hops. Then those left in the jack-back are filled, by men, into tubs, which are drawn up by a tackle worked by the engine, and again boiled in the copper with the second and third worts. Sometimes an axis passes perpendicularly through the copper, furnished at the end with horizontal arms, from which chains are suspended in loops, and which stir up the hops at the bottom of the copper when the axis is made to revolve. This apparatus is called a *rowser*. The following table, extracted from Mr. Richardson's work on the use of the Saccharometer, exhibits the quantity of wort imbibed in boiling by different quantities of hops:—

Hops used.	Wort imbib.	Hops used.	Wort imbib.	Hops used.	Wort imbib.	Hops used.	Wort imbib.
1	0.01	11	0.17	30	0.50	400	6.56
2	0.03	12	0.19	40	0.66	500	8.33

9	0.15	19	0.31	200	3.33	3000	50.00
10	0.16	20	0.33	300	5.00	4000	66.66

The porter brewers generally prefer hops of a brown color.

Cooling, of course, is a process of great importance, and must be conducted on a scale proportionate to our other operations. Nothing yet has been found to supersede the use of large shallow wooden troughs or floors, edged with a wooden ledge, and water-tight; the most exposed situation that the premises will afford being chosen, so that a free current of air may at all seasons be brought over them. To perform it expeditiously, so that the taint of foxing may not ensue in this process, the wort should only be laid at such a depth in the coolers, as will allow it to cool in about seven or eight hours to sixty degrees, which, generally speaking, is about the average temperature for pitching or setting to work. To effect this, in summer, the wort should certainly not be laid at a greater depth than one, two, or three inches; in winter, it may be as deep as five inches. The evaporation that results, on the liquor being conveyed into the coolers, is a great object of the scientific brewer's attention.

On the still more important point of *fermentation*, we have little to add to our previous remarks. In the brewing of porter, which is generally intended to be full bodied (hard), the fermentation must be suffered to proceed slowly, as far as it is consistent with the richness of the wort; if the beer is intended to be rather brisk, the fermentation is the sooner stopped. Ordinarily ale and porter, of which the specific gravity of the wort amounts to 17.25 lbs. per barrel, or 18 lbs. per barrel, requires the fermenting process to be stopped when the specific gravity is reduced to 7, 8, or 9 lbs. per barrel: but scarcely any general rules can here be given. The diminution of the specific gravity is, in some breweries, suffered to proceed to a much greater extent than in others: observation must be directed to the head of the yeast. When the fermentation is brisk, it soon begins to turn of a compact brown color, and becomes rapidly more colored and dense, so that it would fall back into the beer; at this period the fermentation is nearly finished.

'During the process of fermentation,' says an able chemist, 'a large quantity of carbonic acid gas is disengaged; the noxious effect of this gas has been long known, it produces suffocation when taken in the lungs. Being heavier than the air of the atmosphere, it floats on the surface of the fermenting fluid, and occupies, when it overflows the vessel, the lowest parts of the place in which fermentation is carried on. This gas appears to be the only product of fermentation to which we are indebted for all the remarkable changes by which the sweet or saccharine matter of the wort is converted into a vinous fluid. The superfluous carbon of the sweet substance, and a portion of the oxygen, combine to create it, while the balance of principles which remain, becomes capable of generating the ardent spirit, or alcohol. It is, therefore, a necessary consequence of the process of fermentation, but it is not equally necessary that it should be disengaged and separated from the beer, for a large portion of it remains combined with it. It holds a portion of alcohol, in a state either of mixture or combination, of which the true chemical nature has not been well ascertained. This is a question of some difficulty, as well as of importance in a

chemical point of view, but as yet no experiments have been suggested capable of setting it at rest.'

Dr. Thomson complains of the difficulty of ascertaining with accuracy the strength of the worts in the London brewery. In some breweries, as in that of Messrs. Barclay and Perkins, there are three separate mash-tuns. In others, the custom is to mash one kind of malt the first day, another the second, and a third kind the third day. The first day's wort is put into the fermenting vessel, and mixed with yeast; and the other two worts are added to it as they are formed successively. Their strength, therefore, could only be ascertained by knowing the quantity of wort from each malt, and its specific gravity when let into the fermenting vessel. After, in this way, examining the porter wort in the principal breweries in London, he says the average specific gravity of brown-stout wort is 1.0624. The wort of the best common porter is of the specific gravity 1.0535; that of the worst or weakest is as low as 1.0374. The average specific gravity deduced from twenty brewings, was 1.0500. Such wort contains about 46.4 lbs. per barrel of saccharine matter. Judging from the taste of some of the worts, quassia, says Dr. T. seems to be employed in considerable quantity by some of the brewers, and much more sparingly, if at all, by others. The fermentation of porter is carried on with considerable rapidity, so that it is over in two or three days. The specific gravity of the porter is usually brought down to 1.013 or 1.017. That of the best brown-stout, after standing some months in the bottle, is 1.0106.

We know of nothing that distinguishes the mode of cleansing porter from that of cleansing ale, except, perhaps, better mechanical contrivances, according to the size of the breweries. In some breweries, the method of cleansing beer by means of large barrels or rounds, is practised throughout the year. Sometimes it is stored in casks, which are bunged up and removed into the storehouse, but daily examined, and occasionally allowed a little vent, especially in warm weather; or the beer is pumped into a cistern, and from thence into the store-vats, which are from eighteen to forty feet in diameter, and from eighteen to twenty feet high; they will frequently hold from 5,000 to 6,000 barrels. Large arched vaults, built of stone, and lined with stucco, have been, at some establishments, adopted for storing the beer. These contribute greatly to the amelioration of the beer by age, in consequence of the uniform temperature which fluids in such masses preserve. These vats are always placed in the coolest part of the establishment; are made air-tight, and furnished with safety valves, excellent piping, cocks, &c.

For the use of the saccharometer in brewing. See SACCCHAROMETER.

For finings in filling up the casks. See ALE and FININGS.

By law, every barrel of beer or ale, brewed by the public brewers in Great Britain, whether within or without the bills of mortality, is to contain thirty-six gallons, according to the standard ale quart kept in the Exchequer; 43 Geo. III. c. 69.

But nothing herein is to extend to alter the quantity to be returned, as and for a barrel of beer or ale brewed by any victualler or retailer, or any person other than a common brewer, who

Fig. 9.

shall sell, or tap out beer or ale publicly or privately, but the same shall remain as declared by the statute. 1 William and Mary, ses. 1. c. 24.

Within the bills of mortality, every barrel of beer is to contain thirty-six gallons, according to the new standard ale quart kept in the Exchequer; and every barrel of ale thirty-two gallons. 12 Chas. II. c. 53; 1 Will. & Mary, ses. 1. c. 24, &c.

Out of the said limits, every barrel of beer or ale, whether strong or small, is to contain thirty-four gallons, according to the aforementioned standard. 1 William and Mary, ses. 1. c. 24.

The adulterating strong beer, porter, or ale, with small beer, is prohibited by law, since both the revenue and the public suffer by it. The revenue suffers, because a larger quantity of beer is sold as strong beer; that is, at a price exceeding the price of table beer, without the strong beer duty being paid. In the next place, the brewer suffers, because the retailer gets table or mild beer, and retails it as strong beer. The following are the words of the Act, prohibiting the brewers mixing table beer with strong beer:—

‘If any common brewer shall mix, or suffer to be mixed, any strong beer, or strong worts with table beer or table worts, or with water in any guile or fermenting tun after the declaration of the quantity of such guile shall have been made; or if he shall at any time mix, or suffer to be mixed, strong beer or strong worts with table beer worts or with water, in any vat, cask, tub, measures, or utensil, not being an entered guile or fermenting tun, he shall forfeit £200.

‘If any common or other brewer, inn-keeper, victualler, or retailer of beer or ale shall mix, or suffer to be mixed, any strong beer, or ale worts, with table beer worts, or water, in any tub or measure, he shall forfeit £50.’ The difference between strong and table beer, is thus settled by Parliament. ‘All beer or ale above the price of eighteen shillings per barrel, exclusive of ale duties now payable (viz. ten shillings per barrel), or that may be hereafter payable in respect thereof, shall be deemed strong beer or ale; and all beer of the price of eighteen shillings the barrel or under, exclusive of the duty payable (viz. two shillings per barrel) in respect thereof shall be deemed table beer within the meaning of this and all other Acts now in force, or that may hereafter be passed in relation to beer or ale or any duties thereon.’ 59 Geo. III. c. 53, sect. 25.

The gross annual receipt, in money, received by the Excise for beer brewed, and malt and hops, in the united kingdom for the year ending 5th Jan. 1820, amounted to £5,997,216. 3s. 10³/₄d.

We come now to give, lastly, *A practical description of a London Brewery*.—In doing which, we shall suppose our reader again to travel with us through the principal operations. Fig. 1, 2, BREWING, plate 1, is the elevation and bottom of the mash tun, formed of cast iron or vertical staves bound by iron hoops. It has a false bottom, a few inches above the real bottom, pierced, as we have described, with a number of small holes, to admit the liquor, but retain the malt. The liquor is brought by a pipe into the tun beneath the false bottom, and forces its way up through the goods. Fig. 1. Shows the elevation of it; as also the underback beneath; one half of the tun being represented in section, to show the machine within it. AA, fig. 1, is the level of the stage or floor in which the mash tun is placed. BB BB is the tun, formed of a number of pannels of cast iron plates screwed together. The disposition of these in the bottom is shown by the plans in fig. 2. The tun is supported upon eight cast-iron columns, DD, which are united at the upper ends by an iron framing E, which confines them in a vertical position, and connects them with a central column F, shown by dotted lines in fig. 1, at the upper end. This is cast hollow, to form the continuation of a pipe G, which brings the liquor into the tun from the copper. This pipe has also another branch, H, conveying the liquor up into the tun, beneath the false bottom I, which is the only part of this machine made of wood. In the centre of the tun a vertical axis, K, is set up and turned round by wheelwork communicating with the upper end of it. Upon this axis are two bevelled wheels, *a* and *b*, giving motion to the mashing engine. These wheels turn two horizontal axes L, M, extending from the centre to the circumference of the tun. The former has four wheels upon it, over which pass four endless chains, which also pass round wheels upon a horizontal axis, N, near the bottom of the tun. Upon the endless chain, cross pieces of iron, *d*, are fixed; and these have teeth in them, which, as the chains revolve by the action of the wheel *b*, raise up the malt from the bottom of the tun to the top of the mass of malt. That this stirring may be performed in all parts of the tun, the frame containing the axes L, M, N, has a progressive motion round the tun by the following means: On the kirk or upper edge of the tun is a ring of teeth O, shown in the plan. These are engaged by an endless screw, which is mounted in a frame P, and shown in perspective in fig. 3. This screw has a rotatory motion, given it by a wheel Q on the extreme end of the axis M, which turns

pinions *d, e*, on the axis of the screw. The wheel has two rings of cogs *h* and *i* upon its face, one about $\frac{2}{3}$ ds the size of the other. Each engages its pinion *d* and *e* on the spindle of the screw; neither of which are fixed to this spindle, but are at liberty to slip freely round it. Between the pinions is a circular plate, *k*, fitted upon the axis with a fillet, so that it must revolve with it. This plate has studs projecting from both sides, and the pinions have similar studs. Now when the plate *k* is thrust towards either of the pinions, by means of a lever *l*, it causes the axis and screw to revolve with the same velocity that the pinion has; and as the pinions have different velocities, from being turned by two different rings of teeth, it follows, that, by raising or depressing the end *m* of the lever *l*, the screw may be turned with either of these velocities at pleasure, and thus cause the machine to make the circuit of the tun in a greater or less time. The extreme ends of the two axes *L, N*, are supported in an iron arm, fixed to the iron frame *P* of the screw, which runs upon the edge of the tun with four rollers. From this frame two rods *p, p*, fig. 1, extend to a frame which surrounds the central axis, and supports the central axis by a collar at its upper end, and the lower point of the axis is fitted into a socket made through the frame.

The underback, *R R*, is placed between the eight iron columns, upon brickwork, supported upon bearing piles, is formed of cast iron plates, united by screws, in the same manner as the mash tun, and as is explained in the figures. The plates are flat on the inside, but have flanches all round the outside, and ribs across to strengthen them. This is shown by representing part of the plates as removed. The wort is drawn off from the mash tun by eight cocks in the bottom, two of which are shown at *SS*, fig. 1. They allow the wort to flow into the underback, whence it is drawn by a pump, the suction tube for which is marked *T*.

Figs. 1, 2, 3, and 4, BREWING, plate II, are different sections of a close copper, which contains say 250 barrels. *AA*, in all the figures, denotes the external brickwork, which is a cylindrical wall, built upon the arches. In the lower part of this is the ash pit *B*, and the fire-grate placed over it, being partly supported by iron pillars. *CCC* is the copper, hung in the brickwork by a projecting ring of a few inches, at the place where the hemispherical dome *G* joins upon it. The dome is surrounded by a copper from *DD*, to contain the water which is intended for the succeeding mash, or afterwards for the wort produced by the mash. This liquor is heated with the steam produced by the copper, which is conducted up a large tube *E*, rising from the centre of the dome. To the top of this four smaller pipes *F F*, figs. 2 and 3 are joined, turning down to the bottom of the pan, and open at their lower extremities, by which means the steam is conducted beneath the liquor contained in the pan, and by bubbling up through it, soon communicates to it a considerable degree of heat. A recess is made at *X*, figs. 2 and 4, in the copper pan, to expose the dome *G*; and in this place is the man hole for entering to the copper. Another of these man holes is provided in the top

of the copper, at the upper end of a large tube *H*, figs. 2 and 4, rising from the dome. *I* is the chimney to the copper, situated over the fire door *a*, fig. 3, and the chimney has an arch in it, to give passage to the fire door. The course of the flues is shown in fig. 1, which is a horizontal section, taken a little above the level of the grate-bars, upon which the fire rests. On each side of this grate a jamb of brickwork *K, K*, is built. This supports the bottom of the copper, and compels the flame and smoke to go backwards, and surround the copper, by rising up in the dark space shown in figs. 3 and 4. It then turns round in the two semicircular passages over and behind the jambs *K K*, fig. 1, and enters the chimney by the opening at *L*, fig. 3. The chimney is double, having a partition up the centre, which divides it into passages, one of which is appropriated to each flue. The opening *L* is furnished with an iron door, which can be closed at pleasure; and the bottom of the chimneys are likewise shut by iron doors at *d*, fig. 3, which slide back horizontally when they are required to be open. By means of these doors the stoker, or fire-man, can at all times regulate the draught of the fire; for by throwing open the doors *d, e*, and at the same time opening the fire-door at *a* in front, the draught is nearly destroyed, as the cold air passes directly up the chimney without going through the fire; and, by closing the door *L*, the draught is totally stopped, and the fire soon extinguished. In the centre of the copper a spindle *M* is fixed, passing through a tight stuffing box. At the top of the tube *E*, and above this, it has a cog wheel *e*, by which the spindle is turned round. On the lower end of the spindle a cross bar is fixed, and secured by stays, and short pieces of chain are suspended from it, which drag the bottom of the copper when the spindle is turned round, and stir the hops so as to prevent their burning, which they would do if suffered to rest on the bottom. This apparatus, which is called the rowser, is suspended by a swivel at the top of the spindle, from a lever *f*, the opposite end of which is drawn down by a rack and pinion *g*. This raises the rowser from the bottom of the copper, when it is not in use, and at the same time disengages the wheel *e* from its pinion, which is kept in continual motion by the engine. Cast iron braces *g, g*, are fixed across the copper, to support the spindle of the rowser. In the top of the tube *E* is a safety valve, loaded with a weight *h*, to permit the escape of the steam if it should become so strong as to endanger the copper; and by the side of it is another, *i*, which opens, and admits air, if a condensation of the steam should produce a vacuum in the copper. The man holes are closed by lids, which are quite steam tight, and can be quickly opened and shut. The door is of cast iron, and has a ring projecting from its under surface to drop into the ring to which the flat surface of the lid is fitted. The lid is hung by a joint, loosely fitted, and is kept down tight by the pressure of a strong screw. This screw is held over the centre of it by a cross bar fixed to the ring by a joint pin at the end, while the other end slips under a kind of staple. When the central screw

is slackened, the bar can be turned about upon its centre, to remove it from the lid, which can then be opened upon the joint. A balance weight is applied to take off the weight of the lid, as shown at Y, fig. 4; and within the lid is a smaller one of brass, which is fitted in the same manner; and which is removed to introduce the thermometer or a gauge, for the purpose of ascertaining the quantity of liquor in the copper, without the trouble of moving the great lid, which is only opened to allow men to go into the copper to clean it, while the upper man hole, H, is only used to put in the hops. The copper is filled by a pipe from the liquor-back, as before-mentioned. The pipe R, fig. 2, divides into two branches, each of which is provided with a sluice cock, *m* and *n*, just before the branches enter the pan from the recess X. The branch *m* delivers its contents into the pan, but *n* turns down, and is soldered to the dome of the copper. The pan can be emptied into the copper by two valves, *p, p*, fig. 2, in the bottom of it, which are drawn by iron rods and levers reaching over into the recess X.

It is said that the first pan was placed over the copper, for the purpose of heating one liquor by the other, by Mr. Goodwynne, about 1780; but the steam did not in this case pass through the water. About five years afterwards, Mr. Bramah erected a copper at Harford's brewery, with a dome and steam pipes, as in our plate, fig. 3, except that the pipes F were hung by joints from the great central pipe, so as to rise and fall similar to an umbrella; and, a float being attached to the end of each pipe, the steam always passed out under the same pressure of water, whether the pan was full or not, as the floats always kept the mouths of the pipes at the same depth beneath the surface; at the same time, this depth could be readily adjusted by altering the floats, so as to increase or diminish at pleasure the pressure of the steam in the copper; a construction, which having been found to succeed, is now common.

In fig. 5, of plate II., is a sluice-cock, where AA is a cast-iron frame having two pillars B rising from it, to support a frame C, which contains a pinion for raising the rack *a*, and drawing the slider D, which stops the bore of the pipe. A flat plate of cast iron is screwed against each side of the frame A, forming a thin box, in which the slider rises and falls. Each of these plates has a short pipe projecting from it, to connect with the pipe, which the sluice is intended to shut up. One of these plates is ground flat, and the slider D is fitted and ground against it, so as to slide freely, but to fit perfectly water tight. On the opposite side of the slider two steel springs *b b* are bolted. The ends of these act against the other flat plate, in order to press the slider against its fitting, and keep it close. The slider D is connected with the rack by a smooth cylindrical iron rod attached to both, and passing through a stuffing box in the top of the frame A, which is fitted so closely round it with hemp, as to prevent the escape of any fluid by its sides. This kind of sluice-cock, of very general use in the brewery, is also the least expensive;—an object worthy of attention, when

large brass cocks, such as are sometimes used for coppers, cost from thirty to forty pounds. A Mr. Rowntree has constructed some stop-cocks of the form shown, figs. 6 and 7, where AA are the flanches for connecting the cock with the pipe, B a chamber, in the centre of which is a spindle *a*, passing through a stuffing box in the lid *b*, and having a handle *c* to turn it round. Upon this spindle a sector of brass, *d*, is fixed, and when turned about, it either closes or opens at pleasure the opening of the pipe. A piece of brass is screwed into the chamber, for the sector to fit against, and they are ground together till they are perfectly tight, by which means the friction is inconsiderable.

Fig. 8 represents an effectual substitute for a cock in many parts of a brewery, particularly at the bottom of the coolers or backs. A is a brass valve seat, which has a conical valve *a*, exactly fitting the seat, and closing its aperture when shut. The seat is fixed down in the wooden bottom of the back by small screws; and from the seat rises two iron bars, *d, d*, uniting at top, and supporting a screw, which is turned round by a handle, *e*. The shank *b*, of the valve *a*, has an opening through it, and above this the screw is tapped into it. This opening receives a cross bar of the frame *d*, which, at the same time that it sustains the lower pivot of the screw, prevents the valve shank, *b*, from turning round with the screw, which will raise or lower the valve at pleasure.

Fig. 9 is another cock of Mr. Bramah's, called a taster; to be put in a store vat for tasting the beer. It is a brass tube, A, with a shoulder, *a*, which is the only projection on the outside of the vat, and is held in by a nut, *b*, screwed upon it on the inside of the stave, B, of the vat. In the end of the tube is a plug, *c*, ground and fitted in, and having a hole in one side. The key, D, of the cock, which is bored through the shank, and also through one of the ends of the cross handle, being introduced into the cock, fits upon a square, a triangle, a circle, or any other figure, at the end of the plug; and when the key is turned round, so that the handle is upright, the cock is open, and the beer will flow through the handle as a spout. This cock cannot be opened without a key.

Fig. 10 is Mr. Bramah's vent-peg, to be put into the head of a cask when the liquor is drawn off, in order to admit the proper quantity of air, to allow the liquor to run. AA is a section of the head of the cask, in which a taper screw, B, is placed for fastening the apparatus. The upper end of the screw is of large dimensions, and turned out into a cup of a cylindrical form, with a stud or pin rising up in the middle. A hole is drilled through the centre of the peg, to communicate with the interior of the cask at *b*. The cavity surrounding the stud being filled with water, the cap or thimble, C, must be inverted, and dropped into the rabbet, which is turned in the top of the peg. Small holes are drilled round in the cap at 1 and 2, to admit the air freely; and as the lower edge of the cup is immersed in the water round the stud, nearly to the bottom of the cup, the ingress or egress of the air will be prevented, except when the pressure of the air is augmented by drawing the liquor out

of the cask. It is very useful to prevent the liquor in drawing becoming flat or vapid from exposure.

Fig. 1, plate III, is a representation of the beautiful and complete fermenting-house at the brewery of Messrs. Whitbread and Co. Chiswell-street. It was erected after the plan of Mr. Richardson, who conducts the brewing department of that celebrated establishment. R is the pipe which leads from the different coolers to convey the wort to the great fermenting-vessels or squares M, of which there are two, one behind the other; *f/f* represents a part of the great pipe which conveys all the water from the well up to the water cistern at the top of the works. This pipe is conducted up the wall of the fermenting-house, and has a cock in it, near R, to stop the passage. Just beneath this passage a branch-pipe, *p*, proceeds and enters a large pipe *xx*, which has the former pipe *r*, within it. From the end of the pipe *x*, nearest to the squares M, another branch *nn* proceeds, and returns to the original pipe *f*, with a cock to regulate it. The object of this arrangement is to make all, or any part of, the cold water flow through the pipe *xx*, so as to surround the wort-pipe *r*, which is only made of thin copper, and lower the temperature of the wort passing through the pipe *r*, until, by the thermometer, it is found to have the exact temperature which is desirable, before it is put to ferment in the great square M. By means of the cocks at *n* and *p*, the quantity of cold water which shall pass in contact with the surface of the pipe R, can be regulated at pleasure, so as to have a command of the heat of the wort when it enters into the square. When the first fermentation in the squares M is finished, the beer is drawn off from them by pipes marked *v*, and conducted by its branches, *w*, to the different rows of fermenting tuns marked N N, which fill all the building. Between every two rows are placed large troughs, to contain the yeast which they throw off. The representation shows the small tuns all placed on a lower level than the bottom of the great vessels M, so that the beer will flow into them, and, by standing in them all, will fill them to the same level. When they are filled the communication-cock is shut; but, as the working off of the yeast diminishes the quantity of beer in each vessel, it is necessary to fill them up again. For this purpose, the two large vats O O are filled from the great vessels M, before any beer is drawn off into the small casks N, and this quantity of beer is reserved at the higher level for filling up. The two vessels O O are, in reality, placed between the two squares M, but we have been obliged to place them so that they can be seen. Near each filling-up tun *o* is a cistern *t*, with a pipe of communication from the tun O, and this pipe is closed by a float-valve. The small cisterns *t* have always a communication with the pipes, which lead to the small fermenting vessels N; and therefore the surface of the beer in all the tuns and in the cisterns will always be at the same level; and, as this level subsides by the working off of the yeast from the tuns, the float sinks and opens the valve, so as to admit a sufficiency of beer from the filling up tuns *o*, to re-

store the surfaces of the beer in all the tuns, and also in the cistern *t*, to the original level. In order to carry off the yeast which is produced by the fermentation of the beer in the tuns O O, an iron dish or vessel is made to float upon the surface of the beer which they contain; and from the centre of this dish a pipe, *o*, descends, and passes through the bottom of the tun, being filled through a collar of leather, so as to be tight, at the same time that it is at liberty to slide down as the surface of the beer descends in the tun. Over the edge of this dish the yeast flows to a trough beneath, and is conveyed down the pipe.

Under the fermenting-house are noble arched vaults P, built of stone, and lined with stucco. Into these the beer is let down when sufficiently fermented, and is kept till wanted: being beneath the surface of the earth they possess great equality of temperature.

Figs. 2, and 3, are malt-rollers, or machinery for bruising the malt. A is the hopper, into which the malt is let down from the malt-loft above; and from this the malt is let out gradually through a sluice or sliding-shuttle *a*, and falls between the rollers B D. These rollers are made of iron, truly cylindrical, and their pivots are received in pieces of brass let into iron frames, which are bolted down to the wooden frame of the machine. A screw, E, is lapped through the end of each of these iron frames, and by these screws the brasses can be forced forwards, and the rollers made to work closer to each other, so as to bruise the malt in a greater degree. G is the shaft by which one of the rollers is turned; and the other receives its motion by means of a pair of equal cog-wheels H, which are fixed upon the ends of the pivots, at the opposite ends of each of the rollers: *d* is a small lever, which bears upon the teeth of one of these cog-wheels, and is thereby lifted up every time a cog passes. This lever is fixed on the extremity of an axis, which passes across the wood frame; and in the middle of it has a lever *c*, fig. 2, bearing up a trough *b*, which hangs under the opening of the hopper A. By this means the trough *b* is constantly jogged, and shakes down the malt regularly from the hopper A, and lets it fall between the rollers: *e* is a scraper of iron plate, which is always made to bear against the surface of the roller by a weight, to remove the grains which adhere to the roller.

BREWIS. Ang.-Sax. *briu*; Teut. *brosam*; Welsh *brywes*; Scot. *brose*. See BROTH. Bread soaked in fat potage; and also the potage itself.

What an ocean of brevity shall I swim in!

Beaumont's and Fletcher's Dioclesian.

BREYNIA, in botany, a genus of class polygamia, order triæcia: CAL. six-parted: COR. none: ANTH. five: STG. five; berry three-celled: SEEDS two. Species only one. *B. disticha*, a native of New South Wales.

BRIANCON, a noted town of France in the department of the Upper Alps, and ci-devant province of Dauphiné. It has a fine bridge over the Durance, 180 feet high, a strong castle on a steep rock, and other defences. It lies seventeen miles north-west of Embrun, and forty-five east of Grenoble.

Fig. 2.

Fig. 3.

BRIANCONNOIS, a ci-devant territory of France, in Dauphiné, which was bounded by Grenoblois, Gapençois, Embrunois, Piedmont, and Savoy. It comprehends several valleys, which lie among the mountains of the Alps: and though it is extremely cold, yet it is fertile in corn and pastures. Briançon is the capital town. Manna is gathered near it, on the leaves and branches of a species of pine; incisions in it yield large quantities. The chief road from France to Italy passes through it. It is now comprehended in the department of the Upper Alps.

BRIAREUS, in fabulous history, a giant, the son of Æther, Titan, or Cælus and Terra. This was his name in heaven; on earth he was called Ægeon. He was of singular service to Jupiter, when Juno, Pallas, Neptune, and the rest of the gods, endeavoured to bind him in chains and dethrone him. Afterwards, however, he conspired with the rest of his gigantic brethren to dethrone Jupiter. Virgil, on this occasion, describes him as having 100 hands, fifty heads, and breathing out fire. The fable says, that Jupiter, to punish him, threw him under mount Ætna, which, as often as he moves, belches out fire.

BRIBE, *v. & n.* } Goth. *bryfæ*; Sax. *bred*
BRIBING, } *fæ*; that is a perverting
BRIBER, } fee or gift, something
BRIBERY, } added to the simple demands of justice, with a view to influence its decisions: a boon to prevent honesty, given to the worthless in high places; the sop, which when a man takes, the devil enters into him, and he is ready to betray his king, his country, or his God. See *Minutes of Evidence before the House of Commons*—Article **IRISH MAGISTRACY**. The Glossary to Chaucer, thus explains this word, as used by the father of our tongue, or in his time: ‘Briborie,’ says he, ‘seems to signify a thief; briben,’ he adds, ‘may mean to decoy; while a bribe is probably what is given to a beggar; what is given to an extortioner or cheat.’

Who saveth a thefe when the rope is knet,
 With some false turne the *bribour* will him quite.
Lydg. Tra. 152.

This sompnour, waiting ever on a day,
 Rode forth to sompne a evidence, an old ribibe
 Feining a cause, for he wold han a *bribe*.

Chaucer's Canterbury Tales.

And,—for ther n'is no thefe without a louke,
 That helpeth him to wasten, and to souke,
 Of that he *briben* can or borwe moy, *Id.*
 You have condemned and noted Lucius Pella,
 For taking *bribes* here of the Sardians. *Shakspeare.*

There was a law made by the Romans, against the *bribery* and extortion of the governors of provinces: before, says Cicero, the governors did bribe and extort as much as was sufficient for themselves; but now they bribe and extort as much as may be enough not only for themselves, but for judges, jurors, and magistrates. *Bacon.*

Nor less may Jupiter to gold ascribe,
 When he turned himself into a *bribe*. *Waller.*
 If a man be covetous, profits or *bribes* may put him
 to the test. *L'Estrange.*
 There is joy when to wild will you laws prescribe,
 When you bid fortune carry back her *bribe*. *Dryden.*

No *bribery* of courts, or cabals of factions, or advantages of fortune, can remove him from the solid foundations of honor and fidelity. *Id.*

How powerful are chaste vows! the wind and tide
 You *bribed* to combat on the English side. *Id.*

The secret pleasure of a generous act.

Is the great mind's great *bribe*. *Id. Don Sebastian.*

Affection is still a *briber* of the judgment; and it is hard for a man to admit a reason against the thing he loves; or to confess the force of an argument against an interest. *South*

The great, 'tis true, can still the' electing tribe;
 The bard may supplicate, but cannot *bribe*.

Prologue to Good-natured Man.

The kingdom's farm he lets to them bids least,
 (Greater the *bribe*) and cheats at interest. *Marvell,*

BRIBE anciently imported as much as panis mendicatus, which still keeps up the idea of the matter whereof bribes anciently consisted. Hence also the Spaniards use *bribar* and *brivar* for begging; and *brivia*, *brivoneria* and *brivonissimo*, for beggary. In authors of the middle age, a bribe given a judge is called *quato litis*, and the receiver, *campi particeps*, or *cambi particeps*; because the spoils of the field, i. e. the profits of the cause, were thus shared with the liver.

BRIBERY, in law, is a high offence, where a person in a judicial place takes any fee, gift, reward, or brokerage, for doing his office, but of the king only. It signifies also the receiving or offering any undue reward to or by any person concerned in the administration of public justice, whether judge, officer, &c. to act contrary to his duty; and sometimes it signifies the taking or giving a reward for a public office.—In the east it is the custom never to petition any superior for justice, not excepting their kings, without a present. The Roman law, though it contained many severe injunctions against bribery, as well for selling a man's vote in the senate or other public assembly, as for the bettering of common justice; yet, by a strange indulgence, it tacitly encouraged this practice, in one case; allowing magistrates to receive small presents, provided they did not on the whole exceed 100 crowns a-year; not considering the insinuating nature and gigantic progress of this vice, when once admitted. Plato, therefore, in his ideal republic, orders those who take presents for doing their duty to be punished in the severest manner; and by the laws of Athens, he that offered a bribe was also prosecuted, as well as he that received a bribe. In England this offence is punished, in inferior officers, with fine and imprisonment; and in those that offer a bribe, though not taken, the same. But in judges, especially the superior ones, it has always been looked upon as so heinous an offence, that the chief justice Thorpe was hanged for it in the reign of Edward III. By a statute, 11 Henry IV. all judges and officers of the king, convicted of bribery, shall forfeit treble the bribe, be punished at the king's will, and be discharged from his service for ever. And some notable examples have been made in parliament, of persons in the highest stations, and otherwise very eminent and able, but contaminated with this sordid vice.

BRIBERY IN ELECTIONS. See **ELECTIONS**.

BRICIANI, a military order, instituted by St. Bridget, queen of Sweden, who gave them the constitutions of those of Malta and St. Augustine. It was approved by Pope Urban V. The Briciani were to fight for the burying of the dead, to relieve and assist widows, orphans, the lame, sick, &c.

BRICK', v. & n.	} Fr. <i>brique</i> ; Armoric <i>brick</i> ; Ital. <i>bruchio</i> ; terra <i>abruclian</i> , from Goth. and Swed. <i>braka, brasa</i> ; Ital. <i>bruggio</i> , to burn. A piece of burnt clay. 'Brick is a mass of argillaceous earth, sometimes mixed
BRICK'ED,	
BRICK'BAT,	
BRICK'CLAY,	
BRICK'DUST,	
BRICK'KILN,	
BRICK'LAYER,	
BRICK'WALL.	earth, sometimes mixed

with coal ashes, chalk, and other substances, formed in cubical moulds, dried in the sun, and baked into a kind of artificial stone for the use of builders.' To work, build, or fortify with bricks.

A stately palace built of squared *bricks*
Which cunningly was without mortar laid,
Whose walls were high, but nothing strong nor thicke,
And golden-foile all over them displaid,
That purest sky with brightness they dismaid.

Spenser.

Nor *brick* nor marble was the wall in view,
But shining crystall which from top to base,
Out of her womb a thousand rayons threw,
One hundred steps of Africk golds enchase. *Id.*

The elder of them, being put to nurse,
And ignorant of his birth and parentage,
Became a *bricklayer* when he came to age.

Shakspeare.

If you had lived, Sir,
Time enough to have been interpreter
To Babel's *bricklayers*, sure the tower had stood.

Donne.

For whatsoever doth so alter a body, as it returneth not again to that it was, may be called *alteration* major; as coals made of wood, or *bricks* of earth.

Bacon.

Earthen bottles, filled with hot water, do provoke in bed a sweat more daintily than hot *brickbats*. *Id.*

He with a crew, whom like ambition joins
With him, or under him, to tyrannize,
Marching from Eden towards the West, shall find
The plain, wherein a black bituminous gurge
Boils out from under ground, the mouth of hell;
Of *brick*, and of that stuff they cast to build
A city, and tower, whose top may reach to heaven.

Milton.

And hence like Pharaoh that Israel pressed
To make mortar and *brick* yet allowed 'em no straw;
He cared not though Egypt's ten plagues us distressed,
So he could to build but make policy law. *Marcvell.*

Thus daily his gouty inventions him pained,
And to save the expences of *brickbat*,
That engine so fatal, which Denham had brained,
And too much resembled his wife's chocolat. *Id.*

They are common in claypits; but the *brickmakers* pick them out of the clay. *Woodward.*

I observed it in pits wrought for tile and *brick-clay*. *Id.*

They grow very well both on the hazelly *brick-earths*, and on gravel. *Mortimer.*

Like the Israelites in the *brick-kilns*, they multiplied the more for their oppression. *Decay of Piety.*

The sexton comes to know where he is to be laid, and whether his grave is to be plain or *bricked*.

Swift.

This ingenious author, being thus sharp set, got together a convenient quantity of *brickdust*, and disposed of it into several papers. *Spectator.*

But spread, my sons, your glory thin or thick,
On passive paper, or on solid *brick*. *Pope.*

They generally gain enough by the rubbish and *bricks*, which the present architects value much beyond those of a modern make, to defray the charges of their search. *Addison.*

BRICK, a fat reddish earth, formed into long squares, four inches broad, and eight or nine long, by a wooden mould, and then baked or burnt in a kiln, to serve the purposes of building. Bricks are commonly red, though there are some of a white color.

Bricks clearly existed in the very origin of human associations. It appears by the Sacred Writings that the tower of Babel was attempted to be raised with them. They seem to have been in common use while the Israelites were in Egypt, for their oppressive task was the making of brick without straw; and in the book of Exodus we are informed that the Israelites built two Egyptian cities. Straw was clearly then one of the ingredients of these as of modern bricks, and as rain is almost unknown in Egypt, it is probable that their bricks were merely baked in the sun, a mode of making them still practised in the East, where exist the ruins of a considerable tower near Bagdad, which some have considered as the tower in Babylon, described by Herodotus, (lib. i. c. 181.), formed wholly of this material. The Greeks chiefly used three kinds of bricks; the first whereof was called *ῥέγων*, i. e. of two palms or six inches; the second *τετραγωνον*, of four palms, or twelve inches long; the third *πενταγωνον*, of five palms, or fifteen inches. They had also bricks, just half the size of these, to render their brick-work more solid, and also more agreeable to the eye. The bricks chiefly used by the Romans, according to Pliny, were a foot and a half long, and a foot broad; which measures nearly agree with those of several Roman bricks in England. That they excelled in the art of brick-making is clear, several of their structures of this material, as Trajan's pillar for instance, having come down to us unimpaired almost during the lapse of near 2000 years. Pliny mentions a kind of brick used by the ancients, so light as to swim in water. 'Pitanæ in Asia, et in ulterioris Hispaniæ civitatibus Maxilua et Calento, fiunt Lateres, qui ciccati non merguntur in aqua.' (*Plinii Natur. Histor. lib. xxxv. c. 14*). He does not state the part of the world in which they were manufactured, but only that the material employed was a kind of pumice stone. Until the year 1791 this was unintelligible to the modern world; then M. Fabroni found a substance at Castel del Piano, not far from Santa Fiora (between Tuscany and the Papal dominions), which formed bricks capable of being floated on water. It is a white earthy matter, which constitutes a bed in that place, and was known in Italy by the name of Latte di Luna. In recent mineralogical works it is distinguished as the *farina fossilis* (bergmehl). Haüy considers it as a variety of talc, and Brochant, as a variety of meerschau. According to the analysis of Klaproth, it contains,

Silica	79
Alumina	5
Oxide of iron	3
Water	12
Loss	1

From this analysis, we see it appears to be neither a variety of talc nor of meerschaum, but rather a hydrate of silica. Sir Henry Wotton speaks of a sort of bricks at Venice, of which stately columns were built; they were first formed in a circular mould, and cut, before they were burnt, into four or more quarters or sides; afterwards, in laying, they were joined so close, and the points concentrated so exactly, that the pillars appeared one entire piece. In modern times brick-making is nowhere carried to greater perfection than in Holland, where most of the floors of houses and often the streets are paved with excellent and very durable bricks.

Loam and marl are considered the best English materials for bricks. The former is a natural mixture of sand and clay, which may be converted at once into this useful manufacture; marl is a mixture of limestone and clay in various proportions. The best proportion for common bricks would be three parts of clay, and one part of limestone or chalk powdered. Such a mixture exposed to heat experiences an incipient fusion, and thereby is rendered much harder and denser; it imbibes much less water than any other material, and is therefore much less liable to crack and fall to pieces in winter.

We cannot here enter into details respecting the chemical investigations of different periods as to the nature of clay. Suffice it to say, that during the last century the labors of Pott, Baumé, and Margraaf, threw a sufficient light upon the subject to enable us to pronounce it a mixture of alumina and silica, in different proportions. It was shown at the same time that it also frequently contains sulphuric acid and potash. More recent researches have likewise discovered in its composition mica, chalk, felspar, hornblende, bitumen, oxide of iron, and coal, which modify its qualities considerably, and adapt it for the various purposes of different manufactories.

The neighbourhood of London is remarkably adapted for the making of bricks, the soil of the whole surrounding country being clay at a certain depth, generally under a bed of gravel; and the bottom of the Thames yielding the sand which is used in this manufacture. Here, too, of course, is an uncommon consumption of them; and although from the peculiar advantages of the spot an excellent yellow brick has long distinguished the manufacture of the metropolis, great practical carelessness seems to pervade the whole business as conducted here. We see no reason why our Dutch neighbours should so decidedly excel us in this particular; except that the spirit of a short-sighted parsimoniousness has crept into this as into many other of our calculations; that is, houses are built in and about London, not to endure nor to sell, strictly, but to let, and that for comparatively short leases. frequently. Hence our ordinary

architects and takers of building leases have no part in the ambition of rearing an 'eternal city;' whole streets may be seen 'in youth decrepid,' propped, and tottering, sometimes before tenanted, and the greater number of bricks used are not above half kneaded and half burnt.

Brick-clay is generally dug out and exposed at the end of one season, for the operations of the next. It should always be laid open to the air and weather for a considerable time; and if for two or three seasons, the bricks will be the better made. The stones of which the clay has been originally formed, thus become more completely decomposed, and the clay itself better pulverised. The frosts of winter, too, temper and mellow it very beneficially. It should be often turned over, and afterwards ground by a mill to a complete powder; but ordinarily the clay is tempered by the treading of men or cattle; the earth being thrown into shallow pits, where it is wrought and incorporated, until formed into a homogeneous paste. This is facilitated by occasionally adding small quantities of water; but the less water that is used, the better for the substance of the clay, which will be more tough and gluey, and consequently the bricks will be smoother and more firm. This is the most laborious, and perhaps most essential, part of the process; to the negligence of which we are to attribute almost all the bad qualities of modern bricks; hence are they light, soapy, spongy, and full of cracks. Whereas, if the clay be properly tempered, they are hard, ponderous, and durable. Mr. Gallon having taken a quantity of brick-earth tempered in the usual way, let it remain exposed to the air for seven hours, and then caused it to be moistened and beaten for the space of half an hour; the next morning the operation was repeated; and in the afternoon the clay was again beaten for fifteen minutes more; making the whole additional labor an hour and a quarter. The bricks made of this earth being dried in the air for thirteen days, and burned along with the rest without any particular precautions, were found to be not only heavier than common bricks, but also very different in strength; for on placing their centre on a sharp edge, and loading both the ends. Mr. Gallon found, that while it took a weight of 65 lb. at each end to break them; other bricks were broken by the weight of only 35 lbs. The improvement in the quality of the article thus far exceeding the additional labor.

A proper quantity of coarse sand is a fine annealer of brick-clay; it answers best when the particles are of such a size as to be readily distinguished by the eye. When as large as coriander seeds, it has been found to answer better than when very fine.

London brick-makers add also about one-third part of ashes or small coal to their clay, the consequence of which is said to be that when the mixture is sufficiently heated afterwards, those fires burn of themselves, and are chiefly fed with the fuel supplied by the clay. Bricks, according to Mr. Malcolm, are made by the thousand, as the most satisfactory mode between master and man, and a handy man could mould in one day, viz. from five in the morning until eight at night,

5000. To assist him in the preparation of the soil, &c. from the heap (which is usually dug after the season for brick-making is over, and laid up), there is generally a gang, consisting of six persons; one man tempers and prepares the soil, which is done with a hoe made long, in the shape of a mattock, a shovel, scoop, a thick plank or board, and a cuckhold; with the hoe he pulls down the soil from the great heap, which is chopped backwards with the shovel, to turn it as often as may be necessary, to mix and thoroughly incorporate the ashes and soil together, because it is to be understood, that at the time the soil is dug out, and made into this heap, a layer of coal ashes is alternately placed between a layer of soil, as often and in such quantities in each layer as the quality of the soil and other circumstances may make necessary. The scoop is used to throw water over this portion that is pulled down with the hoe, in order that it may become, more and more, in a tempering state, more soft and ductile; and with the board he kneads it together, over which a certain quantity of sand is thrown, and it is then covered with pieces of sacking or matting, to keep the sun and air from it. A boy scoops or cuts off a slice, with an instrument or shovel having a short handle, and the blade of it made concave, called a cuckhold; this he brings on his arms to the moulding table, which is placed under a moveable shed, upon which, another boy rolls out a lump somewhat bigger than will fit the mould, the table have been previously strewed with sand. The moulder, after dipping his mould into dry sand, placed at one corner of his table, throws the lump prepared into the mould, and with a flat smooth stick, about eight inches long, previously dipped in a pan of water, strikes off the surplus soil; he then immediately turns out the brick upon a stand, or board, of the same size with the brick; a boy takes it from thence, and places it on a light barrow, with a lattice-work frame fixed over the frame of the barrow, at about three feet high above the wheel, and reduced to about eighteen inches in height towards the handle, forming an inclined plane. The new made bricks are placed on this lattice frame, and over them sand is thrown in sufficient quantities to prevent their adhering to each other, as well as to prevent, in a certain degree, their cracking in drying while on the hacks. A boy wheels the barrow to the hacks, and places them with great regularity and despatch, one above the other, a little diagonally, in order to give a free passage to the air. Each hack is made wide enough for two bricks, to be placed edgeways across, with a passage between the heads of each brick; they are usually made eight bricks high; the bottom bricks at the end of each hack are old ones.

Wheat or rye straw is, in showery weather, carefully laid over the hacks, at least near London, where the brick-makers do not, as in some places distant from the metropolis, go to the expense of roofed coverings, or sheds; their works being too extensive. If the weather is tolerably fine, a few days is sufficient to make them dry enough to be turned, which is done by resetting them more open, and turning them: and six or

eight days more are required before they are fit to be put into the clamp or kiln for burning. Bricks throughout the country are generally burnt in a kiln thirteen feet long, by about ten feet and a half wide, and twelve feet in height. It will hold about 20,000 bricks. The walls are one foot two inches thick, carried up a little out of the perpendicular, inclining towards each other at the top. The bricks are placed on flat arches, having holes left in them resembling lattice work; the kiln is then covered with pieces of tiles or bricks, and some wood put in, to dry them with a gentle fire. This continues two or three days before they are ready for burning, which is known by the smoke turning from a darkish color to transparent. The mouth or mouths of the kiln are now dammed up with a shinlog, or pieces of brick piled one upon another, and closed with wet brick earth, leaving above it just room sufficient to receive a faggot. The faggots are made of furze, heath, brake, fern, &c. and the kiln is supplied with these until its arches look white, and the fire appears at the top; upon which it is slackened for about an hour, and the kiln allowed gradually to cool. This heating and cooling is repeated until the bricks are thoroughly burnt, which is generally in forty-eight hours. Near London, when the bricks are sufficiently dried by the air, the clammaker levels the ground, at one end of the range of hacks, making the foundation of the intended clamp somewhat higher than the surrounding ground; and with place bricks, if they have any, or otherwise with the driest of those just made, makes a foundation of an oblong form, beginning with the flue, which is nearly a brick wide, and running straight through the clamp. In this flue, dry bawns, coals, and cinders, vulgarly called breese, are laid and pressed in close, in order that the interstices between wood and coal may be properly filled up. On the sides of the flue, the bricks are placed diagonally about one inch asunder, and between each layer of bricks three or four inches of breese are strewed, and in this manner they build tier upon tier as high as the clamp is meant to be; never omitting between each layer, as well as between each brick that is placed diagonally, to put a due portion of breese. When they have made the clamp about six feet long, another flue is made similar in every respect to the preceding, to the extent of the size of the intended clamp, provided only that the bricks are meant to be burnt off quick, which they will be in about twenty-one or thirty days, according as the weather may suit. But if there is no immediate hurry for the bricks, the flues are placed about nine feet asunder, and the clamp left to burn off slowly. When the fire is set to the clamp, and it burns well, the ash-hole, being placed at the west end generally, the mouths are stopped with bricks, and clay laid against them; the outsides of the clamps are plastered with clay if the weather is at all precarious, or the fire burns furiously; and to the end against which addition is made to the clamp, screens made of reeds worked into frames about six feet high, and sufficiently wide to be moved about with ease, are placed to keep off the weather, and against any particular side where wet is

most prevalent. On the top of the clamp a thick layer of breese is uniformly laid.

The excellency of bricks, says Mr. Malcolm, consists chiefly in the first and last operation; for bricks made of good earth, and well tempered, become solid and ponderous, and therefore will take up a longer time in drying and burning than our common bricks seem to require. It is also to be observed, that well drying of bricks, before they are burned, prevents cracking and crumbling in their burning; for when the bricks are too wet, the parts are prevented from adhering together. The best way of ordering the fire is, to make a gentle fire at first, and increase it by degrees, as the bricks grow harder. It has been said to give bricks additional strength if after burning they are steeped in water and burnt afresh.

The common computation is, that every acre of land will yield one million of bricks, in every foot in depth, including ashes, which are usually mixed with it. In general our fields are shallow, with a bottom of gravel, yet we think they will average nearly five feet, though we believe we have none that will run twelve or more feet, as about Kingsland; at least such is Mr. Malcolm's information on this subject. Among modern improvements, the patent bricks of Mr. Cartwright deserve some attention. These are formed with a groove down the middle, a little more than half the width of the side of the brick, leaving two shoulders, each of which will be nearly equal to one-half the groove. When they are laid in courses, the shoulders of the first course fit into the grooves of the second, and the shoulders of the second fall into the grooves of the first, thus forming an indented line of nearly equal divisions. The grooves, however, ought to be somewhat wider than the two adjoining shoulders, to allow for mortar, &c. The construction of these bricks is perfectly simple; but the principle will be preserved, in whatever form of indenture they may be made to lock into, or cramp each other. Brick walls, constructed upon this principle, require no bond timber, one universal bond connecting the whole building, which can neither crack nor bulge out without breaking through the bricks themselves. This invention is also particularly useful in the construction of arches; and when employed for this purpose, the shoulders of the bricks and the sides of the grooves should be radii of the circle, of which the intended arch is a segment. It is, however, recommended that if the arch be particularly flat, or applied in situations which do not admit of end walls, to have the shoulders dovetailed, to prevent the arch cracking across, or giving way edgeways. In forming an arch, the bricks must be coursed across the centre, and the grooved side of the bricks must face the workmen. The bricks may be either laid in mortar, or dry and the interstices filled up by pouring in lime putty, Paris plaster, or any other convenient material. The obvious advantages of arches constructed upon this principle, are, that the same centre, which, whatever be the breadth of the arch, may be in no case many feet wide, may be regularly shifted as the work proceeds; and, as they have no lateral pressure, they require no abutments to prevent their expanding at the

foot, nor any weight upon the crown to prevent their springing up. They may be laid upon a common perpendicular wall, and if used in the construction of common buildings, they will not only preclude the necessity, and save the expense of timber, but will also afford an absolute security against the possibility of fire.

A M. Legressier has also lately announced an invention of the kind in the Archives des Découvertes et des Inventions Nouvelles, pendant l'année 1809. The principle is Mr. Cartwright's followed out to a greater extent. M. Legressier merely proposes, that the bricks should be formed in seven different moulds, according as they are to be placed in the middle or outside of the walls; in the bottom or on the top; in the arches or in corners; and, by the proper disposition of these bricks in the building, every pressure, either longitudinally or laterally, is resisted, in proportion to the strength of the indentures by which they are locked.

Fire-bricks are of different materials to common bricks; but made in the same way. The best clay for them is Stourbridge clay; and, instead of sand, it is usual to mix the clay with a quantity of old fire-bricks, crucibles, or glass pots, reduced to powder. The kinds of bricks made in this country, are principally place-bricks, gray, and red stocks, marble facing bricks, and cutting bricks. The place bricks and stocks are used in common walling. The marbles are made in the neighbourhood of London, and used in the outside of buildings; they are of a beautiful yellow color, hard, and well burnt, and in every respect superior to the stocks. The finest kind of marble and red bricks, are called cutting bricks, and are used in the arches over windows and doors, being rubbed to a centre, and gauged to a height. There is also a fine kind of white bricks made near Ipswich, which are used for facing, and sometimes brought to London for that purpose. In Sweden it is said to be customary, at some of the iron foundries, to cast the scoria into bricks, which they employ in constructing their furnaces. Any quantity of such bricks could then be produced by some of our large iron foundries; and it is surprising that a recommendation upon this subject, long since given, has never been acted upon by them.

As articles of taxation, and furnishing a considerable revenue to Government, the size of bricks has been regulated by act of parliament. They must not be less than eight inches and a half long, two and a half thick, and four inches wide. But for specific purposes, they are allowed to be made of different sizes.

BRICKLAYING is the art of cementing bricks, by lime, or some other cement, so as to form one body. In London, bricklaying includes the business of walling, tiling, and paving with bricks or tiles; and it is sometimes united with plastering. In the country it is very common for the same person to exercise masonry, bricklaying, and plastering. This is of great antiquity.

Tools used by bricklayers, are, 1. The *trowel*, for taking up and spreading the mortar, in order to cement the bricks together, and for cutting them to any shape required. 2. The *hammer*, which is used to cut holes in brick walls. 3. The *plumb rule*, generally about four feet

long, and used with a plumb line, to carry the faces of walls perpendicularly. 4. The *level* from six to twelve feet long, used to try the level of works as it proceeds, more particularly window cills and wall plates. 5. The *large square*, for trying and setting out the sides of buildings at right angles. 6. The *rod*, for measuring, either five or ten feet long, and divided by notches on the edge, into as many feet, the last foot of which is divided into inches. 7. The *jointing rule*, eight or ten feet long, for running the joints of brick-work. 8. The *jointer* is made of steel, and shaped like the letter S; with this and the rule, the joints in brick-work are marked. 9. The *compasses*. They are used for traversing arches, &c. 10. The *raker*, a piece of iron, bent like the letter Z, and pointed at both ends; its use is to pick or scrape decayed mortar out of joints in old walls to be replaced by new. 11. The *hod*, which consists of two boards put together at right angles, with a handle or leg, somewhat resembling the letter Y, fastened to that part where the two sides meet; one end of the trough is open and the other closed; its use is to carry mortar, bricks, stones, &c. up the ladders, on the shoulder, the handle serving to keep it steady while ascending, and to rest it upon when on the scaffolding. Some sand or dust is generally strewed over the inner surface when mortar is carried, to prevent its sticking. 12. The *line-pins*. They are two iron pins for fastening and stretching the line, for the purpose of laying the courses level. 13. The *rammer*. When ground is of a loose kind this tool is used for compressing it, by beating on its surface. 14. The *iron crow and pick-axe* are used for the purpose of breaking through walls; the crow-bar is used alone for raising large stones, or any other heavy bodies. 15. The *grinding-stone*, which is used for sharpening any of the tools. 16. The *banker*, a high bench of six to twelve feet long, two or three feet wide, and two feet eight inches high from the ground, and serves as a bench to rub bricks for arches or other work upon. 17. The *camber-slip* is a piece of wood of at least half an inch thick, with one of its edges curved, and rising about one inch in six feet; its use is for drawing the soffit lines of straight arches. If the other edge is curved, it should rise one half as much; this is used for drawing the upper side of straight arches, to allow for their settling. Some workmen prefer the upper side of the arch straight. When the lines are drawn the camber slip should be given to the carpenter to enable him to form the centre to the curve of the soffit. 18. The *rubbing-stone*, generally of a cylindrical form, about twenty inches in diameter, fixed at one end of the banker. When the bricks are brought as near the shape as convenient, by the axe, they are by this rubbed smooth; it is also used for rubbing headers and stretchers, called rubbed returns. 19. The *bedding-stone*, formed of a piece of marble, about eighteen inches long, and eight or ten inches wide, with one fair side; its use being to try the rubbed sides of the brick, which must be first squared, in order to try whether the surface of the brick is straight, so as to fit upon the leading skew-back, or leading end of the arch. 20. The *small square*, for trying the bedding of the bricks, and squaring

the soffits across the breadth of the bricks. 21. The *bevel*, for drawing the soffit line on the face of bricks. 22. The *mould*, used in giving form to the back and face of the brick, that it may have its thickness reduced to its proper taper, to which end one edge of the mould (which has a notch for every course of the arch), is brought close to the bed of the brick already squared. 23. The *scribe*, any piece of iron ground to a point, to mark by the edge of the rule or mould. 24. The *tin-saw*, for cutting the lines upon the bricks about one-eighth of an inch deep, that when the axe is used the edges may not spalter away. It is also used in cutting the soffit through its breadth, in the direction of the tapering lines, drawn on the face and back of the brick; the cut being made deeper on the face and back than in the middle of its thickness, for the purpose of entering the axe. The saw is likewise useful in cutting false joints. 25. The *brick axe* is used for axing off the soffits of bricks to the scribes, and saw cuttings. The more care that is taken in axing, the less will be the labor of rubbing. 26. The *tamplet* is used in taking the length of the stretches and width of the header.—The last ten articles relate to the cutting of gauged arches.

The *chopping block* is any convenient piece of wood, placed so as to be three inches from the ground, supported either on legs or piers, and used for axing bricks upon. Its length must be according to the number of men that are to work at it.

The *float stone* is used to rub the curved surface of the bricks smooth; it is necessary to bring it as near as possible to the figure of the surface intended to be rubbed, before the operation is begun.

In laying bricks in the summer season, dip them into water, until they become saturated; and when the work is left for only one day, the walls should be as carefully covered as in the winter; for at such time the mortar sets too rapidly, and the necessary cohesion is destroyed. This evil is increased by the dust which hangs about bricks, more especially at this time of the year; and this last circumstance should operate as an additional motive for adopting the above expedient. While the injuries to which brick-work is liable, from frost, &c. is known to all, it is singular, that a point of equal, if not of superior importance, should be almost overlooked, or at least generally deemed too inconsiderable to merit attention.

In working up a wall, it will be proper not to work more than four or five feet at a time, for as all walls, immediately after building, shrink, the part which is first brought up will remain stationary, and when the adjoining part is raised to the same height, a shrinking or settling will take place, and separate the former from the latter, causing a crack, which will become more and more evident as the work proceeds. In carrying up any particular part, each side should be sloped off, to receive the bond of the adjoining work on the right and left. Nothing but absolute necessity can justify the work being carried higher, in any particular part, than one scaffold, for, wherever it is done, the workman is certainly answerable for all the evil which may arise from such palpable error.

There are two kinds of bond in brick-work, which differ materially from each other, and as the subject is of the highest importance to the bricklayer, we shall lay before our readers some remarks contained in a pamphlet, written on this subject, by Mr. G. Saunders, who has treated it with a degree of attention which its importance requires.—‘Bricks laid lengthways in the direction of the wall are called stretchers, and those laid in an opposite way crossing the direction of the wall, are called headers. Old English bond is a continuation of one kind throughout, in the same course or horizontal layer, and consists of alternate layers of headers and stretchers, the headers serving to bind the wall together, in a longitudinal direction, or lengthways; the stretchers to prevent the wall splitting crossways, or in a transverse direction. Of these two evils, the former is by much the worst kind, and is therefore much dreaded by the bricklayer.’

Mr. Saunders is of opinion, that old English brick-work is the best security against these accidents, as work of this kind, wheresoever it is so much undermined as to cause a fracture, is not subject to either of the above evils, but separates by breaking through the solid brick, just as if the wall were composed of one entire piece. The brick-work of the Romans was of this kind of bond, but the specimens of their work, which remain, are of great thickness, and have three or sometimes more courses of brick laid at certain intervals of the height, stretchers on stretchers, and headers on headers, opposite the return wall, and sometimes at certain distances in the length, forming piers, that bind the wall together in a transverse direction. The intervals between these piers were filled up, and formed pannells of rubble or reticulated work; consequently great substance with strength was economically obtained.

Flemish bond, which is the second kind, consists in placing in the same course alternate headers and stretchers, which disposition, according to our author, is decidedly inferior in every thing but in appearance, and even in this, the difference is so trifling, that few common observers would be struck with any great superiority, that the former possesses over the latter. To obtain this, strength is sacrificed, and bricks of two qualities are fabricated for the purpose; a firm brick often rubbed, and laid in what the workmen term a putty joint, for the exterior, and an inferior brick for the interior substance of the wall. As these did not correspond in thickness, the exterior and interior surface of the wall, would not be otherwise connected together, than by an outside heading brick that was here and there continued of its whole length. But as the work does not admit of this at all times, from the want of agreement in the exterior and interior courses these headers can only be introduced where such a correspondence takes place, which sometimes may not occur for a considerable space. Walls of this kind consist of two faces of four inch work, with very little to connect them together, and, what is still worse, the interior face often consists of brick, little better than rubbish. Notwithstanding this, the practice of Flemish bond has continued from the time of William and Mary, when it was introduced with many other

Dutch fashions; and our workmen are so infatuated with this practice, that there is scarcely an instance to be seen of the old English bond.

To the Flemish bond alone must be attributed the frequent splitting of walls into two thicknesses, and various schemes have been from time to time adopted for the prevention of this formidable defect. Some have laid laths or slips of hoop iron, occasionally, in the horizontal joints between the two courses; others lay diagonal courses of bricks at certain heights from each other; but the good effect of this last practice is much doubted, as in the diagonal course, by their not being continued to the outside, the bricks are much mangled where the strength is wanted. Many other practices are enumerated, to unite complete bond with Flemish facings, but with no better success.

For the walls of cottages and small buildings, the system of working walls hollow is attended with many advantages. Cottages in exposed situations in the country, which are built with a nine inch wall, solid, from the porous nature of the bricks, are damp and uncomfortable; the rain passing from the external to the internal part of the wall. The plan of building walls hollow, as shown in fig. 1, consists in placing a course of alternate headers and stretchers on cage A, and the backing course is like it, leaving an interval between of the width of a half brick; these are then covered with a heading course, B, laid flat, and the system is pursued until the whole height required be attained.

Fig. 1.

Fig. 2 is a section of the wall, showing the

Fig. 2.

intervals in the same, and describing the construction of it. It will be seen by inspection that these walls possess the desirable qualities of cheapness and durability, as, from the continued dryness of them, the timbers of roofs, &c. which are laid in them, are not so liable to decay; and the saving of bricks will be 1500 in a rod of reduced work; and the quantity of mortar less by a third than in the usual way.

This system may be well applied to garden walls (with piers about ten feet apart), as the walls retain the heat in summer; and, from their being hollow, admit the air, so that they are always dry.

In the old English bond, the outside of the

last course, points out how the next is to be laid, so that the workman cannot easily err. The outside appearance is all that can be urged in favor of Flemish bond, but even in this, Mr. Saunders is of opinion that were the English manner executed with the same attention and neatness that is bestowed on the Flemish, it would be considered as equally handsome. However this may be, it is surely the duty of all who are concerned in this business, to recommend the adoption of the old English bond in preference. For the construction of chimneys, foundations, roofs, windows, &c. see ARCHITECTURE: and for the building of ovens, see OVEN.

BRICKING, among builders, the counterfeiting of a brick wall on plaster. It is done by smearing it over with red ochre, and making the joints with an edged tool; these last are afterwards filled with a fine plaster.

BRICKLAYERS in London are a regular company, which was incorporated in 1568; and consists of a master, two wardens, twenty assistants, and seventy-eight on the livery.

BRICKLAYERS, MATERIALS AND TOOLS USED BY. These are bricks, tiles, mortar, nails, and tile-pins. Their tools are a brick-trowel, wherewith to take up mortar; a brick-axe, to cut bricks to the determined shape; a saw, for sawing bricks; a rub-stone, on which to rub them; a square, wherewith to lay the bed or bottom, and face or surface of the brick, to see whether they are at right angles; a level, by which to cut the under sides of bricks to the angles required; a small trammel of iron, wherewith to mark the bricks; a float-stone, with which to rub a moulding of brick to the pattern described; a banker, to cut the bricks on; line-pins to lay their rows or courses by; plumb-rule, whereby to carry their work upright; level, to conduct it horizontal; square, to set off right angles; ten foot rod, wherewith to take dimensions; jointer, wherewith to run the long joints; rammer, wherewith to beat the foundation; crow and pick-axe, wherewith to dig through walls.

BRICK-LAYING, the art of framing edifices of bricks. This business in London, includes tiling, walling, chimney-work, and paving with bricks and tiles. In the country it also includes the mason's and plasterer's business. Moxon has a treatise on the art of brick-laying; in which he describes the materials, tools, and method of working, used by bricklayers. Great care is to be taken, that bricks be laid joint on joint in the middle of the walls as seldom as may be; and that there be good bond made there, as well as on the outsides. Some bricklayers, in working a brick and half wall, lay the header on one side of the wall perpendicular to the header on the other side, and so all along the whole course; whereas, if the header on one side of the wall were toothed as much as the stretcher on the other side, it would be a stronger toothing, and the joints of the headers of one side would be in the middle of the headers of the course they lie upon of the other side. If bricks be laid in winter, let them be kept as dry as possible, if in summer, it will quit cost to employ boys to wet them, for that they will then unite with the mortar better than if dry, and

will make the work stronger. In large buildings, or where it is thought too much trouble to dip all the bricks separately, water may be thrown on each course after they are laid, as was done at the building of the Physician's College, by order of Dr. Hooke. If bricks are laid in summer, they are to be covered; for if the mortar dries too hastily, it will not bind so firmly to the bricks as when left to dry more gradually. If the bricks be laid in winter, they should also be covered well, to protect them from rain, snow and frost; which last is a mortal enemy to mortar, especially to all such as have been wetted just before the frost assaults it.

BRICK-MAKING is mostly performed at some small distance from cities and towns; and though some, through ignorance, look upon it as a very mean employment, because laborious, yet the masters about London, and other capital cities, are generally men of substance. See BRICKS.

BRIDE-CHAMBER,	<i>reda, bereda</i> ; Sax. <i>bered-</i>
BRIDEMAD,	dian; Teut. <i>beraten</i> , to
BRIDEGROOM,	betrothe; to solemnise
BRIDEMAN,	legally. Goth. <i>rad</i> ; Teut.
BRIDESTAKE.	<i>hegrath</i> , signified mari-

riage ceremony; and Sax. bryd was applied to any married woman. Tooke, however, is confident that bride is the past participle of the Ang.-Sax. *bredan*, to nourish, to cherish; and that groom is the past participle of the Ang.-Sax. verb *gyman*, to take care of; to girdle; to guard; to attend. So that, according to him, the bride is any woman nourished, cherished; and the bridegroom is the person by whom the nourished, cherished one is attended, served, protected. Bruder, in Runick, signifies a beautiful woman; and all women at the time of their marriage are deemed by their lovers the fairest of their sex. The eye of love fixes on its bruder, its beauty. To be sure this sometimes goes off: but bride and loveliness are synonymous, perhaps for a moon.

At every *bridale*, would he sing and hoppe;
He loved bet the taverne than the shoppe.
For whan there any rïding was in Chepe,
Out of the shoppe, theder wold he lepe,
And til that he had all the sight ysein,
And danced wel, he wold not come again.

Chaucer's *Canterbury Tales*.

Help me mine own love's praises to resound,
Ne let the fame of any be envied;
So Orpheus did for his own *bride*. Spenser.

And let them make great store of *bridale* posies,
And let them eke bring store of other flowers,
To deck the *bridale* bowers. Id. *Epithalamium*.

And ye three handmayds of the Cyprian queene,
The which doe still adorn her beauties pride,
Helpe to adorn my beautifullest *bride*. Id.

Our wedding cheer to a sad funeral feast,
Our solemn hymns to sullen dirges change,
Our *bridal* flowers serve for a buried corse.

Shakspeare.

Come, I will bring thee to thy *bridal* chamber. Id.

Now until the break of day,

Through this house each fairy stray ;

To the best *bridebed* will we,

Which by us shall blessed be.

Id.

As are those dulcet sounds in break of day,

That creep into the dreaming *bridegroom's* ear,

And summon him to marriage.

Id.

Nay, we must think men are not gods :

Nor of them look for such observance always,

As fits the *bridal*.

Id. Othello.

Round about the *bridestake*.

Ben Jonson.

With the phantasies of hey-troll,

Troll about the *bridal bowl*.

And divide the broad *bridecake*

Round about the *bridestake*.

Id.

Sweet day, so cool, so calm, so bright,

The *bridal* of the earth and sky.

Sweet dews shall weep thy fall to-night ;

For thou must die.

Herbert.

The amorous bird of night

Sung spousal, and bid haste the evening star,

On his hill-top to light the *bridal lamp*.

Milton.

Your ill-meaning politician lords,

Under pretence of *bridal* friends and guests,

Appointed to await me thirty spies.

Id.

When to my arms thou brought'st thy virgin love,

Fair angels sung our *bridal* hymn above.

Dryden.

Why, happy *bridegroom* !

Why dost thou steal so soon away to bed ?

Id.

In death's dark bowers our *brideals* we will keep,

And his cold hand

Shall draw the curtain when we go to sleep.

Id.

The day approached, when fortune should decide

The' important enterprize, and give the *bride*.

Id.

The lovely Thais by his side,

Sat like a blooming eastern *bride*,

In flower of youth and beauty's pride.

Id.

These are tributes due from pious *brides*,

From a chaste matron and a virtuous wife.

Smith.

The writer, resolved to try his fortune, fasted all

day, and, that he might be sure of dreaming upon

something at night, procured an handsome slice of

bridecake, which he placed very conveniently under

his pillow.

Spectator.

Would David's son, religious, just, and brave,

To the first *bridebed* of the world receive

A foreigner, a heathen, and a slave ?

Prior.

And now the palace-gates are opened wide

The guests appear in order side by side,

And, placed in state, the *bridegroom* and the *bride*.

Pope.

Full many an age old Hymen had not spied

So kind a *bridegroom*, and so bright a *bride*.

Id.

For her the spouse prepares the *bridal* ring,

For her white virgins hymenæals sing.

Id.

With all the pomp of woe, and sorrow's pride !

Oh early lost ! oh fitter to be led

In cheerful splendour to the *bridal bed* !

Walsh.

Daughters of Salem, see the Hebrew king

Crowned with the beauteous wreath his mother placed

About his temples on that happy day,

When *bridal* rites completed all his bliss.

Rowe.

BRIDE. See *MARRIAGE*.

BRIDEGROOMS. See *MARRIAGE*.

BRIDWELL, *n. s.* The palace built by St.

Bride's, or *Bridget's* well, was turned into a

workhouse. A house of correction.

He would contribute more to reformation than all

the workhouses and *bridewells* in Europe.

Spectator.

BRIDWELL, near Fleet-street, is a foundation

of a mixed and singular nature, partaking of the

hospital, the prison, and workhouse ; it was founded in 1553 by Edward VI. who gave the place where king John formerly kept his court, and which had been repaired by Henry VIII. to the city of London, with 700 merks of land, bedding, and other furniture. Several youths are sent to the hospital as apprentices to manufacturers, who reside there. Having faithfully served for seven years, they have their freedom, and a donation of £10 each, for carrying on their respective trades.

BRIDWELL, is also a workhouse for vagrants, strumpets, and other disorderly persons : who are made to work ; being maintained with clothing and diet ; and when it seems good to their governors, they are sent by passes into their native countries. While they remain in *Bridwell* they are not only made to work, but, according to their crimes, receive once a fortnight, such a number of stripes as the governor commands.

BRIDGE, in gunnery, the two pieces of timber which go between the two transoms of a gun-carriage, on which the bed rests.

BRIDGEND, a town of South Wales, in Glamorganshire, seated on the Ogmore, which divides it into two parts, connected by a stone bridge. It is seven miles west by north of Cowbridge, twenty from Cardiff, and 131 west from London. It has a considerable market on Saturday for cattle and provisions: with two fairs on 17th November and Holy Thursday.

BRIDGENORTH, a borough and market town of Shropshire, seated on the Severn, which divides it into two parts, united by a handsome stone bridge of six arches, and called the Upper and Lower town. It is said to have been built by Ethelfleda, widow of Ethelred king of the Mercians, about A.D. 675. Robert de Belesme, son of Robert de Montgomery, built the castle, and maintained it against king Henry I., in consequence of which it was forfeited to the crown, and remained so till the reign of Richard III., who gave it to John Sutton lord Dudley. This town has undergone several sieges; and in the civil war suffered much, the whole town being almost destroyed by fire, when Sir Lewis Kirke defended the citadel for the king. There are now no other remains of the castle than a small part of the towers, and a place of that name within its walls, within which also stands one of the churches, dedicated to St. Mary Magdalen, exempted from episcopal jurisdiction. The other church is at the north end of the town, on the highest part of the hill. Near this church-yard stood a college, which was burnt during the civil wars, together with the church, which has been since rebuilt. On the west bank of the river are the remains of a magnificent convent, under which are several remarkable vaults and caverns. Part of the Cow-gate-street is a rock, rising perpendicularly, in which are several houses and tenements that make a very grotesque appearance. In many other places there are also caves and dwellings for families in the rocks; and, indeed, the whole town has a singular appearance. It is well supplied with water, not only by pipes from a plentiful spring, half a mile off, but also from the Severn; it being thrown by a water engine to the top of Castle-hill, whence the houses are supplied. There is a curious walk made from the higher part of the town to the bridge, being a hollow way, hewn twenty feet through the depth of the rock. The town is governed by two bailiffs, elected out of twenty-four aldermen (who must have gone through all the offices of the town), a jury of fourteen, together with forty-eight common-council men, a recorder, town-clerk, &c. The corporation has many ancient privileges, as granted by various charters. It has sent two members to parliament ab origine. The right of election is in the burgesses and freemen, the number of voters being about 700. Here are manufactories of stockings, cloths, fire-arms, iron tools, &c. It has a free-school for the sons of the burgesses, and an hospital for ten poor widows. Its market, on Saturday, is well stocked with all kinds of provisions. Its fairs, on Thursday before Shrove-Sunday, June 30th, August 2nd, and October 29th, for cattle, sheep, butter, cheese,

bacon, &c., are resorted to from most parts of the kingdom; the last of these fairs continues three days. Both the churches are curacies. It is twenty miles west by north of Birmingham, and 139 north-west of London.

BRIDGET, or **BRIGIT** (St.), a Swedish lady of the fourteenth century, famous for her revelations, and for being the founder of the order of the Brigittines. Some represent her as a queen; but Fabricius, on better grounds, says she was only a princess, and the daughter of king Birgenes, of Upland.

BRIDGETINES. See **BRIGITTINES**.

BRIDGETOWN, the capital of Barbadoes, situated in the inmost part of Carlisle Bay, which is capable of containing 500 ships, being four miles in length and three in breadth. This was originally a most unwholesome situation, and was chosen entirely for its convenience for trade; but is now deemed as healthy as any place in the island. Bridgetown is esteemed one of the finest cities in the West India islands, as it contains 1200 houses, built mostly of brick. The wharfs and quays are well defended from the sea, and very convenient. The harbour is secured from the north-east wind, which is the constant trade wind there; and is well defended by numerous forts and castles from all attacks at sea. The citadel, which bears the name of St. Anne, cost about 180,000 dollars; on the east side is a small fort mounted with eight pieces of cannon, where are preserved, under the care of a strong guard, the public magazines of ammunition and provision. There are some good inns and houses of refreshment in this city. Its shops and magazines are well stored with all kinds of European productions. The city has a garrison of 1200 men, and is the seat of the governor, the council, the assembly, and the court of chancery. Here is also a post-office, where the foreign mails are made up monthly. The church of St. Michael exceeds many English cathedrals in beauty, largeness, and convenience; and has a fine organ, bells, and clock. Here is a free-school for the instruction of poor boys, an hospital, and a college. The latter was erected by the Society for propagating the Christian Religion, in pursuance of the will of Colonel Christopher Codrington, who left about £2000 a-year for its endowment, for maintaining professors and scholars to study and practise divinity, surgery, and physic. Long. 58° 38' W., lat. 13° 10' N.

BRIDGETOWN, the capital of Cumberland county, in New-Jersey. It is situated on Cohanzey creek, fifty miles south-east of Philadelphia. The county court is held here quarterly.

BRIDGEWATER, a borough of Somersetshire, ten miles north-east from Taunton, and 139 west from London. It stands on the river Parrat, over which is an iron bridge, connecting the town with the suburb of Eastover. Here the tide rises, at high water, six fathoms; and sometimes the boar, as it is called, flows in with such impetuosity that it rises nearly two fathoms at a time, which often occasions damage to the shipping. This river is navigable to Bridgewater for vessels of 200 tons, and for barges up to Taunton and Langport. The church, which is a handsome and spacious structure, has the loftiest spire in the

county Near it is a free-school of stone; and the town-hall is a large building, over which is a cistern, which, by means of machinery, supplies the inhabitants with water. Bridgewater was first incorporated by king John, who built a castle here, and was one of the first towns seized by the barons under Henry III. It was constituted a distinct county, and had other privileges granted it by Henry VIII., in consequence of which the sheriff of Somerset cannot issue any process here. During the civil war it was first garrisoned by the parliament, but soon taken by the royalists, who kept it till the extinction of their cause. The duke of Monmouth was proclaimed king here, and lodged some time in the castle. The corporation, consists of a mayor, recorder, two aldermen, twenty-four common-council men, a town-clerk, water-bailiff, and two sergeants at mace; and sends two members to parliament, who are chosen by such of the inhabitants as reside in that part called the borough, and pay scot and lot. The revenue of the corporation is estimated at about £5000 per annum. The free-men are free of all the ports of England and Ireland, except those of their respective capitals. The inhabitants carry on an extensive trade to Wales, Ireland, Newfoundland and other parts of America, the West-Indies, and the Mediterranean. Here are held four sessions annually, for trying all crimes not capital; and a court of record every Monday, which takes cognizance of debts; the rules and practice being according to those of the court of common-pleas. The streets are irregular, but wide and well paved. Markets on Thursday and Saturday. Its fairs are 24th July, 2nd October, 27th December, and the first Monday in Lent, when great numbers of horses and horned cattle are sold. The assizes of the county are held here every other year. Bridgewater has a very good coasting trade, and a considerable number of coal vessels.

BRIDLE, *v. & n.* { *Goth. bñdöl*, from ride,
BRIDLEHAND, { and *ol*, a strap or rein;
BRIDLER, { *bitol*, a bit rein; Swed.
BRIDLING. { *bitul*; Teut. *brittel*; Belg.
brýdel; Fr. *bride*; Ital. *briglia*. A bit with reins for governing a horse. The verb primarily signifies to guide or manage the horse. Metaphorically it is to rein up the head as a horse does when checked by the bridle, and to hold in; to restrain; to moderate; to govern: and the noun is applied generally to signify a restraint, a curb, or check.

And to the hors he goth him, faire and wel,
And stripeth of the bridel, right anon.

Chaucer's Canterbury Tales.

They hied so (they would not abide
The bridling her horse to ride),
By five, by six, by two, by three,
There was not one abode with me;
The queene to mete everichone
They went, and lode with me not one.

Chaucer's Dream.

Thus while his stony heart with tender ruth
Was toucht, and mighty courage mollified,
Dame Venus' sonne (that teacheth stubborn youth
With yron bit, and maketh him abide,
Till like a victor on his back he ride)
Into his mouth his maystring *bridle* threw
That made him stoupe, till he did him bestride;

Then gan he make him tread his steps anew,
And learne to love, by learning lovers paines to rew.

Spenser.

The disposition of things is committed to them,
whom law may at all times *bridle*, and superiour
power controul.

Hooker.

In the turning, one might perceive the *bridlehand*
something gently stir; but, indeed, so gently, as it
did rather distil virtue than use violence.

Sidney.

With a strong, and yet a gentle hand,
You *bridle* faction, and our hearts command.

Waller.

Enough my dear brother, altho' we speak reason
Yet, truth many times being punished for treason,
We ought to be wary and *bridle* our tongue,
Bold speaking hath done both men and beasts wrong.

Marvell.

The king resolved to put that piece, which some
men fancied to be a *bridle* upon the city, into the
hands of such a man as he might rely upon.

Clarendon.

They seized at last
His courser's *bridle*, and his feet embraced.

Dryden.

How hard see'er it be to *bridle* wit,
Yet memory oft no less requires the bit.

Stillington.

The queen of beauty stopped her *bridled* doves;
Approved the little labour of the Loves.

Prior.

I *bridle* in my struggling muse with pain,
That longs to launch into a bolder strain.

Addison.

A bright genius often betrays itself into many
errors, without a continual *bridle* on the tongue.

Watts.

The heat of summer put his blood into a ferment,
which affected his *bridlehand* with great pain.

Warton.

The wars are all over,
Our swords are all idle,
The steed bites the *bridle*,
The casque's on the wall.

Byron.

BRIDLE. The origin of the bridle is of the highest antiquity, and has been variously assigned. Pausanias attributes its invention to Minerva; Virgil (*Georg. lib. iii. 115.*) and Pliny, to the Lapitha Pelethronius. Many of the coins struck in the ancient towns of Thessaly represent a horse, sometimes with a rider, but often running loose with a long rein trailing on the ground, to show that the bridle was the invention of the Thessalians. The first horsemen, not being acquainted with the art of governing horses with bridles, managed them only with a rope or a switch, and the accent of the voice. This was the practice of the Numidians, Getulians, Libyans, and Massilians. The Roman youth also learned the art of fighting without bridles, which was an exercise or lesson in the manege; and hence it is, that, on the Trojan column, soldier-are represented riding at full speed without any bridles. The different parts of a modern bridle are, the bit or snaffle; the head-stall, or leathers from the top of the head to the rings of the bit; the fillet, over the fore-head, and under the fore-top; the throat-band, which buttons from the head-band under the throat; the reins, or long thongs of leather, that come from the rings of the bit, and being cast over the horse's head, the rider holds them in his hand; the nose-band, going through loops of the back of the head-stall, and buckled under the

cheeks; the trench, the cavesan, the martingal, and the chaff-halter.

BRIDLES, SCOLDING. See BRANK.

BRIDLE-ARM PROTECT, in the broad-sword exercise, a guard used by the cavalry, in which you raise the sword-hilt above the helmet; the blade crossing the back of the head, the point of the left shoulder, and the bridle-arm; its edge directed to the left, and turned a little upwards in order to bring the mounting in a proper direction to protect the hand.

BRIDPORT, a borough town of Dorset, situated in a valley between two small rivers or branches of the river Brit, which falls into the sea about a mile south of the town. Bridport sends two members to parliament: it was incorporated by Henry III. The town is respectably built; its principal manufactures are cordage, nets, and sail-cloth. In the centre of the town is a new and handsome market-cross, which has been completed at the cost of £3000. Here also are a charity-school, three alms-houses, and other benevolent institutions. It is a very ancient corporation, having sent members to parliament ever since the 23d of Edw. I. In the reign of Henry VIII. it was enacted, that all the cordage, &c. for the navy, for a limited time, should be made here, or within five miles, and nowhere else; an Act which was renewed for nearly sixty years. It is noted for making ropes and cables for shipping; whence arises the proverb of a man that is hanged, that he is 'stabbed with a Bridport dagger.' It is twelve miles west of Dorchester, and 135 west by south of London. Long. 2° 52' W., lat. 50° 42' N.

BRIEF, *n. & adj.* } Lat. *brevis*; Fr. *bréf*;
BRIEFLY, } Ital. *breve*; also Goth.
BRIEFNESS. } *bréf*; Teut. *brief*; Sax.
brave; Fr. *brévet*; Ital. *breve*. The first generally signifies short, concise: the second is applied to a short extract; a letter patent; an abbreviated document; the concise substance of something larger, or to be expanded. Brief is technically used as a verb by those very brief gentlemen, the lawyers. For instance, to brief the pleadings.

So after in *breff* tyme, when it was purseyyd,
That she had done a woman's dede, and had a child
censeyyd,

The joy that she made ther may no tung tell.

Chaucer's Canterbury Tales.

But how you must begin this enterprize,
I will your highness thus in *brief* advise.

Fairie Queene.

A play, there is, my lord, some ten words long,
Which is as *brief* as I have known a play;
But by ten words, my lord, it is too long,
Which makes it tedious. *Shakspeare.*

I will be mild and gentle in my words.—

—And *brief*, good mother, for I am in haste. *Id.*

I must begin with rudiments of art,

To teach you gamut in a *brifer* sort,

More pleasant, pretty, and effectual. *Id.*

The shrine of Venus, or straight pight Minerva,
Postures beyond *brief* nature. *Id.*

There is a *brief* how many sports are ripe:

Make choice of which your highness will see first. *Id.*

They nothing doubt prevailing, and to make it *brief*
wars. *Id. Coriolanus.*

The *brief* stile is that which expreseth much in little.

Ben Jonson.

The apostolical letters are of a twofold kind and difference; viz. some are called *briefs*, because they are comprised in a short and compendious way of writing.

Ayliffe.

I doubt not but I shall make it plain, as far as a sum or *brief* can make a cause plain.

Bacon.

The harmony of science supporting each part; the other is, and ought to be, the true and *brief* confutation and suppression of all the smaller sort of objections.

Id.

I will speak in that manner which the subject requires; that is, probably, and moderately, and *briefly*.

Id.

The *brief* of this transaction is, these springs that arise here are impreguated with vitriol.

Woodward.

The modest queen awhile, with downcast eyes,
Pondered the speech; then *briefly* thus replies.

Dryden.

If I had quoted more words, I had quoted more profaneness; and therefore Mr. Congreve has reason to thank me for being *brief*.

Collier.

They excel in grandity and gravity, in smoothness and propriety, in quickness and *briefness*.

Camden.

The *brief* with weighty crimes was charged,

On which the pleader much enlarged. *Id.*

Brief, brave, and glorious, was his young career,

His mourners were two hosts, his friends and foes;

And fifty may the stranger lingering here,

Pray for his gallant spirit's bright repose.

Byron's Childe Harold.

BRIEF, in English law, an abridgment of the client's case, made out for the instruction of council on a trial at law; wherein the case of the party, &c. is to be briefly but fully stated: the proofs must be placed in due order, and proper answers made to whatever may be objected to the client's cause by the opposite side; and herein great care is requisite, that nothing be omitted, to endanger the cause.

BRIEF, in Scots law, a writ issued from the chancery, directed to any judge ordinary, commanding and authorising that judge to call a jury to enquire into the case mentioned in the brief, and upon their verdict to pronounce sentence.

BRIEFS, APOSTOLICAL, letters which the pope despatches to princes, or other magistrates, relating to any public affair. These briefs are distinguished from bulls, the latter being more ample, always written on parchment, and sealed with lead or green wax; whereas briefs are very concise, written on paper, sealed with red wax, and with the seal of a fisherman, or St. Peter in a boat.

BRIEG, a principality of Lower Silesia, adjoining the principalities of Oels, Breslau, and Oppeln. The extent of this tract, which is watered by the Oder, exceeds 1000 square miles. It is peopled by about 110,000 inhabitants, most of whom are Lutherans, and the remainder Roman Catholics. Good pasturage and fine crops of corn are yielded in that part which is cleared.

BRIEG, one of the circles in the above principality, contains about 200 square miles, and 30,000 inhabitants.

BRIEG, the chief town of the preceding principality, stands on the Oder, over which there is

a wooden bridge. The fortifications which once were considerable, have lately been demolished. But here is still a ducal castle worth the traveller's notice, and some few public buildings.

The Prussians, who besieged it in 1741, threw 2172 bombs into it, and 4714 cannon bullets, which reduced a great part of the town to ashes, so that it was obliged to surrender, after sustaining a continual fire for seven days. When it was ceded to Prussia by the peace, Frederic augmented the fortifications, and built a new suburb. Since 1728 a manufacture of fine cloth has been established. It is twenty-four miles north-east of Breslaw. Inhabitants about 9000.

BRIEL, or **BRILL**, a maritime town of the Netherlands, and capital of the island of Voorn, is one of the cautionary towns which was delivered into the hands of queen Elizabeth, and garrisoned by the English during her reign and part of the next. The Dutch took it from the Spaniards in 1572, and laid here the foundation of their republic. It is seated at the mouth of the Meuse, thirteen miles south-west of Rotterdam. The harbour is large and convenient, and the town well built. It was the birth place of the celebrated Van Tromp. In 1813 the inhabitants rose upon the French garrison, and drove them from the town. Here are some good fisheries, and the inhabitants are much engaged as pilots up the river.

BRIENNE, a town of Upper Champagne, France, the head of a canton in the department of the Aube. It has a considerable stocking manufacture, and stands about twenty-two miles east of Troyes. At the military school here Buonaparte received his education; and here a desperate battle was fought in 1814. Population 3,191.

BRIER, } Goth. *bry*; Ang.-Sax. *brær*;
BRIERY. } Irish, *brier*; Welsh, *brath*. A prickly bush; a bramble; a wild rose tree. Briery, rough, thorny; full of briers or prickles.

Greatly agast with this piteous plea,
Him rested the good man on the lea,
And bade the *brere* in his plaint proceede. *Spem.*

What subtle hole is this,
Whose mouth is covered with rude growing *briers*?
Shakspeare.

Then thrice under a *brier* doth creep,
Which at both ends was rooted deep,
And over it three times doth leap;
Her magic much availing. *Dragton's Nymphid.*

BRIET (Phillip), a learned French geographer, born at Abbeville in 1601. He became a Jesuit in 1619, and died librarian of their college at Paris in 1668. His *Parallèle Geographia Veteris et Novæ*, published in 3 vols. 4to. 1648-9, is a very exact work. He published also *Annales Mundi*, in 7 vols. 12mo. from the creation to A.D. 1663; and *Theatrum Geographicum, Europæ Veteris*, in 1653, fol. He was likewise concerned in a chronological work with Labbé.

BRIETKOPF (John Gottlieb Immanuel), an ingenious printer and letter-founder, was born at Leipsic, in 1712. Albert Durer's work in which the shape of the letters is deduced from mathematical principles, suggested to him some valuable improvements in the art of casting types, and he became the first who cast musical types. now so

common; and applied the same method to maps and even portraits. He proved still more fortunate in his endeavours to print the Chinese characters on movable types, and produced some specimens which are much admired. He also made improvements in the composition of type-metal, but these he concealed. His works are, 1. A Treatise upon the Origin of Printing, 1774. 2. An Attempt to illustrate the Origin of Playing Cards, and 3. A small treatise on Bibliography, published in 1793. He died in 1794.

BRIEUC, or **BRIEUX** (St.), a town of France, the capital of the department the Côtes du Nord, stands on a bay, on the north coast of Upper Brittany, called Anse de St. Brieux. It is well built, and, at the village of Legné, has a small secure harbour. The inhabitants are engaged in fisheries, and a small trade in the produce and manufactures of the country. Population 8090; distance west of Paris 200 miles.

BRIG, and possibly also *brix*, is derived from the Saxon *bræg*, a bridge; which, to this day, in the northern counties, is called a *brigg*, and not a bridge. Brig, a ship with two masts.

BRIG, or **BRIGANTINE**, a merchant ship with two masts. This term is not universally confined to vessels of a particular construction, or which are masted and rigged in a manner different from all others. It is variously applied, by the mariners of different European nations, to a peculiar sort of vessel of their own marine. Amongst British seamen, this vessel is distinguished by having her main-sails set nearly in the plane of her keel; whereas the main-sails of larger ships are hung athwart, or at right angles with the ship's length, and fastened to a yard which hangs parallel with the deck; but in a brig, the foremost edge of the main-sail is fastened in different places to hoops which encircle the main-mast, and slide up and down it as the sail is hoisted or lowered. It is extended by a gaff above and a boom below.

BRIGADE, *v. & n.* } Fr. *brigade*; Ital.
BRIGADIER. } *brigata*; Span. *brigada*.

The idea is detached, broken away; and is applied to a party or division of soldiers separated from the main body. Cotgrave says, it means to troop or keep company together.

Or fronted *brigades* form. *Milton.*

Here the Bavarian duke his *brigades* leads,
Gallant in arms, and gaudy to behold. *Philips.*

BRIGADE, a division of forces; consisting of several squadrons of horse, or battalions of foot. A brigade of the army is either foot or dragoons, whose exact number is not fixed, but generally consists of three regiments, or six battalions: a brigade of horse may consist of eight, ten, or twelve squadrons; and that of artillery, of five guns and one howitzer, with their appurtenances. The eldest brigade has the right of the first line, and the second the right of the second; the two next take the left of the two lines, and the youngest stands in the centre.

BRIGADE MAJOR.—An officer appointed by the brigadier, to assist him in the management and ordering of his brigade. According to the regulations published by authority, a brigade-major is attached to the brigade, and not to any

particular brigadier-general, as the aid-de-camp is.

BRIGADIER-GENERAL. An officer who commands a brigade of horse or foot in an army; next in order below a major-general. A post to which the eldest colonels are generally advanced. He that is upon duty is brigadier of the day.— They march at the head of their own brigades, and are allowed a serjeant and ten men of their own brigade for their guard. But the rank of brigadier general in the British service is now abolished.

BRIGAND, } Fr. *brigand*; Ital. *brigante*;
BRIGANDAGE, } Fr. *brigantine*; Ital. *brigante*;
BRIGANDER, } *tino*. An associated robber;
BRIG'ANTINE, } a freebooter; a smuggler.—
BRIG'ANDIZE. Brigandine and brigander, armour worn by brigands. Brig and brigantine, a vessel used by brigands and pirates.

Like as a warlike *brigandine*, applied
 To fight, lays forth her threatful pikes afore
 The engines, which in them sad death do hide.

Spenser.

There might be a rout of such barbarous thievish *brigands* in some rocks; but it was a degeneration from the nature of man, a political creature.

Bramhall against Hobbes.

In your *brigantine* you sailed to see
 The Adriatick wedded.

Otway's Venice Preserved.

The consul obliged him to deliver up his fleet, and restore the ships, reserving only to himself two *brigantines*.

Arbutnot.

Then put on all thy gorgeous arms, thy helmet
 And *brigandine* of brass, thy broad habergeon,
 Vantbrass, and greves. *Milton's Samson Agonistes.*

BRIGANDINES were a kind of ancient defensive armour, consisting of thin jointed scales of plate, pliant and easy to the body.

BRIGANTES, an ancient people of Britain, who occupied the territory from sea to sea, the whole breadth of the island; now called Yorkshire, Lancaster, Durham, Westmoreland, and Cumberland.

BRIGANTINUS LACUS, in ancient geography, a lake of Rhatia, or Vindelicia, which Tacitus includes in Rhatia. Ammianus calls it Brigantia. It took its name either from the Brigantii, or from the adjoining town. It is now called Constance or Bodensee.

BRIGANTINUS PORTUS, in ancient geography, a port of the Hither Spain; so called from Flavius Brigantium; now El Puerto de la Corunna, formerly the Groynne.

BRIGANTIUM, in ancient geography, a town in the Alpes Cottiae, now thought to be Briançon.

BRIGGS (Henry), one of the greatest mathematicians of the sixteenth century, was born at Warley Wood, Yorkshire, in 1556. In 1592 he was made examiner and lecturer in mathematics, and soon after reader of the physical lecture founded by Dr. Linacre. When Gresham College was established, he was chosen the first professor of geometry there in 1596. In 1609 he contracted an intimacy with Mr. Usher, afterwards archbishop of Armagh, which continued many years. In 1619 he was made Savilian professor of geometry at Oxford; and resigned his professor-

ship of Gresham College on the 26th of July 1620. Soon after going to Oxford, he was made M.A. in that university; where he continued till his death on January 26th 1630. His principal works are, 1. *Logarithmorum Chilium Prima*. 2. *Arithmetica Logarithmica*. 3. *Trigonometria Britannica*. 4. A small tract on the north-west passage.

BRIGGS (William), an eminent physician in the latter end of the seventeenth century. He studied physic at Cambridge, and afterwards travelled into France, where he attended the lectures of the famous anatomist M. Vieussens of Montpellier. After his return, he published his *Ophthalmographia*, in 1676. In 1677 he was created M.D. at Cambridge; and soon after was made fellow of the College of Physicians, at London. In 1682 his *Theory of Vision* was published by Hooke. In 1683, he sent to the Royal Society a continuation of that discourse, which was published in their transactions; and the same year he was, by king Charles II. appointed physician to St. Thomas's hospital. In 1684 he communicated to the Royal Society two remarkable cases relating to vision, which were also printed in their transactions; and, in 1685, he published a Latin version of his *Theory of Vision*, at the desire of Mr. afterwards Sir Isaac Newton, professor of mathematics at Cambridge, with a recommendatory epistle from him prefixed to it. He was afterwards made physician in ordinary to king William, and continued in great esteem for his skill in his profession till his death, which happened September 4th, 1704.

BRIGHT,	} Goth. <i>biart</i> , <i>bart</i> ; Mod. Goth. <i>bairt</i> ; Sax. <i>beort</i> , <i>braeht</i> , <i>bryht</i> ; Teut. <i>bert</i> , <i>brecht</i> ; Welsh, <i>berth</i> ; Swed. <i>bar</i> ; Goth. <i>ber</i> , <i>bart</i> ; our bare. Signified not only naked, but manifest, clear, conspicuous, illustrious.
BRIGHT'EN,	
BRIGHT'LY,	
BRIGHTNESS,	
BRIGHT'SOMENESS,	
BRIGHT'ARMED,	
BRIGHT'BURNING,	
BRIGHT'EYED,	
BRIGHT'HAired.	

The birds that han left hir songe,

While they han suffred colde ful stronge,

In wethers grille and dark to sight,

Ben in Mey, for the sunne bright

So glad, that they shewe in singing

That in her hert is suehe liking

That thei mote singen and ben light.

Chaucer. Romaunt of the Rose.

The purp our sone with tendir beymys reid,

In orient bright as angell did apper,

Throw golden sky is putting up his heid

Quhois gilt tressis schone so wondir cleir

That all the world tuke comfort far and neir.

Dunbar. Thistle and Rose.

High above all a cloth of state was spred,

And a rich throne as bright as sunny day;

On which there sat, most brave embellished

With royall robes and gorgeous array,

A mayden queene that shone as Tytan's ray

In glistring gold and perlesse pretious stone;

Yet her bright blazing beautie did assay

To dim the brightness of her glorious throne,

As envying herselfe, that too exceeding shone.

Spenser.

The blazing brightness of her beauty's beam,

And glorious light of her sun-shining face,

To tell, were as to strive against the stream.

Fairie Queene.

Hope elevates and joy

Brightens his crest. *Milton's Paradise Lost.*

Through a cloud

Drawn round about thee like a radiant shrine,
Dark, with excessive *bright*, thy skirts appear. *Id.*

The purple morning, rising with the year,
Salutes the spring, as her celestial eyes
Adorn the world, and *brighten* up the skies. *Dryden.*

A sword, by long lying still, will contract a rust,
which shall deface its *brightness*. *South.*

Bright brass, and *brighter* domes. *Chapman.*

Thy eyes are seen in diamonds *bright*. *Gay.*

Bright as the sun her eyes the gazers strike. *Pope.*

If parts allure thee, think how Bacon shined,
The wisest, *brightest*, meanest of mankind. *Id.*

But let a lord once own the happy lines,
How the stile *brightens*, how the sense refines. *Id.*

Safely I slept, till *brightly* dawning shone
The morn, conspicuous on her golden throne. *Id.*

Generous, gay, and gallant nation,
Great in arms, and *bright* in art. *Anonymous.*

The present queen would *brighten* her character, if
she would exert her authority to instil virtues into her
people. *Swift.*

O Liberty, thou goddess heavenly *bright*,
Profuse of bliss, and pregnant with delight! *Addison.*

From the *brightest* wines

He'd turn abhorrent. *Thomson.*

While the *bright* Seine, to' exalt the soul,
With sparkling plenty crowns the bowl. *Fenton.*

Thy beauty appears,
In its graces and airs,
All *bright* as an angel new dropped from the sky. *Parnel.*

An ecstasy, that mothers only feel,
Plays round my heart, and *brightens* all my sorrow,
Like gleams of sunshine in a louring sky. *Philips.*

This is the worst, if not the only stain,
I' the *brightest* annals of a female reign. *Cotton.*

As stars that shoot along the sky
Shine *brightest* as they fall from high.

Byron. Childs Harold.

— But still

Yon sunny sea heaves *brightly*, and remains
Rolled o'er the peak of the far Rhætan hill
As day and night contending were, until
Nature reclaimed her order. *Id.*

BRIGHTHELMSTONE, or, as it is more commonly called, BRIGHTON, a sea-port town of Sussex, situated at the bottom of a bay formed by Beachy Head and Worthing Point, in the English channel. Though a place of some antiquity, it was inhabited until very recently by only a few families of fishermen. It has now, however, increased into one of the most fashionable sea-bathing places in the kingdom. It is seated on a gently declining eminence, at whose base spreads a lawn called the Steine, now surrounded with many new streets and elegant buildings, the chief of which are lodging-houses. The Steine and Marine Parade are much frequented by fashionable visitants; the promenade commencing after the heat of the day, and continuing until dark, a choice band of music generally playing all the while. His Majesty has a palace here called the Marine Pavilion, fitted up with great magnificence and characteristic taste. It is situate on the north-west of the Steine, and was erected in 1784, with a handsome sea-front

extending 200 feet, in the centre of which is a circular building, having a lofty dome raised on pillars. Two wings, lately added to the fabric, render its portions complete. In the interior the style and furniture is mostly Chinese. Towards the street the front forms a square, with a colonnade in the centre, looking over a green, formerly the road. On the north side of what was called the Promenade Grove, a splendid building has been lately erected, fitted up as stabling, in the centre of which is a lofty dome; on the eastern side is a racket court, and on the west a riding-house. Here are several public libraries and reading-rooms, furnished with all the newspapers, periodical publications, &c.; they are generally well attended: the loo-tables, and singing, in the evening, afford considerable amusement; in addition to the libraries are suites of hot, cold, vapor, and salt-water baths, and air-pump water baths, for the relief of persons afflicted with the gout, or violent scorbutic affections: a swimming-bath has also been erected, upon a very extensive scale. The streets often intersect each other at right angles, and are very clean, neat, and well paved. The hotels and boarding-houses are numerous, and fitted up in the most elegant manner. The parish church of Brighton stands on a hill, at a small distance from the town, and has a square tower, which may be seen a considerable way off at sea. On account of the increase of population, a chapel royal has been erected, within these few years, in the centre of the town. Here are likewise a Quakers' meeting-house, a Baptists', Independents', Methodists', a Roman Catholic chapel, and a Jews' synagogue. About half a mile west of the church is a chalybeate spring, much frequented. Among recent improvements Regency Square deserves to be noticed; the houses are large and handsome; one side of the square being open to the sea, and the centre forming a well-planned garden. An extensive and commodious suspension chain-pier has been just completed, at an expense of £30,000, under the superintendence of captain Brown, R.N. It is founded on four clumps of piles, 258 feet distant, driven nearly ten feet into the rock, and rising thirteen feet above high water mark. The three first clumps contain twenty piles each, and the fourth, or outer clump, which is in the form of a T, contains 150 perpendicular and diagonal piles, strongly braced together; the cross part of which is paved with about 200 tons of Purbeck stones, and, beneath, are galleries and flights of steps, for the convenience of landing and embarkation. The pier, which is 1154 feet long and thirteen wide, with a neat cast-iron railing on each side, is supported by eight chains, each containing 117 links ten feet long, six and a quarter in circumference, and weighing 112 lbs. which is made fast to the cliff on shore. The chains, four in number, pass from the cliff, over towers of cast iron (one on each clump of piles), with a dip of eighteen feet, secured at the outer clump of piles, and from which are suspended 362 rods connected by an iron bar, on which the platforms rest. The length of the esplanade from the Steine to the commencement of the pier is 1250 feet, along which the carriages pass. Brighton

is scarcely observable at sea, and its several bombardments the balls have gone over it without doing any damage. Since the peace it has been considerably benefitted by travellers to France, embarking hence, by the steam-packets, to Dieppe, and through Rouen to Paris. The only manufacture is the making of nets for the use of the fishery, which employs about 100 boats. The mackerel season commences in April, and the herring-fishery in October. The principal market is on Thursday, but it is open every day except Sunday, and is well and reasonably supplied with provisions. The South Down mutton is particularly admired. The downs around afford the invalid delightful rides, and a pleasing landscape. The race-ground is also admired; the race-week, which is the last in July, is esteemed the fullest part of the season. Near to Brighton, on the road to Rottingdean, is Kemp Town, a modern erection, which derives its name from its founder, T. R. Kemp, Esq. and which for magnificence, extent, and the rapidity with which it has been erected, is one of the most splendid wonders of the age. Brighton is fifty-two miles south of London.

BRIGITTINS, or **BRIDGETINS**, a religious order, denominated from their founder St. Bridget. The Brigittins are sometimes also called the Order of Our Saviour; it being pretended that Christ himself dictated their rules and constitutions to St. Bridget. In the main, the rule is that of St. Augustine; only with additions, pretended to have been revealed by Christ. The first monastery of the Brigittin order was erected by the foundress, A. D. 1344, in the diocese of Lincopen; on the model of which all the rest were formed. The constitution of these houses is very singular; though the order was principally intended for nuns, who were to pay a special homage to the Holy Virgin, there are also many friars of it, to minister to them spiritual assistance. The number of nuns is fixed at sixty in each monastery, and that of friars to thirteen, unanswerable to the number of apostles, of whom St. Paul made the thirteenth; besides which there are four deacons to represent the four doctors of the church, St. Ambrose, St. Augustine, St. Gregory, and St. Jerome; and eight lay brothers; making, together with the nuns, the number of the seventy-two disciples. The order being instituted in honor of the Virgin, the direction is committed to an abbess, who is superior both of the nuns and of the friars. Each house consists of two convents or monasteries, separately enclosed, but having one church in common; the nuns being placed above, and the friars on the ground. The Brigittins profess great mortification, poverty, and self-denial, as well as devotion; and they are not to possess any thing they can call their own; nor even to touch money on any account. This order spread much through Sweden, Germany, the Netherlands, &c. In England we read of but one monastery of Brigittins, built by Henry V. in 1415, opposite to Richmond, now called Sion House; the ancient inhabitants of which, after the dissolution, settled at Lislon. The revenues were reckoned at £1495 per annum.

BRIGNOLLES, a town of France, in Lower

Provence, department of the Var, celebrated for the excellent prunes raised in the neighbourhood, and so called from this town. It lies in an agreeable valley between the mountains which give rise to the Calamie. It was formerly noted for its numerous religious houses. Twenty miles north of Toulon, and thirty-three east of Aix.

BRIHUEGA, a fortified town of New Castile, founded by Alonzo, king of Leon, in the year 1071. It was formerly a place of great strength, and has still an old castle. Its staple manufacture is fine cloth, and its principal trade is in wool. Here general Stanhope, with eight squadrons and eight battalions of the English army, were taken prisoners by the duke of Vendome in 1710, after they had separated themselves from count Staremberg. It is seated on the river Tajuna, forty miles north-east of Madrid.

BRIL (Matthew), a native of Antwerp, and a good painter, born in 1550, and educated at Rome. He was eminent for his performances in history and landscape, in the galleries of the Vatican; where he was employed by pope Gregory XIII. He died in 1584, aged only thirty-four.

BRIL (Paul), was born in 1554; followed his brother Matthew to Rome; painted several things in conjunction with him; and after his decease, raised his own fame by his landscapes, owing to his having studied the manner of Annibal Caracci, and copied some of Titian's works of the same kind. He was much in favor with pope Sixtus V. and painted for his successor Clement VIII. the famous piece about sixty-eight feet long, wherein St. Clement is represented cast into the sea with an anchor about his neck. He died at Rome in 1526, aged seventy-two.

BRILLIANCY, } **Fr.** *brillant*; **Ital.** *brilliant*; **n. & adj.** *brillante*; **Teut.** *brilliant*; **Brilliantly**, } **Dan.** *brille*; a magnifying glass; supposed to be from *beryl*, which anciently was greatly esteemed and used in sorcery. A fine diamond. Shining; sparkling; resplendent.

So have I seen in larder dark

Of veal a lucid loin,

Replete with many a *brilliant* spark,

As wise philosophers remark,

At once both stink and shine.

Dorset.

In deference to his virtues, I forbear

To show you what the rest in orders were;

This *brilliant* is so spotless and so bright,

He needs not foil, but shines by his own proper light.

Dryden.

When the ornaments, applied to a style, are too rich and gaudy in proportion to the subject; when they return upon us too fast, and strike us either with a dazzling lustre or a false *brilliance*; this forms what is called a florid style, a term commonly used to signify the excess of ornament.

Blair's Lectures.

—Beneath the glittering morn

An Iris sits, amidst the infernal surge,

Like Hope upon a death-bed, and, unworn

Its steady dyes, while all around is torn

By the distracted waters, bears serene

Its *brilliant* hues with all their beams unshorn;

Resembling, 'mid the torture of the scene,

Love watching Madness with unalterable mien.

Byron. Child Harold

BRILLIANT, in the menage, is applied to a brisk, high mettled, stately horse, having a raised neck, a fine motion, and excellent haunches, upon which he rises, though ever so little put on.

BRIM, *v. n. & adj.* } Goth. *brim*, *brin*; Germ. *brimmi*; Sax. *brymn*; Swed. *bräm*. The upper edge; }
BRIM-FILL, }
BRIM-FULL, } the top; the bank of a
BRIM-LESS, } fountain. To fill to the
BRIM-MER, } top; full; over-charged.
BRIM-MING. }

The feet of the priests, that bare the ark, were dipped in the *brim* of the water. *Joshua*, iii. 15.

His wallet lay before him, in his lappe,
Bret-ful of pardon come from Rome al hote.

Chaucer. Cant. Tales.

A mantelet upon his shoulders hanging
Bret-ful of rubies red, as fire sparkling.

Id. The Knights Tale.

———, this house, in all times,
Was ful of shypmen, and pilgrimes;
With scrippes *bretteful* of lesinges,
Entermedeled with tidinges.

Id. House of Fame.

His hat being in the form of a turban, daintily made,
the locks of his hair came down about the *brims* of it.
Bacon.

Measure my case, how by thy beauty's filling
With seed of woes my heart *brimful* is charged.

Sidney.

We have try'd the utmost of our friends;
Our legions are *brimful*, our cause is ripe.

Shakespeare's Julius Cæsar.

The Scot on his unfurnished kingdom
Came pouring like a tide into a beach,
With ample and *brimfulness* of his force.

Id. Henry V.

It told me it was Cynthia's own,
Within whose cheerful *brims*

That curious nymph had oft been known
To bathe her snowy limbs.

Drayton.

May thy *brimmed* waves,
Their full tribute never miss,
From a thousand rills.

Milton.

How my head in ointment swims!

How my cup o'erlooks her *brims*.

Crashaw.

And twice besides her beestings never fail

To store the dairy with a *brimming* pail.

Dryden.

When Leaths go round, and kindly *brimmers* flow,
Till the fresh garlands on their foreheads glow.

Id.

So when with crackling flames a cauldron fries,
The bubbling waters from the bottom rise,
Above the *brims* they force their fiery way.

Id. Æneid.

Her *brimful* eyes, that ready stood,
And only wanted will to sweep a flood,
Released their watery store.

Id. Fables.

Thus in a bason drop a shilling,
Then fill the vessel to the *brim*.

You shall observe, as you are filling,

The ponderous metal seems to swim.

Swift.

The good old king at parting wrung my hand,
His eyes *brimful* of tears; then sighing cryed,
Prithee, be careful of my son.

Addison's Cato.

Now horrid frays

Commence, the *brimming* glasses now are hurl'd
With dire intent.

Philips.

Observant round

Gay stripling youths the *brimming* goblets crown'd.

Pope's Odyssey.

Yet time, who changes all, had altered him
In soul and aspect as in age: years steal
Fire from the mind as vigor from the limb;

And life's enchanted cup but sparkles near the *brim*.

Byron. Childs Harold.

And the small ripple spilt upon the beach
Scarcely o'erpass'd the cream of your champagne,
When o'er the *brim* the sparkling bumpers reach
That spring dew of the spirit! the heart's rain.

Byron.

BRIM', *v. a. & adj.* } Goth. *brima*. To become
BRIM-MING. } salacious and in heat; hot,
furious, violent, fierce. Obsolete.

BRIMSTONE, } Goth. *brinna*. To burn;
BRIM-STONY. } corrupted from *bren*, or *bren-*
stone; that is, fiery stone. Sulphur. See SUL-
PHUR.

From his infernal furnace forth he threw
Huge flames, that dimm'd all the heaven's light,
Enroll'd in dushish smoke and *brimstone* blue.

Færie Queene

To drive him to despair, and quite to quail,
He shewed him painted in a table plain,
The damned ghosts, that do in torments wail,
With fire and *brimstone*, which for ever shall remain.

Spenser

And so we may arrive by Talmud skill
And profane Greeke to raise the building up
Of Helen's house, against the Ismaelite
King of Thogarna, and his Habergions
Brimtany, blue and fiery.

Ben Jonson.

The vapour of the grotto del Cano is generally sup-
posed to be sulphureous, though I can see no reason
for such a supposition: I put a whole bundle of lighted
brimstone matches to the smoke, they all went out in
an instant.

Addison on Italy.

BRIN, or BRINN, a strong town of Bohemia,
in Moravia. It is large and well built; the
Assembly of the States was held alternately here
and at Olmutz. The castle of Spilberg is on an
eminence out of the town. It was invested by
the king of Prussia in 1742, but he was obliged
to raise the siege. It is near the Swart.

BRIN'DED, *adj.* } Frequentative of brand.
BRIN'DLE, *v.* } To variegate by fire; to
BRIN'DLED. } produce different shades
of singed color. Used in the sense of streaky,
tabby, marked with streaks.

Thrice the *brinded* cat hath mew'd.

Shakespeare's Macbeth.

She tamed the *brinded* lioness

And spotted mountain pard.

Milton.

My *brinded* heifer to the stake I lay;

Two thriving calves she suckles twice-a-day.

Dryden.

The boar, my sisters! aim the fatal dart,
And strike the *brindled* monster to the heart.

Addison's Orid.

A natural *brindle*.

Clarissa.

BRINDISI, anciently Brundisium, a cele-
brated town of Naples, in the Terra d'Otranto,
with an archbishop's see. Its walls are still of
great extent, but the inhabited houses do not fill
above half the enclosure. The streets are crooked
and rough; and the buildings poor and ruinous;
without any remarkable church or edifice. The
cathedral, dedicated to St. Theodore, is a work
of king Roger's, but not equal in point of archi-
tecture to many churches founded by that mo-
narch. Little remains of ancient Brundisium,
except innumerable broken pillars fixed at the

corners of streets to defend the houses from carts ; the column of the lighthouse ; a large marble basin, into which the water runs from brazen heads of deer ; some inscriptions, ruins of aqueducts, coins, and other small furniture for an antiquary's cabinet. Its castle, built by the emperor Frederick II. and repaired by Charles V. to protect the northern branches of the harbour, is large and stately. The port is double, and the finest in the Adriatic ; the outer part being formed by two promontories, which stretch off gradually from each other as they advance into the sea, leaving a very narrow channel at the base of the angle. The island of St. Andrew, on which Alphonsus I. built a fortress, lies between the capes, and secures the whole road from the fury of the waves. In this triangular space large ships may ride at anchor. At the bottom of the bay the hills recede in a semi-circular shape, to leave room for the inner haven ; which as it were clasps the city in its arms, or rather encircles it in the figure of a stag's head and horns. This form is said to have given rise to the name of Brundisium, which in the old Messapian language signified the head of a deer. In ancient days the communication between the two havens was marked by lights, placed upon columns of the Corinthian order, standing on a rising ground in a direct line with the channel. Of these one remains entire upon its pedestal. From the obstructions in the channel, which communicates with the two havens, arise the evils that afflict and desolate this unhappy town. The low grounds at each end of the harbour are overflowed and converted into marshes, the vapors of which created every summer a real pestilence ; and in the course of very few years swept off, or drove away, the largest portion of the inhabitants. From the number of 18,000 they were reduced in 1766 to that of 5000 livid wretches, tormented with agues and malignant fevers, and in 1755 above 1500 persons died during the autumn. This state of misery and destruction induced the remaining citizens to apply for relief to the king's ministers. The channel has been partly cleared, and has now two fathoms of water. It will admit large boats, a great step towards the revival of trade ; but what is of more immediate importance, it gives a free passage to the sea, which now rushes in with impetuosity, and runs out again at each tide ; so that the water of the inner port is set in motion, and once more rendered wholesome. The workmen, in cleaning the channel, found some medals and seals, and drew up many of the piles that were driven in by Cæsar. They are small oak stripped of their bark, and still as fresh as if they had been cut only a month, though buried above eighteen centuries, seven feet under the sand. The soil about the town is light and good. It produces excellent cotton, with which the Brindisians manufacture gloves and stockings. In the year of Rome 509 the Romans first sent a colony hither. Pompey took refuge here ; but finding his post untenable, made a precipitate retreat to Greece. In this city Octavianus first assumed the name of Cæsar, and here he concluded a short-lived peace with Antony. Brundisium had been already celebrated for giving birth to

the tragic poet Pacuvius, and about this time became remarkable for the death of Virgil. The barbarians, who ravaged every corner of Italy, did not spare so rich a town ; and in 836 the Saracens at last gave a finishing blow to its fortunes. The Greek emperors, sensible of the necessity of having such a port as this in Italy, would have restored it to its ancient strength and splendor, had the Normans allowed them time and leisure. The Greeks struggled manfully to keep their ground ; but, after many varieties of success, were finally driven out of Brindisi by William I. The frenzy for expeditions to Palestine, though it drained other kingdoms of their wealth and subjects, contributed powerfully to the re-establishment of this city, one of the ports where pilgrims and warriors took shipping. It also benefitted by the residence of the emperor Frederick, whose frequent armaments for the Holy Land required his presence at this place of rendezvous. The loss of Jerusalem, the fall of the Grecian empire, and the ruin of all the Levant trade after the Turks had conquered the East, reduced Brindisi to a state of inactivity and desolation, from which it has never been able to emerge. Long. 17° 45' E., lat. 40° 25' N.

BRINDLEY (James), celebrated for his mechanical invention, was born in 1716, at Tunstead, in Derbyshire. Through the mismanagement of his father, who possessed some little property, his education was totally neglected ; and at seventeen he bound himself apprentice to a millwright, near Macclesfield, in Cheshire. He served his apprenticeship ; and, afterwards setting up for himself, effected various improvements in the millwright business. His fame as an ingenious mechanic spreading widely, he was employed in 1752 to erect a water-engine, at Clifton, in Lancashire, for the purpose of draining coal-mines ; and in 1755 to execute the larger wheels for a new silk-mill at Congleton, in Cheshire. The potteries of Staffordshire were also, about this time, indebted to him for several valuable additions in the mills used by them for grinding flint stones. In 1756 he undertook to erect a steam-engine near Newcastle-under-Line, upon a new plan ; and it is believed would have brought this machine to a great degree of perfection, if some interested engineers had not opposed him. His attention, however, was soon afterwards called off to another object, which, in its consequences, has proved of still higher importance to the trade of his country, namely, inland navigation. The duke of Bridgewater had, at Worsley, about seven miles from Manchester, a large estate abounding with coal, which was hitherto useless, because the expense of land-carriage was too great to find a market for its consumption. The duke, wishing to work these mines, perceived the necessity of a canal from Worsley to Manchester ; upon which occasion Brindley, now become famous, was consulted ; and declaring the scheme practicable, an act for this purpose was obtained in 1758 and 1759. It being, however, afterwards discovered that the navigation would be more beneficial if carried over the river Irwell to Manchester, another act was obtained to vary the course of the canal agreeable to the new plan, and to extend a side

branch to Longford bridge in Stretford. Brindley, in the meantime, had begun these great works, being the first of the kind ever attempted in England with navigable subterranean tunnels and elevated aqueducts; and as, in order to preserve the level of the water, it was necessary for it to be free from the usual obstructions of locks, he carried the canal over rivers, and many large and deep valleys. When it was completed as far as Barton, where the Irwell is navigable for large vessels, he proposed to carry it over that river by an aqueduct of thirty-nine feet above the surface of the water; and though this was treated as a wild and chimerical project, yet, supported by his noble patron, he began the works in September, 1760, and the first boat sailed over in July, the following year. The duke afterwards extended his ideas to Liverpool, and obtained, in 1763, an act for branching his canal to the tideway in the Mersey: this part of the canal is carried over the rivers Mersey and Bolland, and many wide and deep valleys. The success of the duke of Bridgewater's undertakings now encouraged a number of gentlemen and manufacturers in Staffordshire to revive the idea of a canal navigation through that country; and Brindley was engaged to make a survey from the Trent to the Mersey. In 1766 this canal was begun, and conducted under his direction as long as he lived. The proprietors called it, 'the canal from the Trent to the Mersey; but the engineer, more emphatically, 'the Grand Trunk Navigation,' on account of the numerous branches, which, as he justly supposed, would be extended every way from it. It is ninety-three miles in length; and, besides a great number of bridges over it, has seventy-six locks and five tunnels. The most remarkable of the latter is the subterranean passage of Harecastle, being 2880 yards in length, and more than seventy yards below the surface of the earth. The scheme of this navigation had employed the thoughts of several ingenious men for upwards of twenty years before, and some surveys had been made; but Harecastle hill, through which the tunnel is constructed, could neither be avoided nor overcome by any expedient the most able engineers could devise. It was for Brindley alone to surmount this difficulty and similar ones. Mr. Brindley was engaged in many other undertakings; and died in possession of well-earned fame, and a considerable fortune, at Turnhurst, in Staffordshire, September the 27th, 1772, in his fifty-sixth year. He is supposed to have shortened his days by too intense application to his profession. His habits were very peculiar: he never indulged or relaxed himself with the common diversions of life, not having the least relish for them: when once prevailed on to see a play in London, he declared he would on no account be present at another, for it so disturbed his ideas for several days as to render him unfit for business. With a most imperfect education, he never seems to have had the common recourse to pen and paper for his plans. If any extraordinary difficulty occurred in the execution of his works, he would retire to bed, and has been known to lie there one, two, or three days, in meditation, till he had surmounted it. He would then rise, and

execute his design without any drawing or model. He could read and write, it is said, but very indifferently; and was, perhaps, as *abnormis sapiens*—as 'wise without the schools,' as any man that ever lived. 'As plain a looking man as one of the boors in the Peak, or one of his own carters,' says a contemporary writer: 'when he speaks, all ears listen, and every mind is filled with wonder at the things he pronounces to be practicable. Great in himself, he harbors no contracted notions, no jealousy of rivals; he conceals not his methods of proceeding, nor asks patents to secure the sole use of the machines which he invents and exposes to public view; and, sensible that he must one day cease to live, he selects men of genius, teaches them the power of mechanics, and employs them in carrying on the various undertakings in which he is engaged. His powers shine most in the midst of difficulties; when rivers and mountains seem to thwart his designs then appears his vast capacity, by which he makes them subservient to his will.' Darwin thus beautifully characterises the works of this kindred genius:—

So with strong arm immortal Brindley leads
His long canals, and parts the velvet meads;
Winding, in lucid lines, the watery mass,
Mines the firm rock, or loads the deep morass;
With rising locks a thousand hills alarms,
Flings o'er a thousand streams its silver arms,
Feeds the long vale, the nodding woodland lawns,
And plenty, arts, and commerce freight the waves.

Botanic Garden, Canto iii.

BRINDONES, in natural history, the name of a fruit of the East Indies, called by John Bauhin, and some other botanical writers, *Indici fructus rubentes acidi*. It is by many accounted delicious, notwithstanding its great sharpness; and is used in dyeing, and in making vinegar.

BRINE', } Ang.-Sax. *brein*, *bryn*, *brym*;
BRIN'SUN, } Goth. *bara*. The tide; the sea;
BRIN', } water impregnated with salt;
BRINE' PIT, } tears as they are salt; brinepits;
a pit of salt water.

Nero would be tainted with remorse
To hear and see her plaints, her *brinish* tears.

Shakspeare.

For now I stand as one upon a rock,
Envir'd with a wilderness of sea,
Who marks the raving tide grow wave by wave;
Expecting ever when some envious surge
Will, in his *brinish* bowels, swallow him. *Id.*

Then I loved thee,
And shewed thee all the qualities o' the isle,
The fresh springs, *brinepits*, barren place, and fertile. *Id.*

What a deal of *brine*
Hath wash'd thy sallow cheeks for Rosaline! *Id.*
All but mariners,
Plung'd in the foaming *brine*, did quit the vessel,
Then all aſire with me. *Id. Tempest.*

The encreasing of the weight of water will encrease
its power of bearing; as we see *brine*, when it is salt
enough, will bear an egg. *Bacon's Natural History.*

The air was calm, and on the level *brine*
Sleek Panope, with all her sisters play'd.

Milton
Dissolve sheeps' dung in water, and add to it as
much salt as will make a strong *brine*; in this liquor
steep your corn. *Milton.*

As when two adverse winds
Engage with horrid shock, the ruffled brine
Roars stormy. *Philips.*

So watery fowl, that seek their fishy food,
With wings expanded o'er the foaming flood
Now sailing smooth the level surface sweep,
Now dip their pinions in the briny deep.
Pope's Odyssey.

He, who first the passage tried,
In hardened oak his heart did hide;
Or his, at least, in hollow wood,
Who tempted first the briny flood. *Dryden.*

Then, briny seas, and tasteful springs, farewell,
Where fountain nymphs, confused with Nereids dwell.
Addison.

A muriatick or briny taste seems to be produced by a mixture of an acid and alkaline salt; for spirit of salt, and salt of tartar, mixed, produce a salt like sea salt. *Arbuthnot.*

With thee my bark I'll swiftly go
Athwart the foaming brine. *Eyron.*

BRINE, is either native, as the sea-water, which by coction turns to salt; or factitious, formed by dissolving salt in water. For a description of the process of obtaining salt from brine, see SALT-WORKS.

BRINE, taken out of brine-pits, or brine-pans, used by some for curing or pickling of fish without boiling it into salt; and rock-salt, without refining it into white salt, are prohibited by 1 Ann. cap. 21.

BRINE-PANS, the pits wherein the salt water is retained and suffered to stand to bear the action of the sun. There are divers sorts of salt-pans, as the water-pans, second-pans, sun-pans; the water being transferred only from one to another.

BRINE-PIT, in salt making, is the salt-spring whence the water to be boiled into salt is taken. There are of these springs in many places; that at Nantwich, in Cheshire, is alone sufficient, according to the account of the people of the place, to yield salt for the whole kingdom; but it is under the government of certain regulators, who, that the market may not be overstocked, will not suffer more than a certain quantity of the salt to be made yearly.

BRINE-SPRINGS are fountains which flow with salt water instead of fresh. Of these there are a good number in South Britain, but, though not peculiar to this island, they are far from being common on the continent. There is a remarkable one at East Chennock, in Somersetshire, about twenty miles from the sea. There is another at Leamington, in Warwickshire, very near the river Leam; which, however, is but weak. A third runs into the river Cherwell, in Oxfordshire; and there are several more in Westmoreland and Yorkshire: but as they are weak, and the fuel in most of those counties is scarce and dear, no salt is prepared from them. At Barrow-deal, near Grange, three miles from Keswick in Cumberland, a pretty strong spring rises in a level, near a moss, sixteen gallons of the water of which yield one of pure salt, which is remarkable, as the same quantity of salt cannot be obtained from less than twenty-two gallons of the water of the German ocean. At Salt-water Haugh, near Butterby, in Durham,

there are a multitude of salt springs, which rise in the middle of the river Weare, for the space of about forty yards in length and ten in breadth; but particularly one out of a rock, which is so strong that in a hot summer's day the surface is covered with a pure white salt. At Weston, in Staffordshire, there are brine-springs which afford about a ninth part of very fine white salt. There are others at Enson St. Thomas, and in the parish of Ingestre, but so weak that they are not wrought; though it is believed that by boring stronger springs might be found in the neighbourhood. In Lancashire there are several salt springs, but (if we except those at Barton, which are as rich as the spring at Northwich,) by no means so famous as those of Cheshire, called in general by the name of the Wiches. Nantwich, on the river Weaver, has a noble spring not far from the river, which is so rich as to yield one-sixth part of pure white salt. At Northwich, six miles distant, at the confluence of the Weaver and the Dan, the brine is still richer; for six ounces of salt are obtained from sixteen of water. The inhabitants of Wales, who, before that country was incorporated with England, were supplied chiefly, if not solely, with that necessary commodity from these two towns, called the former Hellath Wen, and the latter Hellath Du, i. e. the white and black salt-pit. In 1670 a rock of salt was discovered at a small distance from Northwich, which has been wrought to a great depth, and to a vast extent, so as to be justly esteemed one of the greatest curiosities in England; and it is highly probable, that there is an immense body of fossil salt in the bowels of the earth, under this whole country; for, upon boring, brine-pits have been found in many places on both sides of the Weaver. This is the more likely, since at Middlewich, which stands at the confluence of the Croke and the Dan, there are salt-springs with a fresh brook running between them. The brines from these pits are of unequal strength; but when mixed, they commonly obtain four ounces of salt from a pound of brine. In these springs the water is strongest nearest the bottom, richer in dry weather than in wet, and when long drawn than when first wrought. But these are no rules in respect to other salt springs, for in those of Franche Comté the brine is strongest in wet weather. There are several other bodies dissolved in these brines besides salt; in some a sulphureous substance, which sublimates as the brine heats; a sort of dirty ochre which discolors the brine, but, if suffered to stand, speedily subsides; and in most brines a calcareous, or rather selenitic earth which settles to the bottom of the pan. See SALT and SPRING.

BRING', } Goth. *briggs*; Mod. Goth.

BRINGER, } *briggan*; Swed. *bringa*; Dan.

BRING'ING. } *bringe*; Sax. brytan, brycean, bringan; Teut. *baeren, bringen*; Belgic, *bringen*.

In the preterperfect and perfect tenses it became, in different dialects, *brigt, brigid, brid, brat, brot, brogt, broht*; to bear, fetch, conduct, draw, lead, produce, breed. So many are the applications of this word, so various the senses in which it is employed, that we must set them down distinctly with their illustrations from Dr. Johnson, for

they cannot be condensed or abridged without injury.

To fetch from another place: distinguished from to carry, or convey, to another place.

I wol bewaile, in manere of tragedie,
The harm of him that stode in high degree,
And fellen so that ther n' as no remedie
To bring him out of his adversitee.

Chaucer's Canterbury Tales.

Bring hither the pincke and purple cullambine,
With gelliflowers;
Bring coronations, and sop in wine,
Worne of paramoures.

Spenser's Shepheard's Calendar.

I was the chief that raised him to the crown,
And I'll be chief to bring him down again.

Shakespeare.

And as she was going to fetch it, he called to her,
and said, *Bring me*, I pray thee, a morsel of bread
in thy hand.

Kings.

A registry of lands may furnish easy securities of money, that shall be brought over by strangers.

Temple.

To convey in one's own hand; not to send by another.

And if wished alliance please your king,
Tell him he should not send the peace, but bring.

Dryden.

To produce; to procure, as a cause.

There is nothing will bring you more honour, and more ease, than to do what right in justice you may.

Bacon.

To reduce; to recal.

Bring back gently their wandering minds, by going before them in the train they should pursue, without any rebuke.

Locke.

Nathan's fable had so good an effect, as to bring the man after God's own heart to a right sense of his guilt.

Spectator.

To attract; to draw along.

In distillation, the water ascends difficultly, and brings over with it some part of the oil of vitriol.

Newton's Opticks.

To put into any particular state or circumstances; to make liable to any thing.

Having got the way of reasoning, which that study necessarily brings the mind to, they might be able to transfer it to other parts of knowledge, as they shall have occasion.

Locke.

The question for bringing the king to justice was immediately put, and carried without any opposition that I can find.

Swift's Presbyterian Plea.

To lead by degrees.

A due consideration of the vanities of the world, will naturally bring us to the contempt of it; and the contempt of the world will as certainly bring us home to ourselves.

L'Estrange.

The understanding should be brought to the difficult and knotty parts of knowledge by insensible degrees.

Locke.

To recall; to summons.

But those, and more than I to mind can bring,
Menalcas has not yet forgot to sing.

Dryden.

—————: the gust of springs,
And fall of lofty fountains, and the bend
Of stirring branches, and the bud which brings
The swiftest thought of beauty, here extend,
Mingling, and made by love, unto one mighty end.

Byron's Child of Harold.

To induce; to prevail upon.

The nature of the things, contained in those words, would not suffer him to think otherwise, how, or whensoever, he is brought to reflect on them.

Locke.

To bring about. See ABOUT. To bring to pass; to effect.

By Him that made water, fire, erthe, and aire!

The youngest man that is in all this route,

Is besy now to bringen it aboute.

Chaucer's Canterbury Tales.

This turn of mind threw off the oppositions of envy and competition; it enabled him to gain the most vain and impracticable into his designs, and to bring about several great events, for the advantage of the publick.

Addison's Frecholder.

To bring forth. To give birth to; to produce.

The good queen,

For she is good, hath brought you forth a daughter:
Here 'tis; commends it to your blessing.

Shakespeare.

More wonderful

Than that which, by creation, first brought forth
Light out of darkness.

Milton. Paradise Lost.

Bewail thy falsehood, and the pious works
It hath brought forth, to make thee memorable
Among illustrious women, faithful wives.

Id. Samson Agonistes

To bring forth. To bring to light.

The thing that is hid bringeth he forth to light.

Job xxxviii. 11

To bring in. To place in any condition.

He protests he loves you,

And needs no other suitor, but his liking,
To bring you in again.

Shakespeare. Othello.

To bring in. To reduce.

Send over to that realm such a strong power of men, as should perforce bring in all that rebellious rout, and loose people.

Spenser on Ireland.

To bring in. To afford gain.

The sole measure of all his courtesies is, what return they will make him, and what revenue they will bring him in.

South.

Trade brought us in plenty and riches.

Locke.

To bring in. To introduce.

Entertain no long discourse with any; but, if you can, bring in something to season it with religion.

Taylor.

There is but one God, who made heaven and earth, and sea and winds; but the folly and madness of mankind brought in the images of gods.

Stillingfleet.

The fruitfulness of Italy, and the like, are not brought in by force, but naturally rise out of the argument.

Addison.

To bring off. To clear; to procure; to be acquitted; to cause to escape.

I trusted to my head, that has betrayed me, and I found fault with my legs, that would otherwise have brought me off.

L'Estrange.

The best way to avoid this imputation, and to bring off the credit of our understanding, is to be truly religious.

Tillotson.

To bring on. To engage in action.

If there be any that would reign, and take up all the time, let him find means to take them off, and bring others on.

Bacon.

To bring on. To produce as an occasional cause.

The fountains of the great deep being broke open, so as a general destruction and devastation was brought upon the earth, and all things in it. *Burnet's Theory.*

The great question, which in all ages has disturbed mankind, and brought on them those mischiefs.

Locke.

To bring over. To convert; to draw to a new party.

This liberty should be made use of upon few occasions of small importance, and only with a view of bringing over his own side, another time, to something of greater and more publick moment.

Sciff's Church of England Man.

To bring out. To exhibit; to show.

If I make not this cleat bring out another, and the shearers prove sheep, let me be unrolled.

Shakspeare. Winter's Tale.

To bring under. To subdue; to repress.

That sharp course which you have set down, for the bringing under of these rebels of Ulster, and preparing a way for their perpetual reformation.

Spenser.

To bring up. To educate; to instruct; to form.

The well bringing up of the people, serves as a most sure bond to hold them.

Sidney.

To bring up. To introduce to general practice.

Several obliging deferences, condescensions, and submissions, with many outward forms and ceremonies, were first of all brought up among the politer part of mankind, who lived in courts and cities.

Spectator.

To bring up. To cause to advance.

Bring up your army; but I think you'll find They've not prepared for us.

Shakspeare.

Bring retains, in all its senses, the idea of an agent, or cause, producing a real or metaphorical motion of something towards something; for it is oft said, that he brought his companion out. The meaning is, that he was brought to something that was likewise without.

BRINING or **CORN**, in husbandry, an operation performed on the wheat seed, to prevent the smut. A liquor is to be prepared for this purpose, by putting seventy gallons of water into a tub (like a mash tub used for brewing), and a corn bushel of unslacked lime-stone. This is to be well stirred till the whole is dissolved and left to stand for thirty hours; after which it is to be drained off into another tub, in the manner practised for beer. In this way about a hogshhead of strong lime-water will be obtained, to which must be added three pecks of salt. The wheat must be steeped in this pickle, by running it gently, and in small quantities, into a broad bottomed basket of about twenty-four inches in diameter, and twenty inches deep, and stirring it. The light seed that floats must be strained off with a strainer, and must not be sown. When the basket has been drawn up, and drained of the pickle, the wheat will be fit for sowing in two hours after the brining.

BRINING of **HAY-RICKS**, a practice common in America, of mixing salt with the hay as it is stacked.

BRINK. Goth. *bryn*; Swed. *brink*; Teut.

and Dan. *brink*. See **BROW** and **BRIM**. The edge of any place, as of a precipice or a river.

And multiplying, evermore—;

Tyl that it be so far ygo

That it at bothe *brinkes* be.

Chaucer.

The amazed flames stand gathered in a heap,

And from the precipice's *brink* retire,

Afraid to venture on so large a leap.

Dryden.

We stand therefore on the *brinks* and confines of those states at the day of doom,

Atterbury.

So have I seen, from Severn's *brink*,

A flock of geese jump down together;

Swim where the bird of Jove would sink,

And, swimming, never wet a feather.

Swift.

Dreadful post

Of observation!—darker every hour!—

Less dread the day that drove me to the *brink*

And pointed at eternity below.

Young.

Friend! have a care

Your next step may be fatal!—for the love

Of him that made you, stand not on that *brink*.

Byron. Manfred.

BRINVILLIERS (Marguerite D' Aubrai, Marchioness of,) was born at Paris in 1651, being the daughter of D'Aubrai, lieutenant-civil of Paris, who married her to N. Gobelin, marquis of Brinvilliers. Possessed of considerable personal attractions, she was for some time much attached to her husband, but at length became madly in love with a Gascon, Goden St. Croix, who had been introduced by the marquis. Her father, informed of the affair, procured the imprisonment of this adventurer in the Bastille, a circumstance which seems to have inspired the marchioness with the most implacable hatred to her whole family. In the Bastille St. Croix learnt, from an Italian, the art of composing the most subtle mortal poisons, and on his release, after a year's confinement, the guilty pair coolly plotted the taking off by this means, her father, sister, and two brothers, all of whom it is said were poisoned by them in 1670. During this time the marchioness visited the hospitals, apparently as a devotee, but as was afterwards strongly suspected, in order to try on the patients the effect of her poisons. The discovery of these criminals was produced in a very extraordinary manner: while at work in distilling poison, St. Croix accidentally dropped a glass mask which he wore to prevent inhaling the deadly vapor, and the consequence was his own instant death. His effects falling into the hands of government, the marchioness had the imprudence to lay claim to a casket, and appeared so anxious to obtain it that the authorities ordered it to be opened, when it was found to be full of packets of poison, with ticketed descriptions of the effects which they would produce. Informed of this discovery the vile woman made her escape to England, and passed thence to Liege, but was there arrested and conducted to Paris. She was now convicted of the murder of her father, sister, and brothers, and condemned to be beheaded and burnt. At this dreadful crisis she evinced extraordinary courage, amounting almost to nonchalance. On entering the chamber in which she was to be put to the torture by swallowing water, she observed three buckets full prepared, and exclaimed, 'It is surely intended to drown me; for it is absurd to suppose one of my dimensions can swallow

all that.' She is said to have listened to her sentence without alarm, and showed no other emotion on her way to execution, than to request that she might be so placed as not to see the officer who apprehended her. This woman was even religious in her way; she confessed regularly, and a form of prayer which she used was found after her death that alluded strongly to her wretched habits. Her husband was supposed to be spared only because of his perfect indifference to her, and her ways. She suffered in July 1676. See *AQUA TOFANA*.

BRIONI ISLES, are three small islands in the Adriatic, near the east coast of Istria, opposite to Pola, in the county of which name they are commonly reckoned. This name more properly belongs to the principal island, the two others being called Coseda and St. Girolamo. All have been long celebrated for their marble quarries, and, with the other islands on the east side of this gulf, belong to Austria: 4 miles west of Pola. Long. $13^{\circ} 53' E.$, lat. $45^{\circ} 3' N.$

BRIOUDE, a town of Auvergne, France, in the department of the Upper Loire. About a league to the south lies the smaller town of Vieille Brioude, where there is a singular Roman bridge of one arch, and extraordinary height and length, across the Allier. Brioude was the birth-place of the celebrated La Fayette. It contains 5486 inhabitants. Twenty miles south by east of Issoire, and thirty-nine south-east of Clermont-Ferrand.

BRISACH, or **OLD BRISACH**, a town of Baden, once the capital of the Brisgau. It was twice in possession of the French; but restored to the house of Austria in consequence of treaties of peace. It has been a strong place, but the fortifications are demolished. It is now seated on the east, but, before the river changed its bed, was on the west bank of the Rhine, where there is a bridge of boats; thirty-three miles south of Strasburg. The French took this town in 1795; but were driven from it by a party of Austrians, under Prince Charles, in 1796. A party of the republicans, however, under General St. Cyr, expelled the Austrians and again took possession of it on the 13th Oct. 1796.

BRISACH, **NEW**, a town of France, in the department of the upper Rhine, and ci-devant province of Alsace, built by order of Louis XIV. over against Old Brisach, and fortified by Vauban. It is thirty-three miles south of Strasburg, and one from the Rhine.

BRISEIS, or Hippodamia, the wife of Mynes king of Lynnessa. After Achilles had taken the city, and killed her husband, she became his captive. The hero loved her tenderly; but Agamemnon taking her from him, she became the accidental cause of numberless disorders in the Grecian army. Achilles, enraged, retired to his tent: and, till the death of Patroclus, refused to fight against the Trojans. The resentment of this prince and its consequences are the subject of the Iliad.

BRISGAU, a district of Germany of large extent, and formerly constituting the south-west part of Suabia. It is now almost entirely included in the grand duchy of Baden. Brisgau has been long a peculiar district, subject to its

own laws, and claiming peculiar privileges. Its situation has rendered it the frequent scene of war. In the thirty-years' war, it was in possession of the Grand Duke of Baden, but came successively into the hands of the duke of Saxe Weimar and the French, and was confirmed to the latter power at the peace of Nimeguen, but restored to Austria by that of Ryswick. In 1801 it was assigned, by the peace of Luneville, to the duke of Modena, but was for some time afterwards occupied by the French. A small part, on the left bank of the Rhine, belongs now to Switzerland, and the districts on the north-east to the kingdom of Wirtemberg; the whole of the rest of Brisgau was assigned to Baden in 1806; and in 1810 on the reorganisation of these states was included in the circles of the Wiesen, the Treisam, and the Kinzig. The soil is very various: some parts of the district being very fertile, others on the contrary as sterile, and some parts of the Black Forest seem utterly incapable of improvement.

BRISIACUS Moxs, in ancient geography, a town on the right or east side of the Rhine; situated on a round hill; a fortified town of Suabia; now called Old Brisac.

BRISK, *v. & ad.* } Goth. *roesk*; Teut. *risch*,
BRISK'LY, } *vrysg*; *breisk*; Dan. *frisk*,
BRISK'NESS. } Belgic *friesch*, *brusk*; Fr.
brusque; lively; gay; sprightly; vigorous. Powerful; spirituous.

— Why do you frown?

Here dwell no frowns, nor anger; from these gates
Sorrow flies far: see here be all the pleasures
That fancy can beget on youthful thoughts,
When the fresh blood grows lively, and returns
Brisk as the April buds in primrose season.

Milton's Comus.

Some remains of corruption, though they do not
conquer and extinguish, yet will slacken and allay,
the vigour and briskness of the renewed principle.

South.

But the most distinguishing part of his character
seems to me to be his *briskness*, his jollity, and his
good-humour.

Dryden.

P'rythee, die, and set me free,

Or else be

Kind and *brisk* and gay, like me.

Denham.

Our nature here is not unlike our wine:

Some sorts, when old, continue *brisk* and fine.

Id.

Under ground, the rude Rhiphaean race
Mimick *brisk* cyder, with the brake's produce wild,
Sloes pounded, hips, and servis' harshest juice.

Philips.

It must needs be some exterior cause, and the *brisk*
acting of some objects without me, whose efficacy I
cannot resist.

Locke.

We have seen the air in the bladder suddenly ex-
pand itself so much, and so *briskly*, that it manifestly
lifted up some light bodies that leaned upon it.

Boyle.

I could plainly perceive the creature to suck in
many of the most minute animalcula, that were swim-
ming *briskly* about in the water.

Ray on the Creation.

Why should all honour then be ta'en
From lower parts to load the brain;
When other limbs we plainly see,
Each in his way, as *brisk* as he?

Prior.

First to the lively pipe, his hand addressed,
But soon he saw the *brisk* awakening viol,
Whose sweet entrancing voice he loved the best.

Collins.

BRIS'KET, *n. s.* Fr. *brichet*. The breast of an animal.

See that none of the wool be wanting, that their gums be red, teeth white and even, and the *brisket* skin red.

Mortimer.

BRISSOIDES, in natural history, a genus of the echini marini. The distinguishing characters are, they are of an oval figure, and have their backs striated, not furrowed, and their rays smooth, not marked with ridges. Of this genus there are two known species.

BRISSON (Barnaby), an eminent French lawyer and president of the parliament of Paris, born at Fontenay le Comte about the middle of the sixteenth century. He was much esteemed and honored by Henry III. who boasted of him as the most learned man in Christendom. He employed him in various negociations, particularly as ambassador to England. Being at Paris, when it was besieged by Henry IV. and remonstrating against the treasonable practices of the Leaguers, they fell upon him, dragged him to prison, and strangled him, Nov. 15th, 1591. He wrote, 1. De Verborum Significatione; 2. De Formalis Solemnibus Populi Romani Verbis; 3. De Regio Persarum Principatu; and some other works.

BRISSOT (Peter), one of the ablest physicians of the sixteenth century, was born at Fontenay le Comte in Poitou. He studied at Paris; and having taken his degree of M.D. bent his thoughts to the reforming of physic, by restoring the precepts of Hippocrates and Galen, and exploding the maxims of the Arabians. For this purpose he publicly explained Galen's works instead of those of Avicenna, Rhasis, and Mesue. He afterwards travelled to acquire the knowledge of plants; and going to Portugal practised physic in Evora. His method of bleeding in pleurisies, on the side where the pleurisy existed, raised a kind of civil war among the Portuguese physicians; it was brought to the university of Salamanca, who at last gave judgment, that the opinion ascribed to Brissot was the pure doctrine of Galen. The partisans of Denys, his opponent, appealed, in 1529 to the emperor, to prevent the practice, as being attended with destructive consequences; but Charles III. duke of Savoy happening to die at this time of a pleurisy, after having been bled on the opposite side, the prosecution dropped. He wrote an apology for his practice; but died before it was published, in 1552. Renatus Moreau procured a new edition of it at Paris, in 1622, and annexed to it a treatise, entitled De Missione Sanguinis in Pleuritide, together with the Life of Brissot.

BRISSOT (John Peter), was the son of an inn-keeper at the village of Ouarville, near Chartres. This name of Ouarville, he afterwards anglicised into Warville, and added to his own. His father, who was a man of property, gave him an excellent education, and intended him for the bar; but the young Brissot devoted himself to literature. He was born in 1754. He met with little success in Paris as a literary man, and therefore

went to Geneva, and afterwards to London, where he published a periodical journal, which was not encouraged. Returning to Paris he was patronised by Orleans, and wrote several pamphlets in favor of liberty, which obliged him to fly to America. At the commencement of the revolution he returned, and became the leader of a party which was destroyed by Robespierre; Brissot and twenty-one of the leaders being guillotined in 1793. He was the author of a theory of Criminal Law; Travels in America; and other works.

BRISOTINES, a political party in France, during its revolutionary state, so denominated from Brissot, their chief leader. They were keen republicans, but wished to establish a federal government in France like that of America.

BRISSUS, in natural history, a genus of the echini marini. The characters are, that they are of an oval figure, and have the aperture of the anus on one of the sides of the superficies; their back is smooth and even, not furrowed; but on the vertex they have several very elegant crenated and dotted lines. Their base is as if cut off on the end nearest the mouth, and is not flat as in the spatangi, but raised in the manner of a cushion.

BRISTLE, *v. & n.* } Goth. *byst, boist*; Bel-
BRIST'LY, } *gie boistel*; Sax. *brustle*.
BRIS'TLELIKE. } Hair on the back of swine.
To *bristle* is to rise up, stand up, like quills upon the porcupine.

Be it ounce, or eat, or bear,
Pard, or boar with *bristled* hair,
In thy eye that shall appear,
When thou wak'st, it is thy dear. *Shakspeare.*

New for the bare pickt bone of majesty,
Doth dogged war *bristle* his angry crest,
And snarleth in the gentle eyes of peace. *Id.*

Which makes him plume himself, and *bristle* up
The crest of youth against your dignity. *Id.*

I will not open my lips so wide as a *bristle* may enter. *Id.*

Thou durst not thus disparage glorious arms
Which greatest heroes have in battle worn,

* * * * *

through all thy hairs
Were *bristles* ranged like those that ridge the back
Of chafed wild boars, or ruffled porcupines.

Milton's Sam. Agon.

He is covered with hair, and not, as the boar, with *bristles*, which probably spend more upon the same matter, which, in other creatures, makes the horns; for *bristles* seem to be nothing else but a horn split into a multitude of little ones. *Grew.*

Two boars whom love to battle draws,
With rising *bristles*, and with frothy jaws,
Their adverse breasts with tusks oblique they wound. *Dryden.*

Stood Theodore surprized in deadly fright,
With chattering teeth, and *bristling* hair upright;
Yet armed with inborn worth. *Id.*

Thy hair so *bristles* with unmanly fears,
As fields of corn that rise in bearded ears. *Id.*
Thus mastful beech the *bristly* chestnut bears,
And the wild ash is white with bloomy pearls. *Id.*

The leaves of the black mulberry are somewhat *bristly*, which may help to preserve the dew. *Bacon.*

If the eye were so acute as to rival the finest microscope, the sight of our ourselves would affright us; the smoothest skin would be beset with rugged scales and bristly hairs.

Bentley.

The careful master of the swine,
Forth hastened he to tend his *bristled* care. *Pope.*

BRISTOL, the *Caer Brito* of the Britons, and Brightstow of the Saxons, a city and county of England, stands on an elevated peninsula, formed by the rivers Frome and Avon, partly in Somerset, and partly in Gloucestershire. In regard to wealth, population, and commerce, it is considered the second city of England. Besides the valley between the Frome and the Avon, which contains the old town, St. Michael's hill and King's Down on the north, College Green on the west, and Redcliffe Hill on the south, are covered with handsome public and private buildings, the whole extending over a surface of full 1500 acres of ground, and being about seven miles in circumference. The city contains 600 streets, lanes, squares, courts, &c., with seventeen churches, and thirty chapels or meeting-houses. Two-thirds of it being on the Gloucestershire side of the river; the population of that part only is included in the return, which, was in 1821, 87,779 persons; the Somerset part contains 7979 additional persons. In the old town the streets are close and irregular, and many of the houses built of wood and plaster. Improvements, however, are daily making, many of these streets have been lately widened, particularly towards the river; and the suburbs, and external parts of the city, contain numerous elegant and spacious buildings, constructed entirely of brick and stone. All other materials are now prohibited here by act of parliament. These streets are well paved and attended to; they are supplied with excellent water from pumps and conduits, and lighted with oil gas.

The quay of Bristol, above one mile in length, is one uninterrupted wharf of hewn stone, extending along the inner shores of the Frome and Avon, from St. Giles to Bristol bridge. At flood tides, there is depth of water for the largest vessels to ride close to the walls, and discharge their cargoes; but, before the late improvement of the harbour, they lay a-ground in the mud, at low water, and often received considerable damage.

The bed of the Avon and Frome has now been dammed up as far as the hot wells, and a new channel cut for the river through Redcliffe meads; while the navigation of the Avon in one level has been opened up as high as Keynsham. The harbour is therefore capable of accommodating 1000 vessels, which are not only kept afloat at the quays, but enabled to enter the locks, and go to sea at neap tides. Upon changing the course of the Avon, two cast iron bridges were erected by Mr. Jessop over the new channel. The span of the iron work of each arch is 100 feet, and the rise 12 feet 6 inches, or $\frac{1}{4}$ of the span. Bristol wet docks are very extensive, and the merchant floating dock is said to exceed in dimensions those at Portsmouth or Plymouth. Here is a crane for loading and unloading ships, erected on fourteen pillars of cast iron, and esteemed a very curious piece of workmanship.

These improvements of the harbour are said to have cost £500,000. An act of parliament for further improvements was passed in 1822. The remarkable public buildings are, the cathedral, the church of St. Mary Redcliffe, the exchange, and the theatre. The cathedral is part of the original church of the abbey of St. Augustine, the other part being demolished at the dissolution of the monastery; when Bristol was erected into a bishop's see, and what remained of the church was converted into the cathedral. It is 173 feet long, and 128 broad; having at the west end a large square tower 130 feet high, ornamented with battlements and four pinnacles. The establishment of the cathedral consists of a bishop, a dean, six prebendaries, and other inferior officers. The arch-deacon of Dorset has also a stall in the cathedral. Here are several noble monuments, particularly one to Mrs. Draper the Eliza of Sterne. St. Mary Redcliffe is one of the most beautiful churches in the kingdom. It stands on Redcliffe hill, and is said to have been founded by Simon de Burton in 1292, and finished in 1376. It was built in the form of a cross, with a tower and spire 250 feet high, and richly ornamented with carved work; but in 1445 part of the spire was destroyed, and the church damaged by lightning. The former has never since been rebuilt.

The exchange, in Corn-street, is a handsome structure in the Grecian style, built by Wood of Bath, at the expense of £50,000. It is 110 feet in front, and 148 deep; the place for the merchants is a peristyle of the Corinthian order, ninety feet by eighty, capable of containing 1440 persons. The merchants, feeling the want of an accommodation similar to Lloyd's in London, determined upon building a commercial coffee room, to supply the deficiency. A subscription was accordingly opened, and £14,000 was raised in two days, £25 being the amount of each share. The entrance is under an Ionic portico of four columns, supporting a grand pediment, on which are placed three beautiful colossal statues, representing the city supported by navigation and commerce. Here is a grand room sixty feet long, forty wide, and twenty-five in height.

An elegant and convenient theatre was erected in King-street in 1766, in which the Bath company perform during the summer season, assisted occasionally by the best London performers.

The principal hospitals are, first, Queen Elizabeth's, in which 100 boys are educated, six of whom, when they go out, have £10 each, and the others eight guineas, to bind them apprentices. Second, Colston's hospital, in which 100 boys are maintained for seven years, taught, and then apprenticed. Third, An hospital founded by the same person in 1691, for twelve men and twelve women, with an allowance of 3s. per week, and twenty-four sacks of coals in the year; for this the sum of £25,000 was appropriated. A fourth, partly founded by Mr. Colston, and partly by the merchants, in which eighteen men on account of the merchants, and twelve men and women on Mr. Colston's account, are maintained. Fifth, An infirmary, opened in 1786, for the sick, lame, and distressed citizens, is said to have been the first regular provincial infirmary

in England. It was not long since enlarged at an expense of £10,000. Besides these are a bridewell, and several alms-houses and charity-schools. Here is also a guildhall for the sessions and assizes; a mayor and sheriff's court; a council-house, where the mayor and aldermen meet every day, except Sunday, to administer justice. Under St. John's gate, the corporation have lately erected a noble and spacious arch, for the accommodation of foot passengers.

Considerable woollen manufactories are established here, and fifteen noble glass houses, for which Kingswood and Mendip furnish the coals. Here are also several large sugar-houses, turpentine, sulphur, and vitriol houses, distilleries, and potteries equal to any in the kingdom for the fineness of their ware. The city companies are thirteen, several of whom have elegant halls. That of the Merchants, in Princes-street, is a capacious stone structure, enclosed with an iron pallisade, and has a very curious front. On the north-west of the city is Brandon hill, granted, it is said, to the city by queen Elizabeth, where the laundresses dry their linen; she also gave the city a charter, whereby every man who marries the daughter of a citizen, becomes free of Bristol, and has a vote for the members to parliament. Upon contested elections it is said to be frequently the grand effort of the contending parties to patch up all the matches they can with the lower order of freemens' daughters, by giving a suitable douceur to a subservient bridegroom. The prison of Newgate has been lately enlarged, and rendered very healthy by improvements. It has a handsome chapel, and an officiating ordinary. The government of the city is in a mayor, twelve aldermen, who are justices of the peace *ex officio*, two sheriffs, twenty-eight common-council, a town-clerk, and deputy town-clerk, chamberlain, vice-chamberlain, under-sheriff, &c. besides a city marshal and other inferior officers. The city is divided into twelve wards, having an alderman to preside over each. The mayor, &c. holds a quarterly session; a court of requests is held every Monday for the recovery of debts under 40s. and the two sheriffs hold a pie-powder-court every year, in autumn, under the piazza, in the old market. Bristol returns two members to parliament.

Close by the river, a mile below the city, is the Hot-well, the waters of which are recommended in diabetes, phthisical, scorbutic, and inflammatory disorders. It is a great resort during the summer, and has a pump-room, ball-room, coffee-house, taverns, and lodging-houses, both below, on a level with the well, and above, in the delightful village of Clifton.

The water is slightly acidulated, inodorous when fresh, perfectly limpid, and sparkling with numerous air bubbles. It is agreeable to the palate without any specific taste. Its specific gravity is 1.00077, approaching so near to that of distilled water, that this circumstance alone would show that it contained but a very small admixture of foreign ingredients. The temperature, taking the average of the most accurate observations, may be reckoned at 74 degrees; and this does not very sensibly vary during winter or summer.

The sensible effects, when drunk warm and fresh from the spring, are a gentle glow of the stomach, succeeded sometimes by a slight and transient degree of headache and giddiness. By a continued use, in most cases it is diuretic, keeps the skin moist and perspirable, and improves the appetite and health. Its effects on the bowels are variable. On the whole, a tendency to costiveness seems to be the more general consequence of a long course of this medicinal spring, and therefore the use of a mild aperient is requisite. These effects, however, are applicable only to invalids, for healthy persons, who taste the water at the fountain, seldom discover any thing in it but a degree of warmth, which distinguishes it from the common element.

Bristol water contains both solid and gaseous matter, and the distinction between the two requires to be attended to, as it is owing to the very small quantity of solid matter that it deserves the character of a fine natural spring; and to an excess in gaseous contents, that it seems to be principally indebted for its medicinal properties. From the different investigations of chemists it appears, that the principal component parts of the Hot-well water, are a large proportion of carbonic acid gas, or fixed air, and a certain portion of magnesia and lime, in various combinations, with the muriatic, vitriolic, and carbonic acids. The high reputation of this spring is chiefly in the cure of pulmonary consumption. From the number of unsuccessful cases among those who frequent this place, many have denied any peculiar efficacy in this spring, superior to that of common water. It is not easy to determine how much may be owing to the favorable situation and mild temperate climate which Bristol enjoys; but it cannot be doubted that the Hot-well water, though by no means a cure for consumption, alleviates some of the most harassing symptoms of this formidable disease. 'It is particularly efficacious,' says Dr. Hooper, 'in moderating the thirst, the dry burning heat of the hands and feet, the partial night sweats, and the symptoms that are peculiarly hectic; and thus, in the earlier stages of phthisis, it may materially contribute to a complete re-establishment of health; and, even in the latter periods, mitigate the disease when the cure is doubtful, if not hopeless.' The season for the Hot-well is generally from May to October; but, as the medicinal properties of the water continue the same throughout the year, the summer months are preferred merely on account of the concomitant benefits of air and exercise. It rises near the bottom of the cliff, above twenty-seven feet below high water-mark, and ten feet above low water, forcibly gushing from an aperture in the solid rock, and so copiously as to discharge sixty gallons in a minute. This water suddenly became red on the 1st of November, 1755, during the time of the dreadful earthquake at Lisbon.

Bristol is a first rate commercial city, and is said to trade with more independence on the port of London than any other British port. Its harbours were filled at a very early period with vessels from Denmark, Prussia, and the Hanseatic towns: many vessels were fitted out at this port for the purpose of discovery; and its merchants

were among the first that entered into the West India trade, and in the cod fishery of Newfoundland. Since canal navigation has been so extensively established, its internal trade has in some measure decreased, as the goods of Liverpool and London now find their way into the country by other channels. Its foreign commerce, however, is in a more flourishing state, the principal branch of which is with the West Indies. Its vessels carry out materials for building, clothing, and provisions; and bring in return the productions of the islands, such as cotton, rum, and sugar, &c. with which they supply all South Wales and the West of England. Large quantities of glass, particularly glass bottles, are exported to Ireland and America, nearly half of them being filled with cyder, beer, or Bristol water. This city has also an extensive trade with the Mediterranean, Africa, and Newfoundland.

All persons are free to trade in this city, and its freedom can be purchased for a very moderate sum. It gives the title of earl to the family of Hervey. Here the unfortunate Thomas Chatterton was born, his father having been sexton of St. Mary Redcliffe, and in this church lies buried Sir William Penn, the father of the celebrated Quaker.

According to William of Worcester, Bristol was built by Brennus, a prince of the Britons, 380 years before the Christian era, and in allusion to this the two statues over St. John's gate are said to be emblematical of Brennus and Belinus, who reigned conjointly. It is certain that Bristol was a place of importance at an early period: it is mentioned by Gildas among the fortified cities of Britain, as early as A. D. 430; and by Nennius in 620, in his enumeration of the twenty-eight cities of Britain. Robert, the illegitimate son of Henry I., first enclosed it with a wall, and in 1130 rebuilt and improved the castle, which was long considered a place of considerable strength. Excluding the outworks, it was 450 feet in length, and 300 in breadth. In 1655 Oliver Cromwell razed it to the ground, and some few vestiges of it which remain, are now incorporated with other buildings in Castle-street. Here is a considerable weekly cattle-market on Thursday; and the markets on Wednesday and Saturday, for butchers' meat, poultry, fruits, and vegetables, are supplied in great plenty and variety. Fairs, 1st of March in Temple-street, and the 1st of September in St. James's church-yard; each of which continues ten days; for horned cattle, horses, leather, &c.

BRISTOL, a maritime county of the United States, in Massachusetts; bounded on the north by Norfolk, on the south-west by the State of Rhode Island, on the south and south-east by Buzzard's bay, and on the north-east by Plymouth county. It is forty-two miles in length, and thirty-two in breadth; and is divided into fifteen townships, viz. Taunton, Norton, Easton, Mansfield, Attleborough, Swanzy, Somerset, Dighton, Raynham, Berkley, Freetown, Welport, Dartmouth, New Bedford, and Rehoboth. This county contains valuable mines of iron ore.

which are worked to a large amount. Copper ore has also been discovered here. The chief town is Taunton.

BRISTOL, a maritime county of the state of Rhode Island, seven miles in length, and three in breadth. It is bounded on the east by Mount Hope, or Bristol-bay, on the west by Warwick-bay, on the north by the state of Massachusetts, and on the south by part of Narraganset bay. It is divided into three townships, viz. Bristol, Warren, and Barrington.

BRISTOL, a post town, and the capital of the preceding county, is situated on the main, twelve miles N. N. E. of Newport. This town was bombarded by captain Wallace, commanding a small British squadron, in October, 1775, and laid under contribution; no lives were lost on the occasion, except the minister of the congregational church, who left his house at the commencement of the bombardment, and perished in the fields. Several of the houses were destroyed; but they have been since rebuilt. It is now flourishing, and carries on a considerable trade. It is four miles south of Warren, fourteen south-east by east of Providence, and 300 from Philadelphia.

BRISTOL, or BRISTOL, NEW, the capital of the county of Bucks, in Pennsylvania, is situated on the Delaware, about twenty miles north of Philadelphia. It is an agreeable handsome place; and the resort of much company in summer. It was incorporated by Sir William Keith, in 1720; and governed by a Burgess and common council men, until the revolution.

BRISTOL BAY, a considerable bay of the North Pacific Ocean, on the west coast of North America, discovered by Captain Cook. It is formed by the peninsula of Alaska on the south, and by Cape Newnam on the north. Long. 157° 0' W., lat. 58° 20' N.

BRISTOL CHANNEL is that arm of the Irish Sea which extends between the southern shore of Wales, and the western peninsula of England, terminating in the mouth of the river Severn. It stretches from east to west, therefore, about ninety miles; from the north-west point of Devonshire to the south shore of Pembroke, it is about fifty miles; and from Somersetshire to Glamorgan-shire, about fifteen miles broad. It is remarkable for its high and often violent tides.

BRISTOL RIVER, a river which empties itself into the above bay. It appeared to Captain Cook to be about a mile broad at its mouth, and abounds with salmon. Long. 201° 55' E., lat. 58° 27' N.

BRISTOL STONES are found in St. Vincent's rock, above the hot well of Bristol: they are six-cornered, and very beautiful and transparent; but they are not so plentiful now as in Camden's days, when he says whole bushels might have been easily gathered.

BRIT, *n. s.* The name of a fish.

The pilchards were wont to pursue the *brit*, upon which they feed, into the havens. *Carew.*

BRIT, a river of England, which runs into the sea, two miles south of Bridport, in the county of Dorset.

B R I T A I N.

BRITAIN, or GREAT BRITAIN, as it is now more commonly called, is the largest, and in every respect the most important of the European islands. It extends from about 50° to $58^{\circ}\frac{1}{2}$ of N. lat., and from 2° of E. to 6° of W. long., being about 500 geographical miles in extreme length: its greatest breadth is 320 geographical miles. In British miles we may take the length at 580, and the breadth at 370 miles. It is of very irregular shape: the North Sea washes its northern shore; the German Ocean and English Channel its south and east; and the Irish Sea, St. George's Channel, and the Atlantic Ocean its western sides. The circuit of the island, including its numerous indentations, is estimated at 1800, and the superficial area at 87,000 square miles, containing, in 1821, a population of 14,379,677, or 165 persons to each square mile. Comparatively with the other nations of Europe its population is greater for its surface than any except the Netherlands.

The most ancient name of this island we are told by Pliny was Albion; Agathemerus speaks of the situation of Albin, a British island. Both names (See ALBION) are of uncertain etymology. Some derive Britain from a Brutus or Brito, said to be the fifth in descent from Æneas; Camden from the word brith, signifying painted; others from a British word, brydid, meaning rage, in allusion to the strong shores of the island. But Bochart, speaking of the colonies and language of the Phœnicians, offers a conjecture, which has been most commonly adopted in modern times. The Phœnicians, according to that writer, called this island and some others near it, כרת-אינך, that is the land or country of tin or lead, and more contractedly Bratannac; which name, passing from the Phœnicians to the Greeks, and from these to the Romans, might have been softened into those of Britannicæ, and Britannia. That the Phœnicians first discovered these islands, which were afterwards by the Greeks called Cassiterides, and are proved by Camden to be our Scilly islands, appears both from Strabo and Pliny; of which the former tells us, that the Phœnicians first brought tin from the Cassiterides, which they sold to the Greeks, but kept the trade to themselves, and the place private; and the latter, that Mediocritus was the first who brought lead from the Cassiterides; where Bochart shows that we ought to read Melichartus, who is the Phœnician Hercules of Sanchoniatho, to whom that nation ascribe their first western discoveries. But, notwithstanding the care of the Phœnicians to conceal these islands, the Greeks at last discovered them, and gave them the name of Cassiterides, which in Greek signifies the same with barat anac in the Phœnician. The name was at first given it in addition to the islands of Scilly, but by degrees communicated to all the others lying in the same sea. Its general appearance to the intelligent traveller is that of great natural variety, and astonishingly minute cultivation. The eastern and southern sides present the greatest extent of

level country; the western and northern are more rugged and mountainous; and, though the whole island contains no mountain more than about 4400 feet above the level of the sea, Wales, the north of England, and many of the northern parts of Scotland, are diversified with scenes of alpine magnificence.

The most important civil division of Britain is into the three countries of England, Wales, and Scotland, occupying, respectively, its southern, western, and northern portions; and each of them subdivided into counties, shires, and parishes. The relative proportions of these countries are, taking England, the seat of the general government, as an unit.

1·00 England

·55 Scotland

·16 Wales.

The primitive rocks of Great Britain are granite, gneiss, or schistose granite, micaceous schistus, and common slate. Scotland affords varieties of primitive limestone, or marble; serpentine appears in Cornwall and at Portsoy, at the extremities of the island; there are extensive beds of syenite in Islay and on the western coasts of Ross-shire; quartz rock composes the central range of the mountains in Islay and Jura, and porphyries of the primitive class are met with occasionally. Granite, the common rock in Cornwall, is occasionally found in some of the interior districts of England, and occupies the central part of some of the Scottish mountains. Gneiss, or schistose granite, is less frequent, but appears on the Grampians and in the Hebrides. Micaceous schistus is the prevailing rock on the sides of the mountains in some of the islands of Scotland, as well as in some of the central parts of the country; and common slate abounds both in England, Scotland, and the whole of the British islands. The secondary formations are all the varieties of sandstone, gypsum, rock-salt, and chalk; the last of which, however, is said to be entirely unknown in Scotland. In England chalk hills commence at Flamborough-head in Yorkshire, and run in a westerly course for the distance of twenty miles; two ridges traverse the middle counties, and approach nearly to the borders of Oxfordshire; and on the south side of the Thames a ridge commences at the North and South Foreland, passes through Kent and Surrey, and terminates in Hampshire; another ridge begins near the lofty promontory of Beachy-head, and passes through Sussex and the south of Hampshire, into Dorsetshire. Britain has been celebrated for the production of tin, as we have seen, from the early dawn of history; lead, iron, and copper, are also abundant; and small quantities of nitric silver have been found in the lead mines; immense fields of coal have been already worked for ages, and seem inexhaustible.

The soil is, in the southern parts, generally clay and strong loams, which sometimes reach to a considerable elevation. Sand is abundant in the more open plains; considerable tracts on the north-eastern shore are occupied with marshes

and fenny ground ; while peat, calcareous earth, and rock, divide the upper lands of the country. In the south, midland, and eastern counties is the most productive soil. Above one-third of the whole soil of England and Wales has been supposed to be under tillage ; another third to be pasture and meadow ; and the remainder marshes, wood, water, or waste land. In Scotland and its islands not above one-fourth of the surface is cultivated. The great mountain ranges are a prominent feature of Britain. In the south is what may be called the Devonian range, extending from the Land's-end through Cornwall, Devonshire, and part of Somersetshire : its greatest height is about 1800 feet above the level of the sea. A ridge of considerable height runs from the sea-coast of Dorsetshire, north-east into Suffolk, with two lateral branches extending from the plain of Salisbury ; the one into Sussex, where it forms the South Downs, and the other to the eastern shore of Kent. The Cambrian range traverses Wales from south to north, and contains Plinlimmon, whose altitude is 2463 feet ; Cader Idris, in Merionethshire, 2914 ; and Snowdon, in Caernarvonshire, 3571 feet. A midland range, sometimes styled the Apennines of England, commences in Derbyshire, and terminates at Galtedale forest in Cumberland, having a branch shooting off on the north of Westmoreland, towards the Irish sea. Of this range in Westmoreland, Wharfedale 2475 feet, Bonyfell 3084, and Ingleborough 2380 ; in Yorkshire, Crossfell 3390, Bowfell 3440, and Ilkellin 3225 ; and in Cumberland, Grasmere 2865, Saddleback 3048, Skiddaw 3175, and Scafell 3240, are the principal elevations. Other hills and mountainous tracts of inferior note occur ; such as the Chiltern-hills, between Tring in Hertfordshire, and Henley in Oxfordshire ; the Malvern-hills in Gloucester, Hereford, and Worcester shires ; the Cotswold and Stroudwater hills in Gloucestershire ; the Wrekin in Shropshire ; the Morelands of Staffordshire, Yorkshire, Lancashire, and Northumberland. The border Cheviot, or Tiviot-hills run in a westerly direction, and form a continuous chain with those in the south-west region of Scotland, many of them are of considerable elevation. In Roxburghshire, Cheviot-top is 2682, and Millenwood-fell 2000 feet ; in Dumfriesshire, Hartfell 3300, and Black Larg 2890 feet ; and in Kirkcudbrightshire, Cairns-muir nearly 4000 feet. A long chain, commencing at Dumbarton, stretches in a north-easterly direction to the neighbourhood of Brechin, and is broken by the Forth and the Tay into three divisions, denominated the Lennox, the Ochil, and the Sidlaw-hills. The Grampian range, including the Mons Grampius of Tacitus, extends from Loch-Lomond, in Dumbartonshire, to Stone-haven, in the county of Mearns, having a branch shooting off from it into the shires of Inverness and Banff. In this chain Ben-Lomond rises to the height of 3260 feet ; Ben-Ledi 3009 ; Ben-More 3903 ; Ben-Lawers 4015 ; Ben-Voirlich 3300 ; Bengloe 3725 ; Sheehallien 3564 ; Loch-na-garaidh, and Binn-na-muichduidh, constantly covered with snow, are not less than 4000 feet high. Some of the other most remarkable mountains of Scotland are Ben-

Cruachan, in Argyllshire, 3390 feet ; Ben Wyves, in Rossshire, 3720 feet in height, and Ben-Nevis, in Invernesshire, the loftiest mountain in Great Britain, 4370 feet.

The climate of Great Britain, though remarkably changeable, is, in that circumstance, as well as some others, a common feature of the island. Its instability has been attributed to the manner in which its circumjacent seas affect the dry winds rushing from the continent, as the various winds of the ocean, its tides, &c. may occur. The larger mountain ranges, running from north to south, also affect the eastern and western sides of the island in a particular way. The latter being generally more humid and mild ; the former drier, but of lower temperature. From the east dense fogs and penetrating winds prevail at particular seasons ; but the most prevalent winds throughout the island are from the west. In London the wind blows from that quarter, on an average, during the year, 215 days, and 116 from the east ; from the south 18, and from the north 16 days. The extremes of heat and cold, experienced in parallel latitudes of Asia and America, are of rare occurrence here, and always of short duration ; a happy mediocrity, to be attributed not merely to the natural position, but to the complete cultivation of the country. July and August are, on an average, its warmest, and December and January its coldest months of the year.

Its rivers and canals are important general features of Great Britain. The most remarkable of the former are, in England, the Thames, Severn, Humber, Mersey, Trent, and Ouse. In Scotland, the Forth, Clyde, Tay, Tweed, Don, and Dee. To particularise its canals would exceed the bounds of a general sketch ; they have been the work, we can only observe, of but little more than half a century ; the first that were constructed on any considerable scale being those of the duke of Bridgewater, planned in 1757 : they now connect all the great towns and rivers of the empire, particularly in England ; here, passing over the valley in tiers of arches, there penetrating mountains and rocks, by tunnels that want a name in relation to the earth, for subterranean they are not in many cases ; and in other instances climbing the outside of hills in inclined planes, raised by mechanical power. See CANAL NAVIGATION.

Great Britain is by nature pointed out as the head of those islands and dependencies which form her European empire—and England as the head of Great Britain. Here, therefore, has long been the seat of government ; and its metropolis is the grand emporium of the internal and external commerce, as well as of the arts and literature, of the country. On a statistical view of Europe, Great Britain ranks but as the seventh power in superficial extent of country. Russia, Sweden (including Norway), Austria, France, Turkey, and Spain, being all her superiors in that respect. According to population she ranks as the fourth power, Russia, France and Austria being her only superiors. In respect to public revenue she ranks as the first of the powers, as well, of course, as in the contributive proportion of each individual to the

burdens of the state. In this last particular every individual contributes nearly double the sum, upon an average, that the inhabitants of any other nation does—more than five times as much as the Swede, the Italian, and Turk, and about ten times as much as the inhabitants of Switzerland.

More particular statistics of this most interesting of all islands, we presume, to the reader, belong, as we conceive, to the respective countries of which it is composed. To the articles ENGLAND, SCOTLAND, and WALES, therefore, we refer for them. Ireland also, though now united under one sovereignty, and represented in one parliament, is still to be regarded as a distinct country, having, as well as the other great divisions of the empire, many geographical and civil peculiarities. See IRELAND.

The civil and ecclesiastical history of this empire, we regard as divisible into two comprehensive periods, the history of Britain, and of Great Britain. The former comprehending that of the early Britons, and the general affairs of the island, until the settlement of its Saxon conquerors here under Egbert. Then the histories of England, England and Wales, and Scotland, as well as Ireland, are distinct; and we shall treat of them distinctly in their alphabetical places, until the union of the English and Scottish crowns under James I. Now begins the history of Great Britain, and from this period it will also be convenient to treat the entire general history of the empire, under that head to the present time. This article, therefore, is devoted to the first of these periods.

HISTORY OF BRITAIN. 1. Of the early Britons, or Britain before the Roman invasion.—All history has its infancy of fables; wholly to disregard which, is, perhaps, as unphilosophical as to slight every account of the infancy of celebrated men, because such accounts also frequently abound in the marvellous. Milton traces, in the romantic details of British history, 'many footsteps and reliques of something here;' and Mr. Turner, one of our ablest modern historians, insists that sufficient attention has not been paid to them by his predecessors. Hume, we know, contends that they ought entirely to be disregarded. We shall advert to a few of the most interesting particulars, and leave the question of their credibility to the reader.

The *Argonautica* of the Greeks, ascribed to their celebrated Orpheus, contains the earliest historical allusion to these islands. Who the real writer of this poem was, is a question equally obscure with the geographical details into which he enters; but Suidas contends that he was an Orpheus the younger, called also Onomacritus, who lived 560 years before Christ. He describes a voyage undertaken by certain Thessalian heroes to Colchis, on the east of the Euxine, whence they pass to the Palus Mæotis, or sea of Azoph, thence up the lands to the Northern Ocean; and, circumnavigating Europe, return home.

He mentions the island Iernida, which is presumed to be Ireland, and which the Argonauts pass with considerable fear in their voyage from the North Sea. Camden thinks that the island

next mentioned under the name of Πευκησσον' or Piceis Obsitam, was Britain, which some writers contend cannot be the fact, because, after they had left Iernida, they were tossed by a furious tempest for twelve days before Lynceus discerned Πευκησσον. We do not see the force of this objection. It is perhaps extraordinary, but not impossible, that they should have touched on the shores of Ireland first; but by no means impossible that they should have been tossed about in the Irish or British Channels twelve days. It is remarkable, that, in opposition to the mythologists, the author makes this island in the Atlantic to have been the residence of Ceres, and the place from which Proserpine was carried off by Pluto. With equal peculiarity he makes another island in the same sea, which he calls Λυκαιον χερσον; and which Camden thought to be the same as the former, though three days sail from the habitation of Circe.

Herodotus, who flourished about 450 years before Christ, says, 'I have nothing certain to relate concerning the western boundaries of Europe. I know as little of the islands called Cassiterides, except from the tin which is thence imported among us; and though I have diligently enquired, yet have I never seen any man, who, by his own experience, could inform me of the nature of that sea which bounds the extremities of Europe; however, it is certain that amber and tin come from its remotest parts. Europe,' he adds, 'has not been fully discovered by any man; and we have no account whether it be bounded on the north and east side by the sea.'

The first classical writer who expressly mentions the British isles, is the author of *De Mundo*, a work that has been ascribed to Aristotle. He professes to give a kind of physiological account of the universe, and a concise survey of the geography of the earth. If it was written by Aristotle, which the Scaligers and other learned men dispute, it will show how confined was the geographical knowledge of that age: if of later date, it will prove how slowly that knowledge advanced. This writer speaks of a sea, that comes towards the Gallic Gulf, and thence to the columns of Hercules. 'In this sea,' he says, 'are two islands, called Βρετανικαι, Αλβιον και Ιέρην (Britannia, Albion, and Ierne), larger than those we named above. They are directly above the Celts.' He further describes the northern parts of Europe as inhabited by the Scythians, and the western by the Celts.

Polybius, who flourished about 200 years before Christ, promises in his third book to write a treatise respecting the *Βρετανικων νησων*, the British islands, and the making of tin; but this tract unfortunately, if ever written, is lost. Strabo, and other Greek writers, now constantly mention these islands; and there can be no doubt that they are intended by the Cassiterides of the classical authors. The Phœnicians, according to Strabo, were long accustomed to visit the Cassiterides from Spain, for the sake of a profitable traffic in tin, lead, and skins. So jealous were they, we are told, of that monopoly of this commerce which they at one time enjoyed, that when the Romans followed a Phœnician ship bound hither, for the purpose of dis-

covering the market, the master ran the vessel aground, and destroyed it, rather than let them trace his course; and he was indemnified by his countrymen out of the public treasury. Through this channel, however, the Greeks generally, and finally the Romans, became well acquainted with the existence of Britain, and what was its then staple commodity—tin. The period of the Roman invasion of the island, under Julius Cæsar, unites it with the regular stream of ancient history.

As Britons, however, we may be permitted to confess a lingering over its earliest details. Much of them, as already admitted, is doubtless fabulous; but industry and erudition have, of late, elucidated many of the once rejected legends: ancient British learning has been cultivated with patriotic zeal, ancient documents have been brought to light; what is probable has been separated from what is hopelessly obscure; and having given, as above, the bald story of our early history that has come down to us through the Greek and Roman writers, we shall now for a brief space engage the reader's attention to those contributions of our native historians, that supply, as we presume, an equally authentic, and much more interesting narrative.

In the Welsh Triads, which have been recently published, we have a test of the accuracy of Geoffry of Monmouth's Chronicle, the only source of information, on early British history, to which the investigator could at one time apply. These write the word Britain, Prydyn or Prydain, a name which they state it to have derived from Prydyn, the son of Aedd, who 'brought it under rule.' The Cymry, or Cimbri, are said to have been the first people who came over; the Brython, Britons, or Britones, were the next considerable colony. Geoffry of Monmouth appears only to have translated the old Welsh Chronicle into Latin, with some embellishments. His name, among the Welsh, is Griffith ap Arthur; but there is evidence, certainly, that the main incidents contained in his book, have a foundation in truth. Two copies of this Chronicle, in Welsh, have been lately published from respectable manuscripts, collated with two more, by Mr. Owen; which purport to be transcripts of the work as edited by Walter de Mapes, archdeacon of Oxford, in the reign of Henry I. The ground-work of the narratives thus supplied is the same, and especially as it regards the origin of the British; which is in them all attributed to one Brutus, a Trojan, and his companions. Brutus is said to be the son of Silvius, the son of Ascanius, the son of Æneas. These Trojans, after meeting with many reverses, and having passed through various scenes of adventure in Greece, Italy, and Gaul, which are very circumstantially related, at length found their way to Britain; about the time that Samuel the prophet governed Israel.

Geoffry peoples the island at this time with giants: some original inhabitants there probably were; but for whom, or what they were, as well as for the Trojan origin of this Brutus, we have only the authority of Geoffry's imagination. It is remarkable, however, that, according to Ammianus Marcellinus, some of the Gauls had a

tradition that they were descendants of the Trojans, which he thus relates: 'Aiunt quidam, paucos, post excidium Trojæ, fugitantes Græcos undique dispersos, loca hæc occupasse tunc vacua.'—It is said, that a few (*Trojans*), after the destruction of Troy, in making their escape from those Greeks who were dispersed abroad, took possession of these countries, which at that time were uninhabited.' Nennius says, that Brutus built a city in Gaul, which he called after the name of Turnus, one of his soldiers. Mr. Roberts, *Early History of the Cymry*, p. 57, thus comments on this circumstance. 'There can scarcely be a doubt but that Nennius had here the district of the Turones, that is, Touraine, in view. Now, Touraine comprehends the confluence of the Liger, or Loire, from the vicinity whereof the colony of the Loegrians came to Britain. This tradition may, therefore, be safely considered as that of the Loegrians in particular; though, in process of time, and from the ignorance of historians, who confounded it with the other, a confusion to which the similarity of the names, Hysichion and Prydain, to Ascanius and Brutus (if any such persons as the two last ever existed) would contribute, it came to be considered as the national tradition. The Loegrians then, having a tradition that they came originally from Phrygia, and the Cymry, that they came from Thrace: the expression of the Triad, *that both were of the same original stock*, was countenanced by the traditions of both.'

The Triads speak of three colonies, as coming over from the continent in some remote age: 'The first is the Cymry, or Cymbrians; these came over the German Ocean, which they call Môr Tawch, or the hazy ocean, from the land of Hâv, or Defrobani, 'where Constantinople now stands;' a remark, probably, of some ancient copyist. These came under the command of Hu Gadarn, who is styled the pillar of his nation, for it was he who conducted the Cymry to Britain. It is said of him, that he aimed not at obtaining territory by war and contention, but in the way of equity and peace. The Cymry are styled one of the three benevolent tribes, of which the second was; 'The Lloegwys, the Loegrians, or Liguais, who came from the land of Gwasgwyn, and were sprung from the primordial race of the Cymry. The third was 'The Brython, or Britons, who came from the land of Llydaw (Lætavia, Armorica, or Bas Bretagne), and were also sprung from the primordial race of the Cymry. These were denominated the three peaceable tribes, inasmuch as they came by mutual consent and permission; and the three were of one language and of one speech.'

'Three tribes came under protection to the isle of Britain; they settled, with the leave and by permission of the Cymry, without weapon or assault: the first, was the tribe of the Celyddon, or the Caledonians, in the north; the second, was that of the Gwydhyf, or Gwydhelians, and these are now in Alban; that is, in the highlands of Scotland: the third, was that of the men of Galedin, who came in their boats (*llongau moelion*, or ships without sails), to the Isle of Wight,

when their country was overflowed, and were allowed a territory by the race of the Cymry: these had no privilege nor claim in the Isle of Britain, any more than a settlement in the land, afforded them under limitations; and these could not be entitled to the rights of natives until the ninth generation.

Three usurping tribes came into the Isle of Britain, and never departed out of it. The first of these was that of the Coraniaid, who came from the land of the Pwyl (or Poland, according to the etymology of the word, and according to the application of it to denote that country, by the modern Welsh): the second was the Gwyddelid Fichti, who came into Alban, over the sea of Llychlyn, or Lochlyn: the third was that of the Saxons. It is further stated in this Triad, that the territory which the Coraniaid occupied was on the banks of the Humber, and on the shores of the German Ocean; and the Gwyddelid Fichti are in Alban, on the shore of the sea of Lochlyn. The Coraniaid, on the coming over of the Saxons, united with them, and, incorporating themselves with that people, they deprived the Loegrians of their government, by wrong and oppression; and then they deprived the race of the Cymry of the monarchical crown. All the Loegrians became one people with the Saxons; those only excepted who are found in Cornwall, and in the Comot of Carnoban, in Deira and Bernicia. It is further added, that the nation of the Cymry kept their country and their language, although they lost the sovereignty of the Isle of Britain; owing to the treachery of the protected, and the devastation of the three oppressive tribes. From another Triad it appears, that until the time of Prydyn, the son of Aedd, there were no settled laws for the maintenance of justice, and the defence of person and property; nor any regular mode of government.

The coming over of the three friendly tribes, Mr. Hughes (*Horæ Britannicæ*) fixes at about 400 years, B. C.; 'for, by the time of Cæsar, not only Kent and Sussex, but Ilants, Dorset, Wilts, Somerset, Devon, and Cornwall, were occupied by their descendants, and bore their names.'

There is great reason to suppose that the Phœnicians not only traded as we have seen to Britain, for tin, &c. but established a colony here at a remote period: they are probably included in some of the tribes already detailed. Certain it is that the date of the voyage of Hamilco, who was sent by the senate of Carthage, about the time of Darius Nothus, to discover the western shores and parts of Europe, agrees almost precisely with the date of the coming over of the friendly tribes above alluded to. Dr. Vincent, in his *Treatise on the Commerce and Navigation of the Ancients in the Indian Ocean*, says 'that tin is mentioned as an import into Africa, Arabia, Scindi, and the coast of Malabar. It has continued an article of commerce brought out of Britain in all ages; conveyed to all the countries: in the Mediterranean by the Phœnicians, Greeks, and Romans, and carried into the eastern ocean from the origin of commerce. Tin,' he continues, 'is enumerated by Arrian as exported to India, and if we find the produce of Britain conveyed to

Malabar in the earliest period that history can reach, we find the spices of Malabar in Britain in an age when the course of the commerce with India was probably as little known as the existence of America: the venerable Bede, who died in the year 735, was possessed of pepper, cinnamon, and frankincense. Did no one ever ask the question how, in that age, these luxuries had been conveyed to Britain, or were treasured in a cell at Wearmouth?'

The Phœnicians, in fact, traded to all parts of the known world, perhaps from the time of Abraham. 'They enriched themselves by exchanging their manufactures, and the productions of the East, for the silver of Spain and the tin of Britain. Spain was, to them, what America has been to us; but Britain was so invaluable to their trade that they uniformly endeavoured to throw a veil of mystery over its situation and its produce.' At every station they visited on the Mediterranean these enterprising navigators established colonies: Strabo mentions their possessing not less than 300 on the shores of that sea. It cannot therefore be unreasonable to infer 'that they established similar settlements in more distant countries, and particularly in Britain, where, for such a length of time, they possessed the monopoly of an article which enriched them, and was so much required by other nations.'

When Cæsar arrived in Britain he describes the sea-coast as inhabited by rovers and pirates, the interior, to which he did not penetrate, by the aborigines of the island, whose numbers he heard of as prodigious; and their buildings numerous, and like those of Gaul. Their cattle also were abundant, but they sowed little corn, and used iron rings for money. Their diet was simple and parsimonious; chiefly milk, butter, and cheese, and perhaps oatmeal. At their feasts they indulged themselves with animal food, cerevisia, or malt liquor, cyder, and metheglin. They had few fixed meals, but ate more or less frequently, according to their convenience; and when they became rather more polished, two meals a day formed their seasons of repast. When Cæsar met them in battle, their appearance was fierce, and their courage undaunted. They painted, or rather tattooed their bodies with wood, partly as a defence against the weather, and partly to terrify their enemies. Dion Cassius says, when pursued by an enemy too powerful, they betook themselves to boggy places, where they were able to endure all the inconvenience of such a miserable situation for whole days and nights, without any other sustenance than a morsel no bigger than a bean. At this period their hills were covered with deer, so that their venison feasts were frequent, rewarding them for the toil of hunting: wolves and bears also abounded in the island. Their towns consisted of huts, with one rather of the superior kind for the chieftain. Their fortresses were rather natural than artificial defences; but we have still the traces of their encampments, which antiquaries distinguish from those of the Romans. Some of our largest towns are upon the site of those built by the ancient Britons. Their garments

were coarse woollen, and their covering by day was their only bedding at night. Their distinguished chiefs wore a gold torch, or massy chain, appended to a collar. Queen Boadicea is described by the Roman historian as adorned with such a princely ornament; while her yellow hair fell down her back over her long flowing robe. Cæsar found them prone to civil wars and disputes: his pretext for his second invasion we know was grounded on the encroachment made by Cassivelaunus, prince of the Catti, and some other tribes, on the neighbouring territory of the Trinobantes, whose prince, Immanuentius, had been slain by that chieftain. He also states that 'ten or twelve of them have their wives in common; particularly brothers with brothers, and parents with their children. The children who were the fruit of such unlawful embraces, were considered as pertaining to those men who married the mothers when virgins.' They imported brass, it seems from the same writer, and exhibited their greatest mechanical skill in the structure of their war-chariots, to which they fastened those celebrated scythes and hooks which evince a considerable knowledge of the art of working iron. 'The chief mechanics of Britain,' say one of the Triads, 'were Corvino, the bard of Ceri Hir Lyngwyn, who first made a ship, sail, and helm, for the Cymry; Morddal Gwr Gweilgi, mason to Ceraint ap Greidiawl, who first taught the Britons to work with stone and mortar, about the time that the emperor Alexander was subduing the world; Coel, son of Cyllin, and grandson of Caradoc, the son of Brân (or Caractacus), who first made a mill turned by a wheel: these three were bards.' Another speaks of barley and wheat as introduced by foreigners; and first of all successfully cultivated, the former in Pembrokeshire, and the latter in Monmouthshire. Rye, at the same time, was introduced into Carnarvonshire. In their books also we read of 'three celebrated astronomers of the Isle of Britain, Idris the chieftain, and Gwydion the son of Don, and Gwyn the son of Nudd; and so great was their knowledge of the stars, and their influences, that they could prognosticate whatever it was desirable to know.'

Ancient commentators on the Itinerary of Richard of Cirencester attempt to distinguish some ancient British ways across the island from the roads constructed by the Romans, and it is considered that both the Skinner-street and the Watling-street of the latter were adopted and improved from the former. The Triads tell us that the nation of the Cymry claimed the supreme monarchy of the Isle of Britain: but of this prerogative they are said to have been deprived by the Loegrians, or the people of the central region, now called England. In a time of common danger the chieftains, who were the reguli, or lords of distinct territories, formed a confederacy, and elected some eminent chieftain of an illustrious family to be their pendragon, or stadtholder, to lead them to battle. Such were Cassivelaunus, Caractacus, Vortigern, and Arthur. These works also mention laws enacted by the general suffrage of what were afterwards called uchelwyr, or noblemen; and the gwyr da, men

of small estate, or such as we would call freeholders; the common people, or the plebeians, being in a state of villenage, or slavery to the great men. Nothing can be more satisfactory to the patriotic antiquarian than the following passage on the genius of their constitution. 'There is one supreme authority, in union with the arbitration or voice of the country and community, agreeable to the distribution of Prydain, the son of Aedd the Great. To the nation of the Cymry does the supreme authority pertain, according to the voice of the country and the nation, because of natural right and equity; and subject to this constitution ought the sovereignty to be regulated in every territory of Britain; and every sovereignty is subject to the voice of the country: on that ground is the proverb founded, 'The country is greater than its lord.' Another Triad says, 'The three pillars of the commonweal of the Isle of Britain; the voice (or decision) of the country, the sovereignty, and the law, according to the distribution of Prydain, the son of Aedd the Great.' They also celebrate the laws of Dunwal Moelmad, which were extant in the time of Gildas (that is, Gildas Nennius), were translated by him into Latin; as were also those of Marcia, the wife of Cyhylin, the third from Dyrnwal; and communicated to Alfred the Great by Aser. Their language, it is well known, had a close affinity with that still spoken in Wales. Their druidical magistracy and priesthood are sufficiently important to claim our attention in a separate article. See DRUIDS.

The independent states or tribes, at the coming of the Romans, were about forty-five, whose names, somewhat altered by a foreign orthography, were as follow:—

Canti	Belgæ
Regni	Durotriges
Bibroces	Iladui
Attrebates	Damnonii
Segontiaci	Carnabii
Silures	Ordovices
Dimetæ	
Trinovantes	Dobuni
Iceni	Huicci
Coritani	Analites
Cassii	Carnabii
Sistuntii	Brigantes
Volantii	
Ottadini	Novantes
Gadeni	Damnii
Selgovæ	
Horestii	Vacomagi
Veturones	Albani
Taixali	Attacotti
Caledoni	Mertæ
Cantæ	Carnonacæ
Logi	Cerones
Cornavii	Creones
Catini	Epidii

The principal of which were thus distributed:

Tribes.

1. Damnonii . . . Cornwall and Devonshire.
2. Durotriges . . . Dorsetshire.
3. Belgæ . . . Somersetshire, Wiltshire, and the northern part of Hampshire.
4. Atrebatii . . . Berkshire.
5. Regni . . . Surry, Sussex, and the south of Hampshire.
6. Cantii . . . Kent.
7. Trinovantes . . . Middlesex and Essex.
8. Iceni . . . Suffolk, Norfolk, Cambridgeshire, and Huntingdonshire.
9. The Catti, or Catticuchlani } Bedfordshire, Buckinghamshire, and Hertfordshire.
10. Dobuni . . . Oxfordshire and Gloucestershire.
11. Silures . . . { Herefordshire, Radnorshire, Monmouthshire, Brecknockshire, and Glamorganshire.
12. Dimetæ . . . Caermarthenshire, Pembrokehire, and Cardiganshire.
13. Ordovices . . . { Flintshire, Denbighshire, Merionethshire, Montgomeryshire, Caernarvonshire, and the Isle of Anglesea.
14. Cornavii . . . Cheshire, Shropshire, Staffordshire, Warwickshire, and Worcestershire.
15. Coritani . . . { Lincolnshire, Nottinghamshire, Derbyshire, Leicestershire, Rutlandshire, and Northamptonshire.
16. Brigantes . . . Yorkshire, Lancashire, Westmoreland, Cumberland, and Durham.
17. Otadini . . . Northumberland.

Modern Counties.

Mr. Hughes supplies us with a list of the principal towns in ancient Britain; several of which were founded before the coming over of the Romans.

Trenovant—Londinium, Llandain, Llundain, or London.

Durovernum vel Cantiopolis—Caer Gaint, or Canterbury.

Camulodunum—Colchester, or Maldon.

Verolamium—St. Alban's.

Venta—(Belgarum), Caer Wynt, Winchester.

Isca—(Damnoniorum), Caer Esk, Exeter.

Isca—(Silurum), Caerleon, Monmouthshire.

Venta—(Silurum), Caerwent.

Glevum—Caer Gloyw, Gloucester.

Brannogenium—Caer Wrangon, Worcester.

Uriconium—Wroxeter, in Shropshire.

Deva—Caerleon Gawr, Chester.

Corinium—Caer Ceri, or Cirencester.

Durnomagus—Caster, near Peterborough.

Cataracton—or Catterick, Yorkshire.

Victoria—Perth.

Theodosia—Caer Aleluyd, or Dunbritton.

Isurium—Aldborough, Yorkshire.

Eboracum—Caer Evroe, or York.

Coccium—Blackrode.

Luguballium—Caerlisle.

Cambodunum—Slack, Lancashire.

Segontium—Caer Segont, near Caernarvon.

Conovium—Caer Hên, near Conway.

Mediolanum—Meivod, Montgomeryshire.

Lindum—Caer Luyt Coed, or Lincoln.

Ragæ—Caer Leir, or Leircester.

Rutupis—Richborough.

Sorbiadunum—Caer Sallog, or Salisbury.

Aquæ Solis—Caer Baddon, or Bath.

Avalonia—Wells, or Glastonbury.

Muridunum—Caerfurdhin, or Caermartnen.

Mcnapia—Mynyw, St. David's.

To which we may add :—

Regentium—Chichester.

Calleva—Silchester.

Gobanium—Abergavenny.

Etocetum—Wall, near Litchfield.

Mancunium—Manchester.

Rerigionum, or Rigodunum.—Ribchester.

Lucophibia, or Candida Casa—Whithorn, in Galloway.

Vanduarium—Renfrew, or Paisley.

Devana—Old Aberdeen.

We now come to treat

II. *Of Britain as a Roman province.*

Julius Cæsar having subdued most of the nations of Gaul, on the opposite side of the channel, began, about B. C. 56, to think of extending his conquests by the reduction of Britain. The motive for this expedition, ascribed to him by Suetonius, was a desire of enriching himself by the British pearls, which were then much esteemed. The pretence, however, to justify his invasion, was, that the Britons had sent assistance to the Gauls during his wars with them. His first expedition was undertaken at the close of the summer (he landed August 26th), and he now therefore only purposed to view the island, and learn something of the manners and customs of the natives; after which, on his return, he could more easily ensure a permanent conquest. Having marched all his forces into the country of the Morini (Picardy), in Gaul, from whence was the shortest passage into Britain; he ordered the vessels that lay in the neighbouring ports, and a fleet which he had built the year before, to attend him. The Britons, alarmed at his preparations, sent ambassadors with offers of submission; but Cæsar, though he received them with great kindness, did not abandon his intended scheme. He only waited till the return of C. Volusenus, whom he had sent out with a single galley to make discoveries on the coast. His force consisted of two legions embarked on board eighty transports; and he appointed eighteen more, which lay wind-bound about eight miles off, to convey over the cavalry; but these last orders were too slowly executed, which occasioned some difficulty in his landing. The British chiefs at this time, although they had endeavoured to conciliate, were far from prepared to submit to him. As soon as they perceived Cæsar's fleet approaching, a number of cavalry and chariots were despatched to oppose his landing, while a considerable body of infantry hastened after. The Romans were chiefly, how-

ever, embarrassed in their attempt to land, by the largeness of their ships; and the soldiers were obliged to leap into the sea while loaded with armour; while at the same time they had to encounter the enemy, who were quite disengaged. Cæsar perceiving this, and in order to drive the Britons from the water side with their slings and arrows, ordered his galleys to advance, with their broadsides towards the shore. On this, the Britons, surprised by a sort of shipping they had never before seen, began to give ground. The battle, however, continued for some time, greatly to the disadvantage of the Romans; till at last Cæsar, observing the distress of his men, caused several of his boats to be manned, and sent them to the assistance of those who were most exposed. The Romans now soon overcame the undisciplined native force, and made good their landing; but were unable to pursue the enemy for want of cavalry. The Britons, on the other hand, were so disheartened with their bad success, that they immediately sent ambassadors to sue for peace. This was granted, on condition of their delivering a certain number of hostages for their fidelity. Part of these they brought immediately; and promised to return in a few days with the rest, who they said, lived at some distance. But, in the mean time, the eighteen transports which carried Cæsar's cavalry, being driven back by a storm, and the fleet greatly damaged, the Britons broke their engagement, and fell unexpectedly on the seventh legion, while busied in foraging. Cæsar hastened to their assistance with two cohorts, and at last repulsed the enemy. This, however, proved only a temporary deliverance; for the Britons, thinking it would be possible to cut off all the Romans at once, drew together a great body of horse and foot, which boldly advanced to the Roman entrenchments. Cæsar came out to meet them; and the Britons were once more put to flight with great slaughter. Having burned several towns and villages, the victors returned to their camp, where they were soon followed by deputies from the natives, to whom the Roman commander, being in want of horse, and afraid lest another storm should destroy the remainder of his fleet, granted peace; on condition of their sending him into Gaul, double the number of hostages which they had before promised. The same night he set sail, and soon arrived safe in Gaul.

No sooner did the Britons perceive the Romans depart, than they again determined to slight all their engagements. Of all the states who had promised to send hostages, only two performed their promises; and this neglect so provoked Cæsar, that he determined to return the year following with a far greater force. Having, therefore, caused his old vessels to be refitted, and several new ones to be built, he arrived off the coast of Britain with a fleet of 600 ships and twenty-eight galleys. The Britons made no opposition to his landing; but Cæsar, getting intelligence that an army was assembled at no great distance, marched in quest of them. He found them encamped on the banks of a river, supposed to be the Stour, twelve miles from the place where he had landed. They attempted to

oppose his passage; but, being briskly attacked by the Roman cavalry, were obliged to retire into a wood, all the avenues of which were blocked up by trees cut down for that purpose. This fortification, however, proved insufficient to protect them. The seventh legion having cast themselves into a *testudo*, and thrown up a mound against their work, drove them from their asylum; but, as the day was far spent, a pursuit was not thought advisable. Next morning Cæsar, with the greatest part of his army, which he divided into three bodies, marched out in quest of the enemy. But when he was within sight of their rear, he was informed, that his fleet had been greatly damaged by a storm. This put an end to the pursuit for that time; but Cæsar having employed all the shipwrights he had with him, and sent for others from Gaul, to repair the damage, resolved to prevent misfortunes of this kind for the future. He therefore drew all his ships ashore, and enclosed them within the fortifications of his camp. This arduous undertaking employed the army for ten days; after which he again set out in quest of the enemy. The Britons had made the best use they could of the respite afforded them by the storm. They were headed by Cassibelan, king of the Trinobantes. He had formerly made war upon his neighbours; and, having rendered himself terrible to them, was esteemed the most proper person for leading them against the common enemy; and, as several states had now joined their forces, the British army was numerous. Their cavalry and chariots attacked the Romans on their march; but were repulsed with loss, and driven into the woods. The Romans pursued them too eagerly, and thus lost some of their own men; which encouraged the Britons to make another fierce attack; but in this also they were finally unsuccessful, and obliged to retire. Next day the Britons suddenly attacked the Roman legions as they were foraging; but, meeting with a vigorous resistance, they soon betook themselves to flight. The Romans pursued them so closely, that, having neither time to rally nor get down from their chariots, great numbers of them were cut in pieces: and this overthrow had such an effect upon the auxiliaries of Cassibelan, that they all abandoned him; nor did the Britons ever after engage Cæsar with united forces. The Roman general pursuing his victory, marched towards the Thames, with a design to enter the territories of the Trinobantes. The river was fordable only at one place, but when he came to it, he found the enemy's forces drawn up in a considerable body on the opposite bank, which was fortified with sharp stakes. They had likewise driven many stakes of the same kind into the bottom of the river, the tops of which were covered with water. Cæsar was not dismayed at these difficulties, which he learnt from prisoners and deserters. He ordered the cavalry to enter first, and the foot to follow. The soldiers advanced with such resolution, that though the infantry were up to their chin in water, the enemy abandoned the bank and fled. After this defeat, Cassibelan dismissed all his forces except about 4000 chariots, with which he watched the motions of the Romans, harassing them by cutting off straggling parties, &c. This.

however, was not sufficient to keep up the spirits of his countrymen. On the contrary, they deposed him and chose Mandubratius, whose father had been murdered by Cassibelan when he usurped the kingdom. The young prince had fled to Cæsar, who gave him protection; and the Trinobantes now offered to submit to the conqueror, provided he would give them Mandubratius for their king. Cæsar readily complied with their request, upon their sending him forty hostages; and the submission of the Trinobantes was soon followed by that of other states and tribes.

Cæsar next marched to Verulamium, Cassibelan's capital, of which he still kept possession; but though the place was strongly fortified the Britons soon fled. Many were taken and many more cut in pieces. After this loss, Cassibelan, as his last resource, drew into confederacy with him four kings (as Cæsar styles them), or rather chiefs of the Cantii. Their names were Cingetorix, Corvilius, Taximagulus and Segonax. These, having raised what forces they could, attacked the camp where the ships were laid up: but the Romans, having made a sally, repulsed them with great slaughter, after which Cassibelan submitted. A peace was concluded on these terms, that the Britons should pay an annual tribute to the Romans, that Cassibelan should leave Mandubratius in peaceable possession of his dominions, and that he should deliver a certain number of hostages. Cæsar then set sail with his whole fleet from Britain, to which he never returned. Such is Cæsar's own account of his two expeditions into Britain; but Dio Cassius tells us, that the Britons utterly defeated the Roman infantry, though they were at last put in disorder by their cavalry. Horace and Tibullus, in many parts of their works, speak of the Britons as a people not yet conquered. Tacitus says, that Cæsar rather showed the Romans the way to Britain, than put them in possession of it; and Lucan tells us plainly that Cæsar turned his back to the Britons and fled. This, however, considering the consummate military genius of Cæsar, is by no means probable. That he left Britain during winter, was probably to prevent insurrections among the Gauls; and his ambition would certainly be more gratified by being emperor of Rome, than conqueror of Britain.

The departure of Julius Cæsar, which happened about A. A. C. 53, left the Britons without any fear of a foreign enemy. We are not, therefore, to imagine, that they would regard their promises of paying tribute; nor was it probably demanded for many years afterwards. Augustus had twice a design of invading Britain, and forcing the inhabitants to pay the tribute promised to Julius Cæsar. Both times, however, he was prevented by revolts in different provinces, so that the Britons still continued to enjoy their liberty. They, however, courted the favor of the Romans by pretended submissions; but, in the reign of Claudius, the Romans set about reducing them to subjection in earnest. The occasion of this war is related by Dio Cassius as follows: 'Cunobelinus, the third in succession from Cassibelan, being dead, his two sons, Togodumnus and Caractacus succeeded to the throne;

but whether they reigned jointly or separately is not known. In their reign one Bericulus, being exiled for sedition, fled with some of his partisans to Rome, and persuaded Claudius to make war on his countrymen. The Britons, on the other hand, resented the behaviour of Claudius in receiving these vagabonds, and therefore prohibited all intercourse with the Romans. A much smaller offence than this would have been sufficient to provoke that haughty nation to declare war. An army was therefore immediately ordered to Britain, under the command of Plautius, prætor in Gaul. The soldiers at first refused to embark, from a superstitious notion, that they were going to be sent beyond the compass of the world; and this mutiny being reported to the Britons, they did not make the necessary preparations for their own defence. But the Roman soldiers were soon brought to a sense of their duty; and set out from three different ports, in order to land in three different places of Britain at once. Being driven back by contrary winds, their fears began to return; they resumed their courage, however, on the appearance of a meteor shooting from the east, which they imagined was sent from heaven to direct their course. They landed without opposition; and the Britons, not having drawn together a sufficient army, kept in small bodies behind their marshes, and in woods, in order to protract the war till winter: which they imagined Plautius would, like Cæsar, spend in Gaul. The Roman general marched first in quest of the two kings Togodumnus and Caractacus; both of whom he found, and defeated one after another. He then reduced part of the Dobuni, at that time subject to the Catticuchlani; and, leaving a garrison to keep them in awe, he advanced to a river where the Britons lay carelessly encamped, supposing that the Romans could not pass it without a bridge. But the Germans in the Roman army had been accustomed to swim across the strongest currents in their heavy armour. They therefore passed the river first; and having fallen only upon the enemy's horses which drew their chariots, these formidable machines were rendered useless; and the Britons were put to flight as soon as another part of the forces passed the river. They, however, engaged the Romans next day with great bravery. Victory continued long doubtful; but at length the Romans prevailed. This battle is thought to have been fought on the banks of the Severn. From thence the Britons fled to the mouth of the Thames. They were closely pursued, but the Romans, being unacquainted with the flats and shallows of the river, were often in great danger. Their German allies, however, crossed by swimming as before, and the rest by a bridge farther up the river; so that the Britons were in a short time surrounded on all sides, and great numbers cut in pieces. Many of the Romans also, pursuing the fugitives with too great eagerness, were lost in the marshes.—In one of these battles Togodumnus was killed; but the Britons were so far from being disheartened, that they showed more eagerness than ever, in order to revenge his death. Plautius, therefore, did not think proper to penetrate farther into the country, but conten-

ted himself with putting garrisons in the places he had already conquered. He then wrote to the emperor himself: who no sooner received an account of his success, than he set out for Britain; where he joined Plautius on the banks of the Thames. Soon after the arrival of Claudius, the Romans passed the Thames, attacked the British army, and totally defeated it. The consequence was the taking of Cunobeline's capital, and the submission of several neighbouring states. The emperor, however, did not make a long stay in the island, but left Plautius to pursue his conquests. This he did with such success, that, on his return to Rome, he was met without the gates by the emperor, who, at his solemn entry, gave him the right hand.—The Britons seem to have made a very obstinate resistance to the Roman arms about this time. Vespasian is said to have fought thirty battles with them; and the exploits of his son Titus are also much celebrated by the Roman historians. In the ninth year of Claudius, P. Ostorius Scapula was sent into Britain. By far the greater part of the seventeen nations were at this time unconquered. Some of these had broken into the Roman territories; but Ostorius falling unexpectedly upon them, put great numbers to the sword, and dispersed the rest. To prevent them for the future from making inroads into the territories of the Romans or their allies, he built several forts on the Severn, the Avon, and the Nen, reducing the country south of these rivers to a Roman province. This so highly offended the Iceni, that, being joined by the neighbouring nations, they raised a considerable army, and encamped in an advantageous situation, in order to prevent the Romans from penetrating farther into the island. Ostorius, however, soon advanced against them. The Romans gained the victory, and the enemy were pursued with great slaughter. The Roman general then, having quelled an insurrection among the Brigantes, led his army against the Silures. They were headed by their king Caractacus, a renowned warrior. He showed his military talents by choosing a very advantageous place for engaging the enemy. Tacitus tells us, 'it was on the ridge of an exceeding steep mountain; and, where the sides of it were inclining and accessible, he reared walls of stone for a rampart. At the foot of the mountain flowed a river dangerous to be forded, and an army of men guarded his entrenchments.' This hill is thought to be Caer-Cardoc (the camp of Caractacus) in Shropshire, situated near the conflux of the rivers Clun and Teme, where the remains of ancient entrenchments are still visible. On the approach of the enemy, Caractacus drew up his troops in order of battle, and according to Tacitus, told them, 'That from this day, and this battle, they must date their liberty rescued, or their slavery for ever established. He then invoked the shades of those heroes who had expelled Cæsar the dictator; those brave men by whose valor they still enjoyed freedom from Roman tribute and taxes, and by which their wives and children were as yet preserved from prostitution.' The whole army then took a solemn oath either to conquer or die, and prepared for the charge with the most terrible

shouts. Ostorius was somewhat dismayed when he considered the uncommon fierceness of the enemy, and the other difficulties which he had to encounter. He led on his men, however, to the charge; and the Romans were attended with their usual good fortune. The Britons were put to flight. Vast numbers fell on the field of battle, and many more were taken prisoners. Among the latter were the wife, the daughter, and the brothers of Caractacus. The unfortunate prince himself fled to Cartismandua, queen of the Brigantes, by whom he was delivered up to the Roman general, who sent him in chains to Rome. Caractacus bore his misfortunes with magnanimity; and when he came before the emperor, addressed him in the following terms. 'If my moderation in prosperity, O Claudius! had been as conspicuous as my birth and fortune, I should now have entered this city as a friend, and not as a prisoner; nor would you have disdained the friendship of a prince descended from such illustrious ancestors, and governing so many nations. My present condition, I own, is to you honorable, to me humiliating. I was lately possessed of subjects, horses, arms, and riches. Can you be surprised that I endeavoured to preserve them? If you Romans have a desire to arrive at universal monarchy, must all nations, to gratify you, tamely submit to servitude? If I had submitted without a struggle, how much would it have diminished the lustre of my fall, and of your victory? And now, if you resolve to put me to death, my story will soon be buried in oblivion; but if you think proper to preserve my life, I shall remain a lasting monument of your clemency.'—This speech we are told had such an effect upon the emperor, that he immediately pardoned Caractacus and his whole family, and commanded them to be set at liberty.

The Silures, notwithstanding this terrible blow, continued the war with great vigor, and gained considerable advantages over the Romans; which so much affected Ostorius, that he died of grief. He was succeeded by Aulus Didius, who restrained the incursions of the Silures, but was not able to restore Cartismandua, queen of the Brigantes, who had been deposed by her subjects. Didius was succeeded by Veranius, and he by Suetonius Paulinus, who reduced the island of Anglesey. See *ANGLESEY*. But while Paulinus was employed in the conquest of this island, he was alarmed by the news of an almost universal revolt among those nations which had submitted to the Romans. The Britons, though conquered, still panted after independence; and the Roman yoke became every day more insupportable, through the insolence and oppressions of the Roman soldiers. An event at length happened which kindled these discontents into an open flame. Prasutagus, king of the Iceni, a prince renowned for opulence and grandeur, had, by his last will, left the Roman emperor joint heir with his two daughters in hopes of obtaining his favor and protection for them. But the result was very different. No sooner was he dead, than his houses and possessions were all plundered by the Roman soldiers. The queen Boadicea reonstrated against this injustice; but, instead of obtaining any redress, she herself

was publicly whipped, her daughters ravished, and all the relations of the late king reduced to slavery. The whole country also was plundered, and all the chiefs of the Iceni deprived of their possessions. Boadicea was a woman of too great a spirit tamely to bear such indignities. She easily persuaded the Iceni to take up arms, who, being joined by the Trinobantes, and some other nations, poured like a torrent on the Roman colonies. Everything was destroyed with fire and sword. The ninth legion, which had been left under Petilius Cerealis, was defeated, the infantry totally cut in pieces, and the commander himself with the cavalry escaped with the utmost difficulty. Suetonius immediately left Anglesey, and marched to London. The inhabitants were overjoyed at his arrival, and used their utmost endeavours to detain him for their defence. But he refused to stay, and in a short time left the place notwithstanding their intreaties. Suetonius was scarce gone, when Boadicea with her Britons entered, and put all they found in it to the sword. Many were tortured in the most cruel manner, and 70,000 persons are said to have perished on this occasion at London and other Roman colonies. The Britons, now elated with success, assembled from all quarters in great numbers, so that Boadicea's army soon amounted to 280,000 men. They despised the Romans; and became so confident of victory, that they brought their wives and children in waggons, to be spectators of the destruction of their enemies. The event was suitable to such ill judged confidence. The Britons were overthrown in a general engagement with most terrible slaughter, no fewer than 80,000 being killed in the battle and pursuit; while the Romans had not above 400 killed, and not many more wounded. Boadicea, not able to survive so great a calamity, is said to have poisoned herself. By this overthrow the Britons were intimidated from raising any more insurrections, and those who had not yet submitted to the Roman yoke, from making incursions into their dominions. Nothing remarkable therefore happened for some time.

In the reign of Vespasian, Petilius Cerealis, being appointed governor of Britain, attacked the Brigantes, defeated them in several battles, and reduced great part of their country. He was succeeded by Julius Frontinus; who not only maintained the conquests of his predecessor, but reduced entirely the warlike nation of the Silures. Frontinus was succeeded by the celebrated Cneius Julius Agricola, who completed the conquest of all the southern Britons. Just before the arrival of Agricola, the Ordovices had cut in pieces a band of horse stationed on their confines, after which the whole nation had taken arms. The summer was pretty far spent, and the Roman army was quite separated and dispersed, the soldiers having assured themselves of rest for the remaining part of the year. Agricola, however, was no sooner landed, than, having drawn together his legions, he marched against the enemy without delay. The Britons kept upon the ridges of the mountains, but Agricola led his troops in person up the ascents. The Romans were victorious; and such a terrible slaughter was made of the Britons that almost

the whole of the Ordovices were cut off. Without giving the enemy time to recover from the terror which this overthrow had occasioned, Agricola resolved upon the immediate reduction of Anglesey, which had been lost by the revolt of Boadicea. Being destitute of ships, he detached a chosen body of auxiliaries who knew the fords, and were accustomed to manage their arms and horses in the water. The Britons, who had expected a fleet and transports, were so terrified by the appearance of the Roman forces on their island, that they immediately submitted, and Anglesey was once more restored to the Romans. With the conquest of Anglesey ended the first campaign of Agricola; and he employed the winter in reconciling the Britons to the Roman yoke. In this he met with such success, through his wise policy, that the Britons began to prefer a life of security and peace, to that independency which they had formerly enjoyed, and which continually exposed them to the tumults and calamities of war. See AGRICOLA. His succeeding campaigns were attended with equal success; he not only subdued the seventeen nations inhabiting England, but carried the Roman arms almost to the extremity of Scotland. He also caused his fleet to sail round the island, and discovered the Orcaes, or Orkney Islands, which had before been unknown to the rest of the world. This expedition took him up about six years, and was completed A. D. 84.

Had Agricola been continued in Britain, it is probable that both Scotland and England would have been permanently subdued; but he was recalled by Domitian in the year 85, and we are thence almost totally in the dark about the British affairs, till the reign of Adrian. During this interval the Caledonians had taken arms, and ravaged the territories of the Britons, who continued faithful to the Romans. Adrian abandoned to them the whole track lying between the Tyne and the Forth; but to restrain them from making incursions into the Roman territories, he built a wall eighty miles in length, from the river Eden in Cumberland to the Tyne in Northumberland. See ADRIAN. Under his successor, Antoninus Pius, the Brigantes revolted; and the Caledonians, having in several places broken down Adrian's wall, began anew to ravage the Roman territories. Against them the emperor sent Lollius Urbicus, who reduced the Brigantes; and having defeated the northern nations, confined them within narrower bounds by a new wall, extending probably between the firths of Forth and Clyde. See ANTONINUS. From the time of Antoninus to that of Severus, the Roman dominions in Britain continued to be much infested by the inroads of the northern nations. That emperor divided Britain into two governments, the southern and northern; but the governor of the northern division was so harassed by the continual incursions of the Caledonians, that he was at length obliged to purchase a peace with money. The Caledonians kept the treaty for fifteen years; after which, breaking into the Roman territories anew, they committed terrible ravages. Virius Lupus, the governor, not being in a condition to withstand them, acquainted the emperor with his distress, intreating

him to send powerful and speedy supplies. Upon this Severus resolved to put an end to the perpetual incursions of the enemy, by making a complete conquest of their country; for which purpose he set out for Britain, with his two sons, Caracalla and Geta, at the head of a numerous army. The Caledonians no sooner heard of his arrival, than they sent ambassadors offering to conclude a peace upon honorable terms. But these the emperor detained till he was ready to take the field, and then dismissed them without granting their request. As soon as the season was fit for action, Severus marched into Caledonia, where he put all to fire and sword. He advanced even to the most northerly parts of the island; and though no battle was fought, yet through the continual ambuscades of the enemy, and the inhospitable nature of the country, he is said to have lost 50,000 men. At last the Caledonians sued again for peace; which was granted them on condition of their yielding part of their country, and delivering up their arms. After this the emperor returned to York, leaving Caracalla to command the army, and finish the new wall between the friths of Forth and Clyde. But the emperor being taken ill at York, the Caledonians again took up arms. This provoked Severus to such a degree, that he commanded Caracalla to enter their country anew with the whole army, and to put all he met to the sword. Before these orders, however, could be put in execution, his two sons, having concluded a shameful peace with the Caledonians, returned to Rome. A long chasm now takes place in the history of the Roman dominions in South Britain. In the beginning of Dioclesian's reign, Carausius, a native of Gaul, passing over into Britain, took upon him the title of emperor, and was acknowledged by all the troops quartered here. He was, however, killed in a battle with one of Constantius's officers, after he had enjoyed the sovereignty for six or seven years. Constantine the Great began his reign in this island; and returned soon after he had left it, probably with a design to put a stop to the daily incursions of the Caledonians. He altered the division of that part of Britain subject to the Romans. Severus had divided it into two provinces, but Constantine increased the number to three, viz. *Britannia Prima*, *Secunda*, and *Maxima Cæsariensis*; and this last was afterwards divided into two, viz. *Maxima Cæsariensis* and *Flavia Cæsariensis*. The removal of the imperial seat to Constantinople, gave the northern nations an opportunity of making frequent incursions into the Roman provinces; the emperor having carried with him, first into Gaul, and then into the east, not only most of the Roman troops, but likewise the flower of the British youth. About the end of the reign of Constantius II. the government of Britain and other western parts of the empire was committed to Julian, afterwards emperor. While he was in his winter quarters at Paris, he was informed that the Scots and Picts, (about this time first distinguished by these names), had broken into the Roman territories and committed dreadful ravages. Against them Julian despatched a body of troops under the command of Lupicinus. He embarked from

Boulogne in the depth of winter, but was no sooner arrived at London than he was recalled; the enemy having probably appeased Julian by submission. Till the reign of Valentinian I. these nations still continued to infest the Roman territories in Britain, and had now reduced the country to a most deplorable condition by their continual ravages. Valentinian sent against them Theodosius, father of Theodosius the Great. That general, having divided his forces into several bodies, advanced against the Scots and Picts, who were obliged to yield to the superior discipline of the Romans. Great numbers were cut in pieces; and the rest were forced to abandon all their booty, and retire beyond the friths of Forth and Clyde. Theodosius then entered London in triumph, and restored that city to all its former splendor. To restrain them from breaking anew into the provinces, he built several forts between the two friths; and, having thus recovered all the country between Adrian's wall and the friths, he formed of it a fifth province, which he called *Valentia*. Though Britain was now in a state of temporary tranquillity, yet, as the Roman empire was daily declining, sufficient care could not be taken to secure such a distant province. In the reign of Honorius, the provincial Britons were annoyed not only by the Scots and Picts, but also by the depredations of the Saxons, on the sea coasts. By the care, however, of Stilicho, prime minister to Honorius, matters were once more settled, and a particular officer was appointed to guard the coast against the Saxons, with the title of *Comes limitis Saxonici*. But, not long after, the empire being over-run by barbarians, most of the Roman troops in Britain were recalled, and the country left open to the attacks of the Scots and Picts. Upon this the provincials, expecting no more assistance from Honorius, resolved to set up an emperor of their own. Accordingly they invested with the imperial dignity one Marcus, an officer of great credit among them. Him they murdered in a few days, and placed on the throne Gratian, a native of Britain. After a reign of four months, Gratian underwent the fate of his predecessor, and was succeeded by Constantine, who was chosen merely for the sake of his name. He seems, however, to have been a man of some experience in war. He drove the Scots and Picts beyond the limits of the Roman territories; but, being elated with this success, he would now be satisfied with nothing less than the conquest of the whole Roman empire. See *CONSTANTINE*.

He now, therefore, passed over into Gaul, in 407, and took with him not only the few Roman forces that had been left, but such of the provincial Britons as were most accustomed to arms, leaving the rest entirely defenceless. Their enemies now broke into the country, and ravaged it with fire and sword; whereupon the Britons, having repeatedly implored assistance from Rome without receiving any, resolved to withdraw their allegiance from an empire which was no longer able to protect them. Honorius himself applauded their conduct, and advised them, by letters, to provide for their own safety. The provincial Britons now regained their liberty, but had lost the martial spirit which at first re-

dered them so formidable to the Romans. They, however, met with some success in their first enterprises; for Zosimus tells us, that they delivered their cities from the insults of an haughty enemy. But, being at last overpowered, they again had recourse to the Roman emperor, to whom they promised a most perfect submission, provided they were delivered from their merciless enemies. Honorius, touched with compassion, sent a legion to their relief. The Roman forces landed in Britain unexpectedly, and having destroyed great numbers of the Scots and Picts, drove them beyond the friths of Forth and Clyde. After this they advised the natives to build a wall on the isthmus from sea to sea; to re-assume their courage, and defend themselves by their own valor. The Romans then quitted the country, being obliged to return, in order to repel those barbarians who had broken into other parts of the empire from all quarters. The Britons immediately set about building the wall with great alacrity. But, as it was constructed only of turf, the Scots and Picts soon broke it down in several places; and, pouring in upon the effeminate provincials, committed more cruel ravages than ever. At last, after many grievous calamities, the Britons sent ambassadors once more to Rome. These appeared with their garments rent, and dust on their heads; and at last prevailed on the emperor, by their earnest entreaties, to send another legion to their relief. The troops arrived in Britain before the enemy knew of their having set sail. They were therefore quite unprepared. The Romans made a terrible havoc among them, and drove the remainder into their own country. As Honorius had sent them, not with any ambitious view, but merely out of compassion to the unhappy provincials, the Romans told them they had now no farther assistance to expect from them. They informed them that the legion must immediately return to the continent, to protect the empire from the barbarians, who had extended their ravages almost to every part of it; and therefore, that they must now take their last farewell of Britain. After this declaration, Gallio, the commander of the Roman troops, exhorted the Britons to defend themselves, by fighting bravely for their country, wives, and children, and what ought to be dearer than life itself—their liberty; telling them, at the same time, that their enemies were no stronger than themselves, provided they would exert their ancient courage and resolution. That they might the better withstand them, he advised them to build a wall of stone, offering to assist them with his soldiers, and to direct them himself in the execution. To this task the Britons immediately applied; and, with the assistance of the Romans, finished it in a short time, though it was no less than eight feet thick, and twelve feet in height. It is thought to have been built on the same place where Severus's wall formerly stood. Towers were also built at convenient distances on the east coast, to prevent descents of the Saxons and other barbarians from Germany. Gallio employed the rest of his time in teaching the provincials the art of war. He left them patterns of the Roman weapons, which he also taught them to make; and, after many encourag-

ing exhortations, took his last farewell of Britain, to which the Romans never returned. There is a great disagreement among chronologers, as to the year in which the Romans finally abandoned Britain; some placing it in 422; others in 423, or 426; and some in 431, 435, or 437.

It was during their struggle with the Romans for the domination of Britain, that Christianity was first introduced among the inhabitants of this island; not by the sword, not as the religion of the state, but by the peaceful preaching of that divine system in the midst of its early persecutions. Dr. Southey (*Book of the Church*, vol. i. p. 12), considers the most probable tradition on this subject to be, that which assigns to Bran the son of Lear, and father of Caractacus, the honor of bringing over the glad tidings. This the Welsh triads expressly state. 'He was the person who first introduced the Christian religion among the nations of the Cymry, from Rome, where he had been detained for seven years as a hostage for his son Caradac (Caractacus) whom the Romans made a captive through the treachery of Aregweda Toeddawg,' i. e. Cartismandua, queen of the Brigantes.

Bishop Stillingfleet, in his *Origines Britannicæ*, says confidently, 'It is certain, that St. Paul did make considerable converts at his coming to Rome; which is the reason of his mentioning the saints in Cæsar's household. And it is not improbable that some of the British captives, carried over with Caractacus and his family, might be some of them, who would certainly promote the conversion of their country by St. Paul.' Now it is remarkable, as Mr. Hughes observes, that the learned prelate should undesignedly coincide with the statement of a British tradition, 'with which he was utterly unacquainted; and the world might have continued ignorant of so valuable a fragment of historical intelligence, had it not been for the liberality of an opulent London tradesman, a native of Wales (Owen Jones, Esq. a furrier of Thames-street), who patronised the design of collecting materials for a Welsh Archaeology.'

The wife of Aulus Plautius, one of the most distinguished Roman generals, and governor of Britain, seems to have been another early convert to the Christian faith. Tacitus says, this lady was charged with having embraced a strange and foreign superstition, for which alleged crime her trial was committed to her husband. He, agreeable to the laws and ancient forms of proceeding in such cases, convened her family and friends together; and, being in their presence tried for her life and fame, she was pronounced innocent.' He adds, 'that the lady lived long after this, but in perpetual sadness.'

There was no other foreign religion of which the Romans were at this time jealous; to embrace Christianity openly, would clearly therefore be viewed as a crime, especially in a person of quality, and the wife of a public officer. The trial of Plautius's lady occurred, according to Stillingfleet, when Nero and Calpurnius Piso were consuls, or A. D. 57, which being, according to him, after St. Paul's coming to Rome, he considers her to have been one of the apostle's converts. Another circumstance has been no-

ticed by bishop Goodwin, and archbishop Usher; it is that St. Paul, in his second epistle to Timothy, makes mention of Linus, and Pudens, and Claudia: Linus is supposed to be the same as the first bishop of Rome of that name. Pudens and Claudia are thought to be the same persons upon whose marriage the poet Martial composed one of his epigrams. Martial's Claudia was undoubtedly a British lady, and married to Pudens, as appears by the poet's encomium:—

Claudia cœruleis, cum sit Rufina Britannis
Edita, cur Latiae pectora plebis habet?
Quale decus formæ! Romanam credere matres
Italides possunt, Attides esse suas, &c.

'Legends which act upon less credible grounds,' adds Soutley, 'pretend that a British king, called Lucius, who was tributary to the Romans, was baptised with many of his subjects. The light of the world shone here, but we know not who kindled it.'

We have noticed all that can be said with truth of the story of St. Alban, as given by Bede and the monkish writers. See ALBAN. But it seems well established that three British bishops attended the council of Arles, B.D. 314. The signatures were, according to Usher, from the Council. Gallie, edit. Paris, 1629:—Eborius Episcopus, de Civitate Eboracensi, Provincia Brit. Restitutis Episcopus, de Civitate Londinensi, Provincia supsr. Adelphus Episcopus, de Civitate Colonia Londinensium, exinde Sacerdos Presbyter. Arminius Diaconus.

St. Athanasius and the bishops assembled in the council of Antioch, A.D. 363, assure the emperor Jovian, that the bishops of Spain, Gaul, and Britain, continued to adhere to the faith of the council of Nice, of which they had been informed by letters from those bishops. Both St. Jerome and St. Chrysostom, speak often of the orthodoxy of the British church in their writings.

Here Pelagianism arose in the beginning of the fifth century; and bishop Burgess contends strenuously that the British prelates of the seventh century formally and steadily disclaimed all authority assumed over them by St. Austin, as the missionary of Rome.

Austin landed in Kent, says a valuable modern writer, prevailed on Ethelbert to profess christianity, and afford him his sanction; though Bertha the Queen, let it be observed, was previously a Christian, and had always had her own religious establishment. This holy and devoted monk soon proved that his zeal to convert pagans was mingled with an ambition to convert the ancient British clergy from their independence. He summoned a synod, at which he required them to conform to the ceremonies of the church of Rome, from which they differed in several things, especially on that cardinal point, the time for celebrating Easter! This may appear to our readers a trifling difference, but such was the importance attached to it in that age, that it gave rise to the most violent dissensions, and required for its maintenance the greatest independence of principle. This synod was followed by another, at which seven British bishops were

present, who boldly and unanimously refused the conformity required, and told the arrogant monk, to his face, that they would not make him their archbishop. Thus it appears that Christianity was professed in Britain even before the popedom existed, and that, at the period when Gregory sent his emissaries hither, they were rejected as the agents of a foreign hierarchy, and doomed, in the fervor of British zeal for Christian liberty, to the same indignant treatment as might have been expected by 'a setter forth of strange gods.' Supposing the reverence for our ancestors a feeling of any value in this controversy, what must we think of those injudicious advocates of Popery, among whom the non-descript Cobbett has taken his stand, who, addressing themselves to this reverence, throw the darkness of their mistakes over the past, and misrepresent the characters they invite us to imitate! Instead of clinging to Popery as the most ancient religion of our fathers, those are only acting in their spirit, and treading in their steps, who oppose and renounce it. And when we discover the delusion which is attempted to be put upon us, in being called to follow the Anglo-Saxon converts of Austin amidst the superstitions of Rome, to the neglect of those British Christians whom these Saxons and this Austin opposed in their attempts to preserve their own authority and customs; the generous ardor of men who feel the love of country and ancestry is roused into indignation, and if we moderate our censure on the Romish missionaries, in the hope that they were useful in some respects, we feel disgusted with the man who lauds them as the source of all the Christianity which originally shone on our land. No fact is better authenticated than this, that when Austin attempted to establish the authority of the Bishop of Rome in Britain, he had the Christianity of centuries to contend with.

'But above all others,' says Usher, 'the British priests that dwelt in West Wales abhorred the communion of these dogmatists above all measure: as Adhelme, abbot of Malmesbury, declareth at large, in his epistle sent to Geruntius, king of Cornwall, where among many other particulars he sheweth, that if any of the Catholics (for so he called those of his own side) did go to dwell among them, they would not vouchsafe to admit them into their company and society, before they first put them to forty days penance,—yea, even to this day (saith Bede, who wrote his History in the year 721) it is the manner of the Britains to hold the faith and religion of the English in no account at all, nor to communicate with them in anything more than with Pagans. Whereunto those verses of Taliessin (honored by the Britains with the title of Ben Beirdd, that is, the chief of the bards, or wise men,) may be added: (which shows that he wrote after the coming of Austin into England, and not fifty or sixty years before, as others have imagined.)

Wo be to him that doth not keep
From Romish wolves, his sheep.
With staff and weapon strong.

Usher's Discourse of the Religion of the Ancient Irish and British, 1687, p. 82.

3. *Of Britain after its abandonment by the Romans, until the Saxon Conquest.*—The final departure of the Romans was no sooner known to the Scots and Picts, than they poured in upon the provincial Britons from all quarters, according to Gildas, like hungry wolves into a sheepfold. When the Scots approached the new built wall, they found it guarded by great numbers of armed men. But so little had the Britons profited by the military instructions of the Romans, that instead of placing proper guards, and relieving one another by turns, their whole number had staid several days and nights upon the ramparts, without intermission. Being therefore quite benumbed and wearied out, they were able to make but little resistance. Many were pulled down with hooks from the battlements, and dashed in pieces. The rest were driven from their stations with showers of darts and arrows. They betook themselves to flight; but the Scots and Picts pursued them close, made a dreadful havoc among the fugitives, and took possession of the frontier towns, which were deserted by the inhabitants. As they now met with no more opposition, they over-ran the whole country. Their ravages soon occasioned a famine; and this was followed by a kind of civil war. The whole country at last became so incapable of supporting those who were left in it, that many fled into the woods, in order to subsist by hunting. In this extremity of distress, they had once more recourse to the Romans; and wrote in the most mournful style that can be imagined to Aetius then consul. Their letter was addressed: 'The groans of the Britons, to the consul Aetius.' The contents of this letter were answerable to the direction. 'The barbarians (say they) drive us to the sea; and the sea drives us back to the barbarians; between which we have only the choice of two deaths, either to be swallowed up by the waves, or to be cruelly massacred by the enemy.' To this letter the Roman general gave no satisfactory answer, and the provincials were thereupon reduced to despair. Great numbers fled over to Armorica, where they settled along with others who had formerly gone over with an usurper called Maximus; while others submitted to the Scots and Picts. Some, however, more resolute than the rest, had once more recourse to arms. They sallied out in parties, and, falling unexpectedly on the enemy, cut great numbers of them in pieces, and obliged the rest to retire. Having thus obtained some respite, they began again to cultivate their lands, which now produced all kinds of grain in the greatest plenty; a plenty which, according to Gildas, occasioned the utmost corruption of manners among all ranks. The clergy, says he, who should have reclaimed the laity by their example, proved the ringleaders in every vice; being addicted to drunkenness, contention, envy, &c. Nor is it probable that this description was exaggerated by Gildas, who was himself a monk. However this was, the Britons had not long enjoyed peace, when they were alarmed by a report that the Scots and Picts were about to return in far greater force. This threw them into the greatest consternation; and, to add to their misfortunes, they were now visited by a dreadful plague which raged with such violence, that the living

were scarce sufficient to bury the dead. The contagion no sooner ceased than they were invaded by the Scots and Picts, who destroyed everything with fire and sword. Such is Gildas' narrative: Mr. Turner, however, here introduces a brilliant period of the history of Independent Britain. But he acknowledges it to have been very short. At this time Vortigern, Gwrthegern, or Gwrtheyrn, is mentioned by various writers as the chief, if not the only king of the southern division of Britain. He is said to have been a cruel debauched tyrant, regardless of the public welfare, and totally incapable of promoting it. Being now roused from his insensibility, however, by a sense of his own danger, he summoned a council of the chief men of the nation, to consult about the proper means for delivering the country from its calamities. In this council the most pernicious measure was adopted that could possibly have been resolved on; namely, to invite to their assistance the Saxons, a people famous for their piracies and cruelties, and justly dreaded by the Britons themselves. See SAXONS. The fatal expedient being agreed upon, ambassadors are said by some writers, to have been despatched into Germany; who, according to Witichind, a Saxon historian of the ninth century, made a dolorous speech before an assembly of that nation, and were very favorably received by the Saxons. The latter embraced their proposal with joy; their soothsayers foretold that they should plunder their British allies for 150 years, and reign over them for twice that time. Three ships were therefore fitted out, this account proceeds to say, under the conduct of Hengist and Horsa, two brothers much celebrated for their valor. They were sons of Witigisil, said to be great grandson to the Saxon god Woden; a circumstance which added much to their authority. Having embarked about 1600 men on board their three vessels, the two brothers arrived in the isle of Thanet, in 449, or 450. They were received by the inhabitants with the greatest demonstrations of joy; the isle in which they had landed was immediately appointed for their habitation; and a league was concluded, in virtue of which the Saxons were to defend the provincial Britons against all foreign enemies; and the provincials were to allow the Saxons pay and maintenance, besides the place allotted them for their abode. Soon after their arrival, king Vortigern led them against the northern nations, who had lately broke into the kingdom, and advanced as far as Stamford, in Lincolnshire. Here a battle was fought, in which the Scots and Picts were utterly defeated. Vortigern was so highly pleased with his new allies, that he bestowed large possessions upon Hengist and Horsa. It is said, that, even at this time, Hengist was delighted with the wealth and fertility of the country; and that, observing the inhabitants to be quite enervated with luxury, he began to entertain hopes of conquering part of it. He, therefore, with Vortigern's consent, invited over more of his countrymen, informing them of the fruitfulness of the country, the effeminacy of the inhabitants, and how easily a conquest might be effected. The Saxons readily complied, and in 452, as

many more arrived in seventeen vessels, as, with those already in Britain, made up 5000 men. Along with these came over Rowena, the daughter of Hengist. Vortigern fell in love with this lady; and to obtain her in marriage, divorced his queen. Hengist pretended to be averse to the match; but Vortigern obtained his consent by investing him with the sovereignty of Kent. Vortigern had as yet continued in friendship with the Saxons, and even put more confidence in them than in his own subjects. For, not long after the arrival of this reinforcement, Hengist obtained leave to send for a second, in order, as was pretended, to defend the king from the attempts of his rebellious subjects. These embarked in forty ships, under the command of Octa and Ebura, the son, or brother, or nephew of Hengist. They landed at the Orkney islands; and having ravaged them, and all the northern coasts of Scotland, they conquered several places beyond the Frith, and at last obtained leave to settle in Northumberland. The pretence for this settlement was, that the Saxons under Octa and Ebura might defend the northern frontiers of the kingdom, as those under Hengist and Horsa did the southern parts. Many more Saxons were, under various pretences, invited over: till at last, their numbers being greatly increased, they began to quarrel with the natives. They demanded larger allowances of corn and other provisions; threatening to lay waste the whole country if their demands were not complied with. The Britons, instead of complying, desired them to return home, since their numbers exceeded what they were able to maintain. Upon this the Saxons concluded a peace with the Scots and Picts; and, turning their arms against the unhappy Britons, over-ran the whole country, committing everywhere the greatest cruelties. All buildings, whether public or private, they levelled with the ground. The cities were pillaged and burnt; and the people massacred in such numbers, without distinction of sex or age, that the living scarce sufficed to bury the dead. Those who escaped took refuge among inaccessible rocks and mountains, where they either perished with hunger, or were forced to surrender as slaves to their enemies. Some crossed the sea and settled in Holland, and in Armorica in Gaul. Vortigern was so far from being reclaimed by these calamities, that he added incest to his other crimes, and married his own daughter. At last, his own subjects, provoked at his enormous wickedness, and the partiality he had shown to the Saxons, deposed him, and raised his son Vortimer to the throne. He was a young man of great valor, and willingly undertook the defence of his distressed country. He first fell upon the Saxons, and drove them into the isle of Thanet, where he besieged them, till, being reinforced by fresh supplies, they opened a way through the British troops. Vortimer, however, engaged them, on the banks of the Darent, in Kent, where he obtained a complete victory. Another battle was fought at Aylesford, in which Horsa the brother of Hengist was killed. A third battle was fought, in which the victory was uncertain, as is also the place where it happened. The fourth battle, however, according to Nennius, proved decisive in favor

of the Britons. Vortimer engaged his enemies, according to some, at Folkstone; according to others, at Stonar, in the isle of Thanet. The Saxons were defeated with great slaughter, and driven back to their ships. So complete is the victory said to have been, that the Saxons quitted the island, without making any attempt on it for five years afterwards. These battles, however, rest entirely upon the credit of Nennius, and the historians who have followed him. They are taken notice of neither by Gildas nor Bede. The former, indeed, acquaints us that the Saxons retired. This, by most historians, is understood of their returning home; though he might mean no more, than that they retired into Kent and Northumberland. Vortimer died after a reign of six years, and Hengist no sooner heard of his death, than he invaded Britain anew with a numerous body of Saxons. He was opposed by Vortigern, who had been restored on the death of his son. Several battles were fought, but at last the Britons being overthrown at a place called Crecanford, with the loss of 4000 men, were obliged to abandon Kent, and retire to London. This happened about A. D. 458 or 459.

From this time most historians date the erection of the first Saxon kingdom in Britain, viz. that of Kent. Hengist assumed the title of king, and chose Esk his son for his colleague. The Britons under Vortigern still continued the war. Hengist finding himself unable to gain a decisive advantage over them in the field, had recourse to treachery. He pretended to be desirous of concluding a peace with the British monarch, and of renewing his ancient friendship with him; and therefore required an interview. To this Vortigern readily consented, and accepted an entertainment prepared for him by Hengist. The king was attended by 300 nobility, all unarmed, but the Saxons had concealed daggers below their garments. The British nobility were all treacherously massacred in the height of their mirth; Vortigern himself was taken and put in fetters; nor could his liberty be procured, but by ceding to the Saxons those provinces now called Essex, Sussex, and Middlesex. The Saxons thus obtained such a footing in Britain that they could never afterwards be expelled. Vortigern, after being set at liberty, is said to have retired to a vast wilderness near the fall of the Wye in Radnorshire, where he was some time after consumed by lightning, together with a city called Kaer Vortigern, which he had built at that place. On the retreat of Vortigern, the command of the British forces devolved upon Aurelius Ambrosius, who gained several victories over the Saxons. See AMBROSIIUS. Notwithstanding this, they still continued to gain ground; and, in 491, the foundation of a second Saxon kingdom was laid in Britain. This at first comprehended only the county of Sussex, but soon after extended over most of the counties lying south of the Humber. It was called the kingdom of the South Saxons. The German nations being informed of the success of the Saxons, in Britain, new adventurers daily flocked over. They were chiefly of three nations, Saxons, Angles, and Jutes. All these passed under the

common appellation sometimes of Saxons, sometimes of Angles. They spoke the same language, and agreed very much in their customs, so that all of them naturally combined against the natives. The most active of these adventurers was Cerdic a Saxon, said to be the tenth in descent from Woden. He landed with his son Cenric, and as many men as he could convey in five ships, at Yarmouth in Norfolk. The Britons immediately attacked him with great vigor; but, after a short engagement, they were totally defeated. Many other battles were fought, the event of which was always favorable to the Saxons, so that the Britons were forced to abandon their coasts to them. In 497 Porta, another Saxon, with his two sons Bleda and Magla, and a fresh body of Saxons, arrived at Portsmouth, so named, it is said, from this chieftain. The Britons attempted to oppose their landing, but were defeated with great slaughter; after which Porta made himself master of all the neighbouring country. The progress of Cerdic, however, alarmed the Britons more than that of all the other Saxon princes. About the year 508, therefore, Nazaleod, styled by Henry of Huntingdon, the greatest of all the British kings, assembled almost the whole strength of the South Britons to drive him out of the island. Cerdic, on the other hand took care to strengthen himself by procuring assistance from all the Saxons already in the island. He then advanced against the Britons, commanding the right wing himself, and his son Cenric the left. As the two armies drew near each other, Nazaleod perceived the enemy's right wing to be much stronger than the left. He therefore attacked it with the flower of his army; and after an obstinate resistance, obliged Cerdic to save himself by flight. But, being too eager in the pursuit, Cenric fell upon his rear; and the British army was at last entirely defeated; and 5000 men, among whom was Nazaleod himself, were left dead on the spot. Who succeeded Nazaleod is not known. The Welsh annals have an interregnum of about six years; after which they place the beginning of the reign of Arthur, the most renowned of our ancient princes. His history is so much obscured by absurd, romantic, and ridiculous fables, that some have supposed, no such person ever existed. But a decisive proof of his existence is, that his tomb was discovered at Glastonbury in Somersetshire, and his coffin dug up, in the reign of Henry II. See ARTHUR. This renowned prince is said to have defeated the Saxons under Cerdic in twelve pitched battles. The last of them was fought on Badon hill (supposed to be Lansdown near Bath), in which the Saxons received such a terrible overthrow, that for many years they gave the Britons no further molestation. As new supplies of them, however, were continually flocking over, a third and fourth kingdom of them were soon formed. The third kingdom comprehended the counties of Devon, Dorset, Somerset, Wiltshire, Hampshire, and Berkshire; to which was afterwards added Cornwall. This was called the kingdom of the West Saxons. The other kingdom, which was called the kingdom of the East Saxons, comprehended Essex, Middlesex, and part of Hertfordshire. In 542

king Arthur was mortally wounded, fighting with his treacherous nephew, Mordred, whom he killed on the spot. Five years afterwards the Saxon kingdom of Northumberland was erected. It extended much farther than the present bounds of that county; for it comprehended all Yorkshire, Lancashire, Durham, Cumberland, Westmoreland, and Northumberland, with part of Scotland, as far as the frith of Forth. Between these Saxon kings frequent contentions now arose, by which means the Britons enjoyed an uninterrupted tranquillity for at least forty-four years. The sixth Saxon kingdom, called that of the East Angles, was founded in 575, and comprehended the counties of Norfolk, Suffolk, Cambridge, and the Isle of Ely. The Saxons once more attacked the Britons, and overthrew them in many battles. The war was continued for ten years; after which the seventh Saxon kingdom, called Mercia, was set up. It comprehended seventeen counties, viz. Gloucester, Hereford, Worcester, Warwick, Leicester, Rutland, Northampton, Lincoln, Huntingdon, Bedford, Buckingham, Oxford, Stafford, Nottingham, Derby, Shropshire, Cheshire, and part of Hertfordshire. The Britons were now confined within very narrow bounds. However, before they entirely gave up the best part of their country to their enemies, they once more resolved to try the event of a battle. At this time they were assisted by the Angles, who were jealous of the overgrown power of the West Saxons. The battle was fought in Wiltshire, at Woden's Bearth, a place near the ditch called Wansdike or Wodensdike: which runs through the middle of the county. The battle was very obstinate and bloody; but at last the Saxons were entirely defeated, and almost their whole army cut off. The victory, however, proved of little service to the Britons: for being greatly inferior in number to the Saxons, and harassed by them on the one side, and by the Scots and Picts on the other, they were daily more and more confined; and at last obliged to take refuge among the craggy and mountainous places in the west of the island, where their enemies could not pursue them. At first they possessed all the country beyond the rivers Dee and Severn, which anciently divided Cambria or Wales from England; the towns which stand on the eastern banks of these rivers having mostly been built to restrain the incursions of the Welsh. But the Anglo-Saxons, having passed the Severn, by degrees seized on the country lying between that river and the Wye. Nay, some parts even of Flintshire and Denbighshire were subject to the kings of Mercia: for Uffa, the most powerful king of that country, caused a deep ditch to be drawn, and a high wall built as a barrier between his dominions and the territories of the Welsh, from the mouth of the river Dee, a little above Flint Castle, to the mouth of the Wye. This ditch is still to be seen in several places; and is called by the Welsh *Claudh Uffa*, or the ditch of Uffa. The inhabitants of the towns on the east side of this ditch are called by the same people *Guyr y Mers*; that is, the men of Mercia. Thus, after a violent contest of near 150 years, the Saxons entirely subdued the Britons whom they had come to

defend, and eventually erected seven independent kingdoms, or the Saxon Heptarchy.

4. *Of the Saxon Conquest and Heptarchy, until the union of the whole under the dominion of Egbert.*—South Britain, which now began to be called Anglia, or England, from the Angles, (See ANGLES), was soon reduced by its Saxon conquerors to a degree of barbarity, almost as great as it had been in, when first invaded by the Romans. The provincial Britons, during their subjection to that people, had made considerable advances in civilisation. They had built twenty-eight considerable towns, besides a number of villages and country seats; but these now were all levelled with the ground, the native inhabitants were reduced to the most abject slavery, and every art and science totally extinguished among them. Before these fierce conquerors could be civilised in any degree, it was necessary that all their kingdoms should be reduced under one head; for, as long as they remained independent, their continual wars with each other still kept them in the same state of barbarity and ignorance. The history of these kingdoms affords few facts that are interesting, on any great scale. It consists only of a detail of their quarrels for the sovereignty. This was at last obtained by Egbert king of the West Saxons, in Wessex, in 827. Before his time, Christianity had been introduced into almost all the kingdoms of the heptarchy, and however much corrupted it might be by coming through the impure channel of the church of Rome, and misunderstood through the ignorance of those who received it, it had considerably softened the barbarous manners of the Saxons. It had also opened a communication between Britain and the more polite parts of Europe, so that there was now some hope of the introduction of arts and sciences into this country. Another effect was, that, by the ridiculous notion of encouraging chastity, the royal families of most of the kingdoms were totally extinct; and the people, being in a state of anarchy, were ready to submit to the first who assumed any authority over them. All these things contributed to the success of Egbert in uniting the heptarchy under his own dominion. He was of the royal family of Wessex; and a nearer heir than Brithric, who had been raised to the kingdom in 784. As Egbert was a prince of great accomplishments, Brithric, knowing that he had a better title to the crown than himself, began to look upon him with a very jealous eye. Young Egbert, sensible of his danger, privately withdrew to France; where he was well received by Charlemagne, the reigning monarch. The French were reckoned at this period the most valiant and polite people in Europe; so that this exile proved of great service to Egbert. He continued at the court of France till he was recalled by the nobility to take possession of the kingdom of Wessex. This recall was occasioned by the following accident. Brithric, the king of Wessex, had married Eadburga, natural daughter of Uffa king of Mercia; a woman infamous for cruelty and incontinence. Having great influence over her husband, she often persuaded him to destroy such of the nobility as were obnoxious to her; and where this

expedient failed, she herself had not scrupled to become their executioner. She had mixed a cup of poison for a young nobleman, who had acquired a great share of her husband's friendship: but, unfortunately, the king drank of the fatal potion along with his favorite, and soon after expired. By this and other crimes Eadburga became so odious to the people, that she was forced to fly into France, whence Egbert was at the same time recalled, as above-mentioned. Egbert ascended the throne of Wessex in 799. He was the sole descendant of those conquerors who first invaded Britain, and who pretended to derive their pedigree from the god Woden. But though this circumstance might have given him great advantages in attempting to subdue the neighbouring kingdoms, Egbert for some time gave them no disturbance; but turned his arms against the Britons in Cornwall, whom he defeated in several battles. He was recalled from his conquests in that country, by hearing that Bernulf, king of Mercia, had invaded his dominions. Egbert quickly led his army against the invaders, whom he totally defeated at Ellendun in Wiltshire. He then entered their kingdom on the side of Oxfordshire with an army, and at the same time sent his eldest son Ethelwolf with another into Kent. The young prince expelled Baldred, the tributary king of Kent, and soon made himself master of the country. The kingdom of Essex was conquered with equal ease; and the East Angles, who had been subjected by the Mercians, joyfully put themselves under the protection of Egbert. Bernulf himself marched against them, but was defeated and killed; and Ludecan his successor met with the same fate two years after. These events facilitated the reduction of Mercia. Egbert gained an easy victory over a dispirited and divided people; but to engage them to submit with the less reluctance, he allowed Wiglaf, their countryman, to retain the title of king, whilst he himself exercised the real power of a sovereign. Northumberland was in a state of anarchy; and this tempted Egbert to carry his victorious arms into that kingdom also. The inhabitants, being desirous of living under a settled form of government, readily submitted, and owned Egbert for their sovereign, who thus became the first monarch of England, A. D. 827.

BRITAIN, NEW, North America. See LABRADOR.

BRITAIN, NEW, a considerable island in the South Pacific Ocean, discovered by Dampier, and situated at the eastern extremity of Papua or New Guinea, from which it is separated by the straits of Dampier. New Ireland is a long island, situated to the east of New Britain. The general aspect of the island is woody and mountainous, it is apparently well peopled, and enlivened with beautiful streams and fruitful valleys. Cocoa nuts, yams, ginger, and other roots, are among its productions. Several volcanoes, in this and in the circumjacent islands, indicate their origin; but none of them have been accurately described. The Admiralty Islands are a group to the north-west. Lat. between 4° and 6° 50' S. and long. between 148° 20', and 151° 20' E. See NEW GUINEA.

BRITANNIA, in ancient geography, Great Britain and all the islands belonging to it.

BRITANNIA MINOR, the ci-devant province of Brittany, or Bretagne, in France.

BRITANNIC PLAGUE, a name given by some writers to the Anglicanus sudor, or sweating disease.

BRITANNICA, in the botany and materia medica of the ancients, the name of a plant described as having leaves of a dark color, very large, and in shape resembling those of the common wild-dock, but somewhat hairy and of an astringent taste; the root small and slender, and the stalk not large. This is the description of Dioscorides, who attributes to its inspissated juice great virtues as an astringent, and a remedy for ulcers of the mouth and tonsils; and Pliny acquaints us of its prodigious efficacy in a distemper attending the army of Germanicus, who, when they had crossed the Rhine, encamped in a place where there was only one spring of water, the drinking of which affected them in a terrible manner in their mouths, and made their teeth drop out; and that the physicians, who called the disease stomacace and scelotyrbe, were at length directed to the herb Britannica, as a remedy, by the Frisians who were in their camp. The virtues attributed to this plant are observed, by later physicians, to agree with those of the hydrolopathum majus, or great water-dock, a plant produced very abundantly with us, but at present neglected in the practice of physic; and Muntingius, who has written professedly of the Britannica of the ancients, is persuaded that this is the genuine plant; which appears extremely probable.

BRITANNICUS, son of the emperor Claudius by Messalina, was excluded from the empire after his father had married Agrippina; who put her son Nero on the throne, and caused Britannicus to be poisoned, A. D. 55.

To BRITE, *v. n.* } Barley, wheat, or hops,
To BRIGHT. } are said to *brite*, when they grow over-ripe.

BRITOMARTIS, in mythology, a daughter of Jupiter, who threw herself into the sea, to avoid the pursuit of Minos.

BRITTANY, or BRETAGNE, a ci-devant province of France, 150 miles in length and 112 in breadth; anciently called Armorica. It is a peninsula, surrounded on all sides by the ocean except on the east, where it joined Anjou, Maine, Normandy, and Poitou. It was divided into the upper and lower. The natives carry on great trade, by the many harbours on its coast. It was united to the crown of France in 1532, and abounds in large forests. Some authors suppose that Great Britain was first peopled from Brittany. It is now divided into five departments. See BRETAGNE.

BRITTLE, } Goth. *brita*, Islan. *briota*,
BRIT'LENESS. } Swed. *bryta*, Sax. *brytan*. To break; to divide; frangible; easily broken.

On *brotel* ground they bilde; and *brotelnesse*,
They finden, whan they wenen sicknesse.

Chaucer's Canterbury Tales.

Neither precious stones, nor durefull brasse,
Nor shining gold, nor mouldring clay it was;

But yet more rare and precious to esteeme,
Pure in aspect, and like to chrystall glass,
Yet glass was not, if one did rightly deeme;
But being fair and brittle likest glass did seerne.

Spenser.
A wit quick without brightness, sharp without brittleness.
Ascham's Schoolmaster.

The wood of vines is very durable; though no tree hath the twigs, while they are green, so brittle, yet the wood dried is extremely tough.
Bacon.

If the stone is brittle, it will often crumble, and pass in the form of gravel.
Arbutnot.

From earth all came, to earth must all return,
Frail as the cord, and brittle as the urn.
Prior.

It is but life
In stronger thread of brighter colour spun,
And spun for ever; dipt by cruel fate
In Stygian dye, how black, how brittle, here!
How short our correspondence with the sun!

Young's Infidel Reclaimed.
For had you laid this brittle ware
On Dun, the old sure-footed mare.
Gay.

She deemed the window-frames and shutters brittle,
Against a daring house-breaker or sprite,
And so she thought it prudent to contract her
With a vice-husband, chiefly to protect her.

Byron. Beppo.
BRITTLENESS. Brittle bodies are extremely hard; a very small percussion exerts a force on them equivalent to the greatest pressure. This effect is particularly remarkable in glass suddenly cooled, the brittleness of which is thereby much increased. Tin, though in itself tough, gives a brittleness to all the other metals when mixed therewith. The brittleness of glass has been said to arise from the heterogeneity of the parts whereof it is composed, as salt and sand can never bind sufficiently together: but this cannot be the case; for the pure calces of metals, or any other simple substances when vitrified, become brittle also. In timbers, brittleness seems to be connected with durability; the more brittle any sort of wood is, the more durable it is found. Thus oak is of very long duration; while beech and birch, being tough, presently rot, and are of little service in building.

BRITTON (Thomas), the famous musical small coal-man, was born at Higham Ferrers in Northamptonshire. He served his time in London, where he set up in a stable, next door to the little gate of St. John of Jerusalem, on Clerkenwell-green, which he converted into a house. Here becoming acquainted with Dr. Gareniers, his neighbour, he became an excellent chemist, and constructed a movable laboratory which was much admired by all who saw it. His skill in music was noways inferior to that in chemistry, either in the theory or practice; he had for many years a well frequented musical club, meeting at his own little cell; and was well respected and known by persons of the first quality; being, above all, a valuable man in his moral character. In Ward's account of clubs, we are told, that 'Britton's was first begun, or at least confirmed, by Sir Roger L' EStrange, a very musical gentleman.' This meeting was the first of the kind, and gave rise to some of the most celebrated concerts in London. Ward says, a concert was performed in his own house, which is thus described. 'On the ground floor

was a repository for small coal: over that was the concert room, which was very long and narrow; and had a ceiling so low, that a tall man could but just stand upright in it. The stairs to this room were on the outside of the house, and could scarcely be ascended without crawling. The house itself was very old and low built, and in every respect so mean as to be a fit habitation only for a very poor man.' This mansion, despicable as it may seem, attracted to it as polite an audience as ever the opera did. Here Dr. Pepusch, Handel, Bannister, Henry Needler, and other capital masters, were performers. At the first institution of the club, Britton would receive no gratuity whatever from his guests, and was offended whenever any was offered him. According to some, however, he departed from this; and the rules were, that Britton should find the instruments, the subscription be 10s. a year, and the company have coffee at a penny a dish. The singularity of his character, the course of his studies, and the collections he made, induced suspicions that Britton was not the man he seemed to be. Among other groundless conjectures, his musical assembly was thought by some to be only a cover for seditious meetings; by others, for magical purposes; and Britton himself was taken for an atheist, a Jesuit, &c. The circumstances of his death are not less remarkable than those of his life. There lived near him one Samuel Honeyman, a blacksmith, who became famous as a ventriloquist, and Robe, an acquaintance of Britton's, was foolish enough to introduce this man to the latter, for the sole purpose of terrifying him. He succeeded but too well: Honeyman, without moving his lips, or seeming to speak, announced, as from afar off, the death of Britton within a few hours, with an intimation that the only way to avert his doom was for him to fall on his knees immediately, and say the Lord's prayer: the poor man not only did this, but went home, took to his bed, and in a few days died. This happened in September, 1714. Britton left behind him a large collection of books, music, and musical instruments. Of the former, Sir Hans Sloane was a considerable purchaser. His collection of music, mostly pricked by himself, sold for nearly £100. In the British Museum there is a painting of him taken from the life. A mezzotint print was taken from this, for which Mr. Hughes (author of the siege of Damascus, and a frequent performer at Britton's concerts,) wrote the following lines:—

Tho' mean thy rank, yet in thy humble cell,
Did gentle peace and arts unpurchased dwell;
Well pleased, Apollo thither led his train,
And music warbled in her sweetest strain.
As fables tell, Cyllenius and Jove,
Came thus as guests to poor Philemon's grove.

BRIVA ISARÆ, in ancient geography, a town of Gallia Belgica on the river Isara or Oise; now called Pontoise.

BRIVATES, in ancient geography, a port of Gallia Celtica; now called Brest.

BRIXELLUM, in ancient geography, a town of Gallia Cispadana; remarkable for being the

place where Otho killed himself after the battle of Bedriacum: now called Bresello.

BRIXEN (the Sublavo of the ancients), the capital of a district, formerly a bishopric, of the Tyrol, of the same name, situated to the south of the Brenner Mountains, in the midst of hills and vineyards, and at the confluence of the Rientz and Eysach. This place is well built, and the houses, which are painted, are adorned with piazzas, and diversified by several spacious squares. The palace of the bishop is in appearance mean, though capacious and well built. In the cathedral there are several paintings by the first Tyrolese masters, and particularly by the Unterbergers. There are six other churches, of which the Benedictine church is the finest. The town is governed by its own magistrates, viz. two burgomasters, and two counsellors. The mineral waters in the neighbourhood are much frequented; and at Klausen, about three leagues from Brixen, is a fine collection of paintings in the convent of Capuchins. The principal article of commerce is the red wine of the surrounding country. The district altogether contains about 375 square miles, and a population of 27,000 persons. It was ceded to Bavaria in 1806, and restored to Austria in 1815 with the rest of the Tyrol. It contains three towns and numerous villages.

BRIZA, in botany, quaking grass: a genus of the digynia order, and triandria class of plants. Natural order, fourth, gramina: CAL. two-valved and multiflorous; the spicula bifarious: COR. two valved, the valves heart-shaped, blunt; seeds growing to the corolla, depressed. Species seven, natives of Europe, and several of our own country; especially 1. *B. minor*, with triangular seven-flowered spikelets. 2. *B. media*, with ovate seven-flowered spikelets, both found in our meadows and pastures.

BRIZE-VENTS, shelters used by gardeners who have not walls on the north side, to keep cold winds from damaging their beds of melons. They are enclosures about six or seven feet high, and an inch or more thick; made of straw, supported by stakes fixed in the ground, and props across, both inside and outside, fastened either with willow twigs, or iron wire.

BROACH, *v. & n.* } Goth. *brodde*, Swed. *broach*. } *brodd*, Welsh *bruyd*, Fr. *broche*. A spit, a tap, a point, a breast ornament. Hence, to spit, to pierce as with a spit, to tap a vessel, by piercing it in order to draw the liquor; to open any store; to let out, or utter any thing.

Were now the general of our gracious empress,
As in good time he may, from Ireland coming,
Bringing rebellion *broached* upon his sword.

Shakspeare.

This error, that Pison was Ganges, was first
broached by Josephus.

Raleigh.

There is much pride and vanity in the affectation
of being the first *broacher* of an heretical opinion.

J. Estrange.

Men have got a fashion now-a-days, that two or three busy bodys will take upon them the name of the world, and *broach* their own conceits, as if they were a general opinion.

Bacon.

He was taken into service to a base office in his kitchen; so that he turned a *broach*, that had worn a crown.

Id. Henry VII.

Whose offered entrails shall his crime reproach,
And drip their fatness from the hazle *broach*.

Dryden.

Those who were the chief instruments of raising the noise, made use of those very opinions themselves had *broached*, for arguments to prove that the change of ministers was dangerous.

Swift's Exam.

BROACH, BROCHA, BROCHE, or BROTCHE, in Scotland, is the name of a utensil, or rather ornament, which the Highlanders use, like the fibula of the Romans, to fasten their vests. They are usually made of silver; of a round figure; with a tongue crossing its diameter, to fasten the folds of the garment, sometimes with two tongues, one on each side of a cross bar in the middle. There are preserved in several families, ancient broaches of very elegant workmanship, and richly ornamented. Some of them are inscribed with names, to which particular virtues used to be attributed; others are furnished with receptacles for relics, supposed to preserve from harm. So that these broaches seem to have been worn not only for use and ornament, but for amulets. One or two of this sort are figured and described by Mr. Pennant, in his *Tour in Scotland*, i. 90. iii. 14., edit. 3.

BROACH, with hunters, the start of a young star's horn.

BROACH, a district and town of Hindostan, in the province of Gujerat, situated between the twenty-first and twenty-third degrees of northern latitude, and bounded on the west by the gulf of Cambay. It is one of the best cultivated and most populous territories on the west coast of India, and celebrated for the production of cotton. It was ceded to the British by the Mahrattas in 1803, with the exception of three small districts, which are the private estate of the peishwa. The river Nerbuddah runs through the centre of it; on an island in this river stands the largest tree in the world: 7000 persons it is said have stood under its shade.

BROACH, the capital of the above district, supposed to be the Barygaza of the ancients, is a place of considerable trade, and situated on the north bank of the Nerbuddah river, about twenty-five miles from the sea. It was twice taken by the British, viz. in 1772 and 1803, and remains still in our possession. Here is an hospital for criminals, supported by voluntary contributions among the Hindoos.

BROAD',
BROAD'EN,
BROAD'ISH,
BROAD'LY,
BROAD'NESS,
BROAD'SIDE,
BROAD'-AXE,
BROAD'-CLOTH,
BROAD'-EYED,
BROAD'-LEAVED,
BROAD'-SHOULDERED,
BROAD'-SWORD,
BROAD'-WISE,

Goth. *braid*, Swed. *bred*, Sax. *brad*, Teut. *breit*, Belg. *breed*, Per. *burdur*. Wide extended, open. It is opposed to narrow, distinguished from long, and is applied to space in the sense of width; to objects in the sense of bulk and dimensions; to any thing clear, open, uncon-

cealed. Figuratively, to what is gross, coarse, obscene, unreserved, bold, and indelicate.

Gret was the prees that swarmed to and fro
To gauden on this hors that stondeth so;
For it so high was and so *brod* and long,
So wel proportioned for to be strong,
Right as it were a stede of Lumbardie.

Chaucer's Canterbury Tales.

Who can speak *broad*er than he that has no house
to put his head in? Such may rail against great
buildings.

Shakspeare.

In despite of *broad-eyed* watchful day,
I would into thy bosom pour my thoughts:
But, ah! I will not.

Id.

The weeds that his *broad* spreading leaves did
shelter

Are pulled up, root and all.

Id.

The mobile are still for levelling; that is to say,
for advancing themselves: for it is as *broad* as long,
whether they rise to others, or bring others down to
them.

L'Estrange.

From vaster hopes than this he seemed to fall,
That durst attempt the British admiral:
From her *broad sides* a ruder flame is thrown,
Than from the fiery chariot of the sun.

Waller.

As chaste and modest as he is esteemed, it cannot
be denied, but in some places he is *broad* and fulsome.

Dryden.

I have used the cleanest metaphor I could find, to
palliate the *broadness* of the meaning.

Id.

Of all your knowledge this vain fruit you have,
To walk with eyes *broad* open to your grave.

Id.

If open vice be what you drive at,

A name so *broad* we'll ne'er connive at.

Id.

Narrow and *broad-leaved* cyprus grass.

Woodward on Fossils.

He, in fighting a duel, was run through the thigh
with a *broad-sword*.

Wiseman.

It no longer seeks the shelter of night and darkness,
but appears in the *broadest* light.

Decay of Piety.

The top may be justly said to grow *broad*er, as the
bottom narrower.

Temple.

The *broadest* mirth, unfeeling folly wears,
Less pleasing far than virtue's very tears.

Pope.

If one should, with his hand, thrust a piece of iron
broadwise against a flat ceiling of his chamber, the
iron would not fall as long as the force of the hand
perseveres to press against it.

Boyle.

I am a tall, *broad-shouldered*, impudent, black fellow;
and, as I thought, every way qualified for a rich
widow.

Speetator.

Thus, a wise taylor is not pinching,

But turns at every seam an inch in;

Or else, be sure, your *broad-cloth* breeches

Will ne'er be smooth, nor hold their stitches.

Swift.

Low walks the sun, and *broadens* by degrees,
Just o'er the verge of day.

Thomson.

BROAD PIECE, a denomination given to certain gold pieces broader than a guinea, particularly caroluses and jacobuses.

BROAD RIVER, a river or arm of the sea, on the east coast of North America, which extends along the west and north-west sides of Beaufort or Port Royal island, on the coast of South Carolina, and receives the river Coosa from the north-west. This may likewise be called an arm of the sea; its waters extend north-westward, and meet those of Broad river round a small island at the mouth of Coosa Hatchee river. The two embrace all the islands between Cambahee river and Dawfuskee sound, with which also Broad river communicates. Channels be-

tween Broad river and Coosa form the islands. The entrance through Broad river to Beaufort harbour, one of the best in the state, is between Hilton's Head and St. Philip's Point.

BROAD-STAIRS, a hamlet of St. Peter's, Isle of Thanet, Kent, distant from Ramsgate two miles north, on the sea-shore, is seventy-five miles east from London. It is chiefly to be noticed as a fashionable and retired resort for sea-bathing. Here are the remains of an ancient gateway, which appears to have been part of some fort of the coast. The bathing machines, and public rooms, are on the same construction as those at Ramsgate; and on the cliff is a good library. It has a small pier, at which light vessels load and deliver their cargoes. The parish church of St. Peter is a handsome gothic structure, a mile distant; the steeple is remarkable for a crack from the top to the bottom, occasioned by the shock of an earthquake, 1580.

BROAD-SWORD, a sword with a broad blade, chiefly designed for cutting; not much used in the British service, except in some few regiments of cavalry and Highland infantry. Among the cavalry, this weapon has in general given place to the sabre.

BROCADE, } Fr. *brocade*, Ital. *broccata*,
BROCA'DED. } from *brooch*, see **BROOCH**; silk
 or stuff variegated with gold or silver embroidery.

I have the convenience of buying and importing
 rich brocades. Spectator.

Or stain her honour, or her new *brocade*;
 Forget her prayers, or miss a masquerade. Pope.

Should you the rich *brocaded* suit unfold,
 Where rising flowers grow stiff with frosted gold. Gay.

BROCADE, or **BROCADO**, a stuff of gold, silver, or silk, raised and enriched with flowers, foliages, and other ornaments, according to the fancy of the merchants or manufacturers. Formerly the word signified only a stuff, wove all of gold, both in the warp and in the woof, or all of silver, or of both mixed together; thence it passed to those of stuffs in which there was silk mixed, to raise and terminate the gold or silver flowers; but at present all stuffs, even those of silk alone, whether they be programs of Tours or of Naples, satins, and even taffeties or lustrings, if they be but adorned and worked with some flowers or other figures, are called brocades.

In manufacturing brocades, the flattened gilt wire is spread on threads of yellow silk, approaching as near as may be to the color of gold itself. The wire, winding off from a bobbin, twists about the thread as it spins round; and by means of curious machinery, too complex to be described here, a number of threads are thus twisted at once by turning one wheel. The principal art consists in so regulating the motion, that the several circumvolutions of the flattened wire on each side may just touch one another, and form, as it were, one continued covering. It is said, that at Milan there is made a sort of flattened wire gilt only on one side, which is wound upon the thread, so that only the gilt side appears; and that the preparation of this wire is kept a secret,

and has been attempted in other places with little success. There is also a gilt copper wire, made in the same manner as the gilt silver. Savary observes, that this kind of wire, called false gold, is prepared chiefly at Nuremberg; and that the ci-devant ordinances of France required it to be spun, for distinction from the gilt silver, on flaxen or hempen threads. One of our writers takes notice, that the Chinese, instead of flattened gilt wire, use slips of gilt paper, which they both interweave in their stuffs and twist upon silk threads: this practice he inconsiderately proposes as a hint to the British weaver. But, whatever be the beauty of stuffs of this kind of manufacture, it is obvious that they must want durability. The Chinese themselves, according to Du Halde's account, sensible of this imperfection, scarcely use them any otherwise than in tapestries, and such other ornaments as are not intended to be much worn, or exposed to moisture. The Venetians have carried on a large trade to the Levant, in a kind of brocade called domasquete, which, though it has only about half the quantity of gold or silver as that made among us, looks far more beautiful. The flattened wire is neither wound close together on the silk threads, nor the threads stuck close in the weaving; yet by passing the stuff betwixt rolls, the disposition and management of which is kept a secret, the tissue or flower is made to appear one entire brilliant plate of gold or silver. The French ministry, judging this manufacture worthy of public attention, engaged the ingenious Mr. Vaucanson, to contrive the machinery; a gentleman well known for his curious pieces of mechanism.

This gentleman, in the memoirs of the Academy for 1757, gives an account of his success, and of the establishment of this manufacture at Lyons. The lower roll is made of wood, thirty-two inches in length and fourteen in diameter; the upper one of copper, thirty-six inches long and eight in diameter. This last is hollow, and open at one end, for introducing iron heaters. For making the roll cylindrical, he has a particular kind of lathes, wherein the cutting tool, which the most dexterous hand could not guide in a straight line through such a length as thirty-six inches, is made to slide by means of a screw, on two large steel rulers, perfectly straight, and capable of being moved at pleasure, nearer, and always exactly parallel to the axis of the roll. He first disposed the rolls nearly as in the common flattening mill. In this disposition, ten men were scarcely sufficient for turning them with force enough to extend the gilding duly; and the collars, in which the axis of the rolls turned at each end, wore so fast, that the pressure continually diminished, insomuch that a piece of stuff of ten ells, had the gilding sensibly less extended on the last part than on the first. He endeavoured to obviate this inconvenience by screwing the rolls closer and closer in proportion as the stuff passed through, or as the wearing of the collars occasioned more play between them; but this method produced an imperfection in the stuff, every turn of the screw making a sensible bar across it. To lessen the attrition, each end of the axis, instead of a collar, was made to turn between three iron cylinders, called friction

wheels; but even this did not answer fully, for now another source of unequal pressure was discovered. The wooden roll being compressible, had its diameter sensibly diminished: it likewise lost its roundness, so that the pressure varied in different points of its revolution. On trying different kinds both of European and Indian woods, all the hard ones split, the soft ones warped without splitting, and of more than twenty rolls, there was not one which continued round for twenty-four hours. These failures put him upon contriving another method of pressing the rolls together, so that the force should always accommodate itself to whatever inequalities might happen. The axis of the copper roll being made to turn between friction-wheels as before, that of the wooden one is pressed upwards by a level at each end, furnished with a half collar for receiving the end of the axis. Each lever has the end of its short arm supported on the frame of the machine, and the long arm is drawn upwards by an iron rod communicating with the end of the short arm of another lever placed horizontally. To the long arm of this lever is hung a weight, and the levers are so proportioned, that a weight of 30 lbs. presses the rolls together with a force equivalent to 17,536 lbs. which was found to be the proper force for the sufficient extension of the gilding. By this contrivance, four men can turn the rolls with more ease than ten can turn those which are kept together by screws; and the same weight acting uniformly in every part, the pressure continues always equal, though the wooden roll should even become oval, and though the stuff be of unequal thickness. A piece of cloth, of about two ells, is sewed to the beginning and end of the stuff, to keep it out to its width when it enters and parts from the rolls, which could not be done by the hands for fear of burning or bruising them; as it would take too much time to sew these cloths to every small piece of an ell or two, a number of these are sewed together. The stuff is rolled upon a cylinder, which is placed behind the machine, and its axis pressed down by springs to keep the stuff tight as it comes off. Four iron bars, made red hot, are introduced into the copper roll, which in half an hour acquires the proper degree of heat or nearly such an one as is used for the ironing of linen; the wooden roll is then laid in its place, and the machine set to work. If more than thirty ells are to be passed at once, the wooden roll must be changed for another, for it will not bear a long continuance of the heat without danger of splitting; and therefore the manufacturer should be provided with several of these rolls, that when one is removed, another may be ready to supply its room; as soon as taken off from the machine, it should be wrapt in a cloth, and laid in a moist place. The principal inconvenience attending the use of this machine, is, that the heat necessary for extending the gilding, though it improves the brightness of white and yellow silks, is injurious to some colors, as crimson and green. A double pressure will not supply the place of heat; and the only method of preventing this injury, of rendering it as light as possible, appeared to be, to pass the stuff through with great celerity.

To clean brocades neither alkalies nor soap must be used; because the former, while they clean the gold, corrode the silk, and change or discharge its color; and the latter also alters the shade, and even the species, of certain colors. But spirit of wine may be used without any danger of its injuring either the color or quality of the subject; and in many cases proves as effectual for restoring the lustre of the gold as the most corrosive detergents. A rich brocade, flowered with a variety of colors, after being disagreeably tarnished, had the lustre of the gold perfectly restored by washing it with a soft brush dipped in warm spirit of wine, and some of the colors of the silk which were likewise soiled, became at the same time remarkably bright and lively. Spirit of wine seems to be the only material adapted to this intention, and probably the boasted secret of certain artists is no other than this spirit disguised. Dr. Lewis says he does not know of any other that is of sufficient activity to discharge the foul matter, without being hurtful to the silk. As to powders, however fine, and however cautiously used, they scratch and wear the gold, which here is only superficial, and of extreme tenuity.

BROCARDICA, **BROCARDICS**, denote maxims or principles in law; such as those published by Azo, under the title of *Brocardica Juris*. Vossius derives the word from the Greek *πρωταρχια*, q. d. first elements. Others, with more probability, from Burchard, or Brochard, bishop of Worms, who made a collection of canons, hence called *Brocardica*; and as this work abounded much in sentences and proverbs, the appellation was extended to similar works.

BROCATTEL, or **BROCADEL**, a kind of coarse brocade; chiefly used for tapestry.

BROCATELLO, a name given by lapidaries to the white and gold-veined red marble.

BROCCOLI, *n. s.* Ital. A species of cabbage.

Content with little, I can piddle here

On *Broccoli* and mutton round the year;

But ancient friends, tho' poor or out of pay,

That touch my bell, I cannot turn away. *Pope.*

BROCCOLI. See **BRASSICA**.

To BRO'CHIE. See **To BROACH**.

So Geoffry of Boullion, at one draught of his bow, shooting against David's tower in Jerusalem, *broached* three feckless birds. *Camden.*

BROCHOS, in surgery, a name used by some writers for bandages in general: in some of the old writers, the same word is also used for a person who has a very prominent upper lip, or teeth, and a thick mouth.

BROCK, *?* Dan. *brook*, Sax. *broc*, Fr. *Brock'sh*. *?* *broc*, Ital. *buco*, apparently from Goth. *brak*, *brok*, a scream, a yell; a badger. Skinner suggests from *to break*, because this animal breaks and bruises with most severe biting. *Brockish* seems to mean beastly, brutal.

Or with pretence of chasing thence the *brock*,

Send in a cur to worry the whole flock. *Jonson.*

BROCKLESBY (Richard), M. D., was of an Irish family, but born in 1722, at Minehead, in Somersetshire. He was educated at Ballytoré, in the north of Ireland, under the same master

with Mr. Burke, though not a school-fellow of that statesman. He afterwards went to Edinburgh, and thence to Leyden, where he took his degree of M.D. in 1745. Soon after, he settled in London, and in 1751 was admitted a licentiate of the College of Physicians. Having obtained a diploma from Cambridge, he became, in 1756, a fellow of the college; and in 1758 was appointed physician to the army, in which capacity he served in Germany during the seven years' war. In October 1760 he was made physician to the hospitals for the British forces, and returned home a little before the conclusion of the peace of 1763. He now acquired in the metropolis an extensive practice, and a general acquaintance with the literary characters and statesmen of the age. Among others he was in terms of close intimacy with Dr. Johnson, and attended him in his last illness. Dr. Brocklesby is characterised in Boswell's Life of Johnson, as a man whose reading, knowledge of life, and good spirits, supplied him with a never-failing source of conversation; and several letters, addressed to him from Dr. Johnson, are preserved in that work. One trait of his character is omitted, however, which does him great honor. Believing that Johnson wished, in the latter part of his life, to remove to the continent for his health, and knowing the benefits that might accrue to him from that measure, Dr. Brocklesby made him an offer of an annuity of £100 during the remainder of his life; and, when this was declined, pressed him to reside in his house, as more suited to his health than the one in which he then lived. In the same noble spirit he transmitted £1000 to Burke, as a legacy he had intended leaving him, but which he thought would be of more use to him in his life time. Dr. Brocklesby died suddenly in 1797. His works are: 1. *Dissertatio de Saliva Sana et Morbosa*, 4to. 2. *Essay concerning the Mortality of Horned Cattle*, 8vo. 3. *Eulogium Medicum, sive Oratio Anniversaria Harveiana*, 1760, 4to. 4. *Economical and Medical Observations tending to the improvement of Medical Hospitals*, 2 vols. 8vo. 5. *Account of a Poisonous Root found mixed with Gentian*. *Phil. Trans.* n. 486. 6. *Case of Diabetes*, *Med. Observ.* 7. *Experiments on Seltzer-water*, ib. 8. *Case of Encysted Tumor of the Eye*, ib. 9. *Dissertation on the Music of the Ancients*.

BRODÆUS, or BRODEAU (John), a great critic, on whom Lipsius, Scaliger, and Grotius, have bestowed great encomiums, was descended from a noble family in France, and born at Tours in 1500. He was liberally educated, and placed under Alciat to study the civil law; but he gave himself up wholly to languages and the belles lettres. He travelled into Italy, where he became acquainted with Sadoleto, Bembo, &c. and applied himself to the study of mathematics, philosophy, and the sacred languages, in which he made no small proficiency. Then, returning to his own country, he led a retired, but not an idle, life, as his many learned works abundantly testify. He was a man free from all ambition, and ostentation, and suffered his works to be published rather under the authority of others than under his own. His chief works are: 1.

A *Commentary on the Anthologia*. 2. *Ten Books of Miscellanies*. 3. *Notes on Oppian, Euripides, &c.* He died in 1563.

BRODERA, a town of Hindostan, in the province of Gujerat, and district of Champoueer, the capital of a Mahratta chief's dominions, called the Guicowar, who is one of the British allies. His revenues are but moderate, and generally collected by an armed force. His territories adjoin Broach, and he is principally supported by the British.

BRODIATORES, in the middle age, a kind of librarii, or copyists, who did not write the words and letters plain, but variously flourished and decorated, after the manner of embroidery.

BRODIUM, a term used by some writers in pharmacy, for a liquor in which any solid substance has been boiled, is to be preserved, or with which a medicine too strong for use alone is to be diluted.

BRODY, a town in the circle of Brody or Zloczow, Austrian Galicia, situated on the borders of the Russian government of Volhynia. It is a trading place of consequence, containing a castle, four parish churches, 2000 Christian inhabitants, and no less than 13,000 Jews. It carries on an extensive commerce with Moldavia, Walachia, the Crimea, and other parts of Turkey and Russia, receiving in return for Polish merchandise, the horses, black cattle, wax, honey, tallow, skins, fur, anise, and fruit, produced in these and other countries. The Jews here are in the habit of frequenting the principal fairs of Germany; and at Brody is a central synagogue.

BRO'GUE. *Ital. brog, bruac, Wel. bro-aeg*, from *bro*, country, and *aeg*, speech. Thus it signifies a country accent, particularly of the Irish. It is also applied to a shoe made of raw leather. *Ir. bro given*, a country shoe; *Wel. gwintas*, shoes.

His *brogue* will detect mine. *Farquhar.*

I thought he slept; and put

My clouted *brogues* from off my feet, whose rudeness
Answered my steps too loud. *Shakspeare.*

Sometimes it is given out, that we must either take these halfpence, or eat our *brogues*. *Swift.*

But what vexed me most was that d——d Scottish
rogue

With his long-winded speeches, his smiles, and his
brogue. *Goldsmith.*

BROID', } *Goth. broda; Dan. brode;*
BROID'ER, } *Welsh, brodiaw; Fr. brodir,*
BROID'ERY, } *from Goth. brodde, a point.*
BROID'ERS. } See BROCADE. To adorn with
figures in needle-work; flower-work; ornaments
wrought upon cloth; to braid, knit, wreath, or
interweave.

A robe, and a broidered coat, and a girdle.

Erodus.

Of rubies, sapphires, and of perles white,
Were all his clothes broided up and down,
For he in gemmes gretly gan delight.

Chaucer's Canterbury Tales.

Infant Albion lay

In mantles broidered o'er with gorgeous pride.

Tickell.

The golden broidery tender Milkah wove,

The breast to Kenna sacred, and to love,

Lie rent and mangled.

Id.

BROIL', *v.* & *n.* } *Fr. brouiller, brusler*; *Ital.*
 BROIL'ER, } *brustolare, from βραζω*;
 BROIL'ING, } *Goth. brasa, brasta. See*
 BROIL'MAKER. } *BREEZE. To roast on the*
 fire; to grill; to be in a heat. *Met. a tumult;*
a quarrel.

Where have you been *broiling*?
 — Among the crowd i' the' abbey, where a finger
 Could not be wedged in more. *Shakspeare.*

Say to the king thy knowledge of the *broil*,
 As thou didst leave it. *Id.*
 Their *broiling* heads can bear no other sounds,
 Than fleets and armies, battels, blood, and wounds.
Marvell.

He has sent the sword both of civil *broils*, and
 public war, amongst us. *Wake.*

Some strip the skin, some portion out the spoil,
 Some on the fire the reeking entrails *broil*. *Dryden.*

BROKE', *v.* } Of uncertain etymology.
 BRO'KAGE, } Skinner seems inclined to de-
 BRO'KER, } rive it from to break, because
 BRO'KERAGE, } broken men turn factors or
 BRO'KERLY, } brokers. *Casaubon, from πρᾶ-
 BRO'KERY. } τειν. Skinner thinks, again,*
 that it may be contracted from procurer. *Mr. Lye*
more probably deduces it from Sax. bpuccan, to
be busy. To transact business for others, or by
others. Brokage, is the gain gotten by procuring
bargains; the hire given for any unlawful office;
dealing in old and second-hand goods; transact-
ing business by commission.

He woeth hire by menes and *brokage*,
 And sworn he wolde ben hire owen page.

Chaucer's Canterbury Tales.

Yet sure his honesty
 Got him small gaine, but shameless flattery,
 And filthy *brokage*, and unseemly shifts,
 And borrow base, and some good ladies gifts.
Spenser.

In chusing for yourself, you shewed your judgment;
 Which being shallow, you shall give me leave
 To play the *broker* in mine own behalf. *Shakspeare.*

Redeem from *broking* pawn the blemished crown,
 Wipe off the dust that lides our sceptre's gilt. *Id.*

He does, indeed,
 And *brokes* with all that can, in such a suit,
 Corrupt the tender honour of a maid. *Id.*

Court officers as used the next place took,
 And followed F—x, but with disdainful look;
 His birth, his youth, his *brokage*, all dispraise,
 In vain, for always he commands that pays.
Marvell.

Brokers, who, having no stock of their own, set up
 and trade with that of other men; buying here and
 selling there, and commonly abusing both sides, to
 make out a little paltry gain. *Temple.*

Some South-sea *broker*, from the city,
 Will purchase me, the more's the pity;
 Lay all my fine plantations waste,
 To fit them to his vulgar taste. *Swift.*

So much as the quantity of money is lessened, so
 much must the share of every one that has a right to
 this money be the less; whether he be landholder,
 for his goods; or labourer, for his hire; or merchant,
 for his *brokage*. *Locke.*

BRO'KEN } The past tense and past
 BRO'KENLY, } participle of the verb to
 BRO'KENNESS, } break. Interrupted; irre-
 BRO'KENHEARTED, } gular; disjointed; crush-
 BRO'KENMLT, } ed; fragments without any
 BRO'KENWIND. } regular series.

He hath sent me to bind up the *brokenhearted*.

Isaiah.

To other woundes, and to *broken* armes,
 Some hadden salves, and some hadden charmes,
 And farmacies of herbes.

Chaucer's Canterbury Tales.

Preserve men's wits from being *broken* with the
 very bent of so long attention. *Hooker.*

Yet would not let their battell so be *broken*,
 Both greedy fiers on other to be broken. *Spenser.*
 Sir Richard Hopkins hath done somewhat of this
 kind, but *brokenly* and glancingly; intending chiefly
 a discourse of his own voyage. *Hakewill.*

Get three or four chairwomen to attend you constantly
 in the kitchen, whom you pay at small charges;
 only with the *broken meat*, a few coals, and all the
 cinders. *Swift.*

Had we never loved so kindly,

Had we never loved so blindly,

Never met, or never parted,

We had ne'er been *brokenhearted*. *Burns.*

BROKEN-BACKED, in sea language, denotes
 the state of a ship which is so impaired, and
 loosened in her frame, as to droop at each end;
 a disorder to which the French ships are most
 exposed on account of their length, &c.

BROKERS, in common, are of three kinds;
 exchange-brokers, stock-brokers, and pawn-
 brokers:

EXCHANGE BROKERS, are a sort of negociators
 who contrive, make, and conclude bargains be-
 tween merchants and tradesmen, in matters of
 money or merchandise, for which they have a
 fee or premium. These, in old English law-
 books, are called broggers, and in Scotland,
 broccarii, i. e. according to Skene, mediators or
 intercessors in any contract, &c. They make it
 their business to know the alteration of the course
 of exchange, to inform merchants of it, and to
 notify to those who have money to receive or pay
 abroad, who are proper persons for negociating
 the exchange with; and when the matter is ac-
 complished, that is when the money is paid, they
 have a *brokage* per £100 sterling. These by
 statute 8 and 9 William III. are to be licensed
 in London by the lord mayor, who gives them
 an oath, and takes bond for the faithful execution
 of their offices. If any person shall act as broker
 without being thus licensed and admitted, he
 shall forfeit the sum of £500, and persons em-
 ploying him £5; and brokers are to register con-
 tracts, &c. under the like penalty: also brokers
 shall not deal for themselves, on pain of forfeit-
 ing £200. They are to carry about with them a
 silver medal, having the king's arms and the
 arms of the city, and pay forty-shillings per year
 to the chamber of the city.

In France, till the middle of the seventeenth
 century, their exchange brokers were called cour-
 tiers de change; by an arret of council in 1639,
 the name was changed for that more creditable
 one of agent de change, banque, et finance; and
 in the beginning of the eighteenth century, to
 render the office still more honorable, the title of
 king's counsellor was added. At Grand Cairo,
 and several places of the Levant, the Arabs, who
 do the office of exchange brokers are called consuls;
 the manner of whose negotiating with the
 European merchants has something in it so very
 particular, that we refer it to a distinct article.

See CONSUL. The exchange brokers at Amsterdam, called *makelders*, are of two kinds; the one like the English, called *sworn brokers*, because of the oath they take before the *burgomasters*; but the others negotiate without any commission, and are called *walking-brokers*. The Jews, Armenians, and Banians, are the chief brokers throughout most parts of the Levant and the Indies. In Persia all affairs are transacted by a sort of brokers whom they call *delal*, i. e. great talkers; and who, after they have launched out into long, and often impertinent discourse, in coming to a conclusion converse only with their fingers.

INSURANCE or POLICY BROKERS are agents who transact the business of insurance between the merchant or party insured and the underwriters or insurers. These insurance brokers, from the nature of their employment, ought to be, and indeed generally are, persons of respectability and honor, and in whom confidence may be safely reposed. To the broker the merchant looks for the regularity of the contract, and a proper selection of responsible underwriters; and to him, also, the underwriters look for a fair and candid disclosure of all material circumstances affecting the risk, and the payment of their premiums. There is usually an open account between each broker, and every underwriter with whom he has much dealing. In this account the broker makes himself debtor to the underwriter for all premiums, and takes credit for all losses to which the underwriter is liable, and which the broker is authorised to receive. Indeed, it is generally understood, that, by the usage of trade in London, the underwriters give credit only to the broker for their premiums, and can resort only to him for payment; and that he alone, and not the underwriters, can recover the premiums from the insured. This point, however, has never been settled by a judicial determination. But though the underwriter thus looks to the broker for his premium, and though the broker in his account with the underwriter takes credit for the losses and returns of premiums, which he is authorised to receive from the underwriter, yet such losses are not to be regarded as a debt from the underwriter to the broker. In the case of the bankruptcy of a policy broker, the Court of King's Bench (23 Geo. III.) held that though credit for the premiums must be given to the broker, because the underwriters know nothing of the principals; yet, that they could not set off the losses or returns of premium due to the principals, and which they only could sue for, against a debt due from the defendants to the bankrupt. In this case the defendants had no commission *del credere*. In a subsequent case, where the action was brought by the assignees of an underwriter against the factor, it was ruled that no general authority in relation to a ship or goods, will make a man an agent for the purpose of insuring, on behalf of the parties interested. He must either have express directions from the principal to cause the insurance to be made, or else it must be a duty evidently arising from the nature of his correspondence. However, though one man cannot, in general, compel another against his consent to become

an agent for procuring an insurance to be effected for him, there are three cases in which an order to insure must be complied with: as first, where an agent has effects of his principal in his hands; secondly, where he has been in the practice of making insurances, and has given no notice to discontinue; and thirdly, where he accepts bills of lading sent him on condition to insure.

If a merchant in this country accept an order from his correspondent abroad to cause an insurance to be made, but limits the broker to too small a premium, in consequence of which no insurance can be effected, he is liable to make good the loss to his correspondent; for though it is his duty to get the insurance done at as low a premium as possible, yet he has no right so to limit the premium, as to prevent the insurance from being effected. And even a voluntary agent, who has no prospect of remuneration for his trouble, is liable, provided that he takes any step in the business.

In an action against an agent, or broker, whether for negligence or unskillfulness in effecting an insurance, the plaintiff is entitled to recover to the same amount as he might have recovered against the underwriters, if the policy had been properly effected. But he can only recover what, in point of law, he might have recovered on the policy; and not what the indulgence or liberality of the underwriters might probably have induced them to pay. In such an action the agent may avail himself of every defence, such as fraud, deviation, non-compliance with warranties, &c. which the underwriters might have set up in an action on the policy; but if the agent act in the usual manner it will be deemed sufficient.

There are many reasons why an agent or broker ought not to be an insurer. He becomes too much interested to settle with fairness the rate of premium, the amount of partial losses, &c.

If an agent or broker meaning to appropriate the premium to himself, and take the chance of a safe arrival, represent to his employer that an insurance has been effected agreeably to his instructions, the principal may maintain trover for the policy against the agent or broker; and, upon proof of a loss, he shall recover to the same amount as he would have been entitled to recover against the underwriters. See **INSURANCE**.

STOCK BROKERS are those who are employed to buy and sell shares in the joint stock of a company or corporation, or more particularly in the public funds. As the practice of stock-jobbing, and dealing in the stocks in various ways, has become very extensive, the legislature has thought fit to bring it within certain bounds, and under particular regulations. The negotiations, &c. of these brokers are regulated by statute 6 Geo. I. cap. 18, and 7 and 10 Geo. II. cap. 8, which, among other things, enact that all premiums to deliver or receive stock, all contracts in the nature of wagers, &c. incur a penalty of £500, and the sale of stock, of which the seller is not possessed, a forfeit of £100. No money shall be given to compound any difference for not delivering or transferring stock. Persons buying, on refusal or neglect of the seller to transfer at the day, may buy the like quantity of

stock, of any other person, and recover the damage of the first contractor. But this act not to hinder lending money on stocks, or contracts for re-delivering or transferring thereon, so as no premium be paid for the loan more than legal interest. Brokers shall keep a book, in which all contracts, with their dates, and the names of the parties concerned, shall be entered, on pain of £50.

An agreement to invest or replace stock at a certain time, in consideration of money actually paid or advanced equivalent to the value of the stock at the time of such payment or advance, is valid; and not usurious, nor within the statute. 8 East's Rep. 304: but all jobbing in omnium is. In an action on this statute, the contract laid in the declaration was to deliver stock on the 27th of February: the contract proved was to deliver stock on the settling-day, which at the time was fixed for, and understood by the parties to mean, the 27th of February: Held, that the proof supported the declaration. *Wickes v. Gordon*, *Term Rep. K. B. Hil. 59 Geo. 3.* 385. It is notorious, however, that the most wholesome provisions of the law are daily evaded in a 'certain house': though men highly honorable in their conduct, and very useful to the public, are found there.

BROKERS, PAWN. See PAWNBROKERS.

BROKERS OF FURNITURE, &c. See APPRAISERS.

BROMIA, from *βρωσκω*, to eat; food of any kind that is masticated; not drank.

BROMBERG, a government and town of the grand duchy of Posen, Prussia. The former contains about 4450 square miles, and 222,000 inhabitants, consisting of Poles, different Christian Germans, and a few Jews. The soil is but indifferent.

The town stands on the river Brahe, and by means of the canal, which joins the Brahe with the Netze, near this place, enjoys a small trade. The length of this canal, which is a work of great importance to this part of the country, is about twenty-eight miles. It is thirty miles north-west of Thorn, and contains 5000 inhabitants. A treaty of peace was concluded here in 1657, between the king of Poland and the elector of Brandenburg.

BROME (Alexander), a poet and attorney, in the reign of Charles II., was the author of the greatest part of those songs and epigrams which were published in favor of the royalists, during the protectorate. These, together with his epistles and epigrams, translated from different authors, were all printed in one volume, octavo, after the Restoration. He also published a version of Horace, by himself and others. He left behind him a comedy, entitled the *Cunning Lovers*; and the world is indebted to him for two volumes of Richard Brome's plays, in 8vo. He died in 1666.

BROME (Richard), a dramatic writer who lived in the reign of Charles I., and was contemporary with Decker, Ford, Shirley, &c. He was originally a servant to the celebrated Ben Jonson. He left fifteen comedies behind him, ten of which were collected together by ALEXANDER BROME, which see.

BROMELIA, in botany, the pine-apple; a genus of the monogynia order, hexandria class

of plants, ranking, in the natural method, under the tenth order, coronariæ, Linnaeus enumerates seven species, of which the following are the most remarkable:—

I. *B. ananas*, with leaves very like some sorts of aloes, but not so thick and succulent, which are strongly armed with black spines. From the centre of the plant rises the flower-stalk, which is near three feet high; the lower part is garnished with entire leaves, placed alternately at every joint; the upper part with flowers set in a loose spike or thyse quite round: these are succeeded by oval seed-vessels, having a longitudinal partition, in the centre of which are fastened smooth cylindrical seeds. There are six varieties, viz. 1. *B. ananas glaber*, with small leaves. 2. *B. ananas lucidus*, with very smooth, shining, grass-green leaves. 3. *B. ananas ovatus*, the oval-shaped pine-apple. 4. *B. ananas pyramidalis*, the pyramidal or sugar-loaf pine. 5. *B. ananas serratinus*, with a yellowish colored flesh. And 6. *B. ananas viridis*, the green pine-apple.

II. *B. lingulata*, with obtuse, sawed, and prickly leaves.

III. *B. nudicaulis*, with the lower leaves indented and prickly. The leaves of this species are shorter than those of the ananas. They are sharply sawed on their edges, and of a deep green color. The flower stem arises from the centre of the plant, which divides upward into several branches: the upper part of these are garnished with spikes of flowers, which come out alternately from the sides of the branches, each having a narrow entire leaf just below it, which are longer than the spike. The flowers are placed very close on the spikes; and when they decay the empalement turns to an oval-pointed seed-vessel, enclosing seeds of the same shape with the other.

The *bromelia ananas ovatus* is the most common in Europe; but the *ananas pyramidalis* is much preferable, the fruit being larger and better flavored; the juice of this sort is not so astringent as that of the first, so that it may be eaten in greater quantity with less danger. It frequently produces suckers immediately under the fruit, whereby it may be increased much faster than the common sort. The *ananas glaber* is preserved by some curious persons for the sake of variety; but the fruit is not worth anything. The *ananas lucidus* was raised from the seeds taken out of a rotten fruit which came from the West Indies to the late Henry Heathcote, Esq., from whom Mr. Miller received one plant, which produced large fruit: this is what the people of America call the king pine. The plants are propagated by planting the crowns which grow on the fruit, or the suckers which are produced either from the sides of the plants or under the fruit; both which are found to be equally good; although by some persons the crown is thought preferable to the suckers, as supposing it will produce fruit sooner than the suckers, which is certainly a mistake. The suckers and crowns must be laid to dry in a warm place for four or five days, or more (according to the moisture of the part which adhered to the old plant or fruit); for if they are immediately planted they will

rot. The certain rule of judging when they are fit to plant, is by observing if the bottom is healed over and become hard; for if the suckers are drawn off carefully from the old plants they will have a hard skin over the lower part, and so need not lie so long as the crowns of those whose bottoms are moist. But whenever a crown is taken from the fruit, or suckers from old plants, they should be immediately divested of their bottom leaves, so high as to allow depth for their planting, so that they may be thoroughly dry and healed in every part, lest when they receive heat and moisture they should perish, which often happens when this method is not observed. If these suckers or crowns are taken off late in autumn, or during winter, or early in spring, they should be laid in a dry place in the stove for a fortnight or three weeks before they are planted; but in summer they will be fit for planting in a week at farthest. These should be planted in a rich good kitchen-garden mould, not too heavy so as to detain the moisture too long, nor over light and sandy; but where this is wanting, some fresh earth should be procured from good pasture, which should be mixed with about a third part of rotten neats' dung, or the dung of an old melon or cucumber bed which is well consumed, six or eight months before they are used, but if it be a year it will be better; and the mixture should be often turned that their parts may be the better united, and the clods well broken. The earth should not be sifted very fine; for if it is only cleared of the great stones it will be better for the plants than when it is made too fine. Always avoid mixing any sand with the earth, unless it be extremely stiff, and then it will be necessary to have it mixed at least six months or a year before it is used; it must be frequently turned that the sand may be incorporated in the earth so as to divide its parts: but do not put more than a sixth of sand; for too much sand is very injurious to the plants. In summer they must be frequently watered; but not with large quantities at a time; and the moisture should not be detained in the pots by the holes being stopped, for that will soon destroy the plants. If the season is warm they should be watered twice a-week, but in a cool season once a-week will be sufficient; and in summer they should once a-week be watered gently all over the leaves; which will greatly promote their growth. Some frequently shift these plants, but unless the pots be filled with the roots by the time the plants begin to show their fruit, they commonly produce small fruit, which have generally large crowns; therefore the plants should not be new potted oftener than twice in a season. The first time should be about the end of April, when the suckers and crowns of the former year's fruit (which remained all the winter in these pots in which they were first planted), should be shifted into larger pots, i.e. those which were in half-penny or three farthing pots should be put into penny or at most three-half-penny pots, according to the size of the plants, for we must not over-pot them, nothing being more prejudicial. The second time for shifting is in the beginning of August; when those which are of a proper size

for fruiting the following spring should be put into two-penny pots, which are full large enough for any of these plants. At each time of shifting the bark-bed should be stirred up, and some new bark added, to raise the bed up to the height it was at first made; and, when the pots are plunged again into the bark-bed, the plants should be watered gently all over the leaves, to wash off the filth, and to settle the earth to the roots of the plants. If the bark-bed be well stirred, and a quantity of good fresh bark added to the bed at this latter shifting it will be of great service to the plants, for they may remain in the same tan until the beginning of November, or sometimes later, according to the mildness of the season, and will require but little fire before that time. During the winter they will not require to be watered oftener than once a-week, according as the earth in the pots seems to dry. Plants beginning to show fruit should never be shifted, for if they are removed after the fruit appears it stops the growth, and thereby causes the fruit to be smaller, and retards its ripening; so that it will be October or November before the fruit is ripe; therefore the plants should be kept in a vigorous growing state from the first appearance of the fruit, as upon this depends the goodness and the size of it, for if they receive a check after this the fruit is generally small and ill tasted. After cutting off the fruit from the plant intended to be propagated, the leaves should be trimmed, and the pots plunged again into a moderate hot-bed, observing to refresh them frequently with water, which will make them put out suckers in plenty; so that one may be soon supplied with plants enough of any of the kinds, who will but observe to keep the plants in health. The most dangerous thing that can happen to these plants is their being attacked by small white insects, which appear at first like a white mildew, but soon have the appearance of lice; these attack both root and leaves at once; and, if not soon destroyed, they will spread over a whole stove in a short time, and in a few weeks entirely stop the growth of the plants by sucking out the nutritious juice, so that the leaves will appear yellow and sickly and have a number of yellow transparent spots all over them. These insects, after they are fully grown, appear like bugs, adhering so closely to the leaves as not to be easily washed off, and seem to have no locomotion. They were originally brought from America upon the plants imported thence; and are probably the same insects which have destroyed the sugar-canes in some of the Leeward Islands; for, upon some sugar-canes which were sent from Barbadoes, great numbers of these insects were observed. Since they have been in England, they have spread greatly in stoves where there has not been extraordinary care taken to destroy them. They have also attacked the orange-trees in many gardens near London, and have done them incredible damage; but, as they do not endure the cold of our winter, they are never found on such plants as live in the open air. The only method yet discovered of destroying them is, by frequently washing the leaves, branches, and stems, of such plants as they attack, with water in which there has been a strong in-

fusion of tobacco stalks. But this method cannot be practised on the aranas plants, because the insects fasten themselves so low between the leaves, that it is impossible to come at them with a sponge to wash them off; so that, although they seem to be all cleared off, they are soon succeeded by a fresh supply from below, and the roots are also equally infected. The safest method therefore, whenever they appear, is to take the plants out of the pots, and clear the earth from the roots; then put them into a tub, filled with water in which there has been a strong infusion of tobacco-stalks, and lay some sticks across to keep them immersed in the water, in which they should remain twenty-four hours; then take them out, and with a sponge wash off all the insects from the leaves and roots, and wash the plants in a tub of fresh water. After this, you should put them in fresh earth; and having stirred up the bark-bed, and added some new tan to give it a fresh heat, the pots should be plunged again, observing to water them all over the leaves, and this should be repeated once a-week during summer; for these insects always multiply much faster where the plants are kept dry than when they are sometimes sprinkled over with water, and kept in a growing state. Mr. Nicol found the following method answer perfectly, in a case where the plants were greatly affected:—Having prepared a strong heat for the plants, in the bark-bed of the nursing pits, he shook out and cut every fibre from their roots, whereby they were rendered the same as suckers at first, not excepting those that were in fruit, some of which were just in flower; dipped them into a liquor prepared by boiling two pounds of soft soap and flower of sulphur, with one pound of roll tobacco, and two ounces of nux vomica, in eight gallons of water to six; put them into pots of six inches diameter, and plunged them to the brims; kept up a fire heat to about 75°, gave them but little air, shading them in sunshine, and afterwards gave them plentiful waterings over head with the same mixture, reduced to about half its former strength. He continued this treatment for two whole months; at the end of which he again shook out their roots, and washed the whole plants in pure water, put them into fresh pots of eight inches diameter, and re-plunged them into a kindly heat in another nursing pit, treating them in all respects as any other plants. He never saw a vestige of the bug afterwards; a few of those plants that were shown, however, died, but the others, he observed, produced such fruit as might be expected from plants of such sizes of any other kind.

As these insects are frequently brought over from America on the ananas plants, those who procure their plants from that country should look carefully over them when they receive them, to see they have none of these insects on them; for if they have they will soon be propagated over all the plants in the stove where they are placed; therefore, whenever they are observed, the plants should be soaked before they are planted into pots.

Of late some considerable improvements have been made in the culture of the pine. Oak leaves have been substituted for the more expensive

bark; and the pines are found to thrive as well, and to produce as good fruit as the others. The proper way of managing these leaves, for rearing exotic plants, will be found under the article *OAK LEAVES*. But the most considerable improvement is that mentioned in the sixty-seventh volume of the Philosophical Transactions, where the following method is shown by William Bastard, Esq., of Devonshire, of raising these fruits in water:— ‘Before I enter into the particulars of raising pine-apples in water, it will be necessary to tell you that my hot-house is covered with the best crown glass, which I apprehend gives more heat than the common sort of green glass generally used in hot-houses. In the front part of the house, and indeed anywhere in the lowest part of it, the pine-apple will not thrive well in water. The way in which I treat them is as follows:— I place a shelf near the highest part of the back wall, that the pine plants may stand without absolutely touching the glass, but as near it as can be: on this shelf I place pans full of water, about seven or eight inches deep; and in these pans I put the pine-apple plants, growing in the same pots of earth as they are generally planted in, to be plunged into the bark-bed in the common way, that is, I put the pot of earth, with the pine plant in it, in the pan full of water, and as the water decreases I constantly fill up the pan. I place either plants in fruit, or young plants as soon as they are well rooted, in these pans of water, and find they thrive equally well: the fruit reared this way is always much larger as well as better flavored than when ripened in the bark-bed. I have more than once put only the plants themselves without any earth, I mean after they had roots, into these pans of water, with only water sufficient to keep the roots always covered, and found them flourish beyond expectation.— In my house, the shelf I mention is supported by irons from the top, and there is an intervening space of about ten inches between the back wall and the shelf. A neighbour of mine has placed a leaden cistern upon the top of the back flue (in which, as it is in contact with the flue, the water is always warm when there is fire in the house,) and finds his fruit excellent and large. My shelf does not touch the back flue, but is about a foot above it; and consequently only warmed by the air in the house. Both these methods do well. The way I account for this success is, that the warm air always ascending to the part where this shelf is placed, as being the highest part of the house, keeps it much hotter than in any other part. The temperature at that place is I believe seldom less than what is indicated by 73° of Fahrenheit’s thermometer, and when the sun shines is often above 100°: the water the plants grow in seems to enable them to bear the greatest heat, if sufficient air be allowed; and I often see the roots of the plants growing out of the holes in the bottom of the pot of earth, and shooting vigorously in the water. My hot-house (the dimensions of which it may be proper to know) is sixty feet long and eleven wide, the flues included, six feet high in the front and eleven feet at the back of the inside of the house. It is warmed by two fires. A leaden trough or cistern on the top of the back flue is preferable to

my shelf, as in it the pine plants grow much faster in the winter, the water being always warmed by the flue; of this I have seen the great benefit these two last months in my neighbourhood. It is not foreign to this purpose to mention, that, as a person was moving a large pine plant from the hot-bed in my house last summer, which plant was just showing fruit, by some accident he broke off the plant just above the earth in which it grew, and there was no root whatever left to it: by way of experiment I took the plant, and fixed it upright in a pan of water (without any earth whatever) on the shelf; it there soon threw out roots, and bore a pine-apple that weighed upwards of two pounds.'

BROMLEY, a town of Kent, situated on the river Ravensbourn, ten miles from London, on the road to Tunbridge. It has an hospital for twenty clergymen's widows, with an allowance of £30 a-year, and £60 per annum to the chaplain. It has fairs Feb. 14th, and Aug. 5th, and a market on Thursday. Near the town is the palace of the bishops of Rochester, where there is a chalybeate spring, of a quality similar to that at Tunbridge. The manor of this place was granted to the bishop by king Edgar, in the year 700. The church is a very old structure.

BROMUS, broom-grass, in botany: a genus of the dygnia order, and triandria class of plants; natural order, fourth, gramina. The CAL. is bivalved, having a partial spike, oblong and round, opposite grains, with an awn below the point of each outer valve. There are thirty-four species, of which seven are natives of Britain, viz. 1. *B. arvensis*, common broom-grass; 2. *B. ciliatus*, wall broom-grass; 3. *B. giganteus*, tall broom-grass; 4. *B. pinnatus*, spiked broom-grass; 5. *B. ramosus*, wood broom-grass; 6. *B. secalinus*, field broom-grass; 7. *B. sterilis*, barren broom-grass.

BROMYARD, a market town of Herefordshire, near the Frome, seated on a rising ground. It has five fairs: market on Monday. It is eighteen miles west of Worcester, and 125 W.N. W. of London.

BRONCHIAL ARTERIES. See ANATOMY.

BRONCHOCELE, DERBYSHIRE NECK. This disease is marked by a tumor on the forepart of the neck, and seated between the trachea and skin. In general it has been supposed principally to occupy the thyroid gland. It is a very common disorder in Derbyshire, and amongst the inhabitants of the Alps, and other mountainous countries bordering thereon. The cause which gives rise to it, is by no means certain; but it is commonly attributed to the water of the place. The swelling is generally without pain, or any evident fluctuation; but when the disease is of long standing, and the swelling considerable, it is a very difficult matter to effect a cure by medicine, or any external application; and it is dangerous to attempt its removal with a knife, on account of the enlarged state of its arteries.

Although relief has been occasionally obtained by blisters, mercurial plasters, &c. yet the best mode of cure is to exhibit internally burnt sponge, in the form of a lozenge; every night for three weeks, one of the troches should, when the patient is in bed, be put under the tongue,

suffered to dissolve gradually, and the solution swallowed. The disgust at first arising from this remedy soon wears off. Sulphuretted potassa dissolved in water, in the proportion of thirty grains to a quart daily, is a remedy which has been employed by Dr. Richter with success. The sodæ subcarbonas, being the basis of burnt sponge, is now frequently employed instead of it, and, indeed, it is a more active medicine.

BRONCHOTOMY, in surgery, from *βρογχος* and *τομή*; is the operation of cutting into the trachea or wind-pipe. This may be practised with greater or less chance of success, in cases where a patient is in danger of suffocation, from an obstacle in the trachea, or a constriction of the glottis. Also where the trachea is compressed by a tumor externally, or where the tonsils and parts adjacent become so enlarged as to impede respiration. In short, should any mechanical cause be supposed to exist, of threatening suffocation and impending death, the surgeon's duty will be too plain and imperious to admit of hesitation: an incision must be made into the trachea without a moment's delay, unless some other obvious remedy can be suggested for the patient's restoration.

The following has been recommended as one of the best modes of performing it:—The patient is placed upon a low stool, or in that posture in which he finds it most easy to breathe; his head is held upright, but by no means bent backwards, and secured by an assistant. Opposite the third or fourth cartilaginous ring of the trachea, the skin is now drawn up into a high cross fold; and it is cut through exactly at the middle of the trachea, to such a depth, that when the fold is let go, the incision extends itself longitudinally from the first cartilaginous ring down to near the upper extremity of the sternum. By making the incision of a proper length, the operation will be greatly facilitated, as its edges can then be drawn farther from each other.

As soon as the hæmorrhage has been entirely stopped, that part of the trachea, where the incision is finally to be made, must be laid bare, by dissecting away the cellular substance and muscular fibres situated about the membranous interstice between the third and fourth ring, and by either entirely removing them or pressing them sideways. The operator then places the nail of the fore-finger of his left hand upon this interstice; and, applying the thumb and middle finger of the same hand to both sides of the trachea, he pushes the point of his instrument, which must previously be dipped in some fresh oil of almonds, along the nail of his fore-finger, through the above-mentioned membranous interstice, between the third and fourth cartilaginous ring, into the trachea. He then applies the fore-finger of his left hand to one or the other of the cartilaginous rings, close to the tube or canula, in order to hold it back whilst he withdraws the blade of his instrument. If we make use of Richter's curved instrument, we must move the hand upwards in pushing it in, in order that we may turn the point of the instrument downwards, and prevent its touching the back part of the trachea.

But in order that we may prevent the tube

from slipping out of the wound, and also to prevent its moving to and fro in the trachea, several dossils are introduced above and below into the wound, so as to keep the lips asunder. To the rings, on both sides of the external opening of the tube, two narrow slips of linen are applied, which press the rings down upon the trachea; and the whole is covered and secured with adhesive plaster. And that none of the fluids which are collected in the wound may make their way into the canula and wind-pipe, the patient must lie or sit inclined on one side, and the wound must, from time to time, be wiped dry with a sponge. When the tube fills with mucus, it must be cleaned with a small feather; or two such tubes may be employed, one enclosing the other, and either of them removed, when necessary, for the purpose of clearing it of mucus.

An improvement upon the instruments employed has been proposed by Mr. Benjamin Bell, or one which has nearly the form of a flat straight trocar, and ought never to be less than two inches in length. Before it is pushed between the two cartilages, it must first be thrust through several linen compresses, which not only serve to cover the pledgit of ointment intended to protect the wound, but also produces the advantage that (by removing one or more of the compresses, which may be done by cutting them open at the sides with a pair of scissors), we are able to increase the length of the tube at pleasure. In order to secure the tube in the situation where it is left after the operation, he passes it through an opening in a plate of polished steel, which is curved so as to fit to the shape of the fore-part of the neck, and fastened behind with straps and a buckle. To prevent any foreign substance from getting through the orifice of the canula into the trachea, it may be covered with a piece of fine gauze, which should previously be wetted, that the dust may not penetrate through it, but stick to the outside. When the cause which gave rise to the operation has been removed, and the patient can again breathe through his mouth, the tube is withdrawn, and the orifice healed up like any other wound of the wind-pipe; in doing which great caution should be used, lest any thing should get into the trachea.

BRONCHUS, the trachea, or wind-pipe. See ANATOMY.

BRONKHORST (John Van), an eminent painter of the seventeenth century, born at Utrecht. He studied under Cornelius Poelenburg, whose style he imitated with great success. He painted both history and landscapes; and his pictures, which are very highly finished, are held in great esteem.

BRONTES, in mythology, one of the cyclops, who was employed by Vulcan to make Jupiter's thunder-bolts.

BRONTES, in entomology, a small species of papilio. The wings are subcaudated and fuscous, with a band on the first pair, and margin of the second snowy white. Found in Africa.

BRONTEUM, in Grecian antiquity, a place underneath the floor of the theatres, in which were kept brazen vessels full of stones and other materials, with which they imitated the noise of thunder.

BRONTEUS, in mythology, an epithet of Jupiter; applied also to Bacchus.

BRONTIE, or thunder stones, in natural history. See BELEMNITES.

BRONTOLOGY denotes an explanation of the causes, phenomena, &c. of thunder. See ELECTRICITY and THUNDER.

BRONZE, *v. & n.* Ital. *bronzo*; Fr. *bronze*; Pers. *burinj*, perhaps from Goth. *bruna*; Fr. *brunir*, to burnish; and Lat. *as*. See BRASS, COPPER COLOR.

Imbrowned with native *bronze*, lo! Henley stands,
Tuning his voice, and balancing his hands. *Pope.*

I view with anger and disdain,
How little gives thee joy or pain;
A print, a *bronze*, a flower, a root,
A shell, a butterfly can do't. *Prior.*

BRONZE, a compound of copper and tin, to which sometimes other metallic substances, particularly zinc, are added. This metal is brittle, hard, and sonorous. It is employed for making bells, cannons, statues, &c. and the proportions of the metals are varied to suit the several purposes to which it is applied. This compound, like some others, is specifically heavier than either of the metals taken separately. A metallic mass, composed of four-fifths of copper and one-fifth of tin, weighs seven and one-tenth grains more than the same quantities of these two metals would together weigh if not alloyed. This proves, that in the union of copper and tin there is a penetration of parts, the one metal entering into the pores of the other; and this is further confirmed by an observation of Mr. Tillet, member of the Royal Academy of Sciences. In his memoir concerning the ductility of metals, he takes notice, that when the mixture of copper and tin is made in the proportions above mentioned, the color of the copper is entirely annulled and covered by that of the tin, although the quantity of the first be four times greater; and this singular effect cannot be understood without admitting a total change in the size and disposition of the pores of the compound metal. Tin being less subject to rust than copper, bronze is also found to be less liable to be covered with verdigris than pure copper is; and this is one reason why it is used for cannons, statues, and works exposed to the air and weather. The greater fusibility of bronze than copper is also an advantageous property, and much facilitates the casting of large works. The operation of casting large works in bronze is a work of considerable difficulty, and requires much scientific knowledge and great practice. Macquer directs a brick furnace to be erected, nearly in the shape of a baker's oven. The floor of this oven is concave, and consists of a composition of sand and clay; on which the metals are placed. The furnace has four openings. The first is a lateral mouth, at which the flame of the fuel enters. The second is a chimney placed on the side opposite the mouth, by means of which the flame is drawn over the metal. The third opening is a hole, which can be opened or shut at pleasure, to inspect the state of the contents of the furnace. When the metal is in the required state, a fourth aperture is opened, communicating with the hollow floor, through which the metal flows by

channels into the moulds prepared to receive it. These moulds are made on the model of the figure intended to be cast, with a mixture of one part of plaster of Paris, and two parts of brick-dust. The mould is then to be taken from the figure, and lined on the inside with a thin layer of clay, the thickness the bronze is intended to be; the mould is then to be put together, and the cavity within the clay filled with a similar composition to the mould which forms the core, which, if large, must be previously supported by bars of iron. When this is done, the mould is to be taken off, the clay thoroughly cleaned out, and the mould and core completely dried; the mould is then to be placed thereon, and the vacuity formed by the removal of the clay is the channel for the metal, in a state of fusion, which must be properly conducted to it, and care taken that proper vents are left in the mould for the expansion of the air by the heat of the metal. The equestrian statue of Louis XIV. in the Place de Vendôme at Paris, is one of the largest pieces of bronze sculpture ever made. This colossal group contains upwards of 60,000 lbs. weight of bronze. Many fine specimens of ancient bronze, as statues, penates, vessels, &c. are to be seen in the collection of the BRITISH MUSEUM, which see.

BRONZE also denotes a color prepared by the colormen of Paris, wherewith to imitate bronze. There are two sorts, the red bronze and the yellow or golden. The latter is made solely of copper dust, the finest and brightest that can be got; the former is made of the same, with the addition of a little red ochre well pulverised. They are both applied with varnish. To prevent their turning greenish, the work must be dried over a chafing dish as soon as bronzed.

BRONZING, the art or act of imitating bronze, which is done by means of copper-dust or leaf, fastened on the outside, as gold leaves are in gilding.

BRONZITE, a massive mineral of a pseudo-metallic lustre, frequently resembling bronze; structure lamellar, with joints parallel to the lateral planes of a rhomboidal prism; the fragments are streaked on the surface. It is opaque in mass, but transparent in thin plates. White streak; somewhat hard, but easily broken. Specific gravity, 3.2. It is composed of 60 silica, 27.5 magnesia, 10.5 oxide of iron, and 0.5 water. It is found in large masses in beds of serpentine, near Kranbat, in Upper Stiria; and in a syenitic rock in Glen Tilt, in Perthshire.

BROOCH. See BROACH. A jewel; an ornament of jewels.

A broche she bare upon hire low colere.

Chaucer's *Canterbury Tales*.

But, natheles, this markis hath do make

Of gemmes sette in gold and in azure,
Broches and rings, for Grisildes sake. *Id.*

Ay, marry, our chains and our jewels.—

Your brooches, pearl, and owches. *Shakspeare.*

Richly suited, but unseasonable; just like the brooch and the toothpick, which we wear not now. *Id.*

I know him well; he is the brooch, indeed,
And gem of all the nation. *Id.*

BROOD', v. & n. } Lat. *incubo*; Belgic,
Brood'Y. } *broedan*; Swed. *brodd*, a
bud; Teut. *brut*; Sax. *brod*, byrd. See BUD,
BRUT, and BRING. To produce young; to hatch;
to set on eggs; to meditate. The noun whence
it is derived, signifies the young of animals, particularly of birds.

And therein sate a ladie passing faire
And bright, that seemed borne of angels brood.

Spenser.

Something's in his soul,
O'er which his melancholy sits on brood;

And I doubt the hatch and the disclose
Will be some danger. *Shakspeare.*

Such things become the hatch and brood of time.

Id.

Ælian discourses of storks, and their affection toward their brood, whom they instruct to fly.

Broune's Vulgar Errors.

It was the opinion of Clinias, as if there were ever amongst nations a brooding of a war, and that there is no sure league but impuissance to do hurt. *Bacon.*

Thou from the first

Wast present, and with mighty wings outspread,

Dove-like sat'st brooding on the vast abyss,

And madest it pregnant. *Milton.*

Meanwhile the tepid caves, and fens, and shores,
Their brood as numerous hatch, from the egg that soon

Bursting with kindly rapture forth disclosed

Their callow young. *Id.*

Where brooding darkness spreads her jealous wings,

And the night raven sings. *Id.*

Or any other of that heavenly brood,

Let down in cloudy throne to do the world some good. *Id.*

Here nature spreads her fruitful sweetness round,

Breathes on the air, and broods upon the ground.

Dryden.

Defraud their clients, and, to lucre sold,

Sit brooding on unprofitable gold. *Id.*

Of crowds afraid, yet anxious when alone,

You'll sit and brood your sorrows on a throne. *Id.*

I was wonderfully pleased to see the different workings of instinct in a hen followed by a brood of ducks. *Spectator.*

The common hen, all the while she is broody, sits, and leads her chickens, and uses a voice which we call clocking. *Ray.*

Bears, wolves, and all the savage brood,

Have dyed the regal den with blood. *Gay.*

BROOK, v. Goth. *bruka*; Sax. *brucan*; Teut. *brauchen*; Dan. *bruge*; Belgic, *bruiken*. See To BREAK. To accustom, endure, habituate, use; to digest; to enjoy.

Put, for men spoke of singing, I wol sey,

(So mote I brouken well mine eyen twey,)

Save you, ne herd I never man so sing

As did your fader in the moevening.

Chaucer's Canterbury Tales.

Even they, which brook it worst that men should tell them of their duties, when they are told the same by a law, think very well and reasonably of it.

Hooker.

He, in these wars, had flatly refused his aid; because he could not brook that the worthy prince Plangus was, by his chosen Tiridates, preferred before him. *Sidney.*

A thousand more mischances than this one

Have learned me to brook this patiently. *Shakspeare.*

Heaven, the seat of bliss,

Brook: not the works of violence and war.

Milton.

Restraint thou wilt not *brook*; but think it hard,
Your prudence is not trusted as your guard. *Dryden.*

BROOK', *n* } Goth. *broka*; Sax. *bruck*; Bel-
BROOK'Y. } *gie, brock*; Pers. *birku*. A small
stream; a rivulet.

And to the launde he rideth him ful right,
Ther was the hart ywont to have his flight;
And over a *brooke*, an so; forth on this wey.

Chaucer's Canterbury Tales.

A substitute shines brightly as a king,

Until a king be by; and then his state

Empties itself, as doth an inland *brook*

Into the main of waters.

Shakespeare.

Springs make little rivulets; those united make
brooks; and those coming together, make rivers,
which empty themselves into the sea. *Locke.*

BROOKE (Henry), an Irish writer of some eminence, was born in Dublin, 1706, and educated by Dr. Sheridan. Early in life he entered of the Temple, London, and numbered among his friends, Pope and Swift. On his return to Ireland, he was entrusted with the guardianship of a female cousin, whom he married, and the young lady became a mother before she had attained the age of fourteen. He now returned to London, and wrote *On Universal Beauty*, a poem. After this he practised as a chamber council in Ireland, and wrote his *Gustavus Vasa*, which government would not allow the theatres to perform; thus rendering it so popular, that he obtained a large sum by its publication. He now attached himself to the opposition and the politics of Frederick, prince of Wales; but, finding his means inadequate to his support, returned once more to a life of privacy in Ireland. Here he wrote *The Earl of Westmoreland*, a tragedy, followed by his *Farmer's Letters*, addressed to the people of Ireland, in reward for which the earl of Chesterfield, then lord-lieutenant, made him barrack-master. In 1747 he assisted in Moore's *Fables for the Female Sex*; and produced his *Earl of Essex*, a tragedy, in 1749. In 1762 he wrote a prose vindication of his countrymen, entitled, *The Trial of the Roman Catholics*. But his most celebrated work was *The Fool of Quality*, which appeared in 1766, and attracted, from the first, much attention. He, about this time, became embarrassed, and under the necessity of selling his paternal lands. Shortly after, the loss of his wife, who died at Kildare, gave an irreparable shock to his intellects. He followed her to the tomb in 1783. He wrote some minor pieces, which plainly indicated the approach of his last attack.

BROOKE (James), an ingenious writer, who succeeded the celebrated Wilkes in the publication of the *North Briton*. He was a man of talent, intimate with Johnson, Garrick, Lloyd, Murphy, &c. and the author of a great number of political pamphlets, prologues, epilogues, songs, &c. of temporary interest, but said to have been often very spirited and humorous. The fund of wit and anecdote which he had accumulated, made him a most agreeable companion. He died after a short illness, at the age of eighty, in Rathbone Place, London, 1807.

BROOKE (Mrs. Frances), daughter of the Rev.

Mr. Moore, was a lady as remarkable for her virtues, and her suavity of manners, as for her great literary accomplishments. Her first literary work was the *Old Maid*, a periodical paper, begun in 1755, and collected in one volume, 12mo. The next year she published *Virginia*, a tragedy; and in 1763 came out *Julia Mandeville*, a work concerning which there were various opinions, but which was read with eagerness. The same year appeared *Letters from Juliet*, Lady Catesby, to Lady Campley, translated from the French. She soon afterwards went to Canada with her husband, who was chaplain to the garrison at Quebec; and the romantic characters and scenes which she here found, gave birth to *Emily Montague*, a work which has passed through several editions, and is now not easily met with. On her return to England, accident introduced her to Mrs. Yates, and an intimacy was contracted, which terminated only with the life of that lady. Mrs. Brooke, in consequence of this connexion, formed an acquaintance with Garrick, and wrote some pieces for the stage, which he rejected, and thus incurred the resentment of the authoress, who revenged herself upon the manager in a novel, entitled *The Excursion*. Her next work was the *Siege of Sinope*, a tragedy, introduced by Mr. Harris, but it never became popular. Her next and most popular production was *Rosina*, which she presented to Mr. Harris. Few modern pieces have been equally successful. Her musical piece entitled *Marian*, was next introduced, and exhibited. Mrs. Brooke also translated several books from the French. She was very intimate with Dr. Johnson, Miss Seward, and most of the first characters of her time. She died in January, 1789, two days after her husband, who enjoyed the rectory of Colney in Norfolk, to which he had been preferred after his arrival from America.

BROOKE (Sir Robert), lord chief justice of the common pleas, was the son of Thomas Brooke, Esq. of Claverly, in Shropshire, and educated at Oxford; whence he removed to the middle temple, and soon became a very eminent lawyer. In 1552 he was made serjeant at law; and in 1553, the first of queen Mary, lord chief justice of the common pleas; about which time he was knighted. He was also appointed recorder of London, and speaker of the House of Commons. He died at Claverly in 1558, with the character of an upright judge. His works are: 1. An Abridgment containing an Abstract of the Year-books till the time of queen Mary. 2. Certain cases adjudged in the reign of Henry VIII. Edward VI. and queen Mary. 3. Reading on the Statute of Limitations, 32 Henry VIII. c. 2.

BROOK'LIME, *n. s.* Lat. *becabunga*. A sort of water speedwell, very common in ditches.

BROOKLYN, a handsome town of Long-Island; pleasantly situated in King's county, opposite New York city. It contains a Presbyterian, and a Dutch Reformed church.

BROOM' *n.* } Teut. *broem*; Sax. *brom*;
BROOM'Y, } Belgic, *brem*; Goth. *bry*;
BROOM'LAND, } Welch, *ber*. A point, a
BROOM'STAFF, } prickle; a shrub; a species
BROOM'STICK, } of genista. It is applied to a
besom, because made of twigs of broom.

They fell on; I made good my place; at length they came to the *broomstaff* with me: I defied 'em still.

Shakspeare.

Not a mouse

Shall disturb this hallowed house;

I am sent with *broom* before,

To sweep the dust behind the door. *Id.*

If they came into the best apartment, to set any thing in order, they were saluted with a *broom*.

Arbutnot.

Even humble *broom* and osiers have their use,

And shade for sheep, and food for flocks, produce.

Dryden.

From the age

The children tread this worldly stage,

Broomstaff or poker they bestride,

And round the parlour love to ride. *Prior.*

Sir Broom pointed at something behind the door, which I found to be an old *broomstaff*. *Spectator.*

I have known sheep cured of the rot, when they have not been far gone with it, by being put into *broomlands*. *Mortimer.*

If land grow mossy or *broomy*, then break it up again. *Id.*

When I beheld this, I sighed, and said within myself, 'Surely mortal man is a *broomstick*.'

Swift's Meditation on a Broomstick.

BROOM, in botany. See GENISTA.

BROOM, AFRICAN. See ASPALATHUS.

BROOM, BUTCHER'S, in botany. See RUSCUS.

BROOM, SPANISH, in botany. See SPARTIUM.

BROOME (William), the coadjutor of Pope in translating the *Odyssey*, was born in Cheshire, of poor parents. He was educated at Eton, and was captain of the school a whole year, by which he might have obtained a scholarship at King's College, had there been a vacancy. He was therefore sent to St. John's College, by the contribution of his friends, where he obtained a small exhibition. He appeared early in the world, as a translator of the *Iliad* into prose, in conjunction with Ozell and Oldisworth; was introduced to Mr. Pope, when visiting Sir John Cotton at Madingley, near Cambridge; and was employed by him to make extracts from Eustathius, for the notes to the translation of the *Iliad*. In the volumes of poetry published by Lintot, commonly called Pope's *Miscellanies*, many of his early pieces were inserted. When the success of the *Iliad* gave encouragement to a version of the *Odyssey*, Pope, weary of the toil, called Fenton and Broome to his assistance; and taking only half the work upon himself, divided the other half between his partners, giving four books to Fenton and eight to Broome. The price at which Pope purchased this assistance was £300 paid to Fenton, and £500 to Broome, with as many copies as he wanted for his friends, which amounted to £100 more. A difference afterwards arose between Pope and Broome, which was carried so far, as to induce the former to give his old friend a place in the *Dunciad*. It has been said that they were afterwards reconciled; but it was peace without friendship. He afterwards published a *Miscellany of Poems*, but never rose to any high dignity in the church. He was some time rector of Sturston in Suffolk, where he married a wealthy widow; and after-

VOL. IV.

wards, when the king visited Cambridge, in 1728, became LL.D. He was, in 1733, presented by the crown to the rectory of Pulham in Norfolk, which he held with Oakley Magna, in Suffolk, given him by Lord Cornwallis, to whom he was chaplain, and who added the vicarage of Eye, in Suffolk. He amused himself with translating Odes of Anacreon, which he published in the *Gentleman's Magazine*, under the name of Chester. He died at Bath in 1745.

BROOM FLOWER, KNIGHTS OF THE, (*Ordre de la Geneste*) a ci-devant order of knights, instituted by St. Louis, of France, on occasion of his marriage. The motto was *Exaltat humiles*; and the collar of the order made up of broom flowers and husks, enamelled and intermixed with fleur-de-lys of gold, set in open lozenges, enamelled white, chained together, and a cross florence of gold hung at it. Some speak of another order of the broom, established by Charles Martel, or rather Charles VI.

BROOM GALL, in natural history, a remarkable species of galls found on the common broom; occasioned, like all other galls, by the puncture and eating of an insect. When opened they are found to contain a small oblong worm, of a red color, but whose size requires a glass to see it distinctly. See GALL.

BROOS, or Bros, a free town of Transylvania, well-built, containing a spacious casle, and about 3200 inhabitants. It is one of the seven royal towns of the Saxon settlers, has a seat and vote at the provincial diet, and is inhabited by Saxon Lutherans, and Hungarian Calvinists. There are besides churches for Catholics and Greek Christians; the Calvinists have an academy. The inhabitants rear corn, wine, and fruit. It lies south-west of Weissenburg, near the Marosch.

BRORA, a lake of Scotland, in the county of Sutherland, four miles long and one broad. At two different places it is so much contracted, as to exhibit the appearance of three lakes. It is environed on both sides with lofty mountains, villages, and natural wood. In the middle of it is an island of an oblong square figure, which, tradition says, was artificially constructed on an immense collection of stones brought there on purpose. One half of it was appropriated for lodgings in time of war, and the other laid out for a garden. The walls are still pretty high, and ascend perpendicularly from the surface of the water, without a vestige of the island behind them; and are only accessible by two stairs, which front the south and east, so that with plenty of stores, and the fishing of the loch, abounding with salmon, trout, and eel, the place was impregnable, when properly defended.

BROSCHI (C.), better known by the adopted name of Farinelli, was born in Naples in 1705, and suffered emasculation in consequence of an accident. Obtaining great applause on the Italian theatres, he came to London, and added considerably to his fame and fortune. He then went to Madrid, and gained the favor of Philip V. and his successor, who conferred on him the order of Calatrava. He is said to have been a man of great probity and charity. On the death

2 Q

of his patron he retired to Bologna, where he died in 1782.

BROSIMUM, in botany, a genus of class diœcia: order monandria: amentum globular, dotted with orbicular peltate scales: cor. none: male, solitary filament, between the scales; female, cloven style, and one-seeded berry: species two: both Jamaica plants. *B. spurium* is propagated in our own gardens under the name of milk-wood.

BROSME, in ichthyology, a species of gadus, that inhabits the southern seas of Greenland. The mouth is bearded; tail oval, and pointed.

BRUSSEA, in botany, a genus of plants; order monogynia, of the class pentandria. The characters are these: *cal.* one-leaved perianthium, divided into five segments, each of which terminates in a long point, of the same length with the petals: *cor.* monopetalous, of the shape of a truncated cone, and undivided at the edge: the germen is divided into five parts: the style is pointed, not so long as the flower, and its stigma simple: *per.* a roundish capsule, divided by five deep furrows into five cells; it is covered with a large cup, which closes over its top; it is succulent and fleshy; and, opening at the side, discharges a great number of seeds. *Sp. B. coccinea*, Linn. Shrubby, with a scarlet flower and black fruit, Plum. A shrub three or four feet high. Root branched; leaves alternate, petioled, sharply ovate, slightly toothed, smooth, pale green; flowers in racemes at the end of the branches, alternate, peduncled, with two bractea about the middle of the peduncles.

BROSSARD (Sebastian de), an eminent French musician. In the former part of his life he had been prebendary and chapel master of the cathedral church at Strasburg; but afterwards became grand chaplain, and also maitre de chapelle, in the cathedral of Meaux. He published a work entitled *Prodromus Musicalis*; and a very useful book entitled *Dictionnaire de Musique*, printed at Amsterdam, in folio, 1703. He died 1730, aged seventy.

BROSSETTE (Claude), a learned French advocate, born at Lyons in 1671. He was keeper of the public library at Lyons; and published the works of Boileau and Regnier, with historical illustrations. He wrote also *L'Histoire Abregée de la Ville de Lyons*; an elegant and correct work. He corresponded with many eminent literati, particularly Voltaire and Rousseau. He died at Lyons in 1746, aged seventy-three.

BROSSIER (Martha), a French woman, who, about the end of the sixteenth century, pretended to be possessed by the devil, and counterfeited convulsive fits. Her father was a weaver at Romorentin, but found he could gain more, in that credulous age, by exhibiting his daughter as a dæmoniac, than by following his honest and useful profession. She was first detected at Orleans, in 1598; and afterwards at Angers. Notwithstanding which, the credulity of the public was such, and some of the priests acquired so much reputation by exorcising the evil spirit, that Henry IV. enjoined the parliament of Paris to take cognizance of the affair; who,

after a consultation of physicians, ordered the father and daughter to be confined to Romorentin, under pain of corporal punishment. The priests, however, carried the business and the parties before the court of Rome; but the pope, being forewarned by the court of Paris, did nothing contrary to the decision of the parliament. Some of the French priests lost their benefices by their villainous zeal; and the pretended dæmoniac and her father died in deserved contempt in an hospital at Rome.

BROTH, *n. s.* Sax. bpoð. Liquor in which flesh is boiled; but originally any liquid preparation of sodden herbs or meal. See *To BREW*.

You may make the *broth* for two days, and take the one half every day. *Bacon*

Instead of light desserts and luscious froth,
Our author treats to-night with Spartan broth.

Snotherne.
If a nurse, after being sucked dry, eats *broth*, the infant will suck the *broth*, almost unaltered. *Arbutnot.*

BROTHER,
BROTHERLY,
BROTHERLING,
BROTHERHOUSES. } From *bordell* by transposition of the letter *r*.
A house of lewd entertainment; a bawdy-house.

Perchance

I saw him enter such a house of sale,
Videlicet, a *brothel*. *Shakespeare.*

Then courts of kings were held in high renown,
Ere made the common *brothels* of the town:
Their virgins honourable vows received,
But chaste as maids in monasteries lived. *Dryden.*

From its old ruins *brothelhouses* rise,
Scenes of lewd loves and of polluted joys. *Id.*
The libertine retires to the stews and to the *brothel*. *Rogers.*

BROTHER,
BRETHREN,
BROTHERHOOD,
BROTHERLESS,
BROTHERLIKE,
BROTHERLOVE,
BROTHERLY, *adj. & adv.*
BROTHERBEAST,
BROTHERYOT,
BROTHERWRITER, } Goth. *broder*;
Mod. Goth. *brothor*;
Teut. *bruder*; Sax.
brothur; Swed. *broder*;
Dan. *broder*;
Belgic *broeder*; Persian *broder*, *birader*;
Heb. *berith*; *φρατερ*;
Slav. Russ. *Bo-*
hem. *bradr*, *brath*;

Arm. *braud*; Welsh *brodor*; Irish *bruther*; Lat. *frater*; Ital. Span. Port. *frate*; Fr. *frere*; Goth. *bryd*, *byrd*: *βρω*, a fetus; Welsh *bru*, the womb: Chal. Heb. Per. *Syr. bar*, a child, are all cognates of our verb to bear. See *BRAT*, *BAIRN*, *BIRTH*. A male of children born of the same parents. In a theological sense it is used for the species, for men in general. More commonly it is applied to persons closely united in one object, associated for any common purpose, engaged in similar pursuits and professions; bearing mental, moral, or social resemblance. The adjective expresses kindness; the fondness of a brother.

He also that is slothful in his work, is *brother* to him that is a great waster. *Proverbs.*

I will eat no meat while the world standeth, lest I make my *brother* to offend. *Corinthians.*

In all this mene while, she ne stent
This maide and eke her *brother* to commend
With all hire herte, in ful benigne intent,
So wel that no man coude her priese amend.

Chaucer's Canterbury Tales.

And to those *brethren* sayd, Rise! rise! bylive!
 And unto battail doe yourselves addresse;
 For yonder comes the prowtest knight alive,
 Prince Arthur, flower of grace and noblesse.

Spenser.

We few, we happy few, we band of *brothers*;
 For he to-day that sheds his blood with me,
 Shall be my *brother*.

Shakspeare.

I speak but *brotherly* of him; but should I anat-
 omize him to thee as he is, I must blush and weep.

Id.

Be sad, good *brothers*;

Sorrow so royally in you appears,

That I will deeply put the fashion on. *Id.*

Whilst kin their kin, *brother* the *brother* foils,

Like ensigns all against like ensigns bend. *Daniel.*

These two are *brethren*, Adam, and to come

Out of thy loins. *Milton.*

Ah! never could he hope once to repair

So great a wane, should not that new-born son

Adopt him both his *brother* and his heir.

Fletcher's Purple Island.

Those tents thou saw'st so pleasant, were the tents
 Of wickedness, wherein shall dwell his race

Who slew his *brother*. *Milton.*

See how it weeps! the tears do come,

Sad, slowly, dropping like a gum;

So weeps the wounded balsam; so

The holy frankincense doth flow.

The *brotherless* Heliades

Melt in such amber tears as these.

Marvell. Wounded Faun.

The lamest cripples of the *brothers*

Took oaths to run before all others. *Hudibras.*

He was a priest, and looked for a priest's reward;
 which was our *brotherly* love, and the good of our souls
 and bodies. *Bacon.*

Though more our money than our cause

Their *brotherly* assistance draws. *Denham.*

There was a fraternity of men at arms, called the
brotherhood of St. George, erected by parliament, con-
 sisting of thirteen of the most noble and worthy per-
 sons. *Davies.*

My father was to Giaffir all

That Selim late was deemed to thee,

That *brother* wrought a *brother's* fall,

But spared—at least, my infancy.

Byron. Bride of Abydos.

BROTHER, a term of relationship applied to a male, among children sprung from the same father, or mother, or both. Scaliger and Vossius derive frater from *φρατηρ*, for *φρατωρ*, a person who draws water in the same well; *φρατωρ*, in Greek, signifying a well, and *φρατρια*, a company of people, who have a right to draw water out of the same well. The word, it is said, came originally from Argos, where there were only a few wells distributed in certain quarters of the city, to which those of the same family or neighbourhood alone repaired. Consistently with this derivation, the ancients applied the term brother to almost all who stood related in the collateral line, as uncles, nephews, cousins german, &c. Cicero, in his *Phillippics*, says, 'Antonia was both wife and sister of Mark Anthony; because she was daughter of his brother C. Antonius;' and Tullus Hostilius, in Dionysius Halicarnasseus, calls the Horatii and Curiatii, brothers; because they were sisters' children. The language of the Hebrews was similar, 'We are brethren,' says Abraham to Lot, Genesis xiii.

8, whereas Lot was only his nephew. So Jacob told Rachel that he was her father's brother, Genesis xxix. 12, whereas he was only her father's nephew.

BROTHERS, fratres, in the civil law, sometimes comprehend sisters: as Lucius and Titia, fratres; tres fratres, Titius, Mævius, and Seia. By the civil law, brothers and sisters stand in the second degree of consanguinity; by the canon law they are in the first degree.—By the Mosaic law the brother of a man who died without issue was obliged to marry the widow of the deceased.—Deut. xxv. 7.

BROTHER, FOSTER, those who suck the same nurse. The French call them freres du lait, or brothers of the milk.

BROTHERS OF ARMS, an appellation given those who contract a kind of fraternity in war, obliging themselves to the mutual service and assistance of each other. In the military orders, the knights are also called brothers.

BROTHERS OF DEATH, those of the order of St. Paul, so named from the figure of a death's head which they always had about them.

BROTHERS OF ST. ALEXIS, in the Low Countries, were an order of persons who attended on those who lay dying, and took care of the burial of the dead.

BROTHERS, POOR, in the Chartreuse, or, as it is more commonly called the Charter House, a denomination given to decayed gentlemen, to the number of eighty, who are subsisted with diet, clothing, and lodging, on the establishment. The poor brothers are to be gentlemen of descent, come to poverty, or decayed merchants, soldiers, or officers of the king's household. The conditions of admission are, that they have no estate for life worth £200, nor coming in, viis et modis, £24 per annum; and that they be fifty years old, unless they have been maimed in the public service; in which case, the age of forty suffices. They wear a livery gown within doors.

BROTHERS, SERVING, fratres clientes, a class of knights in the order of Malta, consisting of such as cannot give proof of their nobility.

BROTHEUS, in mythology, a son of Vulcan, said to have been remarkably deformed; and on that account to have thrown himself into the abyss of Mount Etna.

BROTIER (Gabriel), a learned classic, and French Jesuit, was born in 1723, at Tanay, a small town in the Nivernois. For several years he held the situation of librarian to the college of his order in Paris, and, on its dissolution, retired to the house of M. De la Tour, an eminent printer, where he passed the last twenty-six years of his life; dying at Paris, February 12th, 1789. His principal works are: *Examen de l'Apologie de M. L'Abbé de Prades*, 8vo. 1753; *Conclusions ex universa Theologia*, 4to. 1754; a Treatise on the Ancient Hebrew, Greek, and Roman Coins, 4to. 1760; *Prospectus of an Edition of Tacitus*, in 5 vols. 4to. 1761; an improved edition of the works of that author, in 4 vols. 4to. printed in 1771, and a supplement to the seventh and tenth books of his annals, 8vo. 1775; *Cl. viri de la Caille Vita*, 4to. 1763; an edition of Pliny's Natural History, 6 vols. 12mo

1779; another of Rapin's Poems, On Gardens, to which he subjoined A History of Gardening, 8vo. 1778, and a very complete one of Phædrus, with a comparison between the fables of that writer and those of La Fontaine, 12mo. 1785.

BROTIER (Andrew Charles), a nephew of the above, was also a man of some learning, especially in the science of botany, and published in 1790 a 12mo. volume of *Memoirs*, entitled *Paroles Mémoires recueillies par Gabr. Brotier*. He was for some time editor of *L'Année Littéraire*, a journal during the revolution, but in 1797, becoming obnoxious to the party then in power, was arrested and banished to Cayenne, where he died in 1798.

BROUAGE, a maritime town of France, in the department of the Lower Charente, and cédant province of Saintonge. It is famous for its salt-works, which are some of the finest in the kingdom. It is fifteen miles S.S.E. of Rochelle, and 170 south-west of Paris. Long. $1^{\circ} 4' W.$, lat. $45^{\circ} 52' N.$

BROUGLI, a town in Westmoreland, seated under Stanmore Hill, seven miles from Appleby, and 261 from London. It was formerly a place of great note, being a Roman fortress; but is now much decayed. It contains a neat church, a little distance from the town, in the hamlet of Church-Brough, the pulpit of which is cut out of one entire stone. Near the church are the ruins of an ancient castle, belonging to the Earl of Thanet; part of the tower was standing till 1792, when the greater part fell down. On digging near the ruins, an urn, full of Roman silver coins, was found. On the left of the castle the prospect is closed by a range of craggy mountains, over the tops of which shrubs and trees are promiscuously scattered; to the right is an extensive fertile plain; and behind, the lofty promontory of Wildbore Fell lifts its brow, and terminates the prospect. It is divided into two, the Upper and Lower, and has a market on Thursday, and a fair Thursday before Whitsunday.

BROUGHT. Participle passive of bring.

The Turks forsook the walls, and could not be brought again to the assault. *Knolles.*

The instances brought by our author are but slender proofs. *Locke.*

BROUGHTON (Thomas), a learned divine, and one of the original writers of the *Biographia Britannica*, was born at London July 5th, 1704, in the parish of St. Andrew, Holborn; of which his father was minister. At an early age he was sent to Eton school, where he soon distinguished himself by his acute genius, and studious disposition. He removed about 1722 to the university of Cambridge, where he studied mathematics, under the famous professor Sanderson, and acquired a knowledge of the modern languages. In 1727 he was made A.B. and admitted to deacon's orders. In 1728 he was ordained priest, and took the degree of M.A. when he removed to the curacy of Offley, in Hertfordshire. In 1739 he was instituted rector of Stepington, appointed chaplain to the duke of Bedford, and soon after was chosen reader to the Temple, by which he became known to

bishop Sherlock, who conceived so high an opinion of his merit, that in 1744 he appointed him vicar of Westminster, and not long after prebendary of Westminster and Redcliffe. Upon receiving this preferment he removed from London to Bristol, where he married the daughter of Thomas Harris, clerk of that city, by whom he had seven children, six of whom survived him. He resided on his living till his death, December 21st, 1774, in the seventy-first year of his age. In the course of a long life he published: 1. *Christianity Distinct from the Religion of Nature*, 8vo. 2. *Translation of the Mottoes of the Spectator, Tatler, and Guardian*, 12mo. 3. *The first and third Olynthiæ and four Philippics of Demosthenes revised*, 8vo. 4. *The Bishops of London and Winchester on the Sacrament*, compared, 8vo. 5. *Hercules*, a musical drama. 6. *Bibliotheca Historico-sacra*, or Dictionary of all Religions, 2 vols. folio. 7. *A Defence of the commonly-received Doctrine of the Human Soul*, 8vo. 8. *A Prospect of Futurity*, in four Dissertations, 8vo. 1768. He was a great lover of ancient music, which introduced him to the acquaintance of Mr. Handel, whom he furnished with the words for many of his compositions. In 1778 a posthumous volume of sermons, on select subjects, was published by his son, the Rev. Thomas Broughton, A.M. vicar of Twerton, near Bath.

BROUGHTON'S ARCHIPELAGO, an extensive range of rocky islands, islets, and rocks, in an arm of the Pacific Ocean, on the north-west coast of America; so called from Mr. Broughton, commander of the *Chatham*, who discovered them in 1790, in company with Vancouver. Long. $232^{\circ} 56'$ to $233^{\circ} 40' E.$, lat. $50^{\circ} 33'$ to $51^{\circ} N.$

BROUGHTONIA, in botany, class and order, gynandria monandria; natural order, orchideæ. Essential characters: CAL. petals spreading; cor. attached at the base only to the stalked lip: ANT. a movable lid: masses of pollen four, parallel, divided by complete permanent partitions, and extending at the base into an elastic granulated thread. B. sanguinea, blood-red Broughtonia, a native of Jamaica, is the only known species.

BROUKHUSIUS (Jonas), or John BROEKHUIZEN, a distinguished writer in Holland, was born November 20th, 1649, at Amsterdam, where his father was a clerk to the admiralty. He learned Latin under Hadrian Junius, but his father dying when he was very young, he was placed with an apothecary at Amsterdam, with whom he lived some years. Not liking this profession, he went to the army, where his behaviour raised him to the rank of lieutenant-captain; and, in 1674, he was sent with his regiment to America, in the fleet under admiral de Ruyter, but returned to Holland the same year. In 1678 he was sent to the garrison at Utrecht, where he contracted a friendship with the celebrated Grævius; and here he had the misfortune to be so deeply engaged in a duel, that, according to the laws of Holland, his life was forfeited; but Grævius obtained his pardon from the Stadtholder. Not long after, he became captain of one of the companies then at Amsterdam; which

placed him in an easy situation, and gave him leisure to pursue his studies. His company being disbanded in 1697, a pension was granted him; upon which he retired to a country house near Amsterdam. He died December 15th, 1707. As a classical editor, he is distinguished by his labors upon Propertius and Tibullus, published in 1702 and 1708. A volume of his poems was published at Utrecht, 1684, in 12mo, and an elegant edition of them was given by Van Hoogstraeten at Amsterdam, in 1711, in 4to, who also published his Dutch poems, in 1712, in 8vo. Broukhusius was also editor of the Latin works of Sannazarius and Palæarius.

BROUNCKER (William), lord viscount of Castle Lyons, in Ireland, and the first president of the Royal Society, was the son of Sir William Brouncker, and born about 1620. He was distinguished by his knowledge of the mathematics, and by the considerable posts he enjoyed after the Restoration; being chancellor to the queen, and keeper of her great seal, and one of the commissioners of the navy, &c. He wrote: 1. Experiments of the Recoiling of Guns. 2. An Algebraical Paper upon the Square of the Hyperbola; and several letters to archbishop Usher. He died in 1684.

BROUSSON (Claude), an eminent French protestant martyr, born at Nismes, in 1647. He distinguished himself as an advocate at Castres and Toulouse. The deputies of the Protestants assembled at his house after their churches were demolished, and resolved to continue to meet there. The execution of this resolution, however, as might have been expected, occasioned fresh persecutions and massacres. Brousson retired to Geneva, and afterwards to Lausanne; whence he travelled through the different protestant states, soliciting their assistance and compassion to their suffering brethren in France. Returning to France, he ventured to preach in the Cevennes, and in several provinces: in consequence of which, he was apprehended at Oleron in 1698, and, being convicted of having preached in defiance of the edicts, was broken upon the wheel. He was a man of great eloquence and learning, and wrote many works in favor of the Calvinists: particularly *The State of the Reformed in France*; *Letters to the Clergy of France*; *Letters from the Protestants in France to all other Protestants*; and *Remarks upon Amelot's Translation of the New Testament*. The States of Holland gave him a pension of 400 florins; and, upon his death, added 600 more, making 1000 in all, as a pension to his widow.

BROUSSONET (Pierre-Marie-Auguste), professor of botany at the medical school of Montpellier, and also a member of the Institute, as well as an associate of the Royal Society of London &c. was born at Montpellier, February 28th, 1761. We subjoin the following account of him from the eulogium pronounced by the celebrated Cuvier, at the public session of the Institute of France. His father, François Broussonet, was a professor of medicine there, and his mother's maiden name was Elizabeth Senard-Paquier. From the earliest period of his life he exhibited the promise of great talents; for at eighteen years

of age he was nominated to a chair in the university of the city where he was born; at twenty-four he was unanimously elected a member of the Academy of Sciences, a circumstance which had not occurred from the origin of that body; at a later period, he was chosen an associate of the Institute during his absence, and preserved on the list, notwithstanding his residence in the south of France. He was born in the bosom of a celebrated school; he was the son of a man who exercised, in an honorable manner, the functions of his office. Thus the sciences may be said to have surrounded his cradle; and it was their language which he was first taught to utter. With a view to withdraw his mind from the study of nature, to which he was fondly attached, young Broussonet was sent to a distance from his native home to learn the languages; but on his return, with a view of studying medicine, he employed himself in culling plants during the day, and in dissecting at night. In fine, he encumbered his father's house with productions of every kind, while at the same time he made such a rapid progress in medicine, that he obtained the title of doctor of physic at eighteen years of age. The thesis which he chose on this occasion, had respiration for its object, and was entitled, *Varia positiones circa Respirationem*. The excellence of this composition fully justified the premature honors he received, for it exhibits an admirable specimen of comparative anatomy and physiology; while all the known facts are assembled and illustrated with great judgment. Having repaired soon after to Paris, for the express purpose of obtaining the minister's leave to enter on his new professorship, he met with such opposition on account of his youth, that he resigned all ideas on that subject: and, thinking that natural history presented him a field in which he could distinguish himself, he resolved to apply his time and talents to this subject. Although the eloquence of Buffon had inspired a general taste for the study of nature, it had at the same time deterred the greater part of the scholars from the methods most proper to guide them in respect to it: the zoologists and the mineralogists were not as yet familiarised with the commodious nomenclature and rigorous synonymy of Linnaeus. It appeared as if this great man had written for the botanists alone, and all these, becoming his disciples, constituted a separate class: the example of which then had but a feeble influence in respect to the study of the other kingdoms of Nature; but M. Broussonet, incited by the example of the respectable M. Gouan, with an extraordinary zeal for the pure Linnæan doctrine, resolved to render it victorious in France, and accordingly attached his reputation to the fate of this enterprise. As it is in the distinctions of the species, that the methods adopted by the learned Swede exhibit their superiority, and the collection of Paris did not then afford a sufficient variety to serve as the basis of such important labors, Broussonet determined to visit such foreign cabinets as contained the finest specimens. He accordingly directed his course towards England; the universal commerce of which nation, its immense colonies, its grand maritime expeditions, together with the taste of the king, and several of the

grandees, for natural history, had enabled it, at that period, to form the richest depositories of the productions of the two worlds. Sir Joseph Banks at this time enjoyed that extensive reputation which will render his name immortal in the history of the sciences; and it was under his immediate protection that Broussonet published the first part of his work on fishes, in 1782, under the title of *Ichthyologia*, decas 1. It contains the Latin description, classed after the Linnæan order, of ten rare kinds, one half of which were before unknown. They were accompanied with an equal number of plates; and constituted, as it were, a fine frontispiece to an important work, which, it is to be greatly lamented, was never continued and completed. At length M. Broussonet returned from London, preceded by the reputation of his new work, decorated with the title of a member of the Royal Society, and reckoning among his friends, the son of Linnæus, Solander, Sparman, Silthorp, Scarpa, and several other naturalists of the same rank. His devotion to Linnæus would not, at that period, have operated as a recommendation to many who enjoyed great influence in the capital of France, and particularly to Daubenton, who then possessed much credit, both at the Academy and with the ministry; but the mild manners and modest conduct of Broussonet made his profession of faith be forgotten, and he found a most zealous protector in the very man who was considered as likely to be most vexed with his doctrines. Daubenton made him his deputy at the college of France, his assistant at the veterinary school, and also contributed, more than any other, to his reception at the Academy. He now gave notice of his intentions to publish his grand work on ichthyology, and actually presented the prospectus to the public. The distribution was to be nearly on the same plan as that laid down by Linnæus, but he was to describe 1200 species, while the Swede had only enumerated 460. Nearly at the same time, Broussonet read dissertations at the Academy, and gave a description of the dog-fish, of which he mentioned twenty-seven species; one-third of which were unknown to other naturalists. He also treated of the *annarhiscus lupus*, as well as the *silure trembleur*, (*scomber gladius*), first discovered by Adanson to possess the powers of electricity. He next described the spermatoc vessels of fishes, and demonstrated, that several possessed scales which were supposed to be destitute of them. But the most celebrated of all his discourses, was that 'on the comparison between the movements of plants and of animals.' It is to him we are indebted for the first complete description of that vegetable, to which we are most tempted to attribute something voluntary in its oscillations—the *hedysarum gyrans*, or that kind of grass produced in Bengal, the lateral leaves of which rise and fall both day and night, without any external provocation. He also insisted on the determinate volition of the parts of plants, notwithstanding all obstacles; the progress of the roots in search of humidity; the inflexions of the leaves in order to obtain light, &c. In a short time he aimed at still higher objects; and his memoir on the respiration of fishes appertains entirely to the philosophy of natural

history. He shows how much respiration diminishes in respect to intensity, and the blood in regard to heat, from birds to quadrupeds, and from quadrupeds to reptiles; he compares the size of the heart, and the quantity of blood, of different animals; he explains why those who have small bronchial openings can live longer out of water than the others; he mentions the experiments made to demonstrate the degree of heat which fishes are capable of supporting, &c. His paper on the teeth is of a similar nature: the difference between the teeth of flesh-eating and herbivorous animals; the flakes of enamel which penetrate the substance of the latter, and which give them that inequality so necessary for the purpose of trituration; the infinite variety of the number, of the figure, and of the position, of the teeth of animated beings, &c.; in short, all these facts, which are at present notorious to every one, were not then deficient either in novelty or interest. It is to be lamented, that Broussonet should have quitted a career in which he was destined to shine; but, during the same year he was received into the Academy, he happened also to be chosen secretary to the Society of Agriculture; and this first cause of distraction produced many others. Agricultural societies had been established in the different generalities in 1761. Composed, for the most part, either of wealthy proprietors or simple farmers, they had hitherto displayed but little activity in respect to their operations, while that of the capital had only published a few instructions, during the space of twenty-four years. Berthier de Sauvigny made it something like a point of honor, to confer reputation on this study, and thought that he could not confide this enterprise to any one more capable than M. Broussonet, whom he had known in England. In the exercise of his new functions, he displayed great flexibility of talents; and, quitting by degrees that dryness of style which is the character of the school to which he had attached himself, he soon acquired the powers of composition, and at times displayed all the charms of the most captivating eloquence. The first of his eulogies, that of Buffon, is perhaps still feeble for so great a name; but in those which succeeded, he sometimes makes us enamoured with the peaceable virtues of Blareau; while, at other times, he induces us to admire the frankness, probity, and devotion of Turgot, to whatsoever respected the public good. During those times, when the vows of all seemed to call for a popular revolution, he procured abundant applauses, by constantly and energetically declaring his wishes in behalf of the inhabitants of the country. M. Broussonet, on whom such discourses had conferred a popular reputation, could not fail of being chosen to supply some of those places which, at this period, were about to be conferred by the opinions of his fellow citizens; but the very first one obtained by him made him quickly regret the neglected sciences, and the peaceable occupations of the closet. Having been nominated, in 1789, to the electoral body of Paris, and consequently chosen to supply the place of the suspended authorities, on the very day he

first entered the Hotel de Ville, it was but to behold the intendant, his friend and protector, butchered before his eyes! Being afterwards appointed, along with Vauvilliers, to obtain the necessary quantity of provisions for the capital, he found himself more than twenty times menaced with the loss of his life by the people who were preserved by his solitudes, while they permitted themselves to be misled by those very men whose interest it was to starve them. He afterwards sat in the Legislative Assembly; at the dissolution of which he retired to his house near Montpellier, in order to enjoy that repose which had fled from him for ever, since the first moment that he had yielded to the attractions of ambition. After the revolution of the 31st of May, he was imprisoned in the citadel of the place of his nativity, and would have experienced the same fate as so many other illustrious men, had he not found means to escape to his brother, who at that period was employed as a physician in the army of the Pyrenees. Under pretence of botanising, he found his way into Spain, through the breach of Roland; and, after being nearly frozen to death, at length reached Madrid, without money, and without clothes, after nearly perishing with hunger, having in vain solicited several of the barber surgeons of those villages through which he passed, to employ him as their assistant, for his victuals alone.

MM. Cavanilles and Orteza received him with open arms, and Sir Joseph Banks interested himself in his behalf; but he was soon persecuted by the emigrants, and obliged to fly, first to Xeres, next to Cadiz, and then to Lisbon. Here again they discovered, and denounced him to the Inquisition, under pretence that he was a freemason; they even accused the duke de la Foens, a prince of the blood, and president of the Academy of Sciences, who, at the request of Correa de Serra, a celebrated botanist, had hitherto protected him, of jacobinism. In this extremity, M. Broussonet considered himself very fortunate, in being permitted to accompany, in quality of physician, the ambassador whom the states of America sent to the emperor of Morocco. His next step was to obtain his name to be expunged by the directory, from the list of emigrants; and he then employed all the interest of his friends to obtain for him the office of consul at Morocco. The plague having driven him from that country, he was nominated to the consularship of the Canaries; there, as at Salee, Mogador, Lisbon, &c. he devoted himself to his ruling passion, employing all his leisure moments in studying plants, and making interesting observations, which he transmitted regularly to his native country. Still, however, it was evident, that such a man as Broussonet was destined for the chair of a university; and he accordingly returned to Montpellier, under the protection of M. Chaptal, minister of the interior, and soon rendered the botanical garden the admiration of all botanists, both in respect to the regularity and number of the plants, while his lectures attracted a crowd of students from all parts. But the loss of his wife, and the dangerous state of his daughter's health produced

a slight degree of apoplexy, after which he could never either pronounce or write proper names or substances; he was able to describe the figure of a man, or the color and form of a plant, without being able to utter the precise appellation of the one or the other. Notwithstanding this, Broussonet might have entirely recovered, had he not exposed himself to the heat of the sun, on the 21st of July, 1809, which produced all the agitations incident to a convulsive lethargy, and finally put an end to his life, at the end of six days.

BROUWER (Adrian), a famous Dutch painter, born in 1608, of poor parentage. Francis Hals, under whom he proved an inimitable artist, took him from begging in the streets. His subjects were copied from nature, but taken from low life; such as droll conversations, drunken brawls, boors at cards, or surgeons dressing the wounded. Brouwer was apprehended at Antwerp as a spy; where, being discovered by Rubens, he procured his liberty, took him home, clothed him, and endeavoured to acquaint the public with his merit; but the levity of his temper made him quit his benefactor; and he died in 1638, destroyed by a dissolute course of life, in his thirtieth year.

BROW, *v. & n.* } Goth. *bru, brun*; Swed. BROW'LESS, } *bryn*; Sax. *braw*; Teut. *brav*. BROW'BEAT, } Browbeat, perhaps from BROW'BOUND, } Goth. and Sax. *brog*; Welsh BROW'SICK, } *braw*. Terror; to depress; bear down; dismay. To make the countenance fall. Brow literally is the edge of a place; applied to the forehead, to the arch over the eye, to the general air of the countenance. To brow also is to bound, to limit, to be at the edge of.

With scalled *browes* blake, and pill'd berd;
Of his visage children were sore aferr'd.

Chaucer's Canterbury Tales.

Then call them to our presence, face to face,
And frowning *brow* to *brow*. *Shakspeare.*

She could have run, and waddled about;
For even the day before she broke her *brow*. *Id.*

In that day's feats,
He proved the best man i' the field; and, for his
meed,
Was *brow-bound* with the oak. *Id.*

The earl, nothing dismayed, came forwards that
day into a little village, called Stoke, and there en-
camped that night, upon the *brow* or hanging of a hill.
Bacon.

Them, with fire, and hostile arms,
Fearless assault; and to the *brow* of heaven
Pursuing, drive them out from God and bliss.

Milton.
Tending my flocks hard by, i' the hilly crofts
That *brow* this bottom glade. *Id.*

So we some antique hero's strength
Learn by his launce's weight and length
As these vast beams express the beast
Whose shady *brows* alive they drest. *Waller.*

'Tis now the hour which all to rest allow,
And sleep sits heavy upon every *brow*. *Dryden.*

In thy fair *brow* there's such a legend writ
Of chastity, as blinds the adulterous eye. *Id.*

It is not for a magistrate to frown upon, and *brow-
beat*, those who are hearty and exact in their ministry;
and, with a grave nod, to call a resolved zeal want of
prudence. *South*

But yet a gracious influence from you
May alter nature in our *browsick* crew. *Suckling.*

Yet oft-times on his maddest mirthful mood
Strange pangs would flash along Child Harold's brow,
As if the memory of some deadly feud,
Or disappointed passion, lurked below. *Byron.*

BROW, or EYE-BROWS. See ANATOMY.

BROWALLIA, in botany, a genus of the angiospermia order, in the didynamia class of plants. Its generic characters are: CAL. one-leaved perianth: COR. petal one: STAM. filaments four; antheræ simple: PIST. an ovate germ; filiform style; and thick stigma: PER. ovate capsule; receptacle compressed: SEEDS numerous. The species are annuals, and natives of America.

BROW-ANTLER, among sportsmen, the branch of a deer's horn next the tail.

BROWN', } Goth. *brunc*; Swed. *brun*,

BROWN'ISH, } *brun*; Tent. *brun*; Sax. *brun*;

BROWN'Y, } Bel. *bruin*; Fr. *brun*; Ital.

BROWN'NESS, } *bruno*; from Gothic *bruno*, to burn, corresponding with *πυρρον*. A dark reddish color. That color, says Tooke, which things have that have been burned.

A *burnette* cote honge there withel,
Yfurred with no menivere,
But with a furre rough of here,
Of lambe skynays here and blake.

Chaucer. Romaunt of Rose.

I like the new tire within excellently, if the hair
were a little *brouner*. *Shakspeare.*

Brown, in high Dutch, is called *brun*; in the Netherlands *brujan*; in French *couleur brune*; in Italian *bruno*. *Peacham.*

A *brownish* grey iron-stone, lying in thin strata, is poor, but runs freely. *Woodward.*

From whence high Ithaca o'erlooks the floods,
Brown with o'ercharging shades and pendent woods. *Pope.*

Long untravell'd heaths,
With desolation *brown*, he wanders waste. *Thomson.*

BROWN, among dyers, painters, &c. a dusky color inclining towards redness. Of this color there are various shades or degrees, distinguished by different appellations; such as Spanish brown, a sad brown, a tawny brown, the London brown, a clove brown, &c.—Spanish brown is a dark dull red, of a horse-flesh color. It is an earth; and is of great use among painters, being generally used as the first and priming color that they lay upon any kind of timber-work in house-painting. That which is of the deepest color, and freest from stones, is the best. Though this is of a dirty brown color, yet it is much used to shadow vermilion, or to lay upon any dark ground behind a picture, or to shadow yellow berries in the darkest places, when there is no lake, &c. It is best and brightest when burnt in the fire till it be red-hot.

BROWN (Edward), the son of Sir Thomas, physician to King Charles II. and president of the Royal College at London, was born in 1642, and studied at Cambridge and Oxford. He then travelled; and at his return published a brief account of Hungary, Servia, Bulgaria, Macedonia, Thessaly, Austria, Styria, Carinthia, Carniola, Friulia, &c. He also published an account of travels through a great part of Ger-

many; and joined his name to those of many other eminent men, in a translation of Plutarch's lives. He was acquainted with Hebrew, was a critic in Greek, and no man of his age wrote better Latin. High Dutch, Italian, French, &c. he spoke and wrote with as much ease as his mother tongue. King Charles said of him, that he was as learned as any of the college, and as well-bred as any at court. He died August 27th 1708.

BROWN (George), bishop of Dunkeld, flourished about the end of the fourteenth century. He studied grammar at Dundee, and philosophy at St. Andrews; and was afterwards appointed chancellor of Aberdeen. Being sent to Rome by King James III. on some business relative to the see of Glasgow, he became acquainted with the college of cardinals, and particularly the vice-chancellor Roderick Borja, who, by his interest with Pope Sixtus IV. got Brown raised to the see of Dunkeld. He was a man of learning and public spirit, but has been accused of ambition and rapacity. He procured his diocese to be greatly enlarged; built Clunie castle, and began the stone bridge across the Tay at Dunkeld; but only lived to see one arch completed. He died January 14th, 1514; and was succeeded in his bishopric by the celebrated Gavin Douglas, the translator of Virgil.

BROWN (John, D.D.), a clergyman of the church of England, and an ingenious writer, was born at Rothbury, in 1715. His father was a native of Scotland, of the Browns of Coalstown, near Haddington. Our author was sent in 1732 to Cambridge, and entered of St. John's College, under the tuition of Dr. Tunstall. After taking the degree of A.B. with great reputation (his name being at the head of the list of wranglers), he received both deacon's and priest's orders, and was appointed minor canon and lecturer of the cathedral church. In 1739 he went to Cambridge to take his degree of A.M. In 1745 he distinguished himself as a volunteer in the king's service, and behaved with great intrepidity at the siege of Carlisle. Mr. Brown's attachment to the whig party procured him the friendship of Dr. Osbaldeston, who, when advanced to the see of Carlisle, appointed Mr. Brown one of his chaplains. He wrote about this time a poem, entitled Honor, inscribed to Lord Viscount Lonsdale. His next poetical production was his Essay on Satire; which was of considerable advantage to him, both in point of fame and fortune. It was addressed to Warburton; to whom it was so acceptable, that he took Mr. Brown into his friendship, and introduced him to Ralph Allen, Esq. of Prior Park, near Bath. In 1751 Mr. Brown published his Essays on the Characteristics of Lord Shaftesbury, &c. which was received with great applause. In 1754 he was promoted by the earl of Hardwicke to the living of Great Horkesley in Essex, and in 1755 took the degree of D.D. at Cambridge, and published his tragedy of Barbarossa. A second tragedy named Athelstan, represented at Drury-Lane, was also well received by the public. In 1757 appeared his famous Estimate of the Manners and Principles

of the Times. The reception which this work met with was very flattering; no fewer than seven editions of it having been printed in little more than a year. Voltaire speaks of it in a way very honorable to Dr. Brown. He afterwards wrote *An Explanatory Defence of the Estimate of the Manners and Principles of the Times*. In 1760 he published an *Additional Dialogue of the Dead, between Pericles and Aristides*; being a sequel to a dialogue of lord Lyttelton's between Pericles and Cosmo. Dr. Brown's next publication was *The cure of Saul, a sacred ode*; which was followed by *A Dissertation on the Rise, Union, and Power, the Progressions, Separations, and Corruptions of Poetry and Music*; both in 1763. In 1764 he published in 8vo. *The History of the Rise and Progress of Poetry through its several Species*; which is merely the substance of the Dissertation. The same year he published a volume of sermons, dedicated to his patron bishop Osbaldeston. In the beginning of 1765 *Thoughts on Civil Liberty, Licentiousness, and Faction*; and the same year a sermon on the *Female Character and Education*, preached 16th May, 1765, before the guardians of the asylum for deserted female orphans. His last publication was in 1766, *A Letter to the Rev. Dr. Lowth*, occasioned by his late Letter to the Right Rev. Author of the *Divine Legation of Moses*. In 1765, while Dr. Dumaesq resided in Russia, to which he had been invited in 1764 to give his assistance for the regulating of several schools, which the empress intended to erect, he wrote to Dr. Brown for his advice, and the reply of the latter so pleased the empress that she immediately invited him to Russia. He accepted the invitation, and £1000 being ordered for his expense, he actually received £200. But when on the point of setting out, an attack of the gout and rheumatism, to which he had been long subject, so impaired his health, that his friends dissuaded him from the journey. The disappointment, however, concurring with the general state of his health, was followed by a dejection of spirits: in consequence of which he put an end to his life on the 23d of September 1766, in the fifty-first year of his age.

Brown (John), M. D. author of the Brunonian system of medicine, was born A. D. 1735 in the parish of Bonkle in Berwickshire, in a village near Dunse. His father dying, while young, and his mother's second husband being a weaver, it was intended to bring him up to the same business, but young Brown having already given evidence of uncommon genius, as well as intense application, while attending the grammar school of Dunse, under the celebrated Mr. Cruickshanks, a lady in that neighbourhood took him under her patronage, and sent him to the University of Edinburgh to study divinity. The pious intentions, however, of this benevolent lady were frustrated by a curious incident. He was summoned before the kirk session, for having heard a sermon in the established church, and unwilling to submit to the ecclesiastical censure, for this venial fault, he chose rather to leave his old friends, and join the establishment. He never went farther in divinity, than delivering one probationary sermon in the hall of the Uni-

versity. He returned to Dunse in 1758, and acted for a year as usher or assistant to his late teacher. In the end of 1759 he settled in Edinburgh, with the double view of teaching Latin and studying physic. He addressed a letter in Latin to each of the medical professors, all of whom being apprised of his merits as a classical scholar, presented him with tickets of admission to their lectures gratis. But none of them seemed to entertain a higher opinion of his classical powers, than the late celebrated Dr. Cullen, who not only employed him as a private instructor in his own family, but took every opportunity of recommending him to others. In 1765 he married Miss Lamond, a young lady of a respectable family in Edinburgh, but without any fortune. Mrs. Brown not long after taking a boarding house, her husband's high reputation soon crowded it with boarders. But want of economy and several losses obliged Brown at last to stop payment, about 1770. About this time, too, that warmth of attachment which had hitherto subsisted between him and Dr. Cullen, began to cool. It was about this period also that he first promulgated his new system of medicine. See BRUNONIAN SYSTEM.

Brown's income was by no means increased by his discovery. It was not to be expected, indeed, that a set of learned gentlemen would be ready to acknowledge all the former theories of the science they professed to teach, to have been erroneous, and at once become converts to his new doctrine. His classes were therefore never attended by very great numbers of students, nor were his patients by any means so numerous as might have been expected from the surprising cures he performed upon some individuals, who applied to him in desperate cases, where the ordinary practice had failed. No physician, however, or public lecturer, was ever more beloved by his patients and pupils than Brown. Of their attachment to his person, we shall give one instance out of many. In the session of 1779-80, a few of them, unknown to Brown, collected money among themselves, to pay the usual fees of a diploma from the university of St. Andrews; (where his merits, both as a medical teacher and linguist, were too well known, to render any examination necessary), and surprised him by presenting it to him. In the course of the year 1780 he published the first edition of his *Elementa Medicinæ*, in one vol. 12mo. dedicated to Sir John Eliot, M. D. and in 1784 he reprinted it (but without any dedication), in 2 vols. 8vo. with considerable alterations and large additions. The doctor's affairs now hastened to a crisis. His income not being equal to his expenditure, he was obliged in spring 1785 to take shelter from creditors in the Abbey of Holyrood house: and, though a settlement was soon obtained with most of them, yet one more rigorous than the rest incarcerated him in the Canongate jail, in January 1786. The late lord Gardenstone, having heard of his distress, generously enabled him to execute the plan he had long had in contemplation, of settling in London, by presenting him with 160 guineas. The Dr. accordingly went up in the end of 1786, after having published his *Observations on the*

New and Old Systems of Medicine : and having performed extraordinary cures upon some patients who were able to reward him liberally, he was enabled, within four months after his arrival, to send for his wife and family. But his income being uncertain, and his family expenses very great, he was sent to the King's Bench prison by his creditors, though he was not long confined. In 1788 he published his *Elements of Medicine* in English. Dr. Brown did not long survive this labor; after giving an introductory lecture on the 6th of October 1788, and going to bed seemingly in ordinary health, he was found dead next morning, being then in his fifty-third year. He left a widow and eight children. Dr. Brown was twice elected president of the Royal Medical Society, in 1776 and 1780. He was also elected Latin Secretary to the Society of Scot's Antiquaries; and was the founder of a Lodge of Free Masons, stiled the Roman Eagle, instituted in 1784, in which Latin was the only language spoken.

Brown (Robert), a schismatic divine, the founder of the Brownists, a numerous sect in the reign of queen Elizabeth. He was the son of Mr. Anthony Brown of Tolthrop in Rutlandshire; whose father had obtained the singular privilege of wearing his cap in the king's presence, by a charter of Henry VIII. Robert was educated at Cambridge, and was afterwards schoolmaster in Southwark. About 1580 he began to promulgate his principles of dissent from the established church; and the following year he preached at Norwich, where he soon accumulated a numerous congregation. He was violent in his abuse of the church of England; pretended to divine inspiration, and that he alone was the sure guide to heaven. His sect daily increasing, Dr. Freake bishop of Norwich, with other ecclesiastical commissioners, called him before them. He was insolent to the court, and they committed him to the custody of the sheriff's officer: but he was released at the intercession of lord treasurer Burleigh, to whom he was related. Brown then left the kingdom; and, with permission of the states, settled at Middleburg in Zealand; where he formed a church after his own plan, and preached without molestation. In 1585 we find him again in England: for in that year he was cited to appear before archbishop Whitgift; and seeming to comply with the established church, was, by lord Burleigh, sent home to his father: but, relapsing into his former principles, he wandered about for some time and endured great hardships. At last he fixed at Northampton; where, laboring with too much indiscretion to increase his sect, he was cited by the bishop of Peterborough, and, refusing to appear, was excommunicated for contempt. He moved for absolution, which he obtained, and from that time became a dutiful member of the church of England. This happened about 1590; and, in a short time after, Brown was preferred to a rectory in Northamptonshire, where he kept a curate to do his duty, and where he might probably have died in peace; but having some dispute with the constable of his parish, he proceeded to blows; and was afterwards so insolent to the justice, that he committed him to North-

ampton jail, where he died in 1630, aged eighty. Thus ended the life of the famous Robert Brown; the greatest part of which was a series of opposition and persecution. He boasted on his death-bed, that he had been confined in no less than thirty-two different prisons. He wrote *A Treatise of Reformation without Tarrying for Any*, and of the Wickedness of those Teachers which will not Reform themselves and their Charge, &c. by me, Robert Brown; and two others making together a thin 4to. published at Middleburg, 1582.

Brown (Simon), a dissenting minister of uncommon talents and singular misfortunes, born at Shepton-Mallet in Somersetshire, in 1680. Excelling in grammatical learning, he early became qualified for the ministry, and began to preach before he was twenty. He was first called to be a pastor at Portsmouth, and afterwards removed to the Old Jewry, where he remained for a number of years. But the death of his wife and only son, in 1725, affected him so as to deprive him of his reason; and he became from that time lost to himself to his family, and to the world. His congregation at the Old Jewry, in expectation of his recovery, delayed for some time to fill his post; but at length, all hopes being over, Mr. Chandler was appointed to succeed him, in 1725. This double misfortune affected him at first in a manner little different from distraction, but afterwards sunk him into a settled melancholy. He quitted the duties of his function, and would not be persuaded to join in any act of worship, public or private. Being urged by his friends for a reason of this extraordinary change, at which they expressed the utmost astonishment, he told them that 'he had fallen under the sensible displeasure of God, who had caused his rational soul gradually to perish, and left him only an animal life in common with brutes;' that though he retained the human shape, and the faculty of speaking in a manner that appeared to others rational, he had all the while no more notion of what he said than a parrot; that it was therefore profane in him to pray, and incongruous to be present at the prayers of others; and, very consistently with this, he considered himself no longer as a moral agent, or subject of either reward or punishment. In this way of thinking and talking he unalterably and obstinately persisted to the end of his life; though he afterwards suffered, and even requested, prayers to be made for him. Some time after this, he retired to Shepton-Mallet, and though in his retirement he was perpetually contending, that his powers of reason and imagination were gone, yet he was as constantly exerting both with much activity and vigor. He amused himself sometimes with translating parts of the ancient Greek and Latin poets into English verse; he composed little pieces for the use of children; An English Grammar and Spelling Book; An Abstract of the Scripture History, and a Collection of Fables, both in metre; and with much learning he brought together, into a short compass, all the *Themata* of the Greek and Latin tongues, and also compiled a Dictionary to each of those works, to render the learning of these languages more easy and compendious. Of these performances none have been made public. But

what showed the strength and vigor of his understanding, though he was bemoaning the loss of it, were two works composed during the two last years of his life, in defence of Christianity, against Woolston and Tindal. He wrote an answer to Woolston's fifth Discourse on the Miracles of our Saviour, entitled, *A Fit Rebuke for a Ludicrous Infidel*, with a Preface concerning the prosecution of such writers by the civil power. His book against Tindal was called, *A Defence of the Religion of Nature and the Christian Revelation*, against the defective account of the one and the exceptions against the other, in a book entitled, *Christianity as old as the Creation*; and it is allowed to be one of the best that controversy produced. He intended to dedicate it to Queen Caroline; but, as the unhappy state of his mind appeared in the dedication, his friends suppressed it. The following is a copy which was preserved as a curiosity: 'Madam, Of all the extraordinary things that have been rendered to your royal hands since your first happy arrival in Britain, it may be boldly said what now bespeaks your majesty's acceptance is the chief. Not in itself indeed: it is a trifle unworthy your exalted rank, and what will hardly prove an entertaining amusement to one of your majesty's deep penetration, exact judgment and fine taste; but on account of the author, who is the first being of the kind, and yet without a name. He was once a man, and of some little name; but of no worth, as his present unparalleled case makes but too manifest; for, by the immediate hand of an avenging God, his very thinking substance has for more than seven years been continually wasting away, till it is wholly perished out of him, if it be not utterly come to nothing. None, no not the least remembrance of its very ruins remains; not the shadow of an idea is left; nor any sense, so much as one single one, perfect or imperfect, whole or diminished, ever did appear to a mind within him, or was perceived by it. Such a present, sent from such a thing, however worthless in itself, may not be wholly unacceptable to your majesty, the author being such as history cannot parallel: and if the fact, which is real, and no fiction or wrong conceit, obtains credit, it must be recorded as the most memorable, and indeed astonishing, even in the reign of George II. that a tract, composed by such a thing, was presented to the illustrious Caroline; his royal consort need not be added; fame, if I am not misinformed, will tell that with pleasure to all succeeding times. He has been informed, that your majesty's piety is as genuine and eminent as your excellent qualities are great and conspicuous. This can indeed be truly known to the great Searcher of hearts only. He alone, who can look into them, can discern if they are sincere, and the main intention corresponds with the appearance; and your majesty cannot take it amiss if such an author hints, that his secret approbation is of infinitely greater value than the commendation of men, who may be easily mistaken and are too apt to flatter their superiors. But if he has been told the truth, such a case as his will certainly strike your majesty with astonishment; and may raise that commiseration in your royal breast, which

he has in vain endeavoured to excite in those of his friends: who, by the most unreasonable and ill-founded conceit in the world, have imagined, that a thinking being could, for seven years together, be a stranger to his own powers, exercise, operations, and state; and to what the great God has been doing in it and to it. If your majesty, in your most retired address to the King of Kings, should think of so singular a case, you may, perhaps, make it your devout request, that the reign of your beloved sovereign and consort may be renowned to all posterity by the recovery of a soul now in the utmost ruin, the restoration of one utterly lost, at present, amongst men. And should this case affect your royal breast, you will recommend it to the piety and prayers of all the truly devout who have the honor to be known to your majesty: many such, doubtless, there are, though courts are not usually the places where the devout resort, or where devotion reigns. And it is not improbable, that multitudes of the pious throughout the land may take a case to heart, that under your majesty's patronage comes thus recommended. Could such a favor as this restoration be obtained from Heaven by the prayers of your majesty, with what transport of gratitude would the recovered being throw himself at your majesty's feet, and, adoring the divine power and grace, profess himself, Madam, your majesty's most obliged and dutiful servant, SIMON BROWN.' Mr. Brown survived the publication of this last work a very short time. A complication of distempers, contracted by his sedentary life, brought on a mortification, which put a period to his labors and sorrows about the end of 1732. He was unquestionably a man of uncommon abilities and learning: his work against Woolston showed him to have also vivacity and wit; and, notwithstanding that strange conceit which possessed him, it is remarkable that he never appeared feeble or absurd, except upon the subject of his frenzy. Before he was ill, he published some single Sermons, with a Collection of Hymns and Spiritual Songs.

BROWN (Sir William), a noted physician, and multifarious writer, was settled originally at Lynn, in Norfolk, where he published a translation of Dr. Gregory's *Elements of Catoptrics and Dioptrics*; to which he added, 1. A method for finding the Foci of all Specula, as well as Lenses universally; as also magnifying or lessening a given object by a given Speculum or Lens, in any assigned proportion; 2. A Solution of those Problems which Dr. Gregory has left undemonstrated; 3. A Particular Account of Microscopes and Telescopes, from Mr. Huygens; with the Discoveries made by Catoptrics and Dioptrics. Having acquired a competency by his profession, he removed to Queen's Square, Ormond Street, London, where he resided till his death. By his lady, who died in 1763, he had one daughter, grandmother to Sir Martin Brown Folkes, bart. He wrote a great number of lively essays in prose and verse, which he printed and circulated among his friends. The active part taken by Sir William Brown in the contest with the licentiate, in 1768, occasioned his being introduced by Mr. Foote in his *Devil upon Two Sticks*. Upon Foote's exact

representation of him with his identical wig and coat, tall figure, and glass stiffly applied to his eye, he sent him a card complimenting him on having so happily represented him; but as he had forgotten his muff, he had sent him his own. This good-natured method of resenting disarmed Foote. When he lived at Lynn, a pamphlet was written against him: he nailed it up against his own door. He died in 1774, aged eighty-two; and by his will left two prize medals to be annually contended for by the Cambridge students.

Brown (Thomas), 'of facetious memory,' as he is styled by Addison, was the son of a farmer in Shropshire; and entered in Christchurch College, Oxford, where he soon distinguished himself. But his irregularities not suffering him to continue long there, he went to London to seek his fortune; his companions, however, being more delighted with his humor, than ready to relieve his necessities, he had recourse to the usual refuge of scribbling for bread; and published a great variety of poems, letters, dialogues, &c. full of humor and erudition, but often indelicate. Towards the end of Tom Brown's life, he was in favor with the earl of Dorset, who invited him to dinner on a Christmas day, with Mr. Dryden, and some other gentlemen celebrated for their ingenuity; when Mr. Brown, to his agreeable surprise, found a bank note of £50. under his plate, and Mr. Dryden, at the same time, was presented with another of £100. Mr. Brown died in 1704; and was interred in the cloister of Westminster Abbey, near the remains of Mrs. Behn, with whom he was intimate. His works, consisting of Dialogues, Essays, Satires, &c. have been printed both in 8vo. and 12mo., making four volumes.

Brown (Ulysses Maximilian), a celebrated general of the eighteenth century, was son of Ulysses, baron Brown and Camus, colonel of a regiment of cuirassiers in the emperor's service, and descended from one of the most ancient families in Ireland. He was born at Basil in 1705; and having finished his first studies at Limerick in Ireland, was, in 1715, sent for into Hungary, by count George Brown, his uncle, colonel of a regiment of infantry. He was present at the famous battle of Belgrade, in 1717, being then but twelve years of age. Next year he followed his uncle into Italy, who made him continue his studies in the Clementine College at Rome, till 1721, when he was sent to Prague to learn the civil law. At the end of 1723 he became captain in his uncle's regiment, and in 1725 lieutenant-colonel. In 1730 he went into Corsica with a battalion of his regiment; and contributed greatly to the taking of Calansara, where he received a considerable wound in his thigh. In 1732 the emperor made him chamberlain. He was raised to the rank of colonel in 1734; and distinguished himself so much in the war of Italy, especially at the battles of Parma and Guastalla, and in burning, in the presence of the French army, the bridge which the marshal de Noailles had caused to be thrown over the Adige, that he was made general in 1736. In 1737 he assisted in the retreat of the army, after the unhappy battle of Banjaluca, in Bosnia, and saved all the

baggage. His admirable conduct upon this occasion was rewarded by his obtaining a second regiment of infantry. At his return to Vienna, in 1739, the emperor Charles VI. raised him to the rank of general field-marshal-lieutenant, and made him counsellor in the aulic council of war. After the death of that prince, the king of Prussia entering Silesia, count Brown with a small body of troops, disputed the country with him inch by inch. He signalled himself on several other occasions; and, in 1743, the queen of Hungary made him a privy counsellor, at her coronation in Bohemia. He at length passed into Bavaria, where he commanded the van-guard of the Austrian army; seized Deckendorf, with a great quantity of baggage, and obliged the French to abandon the banks of the Danube, which the Austrian army passed in full security. The same year the queen of Hungary sent him to Worms, as her plenipotentiary to the monarch of Britain; where he signed the treaty of alliance between the courts of Vienna, London, and Turin. In 1744 he followed prince Lobkowitz into Italy; took Velletri, overthrew several regiments, and made many prisoners. The following year he was recalled into Bavaria, where he took Wilshoffen by assault, and received a dangerous shot in the thigh. The same year he was made general of the artillery; and in January, 1746, marched for Italy at the head of a body of 18,000 men. He then drove the Spaniards out of the Milanese; and, having joined the forces under prince de Lichtenstein, commanded the left wing of the Austrian army at the battle of Placentia, on the 15th of June, 1746, and defeated the right wing of the enemy's forces, commanded by marshal de Maillebois. After this victory he commanded in chief the army against the Genoese; seized the pass of Bochetta, though defended by above 4000 men; and took the city of Genoa. Count Brown at length joined the king of Sardinia's troops; and took, in conjunction with him, Mont Alban, and the county of Nice. On the 30th of November he passed the Var; entered Provence, and had taken the isles of St. Margaret and St. Honorat, when the revolution which happened in Genoa, and the advance of Marshal de Belleisle with his army, obliged him to make that retreat which, on account of the skilful manner in which he conducted it, procured him the admiration of all Europe. He employed the rest of the year 1747 in defending the Austrian states in Italy; and, after the peace of 1748, he was sent to Nice to regulate there, in conjunction with the duke of Belleisle and the marquis de las Minas, the differences that had arisen with respect to the execution of some of the articles of the definitive treaty of Aix-la-Chapelle. The empress queen, to reward these signal services, made him governor of Transylvania, where he rendered himself generally admired for his probity and disinterestedness. In 1752, he obtained the government of the city of Prague, with the chief command of the troops in that kingdom; in 1753 the king of Poland, elector of Saxony, honored him with the collar of the order of the white eagle; and in 1754 he was declared field-marshal. The king of Prussia entering Saxony in 1756, and attacking Bohemia,

count Brown repulsed him at the battle of Lowositz, 1st of October, though he had only 27,000 men, and the king of Prussia had at least 40,000. Seven days after this battle he undertook the famous march into Saxony, to deliver the Saxon troops shut up between Pirna and Königstein; an action which, though unsuccessful, is worthy of the greatest captains ancient or modern. He at length obliged the Prussians to retire from Bohemia; for which he was made a knight of the golden fleece. Soon after, he hastily assembled an army in Bohemia, to oppose the king of Prussia, who had again penetrated into that kingdom at the head of all his forces; and on the 6th of May fought the famous battle of Prague; in which, while he was employed in giving orders for maintaining the advantages he had gained over the Prussians, he was so dangerously wounded that he was obliged to be carried to Prague, where he died on the 26th of June, 1757, aged fifty-two.

Brown (Thomas), M. D., late professor of moral philosophy at the university of Edinburgh, was the son of the Rev. S. Brown, minister of Kirkmabreck, and descended from a family which suffered considerably by persecution for their adherence to the covenant. He was born in January, 1778, and the youngest of thirteen children. His father dying while Dr. Brown was in his infancy, the care of his education devolved on his mother, who personally devoted herself to the task, until he had reached his seventh year. He was then taken to England, under the protection of a maternal uncle, Capt. Smith, of the thirty-seventh regiment, and placed at no less than four different schools successively, near London. It appears more surprising that he should thus acquire anything solid than that he should make several respectable friends. At Kensington he became acquainted with the late earl Cowper and his brothers; at Chiswick with Sir John Copley, the present attorney-general; and at Kew Green, where his uncle lived, with the mother and sisters of Sir Robert Graham, now senior baron of the exchequer. These ladies were among the first to discover and stimulate his early taste for poetry; nothing, in our language, is much more touching than his 'Recollections' of their house at Kew Green, in after times; where his

— full bosom deemed, with eager glow,
The ready portal's quickest opener slow :—
Still sure within that cheerful room to find
Kind eyes, kind voices, and O! hearts more kind.

His uncle dying, in 1792, he returned once more to his maternal roof, a tolerable proficient, we are told, in classical literature. He had certainly displayed from childhood a spirit of enquiry, united with a most amiable temper, and great strength of memory.

One of his masters, when speaking of him to a friend, mentioned an example of this. The punishment usually awarded for transgressing the bounds of the play-ground, was to commit to memory a passage of some author. Dr. Brown incurred this penalty more frequently than any other boy in the school; indeed it was the only offence with which he was ever charged; and the punishment, from his great quickness, he did not

regard. 'I was resolved, however,' to use his teacher's own words, 'to fix him for once, and gave him a task that I thought even he should not be able to get in a hurry; soon after, I was called out of the room, and, to my utter astonishment, when I returned, which was in a very few minutes, he came up and repeated it every word without making the slightest mistake.' When the anecdote was mentioned to Dr. Brown, he recollected the circumstance, and added, that he was very impatient for his master's return, as he was prepared for him some time before he made his appearance. He also mentioned, that the passage contained the beautiful description of Adam and Eve in Paradise, and that he was particularly struck with the effect of the following pause:—

hung over her

Enamoured.

All his pocket money had at this period been expended in books, and he had to endure the total loss of this precious treasure as it was coming home to him by sea. Dr. Brown always mentioned the circumstance with considerable feeling, and as one of his greatest misfortunes. He never read without a pencil in his hand, to mark the best passages, and ultimately had no pleasure, says his biographer, in reading a book that was not his own. He also adopted Gibbon's practice of endeavouring to express his own ideas of a subject of importance, before sitting down to read anything upon it.

He entered the university of Edinburgh in his seventeenth year, and commenced with a course of logic under Dr. Finlayson. At Dr. Currie's house in Liverpool, where he spent the vacation of 1793, he first perused Mr. Stewart's Elements of the Philosophy of the Mind; and the next winter attended that distinguished professor's lectures, with the greatest assiduity. He had the acuteness however to detect a want of analysis in his tutor's productions, and, after much hesitation, submitted to him a criticism on one of his theories. Mr. Stewart heard him read his paper with great candor and urbanity; and read to him in return, with a smile of wonder and admiration, a letter which he had previously received from the celebrated M. Prevost of Geneva, containing the very arguments of our young philosopher. At this period commenced a warm and steady friendship between Dr. Brown and Mr. Stewart, which was only terminated by the death of the former. Under professors Stewart, Robison, Playfair, and Black, and making such friends as Mr. Brougham, Mr. Horner, Mr. Leyden, Mr. Reddie, and Mr. Erskine, nothing could be more promising or delightful than Mr. Brown's college life.

'Many of his college acquaintance came and spent their evenings with him in his mother's house. He was always temperate in his habits. His favorite beverage was tea, and, over it, hour after hour was spent in discussing with his youthful companions

The wondrous wisdom that a day had won.

There was no subject in literature, or philosophy, that did not engage their attention. It was often morning before they parted; and such was

the amicable spirit in which their discussions were carried on, that no one who happened to be present ever recollected the slightest appearance of irritation. In these peaceful and happy hours Dr. Brown distinguished himself by the boldness of his speculations, the acuteness of his reflections, and the noonday clearness with which he invested every subject that was introduced.

In lines to Mr. Reddie, prefixed to the War-Friend, Mr. Brown has given a picture of this period, which we cannot refrain from copying :

And, O! whate'er my studious toil may trace,
Well may thy name there find a votive place;
For who shall say, in grave or light design,
How much of lightest, gravest, has been thine?
Still memory loves to linger mid the bowers
That blessed our youthful academic hours;
When zeal to zeal the ready impulse spread,
And Science followed but where Friendship led.
Then in close heart, when mingling oft our lore,
We marvelled much, but questioned, doubted, more;—
In the gay rural walks where, soon or late,
Still rose some never weary old debate;—
Mixed in the flowing theme of truth and mirth,
Thought sprung from thought, one equal mutual
birth;—

And each, perhaps, with changeful strife untired,
Has warred with fancies which himself inspired.

In his nineteenth year he prepared *Observations on Dr. Darwin's Zoonomia*. They relate chiefly to the first volume, and he conceives one remark to be applicable to the whole of that ingenious philosopher's system, viz. that it is inconsistent with the fundamental principle of the theory, by which one faculty of the sensorium cannot increase or decrease without a corresponding decrease or increase of others. With singular ingenuousness he enclosed his papers, before their publication, to Dr. Darwin himself, and a correspondence ensued, in which neither were convinced; and the senior philosopher did not exhibit the better temper. This work received on its publication a very respectable character from the *Monthly Reviewers*, who never suspected it to be the juvenile performance it was. It also introduced its author to the acquaintance and esteem of Lord Woodhouselee, Mr. Mackenzie, and several other writers of eminence.

He was introduced at about the same time into the Literary Society of the University, and the Academy of Physics, distinguished in addition to the names already mentioned among his friends by the assistance of Dr. Birkbeck, Mr. Logan, Mr. Jeffery, Lord Webb Seymour, Mr. Smyth, Mr. Gillespie, &c. In their free and equal discussions every branch of science and morals was occasionally brought forward. Mr. Welsh perpetuates, in his notes to Dr. Brown's life, some curious minutes of their proceedings, drawn up by various gentlemen, and containing the propositions of Mr. Brougham, Mr. Horner, and several of the early writers in the *Edinburgh Review*. With regard to the freedom of some of their investigations, Dr. Brown remarks admirably in after life, 'To conceive that enquiry must lead to scepticism is itself a species of scepticism, as to the power and evidence of the principles to which we give our assent, more degrading, because more irrational, than that

open and consistent scepticism, which it dreads. We are, on the other hand, well reminded by his biographer (*Life of Dr. Brown*, 8vo. p. 76), that where there is a continual endeavour after the detection of fallacies, both our vanity and indolence are apt to lead us to rest satisfied with the detection of an error; without leading us to establish truth in its place.

The Academy of Physics will ever be memorable in the history of English literature, as giving rise to the *Edinburgh Review*, to which the first contributors sent their papers, we are told, gratuitously; and of these Dr. Brown was the author of the review of the *Philosophy of Kant*, the leading article of the second number. But his connexion with it was terminated by some liberties being taken with a paper designed for the fourth number, and was never renewed. We should have observed that, until the year 1798, Dr. Brown had been studying with a view to the legal profession, but finding it impracticable to combine this with his adored literary and philosophical pursuits, he relinquished the study of the law this year, and devoted himself to that of medicine.

Dr. Gregory was much struck with his proficiency, when in 1803 he applied for his diploma. His thesis was entitled *De Somno*, which, independent of its ingenuity as a theory, was much admired for the purity of its language; indeed he expressed himself at this time in Latin with the greatest elegance, and as fast as he could speak in English. A few months after receiving his degree, he published the first edition of his poems in two volumes, which, though neglected a good deal by the public, received the meed of warm applause wherever they came in contact with a refined taste or kindred genius. The next publication of Dr. Brown, though occasioned by a local and temporary dispute in the University of Edinburgh, bears the deep impression of his strength of mind, and accuracy of judgment as a metaphysician. Mr. Leslie was opposed as a candidate for the mathematical chair, on account of the approbation with which he had mentioned Mr. Hume, or rather a particular argument of his on causation, in his *Essay on Heat*. The subject of our memoir undertook to prove that the sentiments of Hume on this point were unobjectionable on any moral or religious ground, and in fact a valuable contribution to philosophical logic: while at the same time he ably convicted the unbeliever of false ideas on the origin of power. We can only refer to the essay in question; and Mr. Welsh's own excellent notes II and I, in chapter IV. of his life of Dr. B., for a further elucidation of this interesting topic. Professor Playfair speaks of his argument as being as clear and exact as could be expected in the solution of an algebraic question.

In 1806 he became associated in partnership with Dr. Gregory, as a physician, and, during a course of the most flattering success in his profession, was invited in 1808 on occasion of Mr. Stewart's ill health, to supply the place of that gentleman in the moral philosophy class of the university. In general, as Dr. Brown's biographer remarks, it is easy enough for a professor to find a substitute. Nothing more is necessary

than to transfer a MS. lecture to a tolerably patient and judicious friend. But Mr. Stewart's MS. lectures were mere notes, and Dr. Brown, it was well understood, if he undertook to lecture on this occasion, must depend wholly on compositions of his own. He acquitted himself, however, with such great credit on his first appearance, that the professor solicited the more serious service of his contributing his three lectures a-week to his class during the succeeding winter. The enthusiastic admiration with which he was at this time received, says Mr. Welsh, was beyond any thing of the kind that I can recollect.

'The moral philosophy class presented a very striking aspect. It was not a crowd of youthful students led away in the ignorant enthusiasm of the moment; distinguished members of the bench, of the bar, and of the pulpit, were daily present to witness the powers of this living philosopher. Some of the most eminent of the professors were to be seen mixing with the students, and Mr. Playfair, in particular, was present at almost every lecture. The originality, and depth, and eloquence of the lectures, was the subject of general conversation, and had a very marked effect upon the young men attending the university, in leading them to metaphysical speculations.'

'Upon its being announced that Mr. Stewart was to resume his lectures, a meeting of the class was held, when it was resolved that a committee should be appointed to draw up an address, congratulating that illustrious philosopher upon the recovery of his health, and expressing at the same time the feelings of admiration that had been excited by the labors of his substitute. The committee was composed of individuals distinguished for their rank and talents, many of whom are well known to the public. Lord John Russel, who has since distinguished himself in political life, and by his literary productions secured for his name no humble place in the brief list of noble authors, was the chairman.'

This display of Dr. Brown's powers so irresistibly established his claims to the future chair, that when Mr. Stewart expressed his desire to receive a coadjutor in the professorship, the decision in favor of him was almost unanimous. Mr. Stewart himself exerted all his influence in the university in his favor; and the most honorable testimonials to his competence crowded the table of the town council of Edinburgh. In May, 1810, the late Mr. Horner thus congratulates him on his elevation:—

TO DR. BROWN.

Lincoln's Inn, May 8th, 1810.

MY DEAR BROWN,

Lord Webb has done me the kindness to give me the news of your appointment as assistant and successor to Mr. Stewart. Upon any occasion of private advantage only to yourself, I need not assure you how sincerely I should rejoice at your good fortune and welfare. But in this event one has the pleasure to find every public as well as private wish gratified. I am made happy by it on Mr. Stewart's account, who felt

so natural an anxiety that the fate of his favorite science and the reputation of his chair should be maintained by no unworthy successor. I am happy for your sake, that you are enabled to devote your life to the pursuits in which you have most pleasure, and in which you have a long course before you of fame and discovery and good to mankind. But what, you will allow me to say, gives me more pleasure than any other consideration, is to see the university, and through it the interests of philosophical opinion in Scotland, rescued from the danger which seemed to threaten them with complete ruin, of the chair of moral philosophy being filled by one of those political priests who have already brought such disgrace upon the university, and done so much injury to learning. In your hands, all those great interests are not only safe, but sure of advancement. Believe me, therefore, it is with no common feelings of satisfaction and exultation that I congratulate you on this appointment. I am ever, my dear Brown,

Most faithfully yours,

F. A. HORNER.

On Dr. Brown now devolved the entire labor of the professorship; and though he retired for a few weeks into the country, to recruit himself in preparation for the ensuing winter's exertions, he had sufficient confidence in his own powers, it is said, to be assured that he could always prepare his lectures on the spur of the occasion. He seldom began to prepare any of them till the evening of the day before they were delivered. His labors commenced immediately after tea, and he continued at his desk till two, and often three, in the morning. After the repose of a few hours he resumed his pen, and often continued writing till he heard the hour of twelve, when he hurried off to the delivery of what he had composed. When the lecture was over, if the day were favorable, he would walk out, or employed his time in light reading, until his favorite beverage of the afternoon again restored him to the proper tone for renewed exertion. The first three volumes of his printed lectures were thus written during the first year of his professorship, and the whole of the remainder in the following season. He continued to read nearly the same lectures till the period of his lamented decease. The examination of his theory, and his many most valuable observations on the sciences, are necessarily referred to our articles on the subject of METAPHYSICS; and to MORAL PHILOSOPHY.

The further details of his personal history are few and mournful. We must not omit, however, a characteristic anecdote of their intercourse, preserved by Mr. Welsh.

'In speaking of a celebrated philosophical work, recently published, which I had been reading, I happened to express myself with considerable warmth of admiration. Dr. Brown, I observed, did not go along with me in my praises; and when I mentioned one particular chapter as very valuable, 'Why, really,' said he, 'I am not quite sure that I recollect his doctrines upon that head; will you state in a single sentence what his views are.' This I found no little difficulty in accomplishing. And I discovered that

he took this method of leading me to perceive that there was a want of precision in my favorite author, and that I had allowed my admiration of his eloquence to make me forget a vagueness in his ideas, and an obscurity in some of his statements. The critical doctrine implied in this short sentence of Dr. Brown was of so much advantage to me at that period of my studies, that I have recorded it for the benefit of those who may be at a similar stage in their academical course, though, in other respects, of little interest. Connected with his views of philosophical disquisition, however, it is valuable. I may here put together the substance of his ideas upon this subject, which I heard him at different times express.

‘He conceived that every philosophical writing ought to resemble a system of pyramids, each part a whole in itself, portions of which are to be grouped into larger pyramidal forms, which ought all to be so arranged as to constitute one great pyramid. In every sentence there ought to be a principal idea complete in itself, but forming an element of all the ideas that are joined into one paragraph. The idea of the paragraph is still one, which is to be grouped with all the other paragraphs into a section; the sections in their turn form larger divisions, which altogether constitute one mighty whole. To have a distinct view of all the particulars, each in itself, and at the same time in their mutual references and in their united reference to the great whole, constitutes, as he conceived, an essential element of the philosophic genius. This was what Dr. Brown himself constantly aimed at, and the effect of his system is to be observed in all his works. It was chiefly for this reason that he made use of a method of short-hand, which he invented; the benefit of which he found to consist not merely in enabling him to put down his ideas rapidly, but also in the power thus given him by the extreme minuteness of the character of taking in the whole subject both with his eye and his mind at a single glance.’

He instanced the Latin as affording the best example of synthetic language, and considered it indispensably necessary for every author who aimed at precision, to keep up a constant familiarity with the Latin classics, and to compose frequently in Latin. He also recommended his pupils frequently to attempt the translation of English works of eminence in their own words. From a miscellaneous MS. work of his, entitled *A Chaos*, we must gratify the reader with the following extract on the subject of religion:—

‘To the use of religion, as one of the great parts of the complicated machinery employed in the production of general happiness, it is objected, that the vindictive hatred of vice, so necessary to the preservation of virtue, is diminished by the thought that the criminal is to be punished for the same fault by a judge more terrible in his wrath, and less bounded by time, than those whose sentence extends only over a small portion of the criminal’s existence. The effect, however, will surely be contrary, if the justice of God, as well as his power and disposition to punish, be admitted by the pious believer; for the idea of deserved punishment being thus continually

associated with the idea of offence, all the disagreeable feelings which attend the idea of punishment will be suggested by that of guilt, and will thus render it doubly hateful, in the same manner as the idea of poverty becomes doubly hateful to those who could submit to the absolute physical privations which it causes, from suggesting the disagreeable feelings excited by that contempt which usually follows indigence. There is also another mode in which religion acts in the aggravation of moral guilt. It furnishes a new relation which is violated; and we hate the sinner not merely for injuring man whom we love, but for contemning likewise the adorable Being whom we revere. That man is frequently led by creeds and rituals to console himself in the mysterious pomp of complicated forms, for his neglect of the simple principles of useful activity, is a remark unfortunately verified by experience. But this only tends to show still more clearly the influence of religious opinion if properly directed. It is a concurring force which adds equally to the momentum of bodies, whether the line in which they move be that of virtue or of vice. If the religion of Moloch could lead the half-unwilling mother in dreadful procession to the fire which was about to receive the infant that clung smiling round her neck, can we suppose that a religion of benevolence would be scorned, which, mixing the solemnity of divine command with the sweet eloquence of nature, should teach the parent that his purest worship was the protection of that helplessness which heaven had trusted to his love? Would desire be rendered less powerful by the addition of new motives, and virtue cease when it became devotion? Is there so great a love of misery in man that he would submit to the feverish repose of a bed of spikes, that he would lacerate his limbs with daily penance, and consume his strength with the pangs of voluntary hunger, while, with the same motives of obedience to the awardee of eternity, he would be unwilling to partake of the luxury of tranquil life, and to praise with the thankfulness of enjoyment! But the most important effect of religion is the reality which it gives to the idea of obligation. The belief of the doctrine of necessity prepares the mind for the denial of any essential difference of morality; and it is the advantage of piety, that it arrests scepticism in this most dangerous of its stages, by referring to the sanction of the divine will: we believe, and we cease to inquire. Let those who deny the utility of religion conceive a world without it, a world of Enquirers, of Necessarians, of Indifferentists. They will find comfort in reflecting, that it is not the scene around them, but a picture of imagination, and will allow the importance of that principle which, if it be false, preserves from the evils of truth, and checks enquiry only where enquiry is dangerous.’

In the summer of 1814 he finished his *Paradise of Coquettes*, a publication on which his fame as a poet chiefly rests. A part of it had been written nearly six years: it was published anonymously in London. To this succeeded, in 1815, *The Wanderer of Norway*, and, in 1816, *The Bower of Spring*, as the works of The Author

of the Paradise of Coquettes. In the following year he lost his amiable and excellent mother, to commemorate whose virtues he composed his *Agnes*, published in 1818. A real mother's smile was never more beautifully described.

But age has still, all gentle and benign,
Another form,—and O! that form was thine;—
The smile, which youth, when gayer eyes are round,
Oft turns to seek,—more happy, when 'tis found;
The glance that bids but wrath or sorrow cease;
The peaceful voice, which but to hear is peace;
The temper, milder, as the years that part
Loose many a ruffling care which galled the heart;
And all the soul, to holiest wishes given,
More pure, more heavenly, as still nearer heaven.

His poem *Emily* succeeded the above in 1819. His biographer admits that his fame as a philosopher suffered by this evident devotion to the Muses: but pleads in extenuation, the rapidity with which he arrived at the knowledge of all the abstruse questions of moral philosophy, and the weariness that the further investigation of them excited in his mind! We must leave the facts and this singular plea with the reader, regretting still that in his important situation, and for a philosopher so gifted, such an apology should be necessary—as also that we cannot here indulge ourselves with extracting some of those beautiful productions of his muse, which will prove his best defence at the bar of posterity.

In the summer of 1819 he began to print the first part of his Course of Lectures, and returned to Edinburgh in the autumn, apparently in high health: but just before the Christmas vacation he became unwell, and confined himself during the holidays to his house. His only complaint at this time seemed to be an encreasing quickness of pulse when composing, and a feeling of weakness. When he again met his class the lecture unhappily was one of great moral interest. It is the thirty-fifth in the printed course. He was observed to repeat with unusual emphasis the extract from *Beattie's Hermit*—concluding with—

Nor yet for the ravage of winter I mourn,
Kind nature the embryo blossom will save,
But when shall spring visit the mouldering urn
O! when shall it dawn on the night of the grave?

and this was the last lecture he delivered. He was now compelled to find a substitute in Mr. John Stewart, and the regret he felt at being unable to attend his class is said to have rapidly increased his disorder. In the beginning of February he retired to the country seat of his friend Dr. Charles Stewart; and here a dreadful storm, succeeded by heavy falls of snow, evidently shattered his declining frame. His biographer visited him here for the last time, and found him in bed. The very first look impressed him, he says, with the mournful presage that there was nothing to hope. His face was pale, his cheeks excessively sunk; but, amidst the death of every other feature, his eye had all its former mild intelligence. He complained at this time that his friends pressed him to go abroad; and consented with reluctance shortly after to undertake a voyage to London. At sea he felt relieved, es-

pecially when the vessel was in rapid motion, and revived a little at Brompton; but soon gradually sunk into the most distressing weakness, and finally died in his drawing-room on the 2nd of April, 1820, suddenly, but without the least apparent pain.

The character of Dr. Brown as a philosopher is already too well estimated to require any further comment here. We are particularly pleased with the gentleness and sweet domestic manners with which it was united in this distinguished person: and the eulogium of his man-servant surpasses that of many that 'mark the marble' of such tombs as his. 'My master always had a happy face, but it never looked so happy as when he was coming in at his own door.' To his mother and sister he read everything he wrote, often more than once; and so enjoyed his family circle, that, after being called to the moral philosophy chair, he allowed himself only two days in the week to go abroad. So perfect, it is said, was his command over his temper, that an angry word was hardly ever heard from him. Yet he never submitted to disrespectful treatment; a look of his would instantaneously produce the most perfect silence among his pupils. 'In affection, as a son and brother,' says his warm friend and biographer, Mr. Welsh, 'he was unequalled. He was kind and considerate as a master, and his friendship was truly invaluable.' As a poet, he is of the school of Pope, and has many claims to be ranked as 'a brother—near the throne.'

Brown (William), a late eminent engraver of gems, was in early life much patronised by the empress Catharine of Russia, in whose cabinet his best specimens are preserved. He was afterwards employed at Paris by Louis XVI., and, being driven by the revolution to England, produced a beautiful set of portraits, now the property of his Majesty. He died in John-street, Fitzroy-square, July 20th, 1825, aged seventy-six.

BROWN-BILL, *n. s.* From brown and bill. The ancient weapon of the English foot; why it is called brown I have not discovered; but we now say brown musket from it.

And *brownbills*, levied in the city,
Made bills to pass the grand committee. *Hudibras.*

BROWNE (George), archbishop of Dublin, and the first prelate who embraced the doctrines of the reformation in Ireland, was originally an Austin-friar of London, and was educated near Halywell, Oxford. He afterwards became provincial of his order, and having obtained his degree of D. D. abroad, was admitted to the same at Oxford and Cambridge, in 1534. After reading Luther's writings he began to teach the people. This recommended him to Henry VIII. who, in 1535, promoted him to be archbishop of Dublin, and nominated him one of the commissioners for abolishing the papal supremacy in Ireland. In 1551 king Edward VI. gave him the additional honor of primate of all Ireland; but in 1554 he was deposed by queen Mary, on pretence of his being married. He published a work against keeping the Scriptures in the Latin tongue, and against the worship of images. He died in 1556.

BROWNE (William), an English poet of the seventeenth century, born at Tavistock, in 1590. He was sent to Exeter College, Oxford, in the beginning of the reign of James I. and became tutor to Robert Dormer, afterwards earl of Carnarvon. After he had left college with his pupil, he was taken into the family of William earl of Pembroke. His poetical works procured him great reputation. They are, 1. *Britannia's Pastorals*. The first part was published at London, 1616, in folio; and ushered into the world with verses by his friends John Selden, Michael Drayton, Christopher Cook, &c. The second part was printed at London in 1616, and recommended by verses written by John Glanville, (afterwards eminent in the law) and others. 2. *The Shepherd's Pipe*, in seven eclogues. Lond. 1614, in 8vo. 3. *An Elegy on the never enough bewailed death of prince Henry*, eldest son of king James I.

BROWNE (Sir Thomas), M. D. now principally known as the author of *Vulgar Errours*, was of respectable parentage, and was left an ample fortune by his father, who died young. He was educated at Winchester and Oxford, and was the first man of eminence, as Ward observes, who graduated at Pembroke College. He devoted himself to the study of physic, and having taken his degree of A. M. practised for a short time in Oxfordshire. After this he visited his mother, who was then with her second husband, Sir Thomas Dutton, in Ireland, and travelled over a great part of that country with his father-in-law. He now went to France, and spent some time at Montpelier; visited Padua; and thence proceeded to Leyden, where he continued until he took his doctor's degree. This was about the year 1633. There is no authentic account of his travels. 'To consider, therefore,' says Dr. Johnson, 'what pleasure or instruction might have been received from the remarks of a man so curious and diligent, would be voluntarily to indulge a painful reflection, and load the imagination with a wish, which, while it is formed, is known to be vain. It is, however, to be lamented, that those who are most capable of improving mankind, very frequently neglect to communicate their knowledge; either because it is more pleasing to gather ideas than to impart them, or because to minds naturally great, few things appear of so much importance as to deserve the notice of the public.'

In 1764 was published, in London, his *Religio Medici*, the MS. of which, as Browne alleged, was obtained surreptitiously, but Johnson regards this as a mere stratagem of authorship. On this Sir Kenelm Digby published observations, which are now generally bound up with it. The remarks are acute and ingenious, but what seems most wonderful is, that it cost the writer only twenty-four hours in procuring, reading, and making annotations on the book. The *Religio Medici*, was soon after translated into Latin by Mr. Merryweather, a gentleman of Cambridge, and from his version it was again translated into Italian, German, Dutch, and French. An edition of the Latin version was published at Strasburg, with large notes by L. Nicolaus Moltfarius. The peculiarities of this book raised the author many admirers, and many enemies; it was only,

however, professedly answered by one writer, Alexander Ross, in a work entitled *Medicus Medicatus*, which was never much noticed. In 1637 he was incorporated M. D. in the university of Oxford, and then settled at Norwich as a physician, where he obtained considerable practice. Shortly after, his reputation procured his admission as an honorary member of the Royal College of Physicians, London. In 1641 he married Mrs. Dorothy Mileham, a lady of a good family in Norfolk, and of great personal as well as mental endowments; but the qualities of the lady did not protect him from the sarcasms of the wits, who remembered that he had described the taking a wife as 'the foolishhest thing a wise man did.'

In 1646 appeared his *Pseudoxia Epidemica*, or *Treatise on Vulgar Errours*, a work received like the former, with great applause. Amongst these errors he ranks the Copernican system, and mentions the idea of the earth's motion more than once with perfect contempt. 'He was not unwilling to pay labor for truth,' says Johnson, 'and combats with great learning and ingenuity, numerous notions or opinions on natural and other objects, which had obtained general credit, not only among the common people, but among physicians and other literary persons.' In the latter part of his life we apprehend, however, that a little labor might have brought him better acquainted with the brilliant discoveries of some of his contemporaries. In 1658 he published *Hydriotaphia*, or *Discourse on Urn-burial*, together with the garden of Cyrus, or the Quineunxial Lozenge, or Net-work Plantation of the Ancients, &c. a work sufficient of itself to establish his claim to prodigious learning: was knighted in 1671 by Charles II. as he passed through Norwich; and died in that city, on his seventy-seventh birth-day, in 1682.

He left several tracts, says Whitefoot, in his closet, which he intended to publish; and two collections of them made their appearance, one edited by Dr. Jennison, the other in 1722 by an anonymous editor. Dr. Johnson's fine observations on his style we cannot omit. 'It is not on the praises of others, but on his own writings, that he is to depend for the esteem of posterity of which he will not easily be deprived, while learning shall have any reverence among men; for there is no science in which he does not discover some skill, and scarcely any kind of knowledge, profane or sacred, abstruse or elegant, which he does not appear to have cultivated with success. His style is vigorous, but rugged; learned, but pedantic; deep, but obscure; it strikes, but does not please. His tropes are harsh and his combinations uncouth. In defence, however, of his uncommon words and expressions, it should be considered, that his sentiments were uncommon, and that he was not content to express in many words, that idea for which any language could supply a single term.' As Browne has been accused of infidelity, the following extract, from his *Treatise on Urns*, may do some justice to his sentiments on the subject of a future state; and will, at the same time, exhibit some characteristics of his style. 'With these hopes Socrates warned his doubtful spirits against the cold potion; and Cato, before he durst give the fatal stroke, spent part of the

night in reading the immortality of Plato, thereby confirming his wavering hand unto the animosity of that attempt.—It is the heaviest stone that melancholy can throw at a man to tell him he is at the end of his nature; or that there is no further state to come, unto which this seems progressional, and otherwise made in vain: without this accomplishment, the natural expectation and desire of such a state were but a fallacy in nature: unsatisfied considerators would quarrel at the justness of the constitution, and rest content that Adam had fallen lower, whereby, by knowing no other original, and deeper ignorance of themselves, they might have enjoyed the happiness of inferior creatures; who in tranquillity possess their constitutions, as having not the apprehension to deplore their own natures; and being framed below the circumference of these hopes of cognition of better things, the wisdom of God hath necessitated their contentment.'

BROWNE (Isaac Hawkins), an ingenious English poet, born at Burton upon Trent, January 21st 1705-6; of which place his father was the minister. He received his grammatical instruction first at Litchfield, then at Westminster; whence, at sixteen years of age, he was removed to Trinity College, Cambridge. He remained there till he had taken the degree of M. A. and about 1727 settled in Lincoln's Inn, where he devoted more of his time to the muses than to the law. He wrote several poems, particularly one on Design and Beauty, which he addressed to Mr. Highmore the painter, for whom he had a great friendship: and the Pipe of Tobacco; in imitation of Cibber, Ambrose Philips, Thomson, Young, Pope, and Swift, who were then all living. This is reckoned one of the most pleasing and popular of his performances. In 1743-4 he married the daughter of Dr. Trimmell, archdeacon of Leicester. He was twice chosen to serve in parliament, in 1744 and 1748, for the borough of Wenlock in Shropshire; near which place he had a considerable estate, left by his maternal grandfather, Isaac Hawkins, Esq. In 1754 he published what was deemed his principal work, *De Animi Immortalitate*, in two books; in which, besides a most judicious choice of matter and arrangement, he is thought to have shown himself a happy imitator of Lucretius and Virgil. The great popularity of this poem produced several English translations of it; the best of which is that by Soame Jenyns, printed in his *Miscellanies*. Mr. Browne intended to have added a third part, but left only a fragment. This excellent person died, after a lingering illness, in 1760, aged fifty-five. In 1768 his son Hawkins Browne, Esq. published an elegant edition of his father's poems, in large 8vo. to which is prefixed a print of the author, from a painting of Mr. Highmore, engraved by Ravenet.

BROWNE (William G.), an English traveller, visited the kingdoms of Darfur and Bornou in the interior of Africa, and was the first who made those countries known to Europeans. Returning to England he published in 1799 '*Travels in Africa, Egypt, and Assyria, from 1792 to 1798*,' 4to. He subsequently went to Asia, and in a journey through Persia, about 1814, lost his life under circumstances which have never been

fully understood. He had staid some time at Constantinople, to perfect himself in the Turkish language; and thinking it would facilitate his progress among the Asiatic tribes, he assumed the Turkish costume. Thus equipped he set off with an intention to penetrate through Khorasan, and then visit the Caspian and Astrachan. During the early part of his journey he had a conference with Sir Gore Ouseley, the British ambassador; and at Oujon was admitted to an audience of the king of Persia. Proceeding on his route, he reached the pass of Irak, where he stopped to take some refreshment. He now mounted his horse, and, leaving the servant to pack up and follow him, rode gently forward along the mountains; but had scarcely gone forward half a mile, when two men on foot suddenly coming behind him, one of them with a club struck him senseless from his horse. Several others instantly made their appearance, and bound him hand and foot. As soon as he recovered the use of his faculties, he saw the banditti plundering his baggage, with which his servant had in the mean time come up. He was told by the wretches into whose hands he had fallen, that they intended to put an end to his life, though not in that place. Finding expostulation useless, and incapable of resistance, he merely entreated them to spare his servant, and allow him to depart with his papers, which could be of no use to them. This they agreed to; and what will appear more singular, the assassins, who might be supposed to consider arms as acquisitions of the utmost importance, made the man a present of his master's pistols and double-barrelled gun. They then suffered Mr. Browne to see his servant safe off, who immediately returned to Tabreez, and related what had occurred. Abbas Mirza, prince of Persia, now despatched several parties of horsemen to search the pass of the caravanserai and its neighbourhood, and in a valley on the opposite side of the mountain they found the corpse of the unfortunate traveller, which had been left naked and exposed to the beasts of the forest. It was by the prince's orders conveyed to Akhand, and interred. See *Sir R. K. Porter's Travels in Georgia, Persia, &c.* 4to.

BROWNEA, or BROWNEA, in botany, a genus of the endecandria order, in the monadelphia class of plants: CAL. bifid; COR. double, the exterior quinquefid, and the interior pentapetalous; legume unilocular. Species four; all natives of South America, and magnificent plants; especially B. coriacea and B. rosa de monte with heads of red flowers as large as a cocoa-nut.

BROWNISTS, a religious sect, which sprung out of the Puritans, towards the close of the sixteenth century; so named from their leader, Robert Brown, which see. They were also called Barrowists, from another of their preachers. To avoid the persecutions of the English bishops, Brown, with his congregation, left the kingdom, and settled at Middleburgh in Zealand; where they obtained leave of the states to worship God in their own way, and form a church according to their own model; which they had not long done before they began to differ among themselves, and divide into so many parties, that

Brown, their pastor, grew weary of his office; and returned to England in 1589. This was attended with the dissolution of the church at Middleburgh; but the seeds of Brownism, sown in England, were so far from being rooted out, that Sir Walter Raleigh in a speech, in 1592, computes no less than 20,000 Brownists. The occasion of their separation was not the faith, but only the discipline and form of government of the churches in England. They equally charged corruption on the episcopal and presbyterian forms; nor would they join with any other reformed church, because they were not assured of the sanctity and regeneration of the members that composed it; on account of the toleration of sinners, with whom they maintained it an impiety to communicate. They condemned the solemn celebration of marriages in the church; maintaining, that matrimony being a political contract, the confirmation thereof ought to come from the civil magistrate; an opinion in which they are not singular. They would not allow any children to be baptised of such as were not members of the church, or of such as did not take sufficient care of those baptised before. They rejected all forms of prayer; and held that the Lord's prayer was not to be recited as a prayer, being only given for a rule or model whereon all our prayers are to be formed. Their form of church government was democratical. When a church was to be gathered, such as desired to be members made a confession of it, and signed a covenant, by which they obliged themselves to walk together in the order of the gospel. The whole power of admitting and excluding members, with the decision of all controversies, was lodged in the brotherhood. Their church officers were chosen from among themselves, for preaching the word, and taking care of the poor, and separated to their several offices by fasting, prayer, and imposition of hands of some of the brethren. But they did not allow the priesthood to be any distinct order. As the vote of the brotherhood made a man a minister, and gave him authority to preach and administer the sacraments among them, so the same power could discharge him from his office, and reduce him to a mere layman again. And, as they maintained the bounds of a church to be no greater than what could meet together in one place and join in one communion, so the power of these officers was prescribed within the same limits. The minister or pastor of one church could not administer the Lord's supper to another, nor baptise the children of any but those of his own society. Any lay brother was allowed the liberty of giving a word of exhortation to the people; and it was usual for some of them, after sermon, to ask questions, and reason upon the doctrines that had been preached. In a word, every church on their model is a body corporate, having full power to do everything which the good of the society requires, without being accountable to any class, synod, convocation, or other jurisdiction whatever. Most of their discipline has been adopted by the Independents, a party which afterwards arose from among the Brownists. The laws were executed with great severity on the Brownists; their books were prohibited by queen Elizabeth, and their persons imprisoned, and many of them

were hanged. The ecclesiastical commission, and the star-chamber, distressed them to such a degree that they resolved to quit their country. Accordingly, many families retired and settled at Amsterdam, where they formed a church, and chose Mr. Johnson their pastor; and after him Mr. Ainsworth, author of the learned commentary on the Pentateuch. Their church flourished near 100 years. See INDEPENDENTS.

BROWNSTUDY, *n. s.* From *brown* and *study*. Gloomy meditations; study in which we direct our thoughts to no certain point.

They live retired, and then they doze away their time in drowsiness and *brownstudies*; or, if brisk and active, they lay themselves out wholly in making common places. *Norris.*

BROWNSVILLE, or Redstone Old Fort, a flourishing post town of Pennsylvania. It is situated in Fayette county, on the south-east bank of Monongahela river, between Dunlop and Redston creeks; over the former a bridge has been erected, which connects Bridge-port, a small village on the opposite side of the creek, with Brownsville. It is 260 feet long, fourteen broad, and thirty-six feet in height. The town is laid out in regular streets, crossing each other at right angles. Boats are built here for trade and emigration to Kentucky. It is thirty-five miles south by east of Pittsburgh, twelve north-west of Union, twenty-five south-east by east of Washington, and 310 west of Philadelphia.

BROWNY, a serviceable kind of sprite, who, according to a superstitious notion, formerly prevalent in the Hebrides and Highlands of Scotland (as well as among the country people in England, where he had the name of Robin Goodfellow), was wont to clean the houses, help to churn, thresh the corn, and belabor all that pretended to make a jest of him. He was represented as stout and blooming, had fine long flowing hair, and went about with a wand in his hand. He was the very counter part of Milton's Lubber Fiend.

BROWSE, *v. & n.* Ital. *broscare*; Fr. *brou-*
Brows'ing. } *ter*; from Lat. *abrodo*,
or *βρωσκω*. See **BRUSHWOOD**. To feed on young shoots or branches of trees.

And being down, is trod in the dirt
Of cattle, and *browsed*, and sorely hurt. *Spenser.*

Thy palate then did deign
The roughest berry on the rudest hedge:
Yea, like the stag, when snow the pasture sheets,
The barks of trees thou *browsedst*. *Shakspeare.*

They have scared away two of my best sheep; if
any where I have them, 'tis by the sea-side, *browsing*
on ivy. *Id.*

The greedy lioness the wolf pursues,
The wolf the kid, the wanton kid the *browse*. *Dryden.*
Could eat the tender plant, and, by degrees,
Browse on the shrubs, and crop the budding trees.
Blackmore.

On that cloud-piercing-hill,
Plinlimmon, from afar, the traveller kens,
Astonished, bow the goats their shrubby *browse*
Gnaw pendent. *Philips.*
But, peering down each precipice, the goat
*Browse*eth. *Byron. Child Harold.*

BROWTING; *brouter*; among the French gardeners, signifies breaking off the tips of the slender branches of trees, when too long in proportion to their strength.

BRUCE (James), Esq. of Kinnaird, F. R. S., one of the most celebrated travellers known in history, was born at Kinnaird in Stirlingshire, December 14th, 1728. He was instructed in classical learning at Harrow. Returning to Scotland, he intended to study the law; but, from the barbarity of his step-mother, a daughter of the late Governor Glen, he resolved to push his fortune in the East Indies. But, not procuring an appointment in the Company's service, he engaged in partnership with Mr. Allen, merchant, London, whose daughter he married, but lost within a year after. To dispel grief he travelled, but, his father dying in 1758, he returned to Britain to take possession of the inheritance of his ancestors. About this time Lord Chatham intended to employ Mr. Bruce upon a particular service, but his resignation soon after put it out of his power. Similar intentions were entertained by Lord Egremont, but his lordship's death prevented the fulfilment. It fell to the lot of the earl of Halifax to do more than fulfil the intentions of his predecessors, by pointing out a scene of action to Mr. Bruce, where his abilities have since been exerted with so much honor to himself and his country. To explore the coast of Barbary; to investigate its natural history, ancient architecture, and other curiosities, hitherto little known or illustrated by former travellers; and to make large additions to the royal collection; were the outlines of his lordship's plan. To discover the source of the Nile was also mentioned, but rather as an object to be wished than hoped for, from so young a traveller. The resignation of the consul of Algiers at this time, and the death of his newly appointed successor, favored the earl's plan; who pressed Mr. Bruce to accept of the consulship; which he did the more cheerfully, that the transit of Venus was at hand, which he hoped to see from Algiers. Within a year after his arrival there he qualified himself, by the acquisition of the Arabic, to appear without an interpreter. At Algiers he was detained longer than he expected, in consequence of a dispute with the Dey concerning Mediterranean passes. The business being adjusted, he proceeded to Mahon, and from Mahon to Carthage. He afterwards visited Tunis and Tripoli, and travelled over the interior parts of those states. At Bengazi, a small town on the Mediterranean, he suffered shipwreck, and with extreme difficulty saved his life, though with the loss of all his baggage. He afterwards sailed to the isles of Rhodes and Cyprus; and, proceeding to Asia Minor, travelled through a considerable part of Syria and Palestine, visiting Latakia, Aleppo, and Tripoli, near which last city he was again in imminent danger of perishing in a river. The ruins of Palmyra and Baalbec were next carefully surveyed and sketched by him; and his drawings of these places are deposited in the king's library at Kew; the most magnificent present, in that line, to use his own words, 'ever made by a subject to his sovereign.' Bruce now prepared for the grand expedition, the accomplishment of which had ever been nearest his heart, the discovery of the source of the Nile. In the prosecution of that great and dangerous object, he left Sidon on the 15th of

June 1768, and arrived at Alexandria on the 20th of that month. He proceeded from thence to Cairo, where he continued till the 12th of December, when he embarked on the Nile, and sailed up that river as far as Syene, visiting in the course of his voyage the ruins of Thebes. Leaving Kenne on the Nile, 16th of February 1769, he crossed the desert of the Thelaid to Cossair on the Red Sea, and arrived at Jidda on the 3d of May. In Arabia Felix he remained, not without making several excursions, till the 3d of September, when he sailed from Loheia, and arrived on the 19th at Masuah, where he was detained near two months by the treachery and avarice of the Naybe of that place. It was not till the 15th of November that he was allowed to quit Arkeeko near Masuah; and he arrived 15th of February 1770 at Gondar, the capital of Abyssinia, where he ingratiated himself with the most considerable persons of both sexes belonging to the court. Several months were employed in attendance on the king; and in an unsuccessful expedition round the lake of Dambea. Towards the end of October, Bruce set out for the source of the Nile, at which long desired spot he arrived on the 14th of November; and his feelings on the accomplishment of his wishes cannot better be expressed than in his own words: 'It is easier to guess than to describe the situation of my mind at that moment; standing in that spot which had baffled the genius, industry, and enquiry of both ancients and moderns, for the course of nearly 3000 years. Kings had attempted this discovery at the head of armies, and each expedition was distinguished from the last, only by the difference of the numbers which had perished, and agreed alone in the disappointment which had uniformly and without exception followed them all. Fame, riches, and honor, had been held out for a series of ages to every individual of those myriads those princes commanded, without having produced one man capable of gratifying the curiosity of his sovereign, or wiping off the stain upon the enterprise and abilities of mankind, or adding this desideratum for the encouragement of geography. Though a mere private Briton, I triumphed here in my own mind over kings and their armies; and every comparison was leading nearer and nearer to the presumption, when the place itself where I stood, the object of my vain glory, suggested what depressed my short-lived triumphs. I was but a few minutes arrived at the source of the Nile, through numberless dangers and sufferings, the least of which would have overwhelmed me, but for the continual goodness and protection of Providence; I was, however, then but half through my journey, and all those dangers which I had already passed, awaited me again on my return. I found a despondency gaining ground fast upon me, and blasting the crown of laurels I had too rashly woven for myself.' He now bent his thoughts on his return to his native country, and arrived at Gondar 19th of November 1770; but found, after repeated solicitations, that it was not an easy task to obtain permission to quit Abyssinia. A civil war in the mean time breaking out, no uncommon occurrence in that barbarous country, several engagements took place between the king's forces and the rebels,

particularly three actions at Serbraxos, in May 1771. In each of them Bruce acted a considerable part; and, for his valiant conduct in the second, received as a reward from the king a chain of gold of 184 links; each link weighing $3\frac{1}{2}$ dwts., or somewhat more than $2\frac{1}{2}$ lbs. troy, in all. At Gondar, after these engagements, he again earnestly entreated to be allowed to return home, which was long resisted: but his health at last giving way, from the anxiety of his mind, the king consented to his departure, on condition of his engaging by oath to return to him in the event of his recovery, with as many of his kindred as he could engage to accompany him. After a residence of nearly two years in that wretched country, he left Gondar, Dec. 16th, 1771, taking the dangerous way of the desert of Nubia, in place of the most easy road of Masuah, by which he entered Abyssinia. He was induced to take this route from his experience of the savage temper of the naybe of Masuah. Arriving at Teawa, 21st March 1772, he found the sheik Fidele, at Atbara, the counterpart of the naybe of Masuah in every bad quality. By his intrepidity and prudence, however, and by making good use of his foreknowledge of an eclipse of the moon, which happened on the 17th of April, he was permitted to depart next day, and arrived at Senaar on the 20th. At this miserable and inhospitable place he was detained upwards of four months. This delay was occasioned by the villany of those who had undertaken to supply him with money; but at last, by disposing of 178 links of his gold chain, the well-earned trophy of Serbraxos, he was enabled to make preparations for his dangerous journey through the deserts of Nubia. He left Senaar on the 5th of September, and arrived on the third of October at Chendi, which he quitted on the 20th, and travelled through the desert of Gooz, to which village he came October 26th. On the 9th of November he left Gooz, and entered upon the most dreadful and dangerous part of his journey, the perils attending which he has related with a power of pencil not unworthy of the greatest masters. All his camels having perished, he was under the necessity of abandoning his baggage in the desert, and with the greatest difficulty reached Assouan upon the Nile, November 29th. After some days rest, having procured fresh camels, he returned into the desert and recovered his baggage, among which was a quadrant, of three feet radius, supplied by Louis XV. from the Military Academy at Marseilles, by means of which noble instrument, now deposited in the museum at Kinnaird, Mr. Bruce was enabled with precision and accuracy to fix the relative situations of the several remote places he visited. On the 10th of January 1773, after more than four years absence, he arrived at Cairo, where, by his manly and generous behaviour, he so won the heart of Mahomet Bey that he obtained a firman, permitting the commanders of English vessels belonging to Bombay and Bengal, to bring their ships and merchandise to Suez, a place far preferable, in all respects, to Jidda, to which they were formerly confined. Of this permission, which no European nation could ever before acquire, many English vessels have already availed themselves;

and it has proved peculiarly useful both in public and private despatches. Such was the worthy conclusion of his memorable journey through the desert—a journey, which, after many hardships and dangers, terminated in obtaining this great national benefit. At Cairo, Mr. Bruce's earthly career had nearly been concluded by a disorder in his leg, occasioned by a worm in the flesh. This accident kept him five weeks in extreme agony, and his health was not re-established till a year afterwards, at the baths of Poretta in Italy. On his return to Europe, Mr. Bruce was received with all the admiration due to so exalted a character. After passing some time in France, particularly at Montbard, with his friend the Comte de Buffon, by whom he was received with much hospitality, he at last revisited his native country from which he had been upwards of twelve years absent. On his return public curiosity was highly excited to see a narrative of his travels; but this was retarded by various circumstances.

At last, however, he found leisure to put his materials in order; and in 1790 his long expected work appeared in five large quarto volumes, embellished with many plates, maps, and charts. The work has been criticised and the author accused of vanity, and even of falsehood; some even asserted that he had never seen Abyssinia; but later travellers have confirmed most of his statements, which they themselves had not believed when first made by him. To one objection, the account which he gives of his prediction of an eclipse—the time of which, by some strange mistake, refers to Britain—no answer we believe was ever made. The story, indeed, seems to be taken from a similar occurrence which happened to Columbus.

There never, perhaps, existed a man better qualified for the hazardous enterprize he undertook than Mr. Bruce. His person was of the largest size, his height exceeding six feet, and his bulk and strength proportionally great. He excelled in all corporeal accomplishments, being a hardy, practised, and indefatigable swimmer, trained to exercise and fatigue of every kind, and his long residence among the Arabs had given him a more than ordinary facility in managing the horse. In the use of fire-arms he was unerring; and his dexterity in handling the spear and lance on horseback was also uncommonly great. He was master of most languages, understanding the Greek perfectly; and was so well skilled in Oriental literature, that he revised the New Testament in the Ethiopic, Samaritan, Hebrew, and Syriac, making many useful notes and remarks on difficult passages. He had applied from early youth to mathematics, drawing, and astronomy: and had acquired some knowledge of physic and surgery. His memory was astonishingly retentive, his judgment sound and vigorous. He was dexterous in negotiation, a master of public business, animated with the warmest zeal for his king and country, a physician in the camp or city, a soldier and horseman in the field, while at the same time his breast was a stranger to fear, though he took every precaution to avoid danger. Of his learning and sagacity, his delineation of the course of Solomon's fleet from Tarshish to Ophir, his account

of the cause of the inundations of the Nile, and his comprehensive view of the Abyssinian history, afford ample proofs. He was preparing a second edition of his travels for the press, when he died, April 27th, 1794, in consequence of a fall down his own stairs, in the sixty-sixth year of his age.

BRUCE (Robert), son of the earl of Carrick, being competitor with Baliol for the crown of Scotland, lost it by the arbitration of Edward I. of England, for generously refusing to hold that crown as dependent on him, which his ancestors had left him independent.

BRUCE (Robert), grandson of the preceding, when Baliol broke his agreement with Edward, was easily persuaded to side with him against Baliol, upon promise that he would settle him on the throne. Having contributed much to the breaking of Baliol's party, he demanded the accomplishment of king Edward's promise, who is said to have given him this answer: 'What! have I nothing else to do but to conquer kingdoms for you?' He, however, recovered his crown, defeated the English in several battles, raised the glory of the Scots, and extended their dominions. See SCOTLAND.

BRUCEA, in botany, a genus of the tetrandria order, belonging to the diœcia class of plants.

BRUCHHAUSEN, a county of Westphalia, lying on the Weser, in Hanover, near the territory of Bremen. It is composed of the two towns of the Old and New Bruchhausen, each with a town and bailiwick. They are about four miles asunder, and between five and six miles west of the town of Hoya.

BRUCHSAL, the head of a district in the circle of the Pfalz and Enz, in the grand duchy of Baden, is situated on the Salza. It is well built, especially the suburbs of St. Peter and St. Paul, and has seven churches. The population is about 6000. The principal public buildings and institutions are the elegant castle, formerly the residence of the bishop, a Catholic academy, founded in 1803, the town-house, and hospital. It is eleven miles south-east of Spire, and fifteen south of Heidelberg.

BRUCHIUS, in zoology, a genus of insects belonging to the order of coleoptera. The specific character of this insect is, body black; antennæ filiform, testaceous; feelers equal, filiform; lip pointed; thighs unarmed; head prominent; thorax tapering before; shells striate; species twenty-seven; scattered over the globe, of which the *B. seminarius* is the only one traced in our own country, and inhabiting our flowers. The other principal species are; 1. *B. bactris*, with smooth elytra, a hoary body, and the hind part of the thighs oval. It frequents the palm-trees of Jamaica. 2. *B. gleditsiæ*, with striated elytra, of the same length with the belly, a pitch-colored body, and green feelers. It is a native of America. 3. *B. granarius*, has black elytra; the fore-feet are red, and the hind-feet are denuded. It infests the seeds of plants in different parts of Europe. 4. *B. pecticornis*, with comb-shaped feelers longer than the body. It is a native of Barbary and China. 5. *B. pisi*, has gray elytra, interspersed with white spots, and a white

fundament with two black spots. It is a native of North America, and destroys whole fields of peas. It is now found in several of the southern parts of Europe, where it does great injury to the corn. 7. *B. theobromæ*, with whitish elytra, interspersed with black points. It frequents the theobromæ or chocolate-trees in the East Indies.

BRUCIA, or BRUCINE, a new vegetable alkali, lately extracted from the bark of the false angustura, or brucia antidysenterica, by M.M. Pelletier and Caventou. Its taste is exceedingly bitter, acrid, and durable in the mouth. When administered in doses of a few grains, it is poisonous, acting on animals like strychnia, but much less violently. It is not affected by the air. The dry crystals fuse at a temperature a little above that of boiling water, and assume the appearance of wax. At a strong heat it is resolved into carbon, hydrogen, and oxygen, without any trace of azote. It combines with the acids, and forms both neutral and super-salts.

BRUCKER (John James), a Lutheran clergyman, was born in 1696 at Augsburg, and studied at Jena. In 1724 he became rector of Kaufbeuren, and was, in 1731, chosen a member of the Berlin academy of sciences. He was afterwards pastor of St. Ulrich's, and senior minister in his native city, where he died in 1770. He was the author of several works and tracts on philosophy, but his most important production is his *Historia Critica Philosophiæ*, four volumes, 4to. which appeared in 1744, and with great improvements, in six volumes, 4to. 1767. This work acquired the general approbation of the learned, as the most copious and methodical history of philosophy ever written.—A judicious abridgment of it was published by Dr. Enfield, in 1791, two volumes, 4to.

BRUCKNER (John), a literary divine of the Lutheran persuasion, settled at Norwich; was born in the island of Cadsand in 1726, and received his education at Leyden and Franeker, after which he became pastor of the Walloon congregation at Norwich until his death, in 1804. He was author of—1. *Theorie du Systeme Animal*, which has been translated into English, under the title of a Philosophical Survey of the Animal Creation, 1768; in this work is some anticipation of the sentiments of Mr. Malthus' famous Essay on Population. 2. Criticism on the Divisions of Purley, in which he discovers great knowledge of the various Gothic and Hebrew dialects. 3. Thoughts on Public Worship, in answer to Gilbert Wakefield. He also commenced a didactic poem in French verse on the principles of his Theorie.

BRUGES, a large and opulent city of the Netherlands, the capital of West Flanders, and, during the domination of the French, the chief town of the department of the Lys. It is situated in a spacious plain, intersected by a great number of canals, about six miles from the sea. Before the French Revolution it formed, with its territory, a separate district. No river passes near it, but the canals leading to Sluys and Ostend bring up, at high water, vessels of from 200 to 300 tons. The trade and manufactures of Bruges were once

far more flourishing than at present. In the fourteenth century, under the dukes of Burgundy, it was one of the greatest places of commerce in Europe, forming an important branch of the Hanseatic confederacy, and carrying on a lucrative intercourse with England, Venice, &c. Towards the end of the fifteenth century it began to decline, Antwerp becoming its rival, and afterwards its superior. On the decay of the latter, by the shutting up of the Scheldt, Bruges partly recovered its prosperity, and still carries on a considerable trade with Ostend, Sluys, Ghent, and the north of Europe. It takes an active part in the herring-fishery. The exchange here is one of the earliest establishments of the kind in Europe, and still a fine building. During the great fairs the merchants expose their goods here, and the retail trade is carried on to a great extent. There is besides a chamber of commerce, a large insurance company, a dock-yard, and a navigation school. The population is about 45,000. The streets are in general wide and well-lighted, and the houses large. There are seven gates and six market-places. The principal public buildings are the lycée, formerly the celebrated convent of the Downs the town-house, the exchange, and the church of Notre Dame, having a lofty spire. The authorities are two burgomasters, twelve echevins, twelve councillors, ten pensioners, and two treasurers. In 1559 Bruges was made a bishopric by Paul IV., and continued so until it was taken possession of by the French army in 1794. At that time it contained not less than twelve convents for the different orders of both sexes; all of which were forthwith abolished. During his consulate Buonaparte annexed Bruges to the bishopric of Ghent, confiscated the revenues, and caused the cathedral church of St. Donatus to be demolished. It has long been the residence of a convent of English nuns, who, during the late stormy periods, fled to their native country, but have since returned, and enjoy their former revenues. In the church of Notre Dame the tombs of Charles the Brave and his daughter, Mary of Burgundy, are preserved. They are formed of touch-stone, and beautifully gilt, and though constructed in 1550 appear as perfect as if new. Bruges carries on a considerable trade in grain, particularly when the ports of England are open, likewise a good traffic in coarse lace, made by the female population, and some trade in linen. The manufactures of earthenware, &c. have dwindled to nothing. This city gave birth to John of Bruges, the inventor of painting in oil. The French entered it in the summer of 1794, and the town was soon after incorporated with the French empire, a part of which it remained till the fall of Buonaparte. In 1798 an English force, under general Coote, attempted to destroy the sluices between this place and Ostend: they succeeded in their object, but the greater part were made prisoners. Twelve miles east of Ostend, twenty-two north-east of Ghent, and thirty-three north-east of Dunkirk.

BRUIN (John de), professor of natural philosophy and mathematics at Utrecht, was born at Gorcum in 1620. He possessed great skill

in dissecting animals, and also in astronomy. He published dissertations *De Vi altitric*; *De Corporum Gravitate et Levitate*; *De Cognitione Dei Naturali*; *De Lucis Causâ et Origine*, &c. He had a dispute with Isaac Vossius, to whom he wrote a letter printed at Amsterdam, 1663; wherein he criticises Vossius's book *De Natura et Proprietate Lucis*; and strenuously maintains the hypothesis of Descartes. He died in 1675, after he had been professor twenty-three years.

BRUISE, *v. & n.* } A.S. *brysan*; Teut. *briſen*;
BRUIS'ER. } Bel. *bryzin*; Arm. *brisa*;
Fr. *briser*. See To BRAY. To crush, beat, and mangle. To press together so as to destroy the continuity of the parts.

Then searcht his secret woundes, and made a priefe
Of every place that was with bruizing harmed,
Or with the hidden fire too inly warmed. *Spenser.*

Fellows in arms, and my most loving friends,
Bruised underneath the yoke of tyranny. *Shakspeare.*

And fix far deeper in his head their stings,
Than temporal death shall *bruise* the victor's heel,
Or theirs whom he redeems. *Milton.*

One armed with metal, the' other with wood,
This fit for *bruise*, and that for blood. *Hudibras.*

I since have laboured
To bind the *bruises* of a civil war,
And stop the issues of their wasting blood. *Dryden.*

They beat their breasts with many a *bruising* blow,
Till they turn livid, and corrupt the snow. *Id.*

As in old chaos heaven with earth confused,
And stars with rocks together crushed and *bruised*.
Waller.

BRUISER, in mechanics, a concave tool used for grinding and polishing the specula of telescopes. It is made of brass, about a quarter of an inch thick, and hammered as near to the gage as possible. It is tinned on the convex side, and made equally broad at bottom and top. It serves to reduce the figures of the hones, when too convex, and to rub down any gritty matter that happens to be mixed with the putty, before the speculum is applied to the polisher.

BRUISING, in pharmacy, the operation of breaking or pounding a thing coarsely; frequently practised on roots, woods, and other hard bodies, to make them yield their juice more freely than they would do whole.

BRUIT, *v. & n.* Arm. *bruit*, Fr. *bruit*, Span. *ruido*, see ROUT. To report, to spread a rumor; to make anything known with noise and clamor.

As slander's loathsome *bruit* sounds folly's just reward,
Is put to silence all betime, and brought in small regard,

Even so doth time devour the noble blast of fame,
Which should resound their glories great that do deserve the same. *Earl of Surrey.*

His death
Being *bruited* once, took fire and heat away
From the best tempered courage in his troops. *Shakspeare.*

I am not
One that rejoices in the common wreck,
As common *bruit* doth put it. *Id.*
It was *bruited*, that I meant nothing less than to go to Guiana. *Raleigh.*

A *bruit* ran from one to the other, that the king was slain. *Sidney.*

BRUMAIRE, i.e. the foggy month, French, from *brume*, fog, the second month in the French revolutionary calendar. It began October 22d. and ended November 20th, consisting of thirty days.

BRUM'AL, *adj.* Lat. *brumalis*. Belonging to the winter.

About the *brumal* solstice, it hath been observed, even unto a proverb, that the sea is calm, and the winds do cease, till the young ones are excluded, and forsake their nests. *Brown.*

BRUMALIS PLANTÆ, in botany, from *bruma*, winter; plants which flower in our winter; common about the Cape.

BRUMALIA, in Roman antiquity, festivals of Bacchus, celebrated twice a year; the first on the 12th of the kalends of March, and the other on the 18th of the kalends of November. They were instituted by Romulus, who during these feasts used to entertain the senate. Among other heathen festivals which the primitive Christians were much inclined to observe, Tertullian mentions the *brumæ* or *brumalia*.

BRUMALIS, in ornithology, a species of *emberiza*, found in the north of Italy, the *Brumal Bunting* of Latham

BRUMOY (Peter), a learned Jesuit, born at Rouen, in 1668, distinguished by his talents for the belles lettres. His works are 1. A History of the Gallican Church, 6 vols; 2. *Morale Chretienne*, 12mo.; 3. *Examen du Poeme sur la Grace*; 4. *La Vie de la Imperatrice Eleonora*; 5. *Theatre des Grecs, Contenant des Traductions et Analyses des Tragedies Grecques, des Discours et des Remarques Concernant la Theatre Grecque*, 3 vols. 4to. This very valuable performance was translated into English by Mrs. Lenox, who received assistance from Dr. Johnson and other able writers; 6. History of the Revolutions of Spain, 3 vols. 4to. He died at Paris in 1742

BRUN, BRAN, BROWN, BOURN, BURN, are all derived from the Saxon *bopn*, *boupn*, *brunna*, *bupna*; all signifying a river or brook.

BRUN (Charles Le), was born in 1619, of a family of distinction in Scotland. His father was a statuary by profession. He discovered such an early inclination for painting, that his father being employed in the gardens at Seguiet, the chancellor placed him with Simon Vouet an eminent painter. He was afterwards sent to Fontainebleau, to copy some of Raphael's pieces. He sent him next to Italy, and supported him there for six years. Le Brun, in his return, met with the celebrated Poussin, with whom he contracted a friendship which lasted as long as their lives. A painting of St. Stephen, which he finished in 1651, raised his reputation to the highest pitch. Soon after, the king made him his first painter, conferred on him the order of St. Michael, and spent two hours every day to see him work, while he was painting the family of Darius at Fontainebleau. About 1662 he began his five large pieces of the history of Alexander the Great, in which he is said to have set the actions of that famous conqueror in a more glorious light than Quintus Curtius has done in his history. He procured several advantages for the royal academy of painting and

sculpture at Paris, and formed the plan of another for the students of his own nation at Rome. The king gave him the direction of all his works, particularly of his royal manufactory at the Gobelins, where he had a handsome house with a large salary. He was the author of two treatises; 1. On Physiognomy, and 2. On the Different Characters of the Passions. The pieces that gained him the greatest reputation were those which he finished at Fontainebleau, the great staircase at Versailles, and especially the grand gallery, which is the last of his works, and is said to have taken him up fourteen years. He died at Paris in 1690.

BRUNCK (Richard Francis Philip), a modern classical scholar and critic of the greatest reputation; he was a native of Strasburg, and educated by the Jesuits at Paris. He was made early in life a commissary at war and receiver of finances; but finally settled at Strasburg, and devoted all his leisure to the study of the Greek language. His Greek Anthology was first published at Strasburg in 1776, 3 vols. 8vo.; and followed in 1779 by Selections from the works of *Æschylus*, *Sophocles*, and *Euripides*, 2 vols. In 1780 appeared his edition of *Apollonius Rhodius*; and his *Aristophanes* in 1783. In 1785 he published an edition of *Virgil*; and in 1786 appeared the whole works of *Sophocles*, 2 vols. 4to. Brunck was now partially disturbed in his pursuits by the storms of the French Revolution, and became one of the first members of the popular associations at Strasburg. He was imprisoned at Besançon during the tyranny of Robespierre, on whose death he was liberated. In 1791 and 1801 our critic was under the necessity of selling portions of his fine library; which affected his composure to such a degree as to compel him to give up his Greek studies. He still, however, proceeded with the Latin poets; and in 1797 published a beautiful edition of *Terence*. He was preparing the works of *Plautus* for the press, when he died, June 1803.

BRUNDISIUM, or **BRUNDISIUM**, in ancient geography, a town of Calabria, with the best harbour in Italy. It was a very ancient town, and belonged originally to the *Salentines*; but was taken by the Romans about A.A.C. 256. It is now called *BRINDISI*; which see.

BRUNETT, *n. s.* Fr. *brunette*. A woman with a brown complexion.

Your fair women therefore thought of this fashion, to insult the olives and the *brunettes*. *Addison.*

BRUNIA, in botany, a genus of the monogynia order, and pentandria class of plants. The flowers are aggregate or clustered; the filaments inserted into the heels of the petals; the stigma is bifid; the seeds are solitary, and the capsule is bilocular. There are eight species, all Cape plants.

BRUNION, *n. s.* Fr. *brugnon*. A sort of fruit between a plum and a peach.

BRUNN, a circle and town of Moravia; the former, bounded by Bohemia on the north, and Austria on the south, contains about 1860 square miles, and a population of 299,960 individuals. Corn, flax, and large herds of cattle, are the chief produce. It also contains mines, medicinal springs, marble quarries, forges, alum-works and

glass-houses. Brunn is considered the capital of the kingdom, and has, besides the government offices, several large manufactures of fine woollen cloths and kerseymeres. It is well supplied with coals, water, and other requisites for these works, and was once fortified; but the trenches are now well filled with tanneries, rope-yards, dye-houses, &c. The principal buildings are the church, with an elegant spire covered with copper, the state-house, the town-house, and the palace of prince Lichtenstein. Near it, on the top of a hill, stands the fortress of Spielberg, now used as a state-prison. The town and suburbs contain about 24,000 inhabitants. Here are very large fairs for general commerce, held quarterly. Brunn is 100 miles south-east of Prague.

BRUNNEUS, in entomology, a species of pinus, and also the name of a species of curculio, cimex, cryptocephalus, coluber, asilus, and elater.

BRUNNICIHA, in botany, a genus of plants, class decandria, order tryginia: CAL. five-cleft: COR. none: CAPSULE one-celled, many-seeded. Species one, a Bahama plant.

BRUNO, i. e. Brown, Ital. the Latin name assumed by the late Dr. Brown, in his *Elementa Medicinæ*; whence the epithet Brunonian.

Bruno, Giordano, a dominican, born at Nolo, in Naples. About A. D. 1582 he began to call in question some of the tenets of the Romish church, which obliged him to retire to Geneva: but after two years stay there, he expressed his aversion to Calvinism in such a manner that he was expelled the city. After having staid some time at Lyons, Toulouse, and Paris, he came to London, and continued two years in the house of M. Castlneau the French ambassador. He was very well received by queen Elizabeth and the politer part of the court. His principal friends were Sir Philip Sidney and Sir Fulk Greville. With these, and some others of their club, Bruno held assemblies; and, at Sir Philip's request, he composed his *Spaccio della Bestia Trionfante*, which was printed in 8vo. 1584 and dedicated to that gentleman. This work, which is remarkable for nothing but its impiety, we are told in the *Spectator*, No. 389, sold at an auction in London for £30. From England he went to Wirtemberg, and thence to Prague, where he printed some tracts, in which he openly discovered his atheistical principles. After visiting some other towns in Germany, he made a tour to Padua; where he was apprehended by the inquisition, tried, condemned, and, refusing to retract, was burnt at the stake in Rome, February 9th, 1600.

BRUNONIAN SYSTEM, a system of medicine, discovered by the late Dr. Brown, and explained at large in his *Elements of Medicine*. It differs so widely from all former systems of that science, and made so extensive an impression on the medical world at the time of its appearance, that we think it consistent with propriety to delineate it under its own title. The following will give a sufficient view of its outlines, to such as are unacquainted with it: and for its minutiae we must refer to the Dr's own works, and those of Dr. Beddoes, Dr. Jones, &c.

The human body, particularly the system of solids it consists of, is a form of living matter,

whose characteristics are sensation and motion. The capability of being affected by external powers is termed excitability; the agents, stimuli, or exciting powers; the result excitement. Without this property (excitability), the body would be dead inert matter: By this property, it becomes living matter; by this property, called into action by the exciting powers, it becomes a living system. While the stimuli act on the excitability with a sufficient degree of power, then is the pleasant sensation of health; when they raise the excitement above this point, or depress it below it, disease takes place: when the stimuli cease to act, or the system to feel their power, death ensues. Excitability is a property of living matter, peculiar and inherent, but it is a property which Dr. Brown did not pretend to explain. He left it as Sir Isaac Newton did his Attraction, as a property not to be investigated. Of this energy or power, there is assigned to every living system, at the commencement of life, a certain quantity or proportion; but its quantity differs in each, and in the same body it is found to change, for the excitability, according to circumstances, may be abundant, increased, accumulated, superfluous, exhausted, consumed, &c. The stimuli, or exciting powers, are of two classes: external and internal. The external stimuli are heat, light, sound, air, and motion; food, drink, medicines, and whatever else is taken into the body, not excepting poisons and contagions. The internal are the functions of the body, the blood, the secretions, muscular exertion, and finally the powers of the mind, as sensation, passion and thought. Dr. Beddoes, we know not for what reason, ranks 'the blood and secreted fluids' among the external stimuli. Excitement is Life; the natural movements of the machine, and the functions resulting from these, as sensation, reflection, and voluntary motion; which, as they immediately flow from the exciting powers, are vigorous when they are strong, languid when they are weak, and cease when they are taken away entirely. Thus our body is continually moved by external agents, and life is a forced state. The frame has an unceasing tendency to dissolution, which is opposed only by the incessant application of exciting powers; which are the sources of life, and which being partially or completely withdrawn are immediately followed by disease or death. It is also a principle of this doctrine, that 'all stimuli by acting on the excitability exhaust it.' On awaking we feel a new power of excitement in every object around us; we are refreshed in the morning, and languid at night, and our whole life is an alternation of motion and rest, of action and sleep, of apathy and pleasure, of wasting our excitability by day in labor or enjoyment, and of recruiting it by night by the abstraction of all stimulant powers. The same philosophy extends to the duration of life: in childhood, excitability is abundant in quantity, as being little exhausted; but it is low in power, because the tender stamina, and accumulated excitability of children, can neither suffer nor support high excitement. Their excitability is so abundant, that they are easily supported by weak diet and low exciting powers, and therefore most of their diseases are diseases of

weakness. In youth and manhood the excitability is yet entire, the stamina are strong : the powerful stimuli are applied, and high passions prevail : these are the periods of vigor, and the æra of inflammatory disease. In old age the stamina are worn, the excitability is exhausted, the common stimuli have lost their power, and the system begins to decline ; we have weakness of body, imbecility of mind, and asthenic diseases. We may, last of all, have recourse to more generous diet, and raise the stimulant powers by substituting wine to water, or brandy to wine ; thus perhaps excitement may be a while supported, and life prolonged ; but in a few years, these also fail. This doctrine farther teaches, that the body is never moved but by exciting powers. None but stimuli affect our system. Health is the due operation of stimuli on a well regulated excitability, producing a moderate excitement, and a pleasant sensation ; moving the whole system with a just degree of power, and giving all the functions their due energy and tone. Asthenic disease, disease of debility or of weakness, is the result of stimuli applied in a low degree, or of the system less easily excited. Sthenic disease, or disease of strength, is the result of stimuli applied in too great a degree, or of a system too susceptible of excitement. The first is depression of excitement below the healthy state : it produces languid motions and functions ; and requires excitement for its cure. The second is a strong state of the system, wound up to too high a pitch of excitement. It is an exuberance of health and strength. It is marked by violent movements, and is cured by abstraction of stimuli. Thus are all our maladies either diseases of weakness or of excessive strength, and this is the foundation of the Brunonian scale, which has for its middle point health ; below that are arranged the diseases of weakness ; above it the diseases of excessive strength : and, in both divisions of the scale, diseases are so arranged, that the worst forms are set off at the greatest distance from the middle point, to mark them as the widest deviations from the healthy state.

‘The Brunonian system,’ says Dr. Beddoes, ‘has been frequently charged with promoting intemperance ; the objection is serious, but the view given of its principles shows it to be groundless. No writer has insisted so much upon the dependence of life upon external causes, or so strongly stated the inevitable consequences of excess : and there are no means of promoting morality upon which we can rely, except the knowledge of the true relations between man and other beings or bodies. For by this knowledge we are directly led to shun what is hurtful, and pursue what is salutary. It may be said that the author’s life disproves the justness of this representation. His life, however, only shows the superior power of other causes, and of bad habits in particular ; and I acknowledge the little efficacy of instruction when bad habits are formed. Its great use consists in preventing their formation, for which reason, popular instruction in medicine would contribute to the happiness of the human species. But though the principles of the system did not correct the propensities

of its inventor, it does not follow that they tend to produce the same propensities in others.’

Dr. Beddoes has, with great candor as well as judgment, pointed out a few of the imperfections of this doctrine. 1. He observes, that, as Dr. Brown ‘assumes, that a certain portion of excitability is originally assigned to every living system, by his very assumption, he denies its continual production, subsequent diffusion, and expenditure.’ Dr. Beddoes thinks that the brain is destined to secrete a successive supply of this principle. 2. He next objects against the Dr’s ‘uniformity of operation in stimulants.’—‘Heat and wine (he justly observes) can never act in the same manner, for no person is intoxicated by heat.’ He adds, ‘had it been once allowed by Brown, that the different constituent parts of the body bear a different relation to the same agents, he must have admitted the operation of specific stimulants to an unlimited extent.’ On the subject of Predisposition to Disease, he observes that ‘though facts have been noted, the principle lies involved in total obscurity. Brown does not purposely elude the difficulty, but his principles lead him beside it ; and we may doubt whether the term predisposition ought in strict propriety to have appeared in his Elements ; for predisposition is with him a slight disease, differing only in degree from that into which the person predisposed falls.’ 4. ‘There are several other opinions,’ he adds, ‘which, in a complete revival of the Brunonian system, would require particular examination, such as his doctrine concerning hereditary diseases,’ which Brown denies the existence of, ‘the peculiar state of sthenic inflammation, and the nature of the passions.’ 5. And in a note upon Brown’s preface, he styles the Dr’s opinion, that ‘nearly all the diseases of children depend on debility,’—‘a gross and dangerous error,’ though he admits that ‘thousands of them are cut off at an early period of life, and tens of thousands kept languishing in misery, by asthenic diseases, for want of ‘the necessities of life.’ This admission of Dr. Beddoes might have superseded his criticism. Dr. Brown did not say all diseases of children were asthenic. But if thousands and tens of thousands are, they may be surely said to be nearly all such. Neither Dr. Brown nor any man in his senses would prescribe stimulants in croup, peripneumony, or the first stage of hooping cough ; though we have known the most speedy and effectual cures performed by opium in this last disease, after the sthenic diathesis was gone.

Some have asserted that Dr. Brown borrowed the first idea of his doctrine from some hints thrown out by his then intimate friend Dr. Cullen ; but Dr. Beddoes, after quoting the passage from Cullen’s Institutions (parag. cxxx.), where excitement is mentioned, shows plainly that when Dr. Cullen wrote it, ‘his thoughts were turned from a living body to an electrical machine,’ and that ‘his idea of excitement has therefore nothing in common with that of Brown.’—Others have affirmed, that Dr. Brown only revived the old doctrine of the Methodic sect, and that Themison was the discoverer, and Thessalus and Soranus the improvers, of the doctrine now called Brunonian. But nothing can be more distant from the

truth than this. The methodic doctrine of stricture and relaxation bears no analogy to Brown's definitions of sthenic and asthenic diseases; and the doctrine of spasm itself is not more opposite to the Brunonian system, than Themison's notion of a third class of diseases, which partook of both stricture and relaxation. The truth is incontrovertible, that the discovery, such as it is, is wholly Brown's own. Dr. Darwin suggested an ingenious modification of this system; but the system itself has, of late, been almost entirely abandoned by medical men.

BRUNSFELSIA, in botany, a genus of the monogynia order, and pentandria class of plants. CAL. five-toothed, angular; cor. a long tube: CAPS. berried, one-celled, many-seeded. Two species, both natives of the West-Indies.

BRUNSVIGIA, in botany, a genus of plants class hexandria, order monogynia, natural order narcissi; essential characters, cor. superior, having six deep segments: CAPS. turbinate,

with three membranous wings: SEED. numerous and pointed. The species are, 1. *B. multiflora*, broad-leaved brunsvigia. 2. *B. marginata*, red edged brunsvigia. 3. *B. radula*, rasp-leaved brunsvigia. 4. *B. striata*, striated brunsvigia. These are all natives of the Cape of Good Hope.

BRUNSWICK, a duchy of Germany, in the former circle of Lower Saxony, and having for its boundaries Lüneburg on the north, Westphalia on the west, the duchy of Hesse on the south, and Magdeburg, Anhalt, and Halberstadt, on the east. It is sometimes considered in two distinct parts: the principality of Wolfenbüttele, and the county of Blankenburg, containing altogether about 1452 square miles, and a population of 208,700 persons, or nearly 144 persons to each square mile, and is, in its civil government divided into two cities and six districts, which, with their extent, population, and chief towns, have been thus exhibited;—

Districts.	Extent in Eng. Sq. miles.	Population.	Chief Towns.
Wolfenbüttele	456	56,593	Wolfenbüttele
Schöningen	296	32,880	Helmstadt
Hartz	209	19,841	Langelsheim
The Leine	95	15,748	Gandersheim
Weser	252	31,468	Stadtoldendorf
Blankenburg	144	16,317	Blankenburg
	1452	208,697	

Brunswick and Wolfenbüttele are cities, ranking as distinct districts, the former containing a population of 29,050, and the latter 6,800 inhabitants. A late survey gives the following distribution of the surface of this duchy.

	Eng. Acres.
Under the plough	291,575
Under garden culture	16,752
In meadows	42,049
Pasture land	207,751
Woods and plantations	284,423
Fish-ponds and lakes	2,217

The most valuable are the mineral productions of the duchy, particularly its iron, the mines of which, with the marble and timber, are the chief basis of its revenue. The northern part is flat, but the southern district a mountainous region, forming the thickest part of the Hartz, and largely covered with forests. The lower tracts, besides abundance of timber, and metals, produce various kinds of grain. The rivers are the Weser, the Ocker, the Innerste, and the Leine. The principal exports,—rye, wheat, wool, linen, rape-seed, hops, vitriol, sulphur, zinc, and a few other articles, amount to two millions and a half of Rix-dollars annually. The imports are wine, sugar, tea, and coffee. The inhabitants are principally Lutherans; the whole of the Catholics and Calvinists being only estimated at between 3000 and 4000. About 3000 men includes the whole military establishment. The annual revenue arising from taxation is about £170,000 a year, but, in addition to this, the prince has a yearly income of about £210,000, from his patrimonial domains.

The illustrious house of Brunswick has been one of the most distinguished in history, and traces

its descent from Azo I., marquis of Este, in Italy, who died in 964. It consists of two branches, the Brunswick Lüneburg, and that of Brunswick Wolfenbüttele; the head of the former being the king of Great Britain and Hanover, and of the latter the duke of Brunswick Wolfenbüttele, the ruling prince of Brunswick, who holds the twelfth place in rank among the princes of the empire. In the modern arrangement of the German states it has its place in the third class.

Brunswick, the capital, is composed of five towns, viz. the Old Town, the New, the Hagan or Burg, the Old Wieck, and the Sack, which make it a large place, but the houses are almost all built of wood. There are several churches, one of which is an ancient Gothic building, but the appearance of its antiquity is almost absorbed by modern repairs. It is a fortified place, but not of much strength. The inhabitants carry on a considerable trade with Bohemia. Brunswick mun is well known in England; a small sort of which is the common drink of the inhabitants of the city. Here spinning-wheels are said to have been invented. The buildings most deserving of notice here, are the cathedral of St. Blasius, with the tombs of deceased members of the royal family; the Graue-Hof, the residence of the duke, originally a monastery, the public wine cellars, the exchequer, the meeting-house of the diet, the mint, the opera-house, the new town-house, and the arsenal. The Collegium Carolinum was founded in 1745, and affords instruction in the languages, arts, sciences, and polite exercises. Here are also two other academies. The manufactures beside mun, are wool, yarn, linen, porcelain, pasteboard, and paper-hangings. The great Brunswick fairs rank next

to those of Leipsic and Frankfort. Between 1807 and 1814, Brunswick was the capital of the department of the Ocker, in the kingdom of Westphalia. It is seven miles north of Wolfenbuttle, and forty-seven W.N.W. of Magdeburg.

BRUNSWICK, a maritime county of North Carolina, America.

BRUNSWICK, formerly the best built town in the above county, and one that carried on the most extensive trade; but having been burnt down in the year 1780, by the British, it has never since recovered.

BRUNSWICK, a town of New Jersey, United States of America, is situated on the south-west bank of the Rariton river. It contains about 2500 inhabitants, most of whom are Dutch. The commodious wooden bridge across the Rariton river, is about 200 paces long, and the only object worth notice. The part over the channel is contrived to draw up, and on each side is a footway, with rails and lamps. It carries on a considerable trade, and is eighteen miles north-east of Princetown, sixty north-east from Philadelphia, and thirty-five south-west from New York.

BRUNSWICK, a town of the United States, in Cumberland county, district of Maine, contains about 1400 inhabitants, and lies thirty miles north-east of Portland, and 151 north-east of Boston.

BRUNSWICK, a town of the United States, the chief town of Glynn county, Georgia, is situated at the mouth of Turtle river, in Simon's sound. It has a safe and capacious harbour. From its advantageous situation, and the fertility of the back country, it promises to be a most commercial and flourishing place. It is sixty miles S.S.W. from Savannah, and 110 south-east from Louisville.

BRUNSWICK NEW, one of the four British provinces in North America, bounded on the south by the bay of Fundy, on the west by the United States, and part of Lower Canada, on the north by Chaleur bay, and on the east by the gulf of St. Lawrence. Its chief towns are St. John's the capital, Fredericktown, St. Andrews, and St. Ann, the present seat of government. The rivers, St. John's, Magegadavick, or eastern river, Dicuasset, St. Croix, Merrimichi, Petitcodiac, Memramcook; all, the three last excepted, falling into Passamaquoddy bay. St. John's river opens a vast extent of fine woody country, the pines of which are said to be the best yielded in America. The Passamaquoddy is surrounded with noble meadows. See AMERICA, BRITISH.

BRUNSWICK GREEN. This is an ammoniacumate of copper, much used for paper-hangings, and on the continent in oil-painting. See COPPER.

BRUNSWICK (Ferdinand, duke of), a celebrated general of the last century, was born in 1721, and travelled in Holland, France, and Italy. Returning home in 1740, he entered the service of the king of Prussia, and soon distinguished himself in Silesia. After the rupture of the convention of Closterseven, he was employed by George II. in the command of the English and Hanoverian forces destined to act against the French. He now drove the enemy beyond the Rhine, and won, by a daring manœuvre, the

battle of Crevelt. Shortly after followed the famous victory of Minden, in which Lord George Sackville, who commanded the British and Hanoverian cavalry, was accused of standing aloof in the action. In 1762 Ferdinand drove the French out of the territory of Hesse: the peace of the following year terminated his career as a general, and he retired to Brunswick, where his death took place July 3rd, 1792.

BRUNSWICK LUNEBURG (Charles William Ferdinand, duke of), nephew of the preceding, and born at Brunswick in 1735, studied the art of war under his uncle and Frederic the Great of Prussia. When only twenty-two, he distinguished himself at the battle of Hastenbeck, and afterwards served with reputation. The king of Prussia employed him in a military capacity in 1770 and 1771; and in 1778 the war concerning the succession of Bavaria gave him an opportunity of establishing his fame. He succeeded to the duchy on the death of his father in 1780. In 1787 he conducted his memorable campaign in Holland, quieted its disturbances, and established for a time the preponderance of Prussia. The revolution now rising in France furnished him with fresh employment: in 1792 he was appointed to the command of the allied forces destined to act against France, with a view to liberate Louis XVI. Nothing could be more unfortunate than the result of this expedition; the duke resigned his command in the beginning of 1794. He once more took up arms against France in 1806, and received a wound, while in command of the Prussians at the battle of Auerstadt, of which he died at Altona, November 10th, 1806. In 1764 this prince married the princess Augusta of England, by whom he had three sons and four daughters. His eldest son and successor fell in the midst of his brave Brunswickers early in the battle, fought in 1815, near Waterloo. For a sketch of the life of his not less brave but unhappy daughter, Caroline, see CAROLINE.

BRUNSWICK-OELS (Frederick Augustus, duke of), younger brother of the preceding, was born in 1741 at Brunswick. Destined, from his station, to a military life, he had yet a strong predilection for the belles lettres; and, while acting as a general officer in the service of Prussia, distinguished himself by his literary acquirements. His productions, printed and circulated among his friends, but never published, were *Critical Remarks on the Character and Actions of Alexander the Great*; *a Treatise on Great Men*; *The Thoughts of a Cosmopolite on Air Balloons*; *Military Instructions*; *A Discourse on Taking the Oath*; *Considerations on the Grandeur, &c. of Ancient Rome*; *An amusing Historical, Political, and Literary Journal*; all in 8vo.: and *a History of the Military Life of Prince Frederick Augustus of Brunswick Lunenburg*, 4to. His highness was an honorary member of the Berlin Academy of Sciences. In 1792 he succeeded to the principality of Brunswick Oels, and died in 1805 at Weimar.

William Adolphus, another brother, belonged to the Academy at Berlin, and published a *Translation of Sallust, a Discourse on War, and a Poem on the Conquest of Mexico*, in French.

He served in the armies of the king of Prussia, and died of a fever in 1771, when about to join the Russian army.

BRUNT. Swed. *branad*, Belg. *brand*, from Goth. *brenna*. To burn; ardor; vehemence; shock; violence; blow; stroke.

Erona chose rather to bide the *brunt* of war, than venture him. *Sidney.*

A wicked ambush, which lay hidden long
In the close covert of her guileful eyen,
Thence breaking forth, did thick about me throng,
Too feeble I to abide the *brunt* so strong. *Spenser.*

The friendly rug preserved the ground,
And headlong knight, from bruise or wound,
Like feather-bed betwixt a wall,
Or heavy *brunt* of cannon-ball. *Hudibras.*

God, who caused a fountain, at thy prayer,
From the dry ground to spring, thy thirst to allay
After the *brunt* of battle. *Milton.*

BRUNTON (Mary), an authoress of some repute, was the daughter of Colonel Thomas Balfour, and born in the island of Barra, Orkney, in 1778. She married, in her twentieth year, Dr. Alexander Brunton, minister of Bolton, near Haddington, and afterwards of Edinburgh. She wrote *Discipline, and Self-Control*, two very successful novels of the religious class, and died in 1818, leaving *Emmeline*, a tale, and other pieces, which have been published by Dr. B. with a sketch of her life.

BRUNY'S ISLE, an island on the south-east coast of Van Diemen's land, of an irregular figure, and about thirty miles in length. On the east it is penetrated by Adventure Bay, and by Isthmus Bay on the west; the tides nearly meet on each side of the narrow intervening lands. From the mainland this island is separated by D'Entrecasteaux's channel, and has a beautiful sandy beach, of which the interior is covered with lofty trees, many of which seem peculiar to the island. Enormous rays are found here, weighing 300 or 400 pounds. Mosquitoes are numerous, and a species of large black ant, which inflicts a very painful bite. Eagles, hawks, parrots, and several kinds of crows, frequent the shore, where numbers of aquatic birds are taken. Kangaroos are also found here, and a singular species of the duck-billed ant eater. It is seventeen inches long, two inches high when walking, and covered by spines, just projecting above the skin. It is a sort of connecting link between birds and quadrupeds. The few inhabitants here are of similar tribes to those of Van Diemen's land, dark, and tattooed with fanciful elevated punctures. Both sexes go naked, and are very barbarous and treacherous. Long. 147° 29' E., lat. 43° 21' S.

BRUSCHIUS (Gasper), a Latin historian and poet, born at Egra, in Bohemia, in 1518. He was devoted to literature from his childhood, and especially to poetry, in which he gained so much reputation, that he attained to the poetical crown, to the dignity of poet laureat, and of count palatine. He wrote with prodigious facility; and his verses are easy, and natural. He published Latin poems on various subjects; the History of the Bishops and Bishopries of Germany; of German Monasteries; and many other works, of

which a catalogue is given in Gesner's *Bibliothèque*. He was very poor, subsisting almost entirely by the benefactions of his poetical patrons, and by presents from the abbots whose monasteries he described. The liberality of some abbots at Basil enabled him to buy a new suit of clothes; but when he found that appearing well dressed in the streets procured him respect from the vulgar, he tore his new finery to pieces, 'as slaves that had usurped their master's honors.' He was murdered in the forest of Schlingenbach between Rottemberg and Winsheim, by some gentlemen (it was supposed) against whom he was about to write something.

BRUSH, *v. & n.* } Swed. *borst*, Dan. *bæerst*,
BRUSH'ER, } Fr. *brosse*. This in the
BRUSH'Y. } sense of an instrument made with bristles of hair: but Goth. *brask*, *brad-ska*, Swed. *brad-ska*, Scot. *brash*, Bel. *brusk*, Fr. *brusque*, Ital. *brusco*. In this it signifies a sudden effort, a strenuous act, an assault. To brush, is with a brush either to clean, rub, or paint anything; to strike with quickness, to move with rapidity, or to fly over, to skim lightly. The adjective is used in the sense of rough or shaggy. A fox's tail is on this account called a brush.

The wrathful beast about him turned light,
And him so rudely passing by, did brush
With his long tail, that horse and man to ground did rush. *Færie Queene.*

If he be not in love with some woman, there is no believing old signs: he *brushes* his hat o' morning; what should that bode? *Shakspeare.*

Let grow thy sinews till their knots be strong,
And tempt not yet the *brushes* of the war. *Id.*

Sir Henry Wotton used to say, that critics were like *brushers* of noblemen's cloathes. *Bacon.*

Another holder stands at push
With their old holy-water brush. *Marvell.*

And from the boughs brush off the evil dew,
And heal the harms of thwarting thunder blue. *Milton.*

Has Somnus brush'd thy eyelids with his rod?
Dryden.

His son Cupavo brushed the briny flood,
Upon his stern a brawny centaur stood. *Id.*

Nor wept his fate, nor cast a pitying eye,
Nor took him down, but brushed regardless by. *Id.*

High o'er the billows flew the massy load,
And near the ship came thundering on the flood,
It almost brushed the helm. *Pope.*

You have commissioned me to paint your shop, and
I have done my best to brush you up like your neighbours. *Id.*

The French had gathered all their force,
And William met them in their way;
Yet off they brushed, both foot and horse. *Prior.*

With a small brush you must smear the glue well
upon the joint of each piece. *Mozon.*

Whence comes all this rage of wit? this arming all
the pencils and brushes of the town against me?
Stillingfleet.

As on a time the fox held forth,
On conscience, honesty, and worth,
Sudden he stopped; he cocked his ear;
Low dropt his brushy tail with fear. *Gay's Fables.*

Alike the busy and the gay
But flutter through life's little day,
In fortune's varying colours drest,
Brushed by the hand of rough mischance. *Gray.*

BRUSH, in electricity, denotes the luminous appearance of the electric matter issuing in a parcel of diverging rays from a point. Beccaria ascribes this appearance to the force with which the electric fluid, going out of a point, divides the contiguous air, and passes through it to that which is more remote.

BRUSH MAKING. This is done by folding the hair or bristle in two; and bringing it by means of a packthread, which is engaged in the fold, through the holes with which the wood is pierced all over, being afterwards fastened therein with glue. When the holes are thus filled, the ends of the hair are cut to make the surface even. The Chinese painter's brush consists of the stalk of a plant; whose fibres being fretted at both ends, and tied again, serve for a brush.

BRUSH, SHEARMEN'S, is made of wild boar's bristles; and serves to lay the wool or nap of cloth, after shearing it for the last time.

BRUSH, WIRE, is made of brass or iron wires instead of hair. These are used by silver-smiths and gilders, for scrubbing silver, copper, or brass, previous to gilding them.

BRUSH OF A FOX, among sportsmen, signifies his drag or tail.

BRUSHWOOD. Teut. *brusch*, Fr. *brusc*, *brosse*, *brossailles*, Ital. *brusca*. Young trees, or branches that are stunted by cattle. See **Browse** and **Risewood**.

It smokes, and then with trembling breath she blows,
Till in a cheerful blaze the flames arose.

With *brushwood*, and with chips, she strengthens these,
And adds at last the boughs of rotten trees. *Dryden*.

BRUSSELS, the capital of the southern provinces, and second town of the kingdom of the Netherlands, is a handsome city of South Brabant, situated partly on a gentle eminence, and partly on a plain watered by the Senne. It is stated to be seven English miles in circumference, and was formerly surrounded by a wall, ditch, and other fortifications; but these were demolished by Joseph II. and the ramparts are laid out in public walks. No town in Europe has finer walks. That part of the city on the hill has a very imposing appearance. The park is an immense square, laid out in regular walks, shaded with trees, and surrounded by the palaces, public offices, and houses of the great. In one of these walks, there is a fountain into which the czar Peter, when on a visit to this city, fell one evening after dinner, while strolling through the park; an event recorded on a marble tablet. In the lower town are many narrow streets of the character of all bustling towns; but the great market-place here is beautiful; and the public buildings are good specimens of the florid Gothic. The Hotel de Ville is a magnificent structure of this kind, with a spire of curious architecture, 364 feet high, and surmounted by a statue of St. Michael with the dragon, in gilt copper. The internal decorations of this edifice correspond with its external appearance. Some of the apartments are adorned with beautiful specimens of tapestry, representing the resignation of Charles V. Many of the churches and palaces

of the nobility are also elegant structures, mostly decorated with the finest paintings of the Flemish school. Of twenty public fountains which supply the city with water, some are elegantly executed and ornamented. The church of the Capuchins is one of the finest they possessed in Europe. Brussels has also a public library, containing 100,000 volumes; an academy of sciences, instituted in 1772, which holds its meetings in the library; a botanic garden, with more than 4000 exotics; a cabinet of curiosities; collection of paintings; &c. Besides, being the permanent abode of the hereditary prince, and the usual residence of the court of the Netherlands, the states-general of the kingdom meet here and at the Hague alternately. The magistracy is composed of a superior officer, a burgomaster, seven echevins, two treasurers, and a pensionary, besides nine councillors and three receivers.

Brussels has long been celebrated for its lace and carpets, of a superior manufacture. The former alone employs about 10,000 people. Silks and earthenware are also wrought, woollen and cotton stuffs of various kinds, and potash. Since the peace of 1814, its population has increased from 60,000 to 80,000, which includes a great number of English families. Brussels has also a respectable foreign trade, by means of the Scheldt, with which it is connected by a canal.

The environs of Brussels are well cultivated, and, striking along the whole southern line, stretches the large forest of Soignies. The city was the head-quarters of the British troops on the eve of the memorable battle of Waterloo; and, both before and after that glorious victory, was a scene of the deepest interest to every nation and country of Europe. The numerous tours, sentimental, descriptive, or of a mixed character, which the vanity or industry of its visitants has given the public, must have rendered the city and its scenery familiar to most of our readers.

Brussels was founded by St. Gery, bishop of Cambray, about the beginning of the seventh century, who commenced with a small chapel, built on an island formed by the Senne. The labors of the bishop, it is said, and the pleasantness of the situation, soon surrounded him with a considerable village; and in the year 900 both a market and a castle are found here. It received its walls and towers when, about the middle of the eleventh century, it became the residence of the dukes of Brabant. Subsequently the Austrian governors of the Netherlands resided here. In 1555 Charles V. here resigned his dominions to his son Philip; the chair of state which he used is still preserved. In 1695 Marshal Villeroy bombarded it for sixteen hours, when fourteen churches and 4000 houses became a prey to the flames. After the battle of Ramillies, the keys were resigned to the duke of Marlborough. The Elector of Bavaria made an unsuccessful attack upon this city in 1708; but it was taken by the French in 1746, and restored at the peace of Aix-la-Chapelle. It was first entered by the French revolutionary troops in 1792, about ten days after the battle of Jemappe; was afterwards evacuated, but again taken on the 10th of July, 1794, and kept till the general

peace. During these years it was the chief town in the department of the Dyle, the seat of a prefect and receiver-general, a court of criminal and special justice, a chamber and tribunal of commerce, and a court of appeal for five departments. Lat. 50° 51' N., long. 4° 22' E.

BRUTA, in zoology, the second order of animals of the class mammalia, comprehending those animals which have no fore teeth in either jaw; feet with strong hoof-like nails. The genera included in this order are,—the rhinoceros, having a horn in the middle of its forehead; bradypus, sloth; myrmecophaga, ant-eater; platypus; manis; sypus, armadillo; sukotyro, double-horned rhinoceros; elephas, elephant; trichechus, morse.

BRUSTLE. Sax. *brastlian*, Teut. *brasteln*, from Goth. *brasa*, Swed. *brasta*, to burn. To crackle like the burning of sticks; to raise the bristles like a boar or hedgehog. See BRISTLE. To make a noise like the rubbing of silk. See RUSTLE.

BRUTE, <i>n. & adj.</i>	} Lat. <i>brutus</i> , Fr. <i>brute</i> , Ital. <i>bruto</i> . Brute is an irrational animal; a creature without reason; a savage. The adjective is applied to that which has the distinguishing characteristic qualities of a brute. Stupid, savage, cruel, inhuman. Rough, gross, ferocious, uncivilised, ignorant.
BRUTAL,	
BRUTALITY,	
BRUTALIZE,	
BRUTALLY,	
BRUTE'NESS,	
BRUTIFY,	
BRUTISH,	
BRUTISILY,	
BRUTISHNESS.	

In such a salvage wight, of *brutish* kynd,
Amongst wild beastes in desert forrests bred,
It is most strange and wonderful to fynd,
So mild humanity and perfect gentle mynd.

Spenser.

Thou dotard vile,
That with thy *bruteness* shend'st thy comely age. *Id.*

They were not so *brutish*, that they could be ignorant to call upon the name of God. *Hooker.*

There is no opposing *brutal* force to the stratagems of human reason. *L'Estrange.*

What may this mean? Language of man pronounced
By tongue of *brute*, and human sense expressed!

Milton.

Osiris, Isis, Orus, and their train,
With monstrous shapes and sorceries abused
Fanatic Egypt, and her priests, to seek
Their wandering gods disguised in *brutish* forms.

Id.

Then to subdue, and quell through all the earth,
Brute violence, and proud tyrannick power. *Id.*

To these three present impulses, of sense, memory,
and instinct, most, if not all, the sagacities of *brutes*
may be reduced. *Hale.*

For a man to found a confident practice upon a dis-
putable principle, is *brutishly* to outrun his reason.

South.

After he has slept himself into some use of himself,
by much ado he staggers to his table again, and there
acts over the same *brutish* scene. *Id.*

The *brutal* business of the war
Is managed by thy dreadful servants' care.

Dryden.

O thou fallacious woman! am I then *brutified*?—
Ay; I feel it here; I sprout, I bud, I am ripe horn
mad.

Congreve.

All other courage, besides that, is not true valour,
but *brutishness*. *Spratt.*

Courage, in an ill-bred man, has the air, and es-
capes not the opinion, of *brutality*. *Loeche.*

Brutes may be considered as either aerial, terres-
trial, aquatick, or amphibious. I call those aerial
which have wings, wherewith they can support them-
selves in the air; terrestrial are those whose only
place of rest is upon the earth; aquatick are those,
whose constant abode is upon the water. *Id.*

Upon being carried to the Cape of Good Hope, he
mixed, in a kind of transport, with his countrymen,
brutalized with them in their habit and manners, and
would never again return to his foreign acquaintance.

Addison.

Mrs. Bull aimed a knife at John, though John
threw a bottle at her head, very *brutally* indeed.

Arbuthnot.

O how infallible the thoughtless *brute*!

'Twere well his holiness were half as sure.

Savage.

Why starved, on earth, our angel appetites,
While *brutal* are indulged their fulsome fill? *Young.*

Patience! Hence—that word was made

For *brutes* of burthen, not for birds of prey;

Preach it to mortals of a dust like thine—

I am not of thine order.

Byron's *Manfred*.

BRUTIA, in the medical writings of the
ancients, the fattest and most resinous kind of
pitch, such as was properest for making the oil
of pitch, called *oleum picinum*.

BRUTTII, in ancient geography, one of the
two peninsulas of Italy, the ancient Calabria
being the other; stretching south towards Sicily;
bounded by the sea on every side except by the
isthmus, between the river Laus and the Thurii,
where it is terminated by Lucania; inhabited by
the Brutii, for whose country the ancient Ro-
mans had no peculiar name, calling both the
people and the country indiscriminately Brutii.
This and a part of Lucania formed the ancient
Italia. It was called *Boetria*, which in Greek
signifies pitch, from the great quantity of it pro-
duced there. It is divided into two coasts by
the Apennine; that on the Tuscan, and that on
the Ionian sea; and is now called Calabria Ul-
tra. It now differs from the ancient Calabria or
Messapia, on the east, on the Adriatic sea, which
formed the other peninsula or heel of the leg,
now called Calabria Citra, the Brutii forming
the foot.

BRUTUS (Lucius Junius), the avenger of the
rape of Lucretia, and founder of the Roman re-
public, flourished about A. A. C. 509. See
ROME, HISTORY OF.

BRUTUS (Marcus), the passionate lover of his
country, and chief conspirator against Cæsar, slew
himself on losing the battle of Philippi, A. A. C.
43. See ROME, HISTORY OF.

BRUTUS (Decimus Junius), one of the conspi-
rators against Cæsar. He was slain by Marc
Antony.

BRUTUS (John Michael), a man of learning in
the sixteenth century. He was born in Venice;
and, having studied at Padua, spent great part of
his life in travelling, and became historiographer
to the emperor. He wrote, 1. A History of
Hungary. 2. A History of Florence. 3. Notes
on Horace, Cæsar, Cicero, &c. and other works.

BRUTUS, or BRUTE, according to the ancient
fabulous history of this island, by Geoffrey of

Monmouth, was the first king of Britain. He is said to have been the son of Sylvius, and grandson of Ascanius, the son of Æneas, and born in Italy. Having accidentally killed his father, he fled into Greece, where he took king Pandrasus prisoner, who kept the Trojans in slavery, whom he released on condition of providing ships, &c. for the Trojans to emigrate with them. Being advised by the oracle to sail west beyond Gaul, he, after some adventures, landed at Totness in Devonshire. Albion was then inhabited by a remnant of giants, whom Brutus destroyed; and called the island after his own name Britain. He built a city called Troja Nova, or Troynovant, now London; and, having reigned twenty-four years, at his death divided the island among his three sons: Lochrine had the middle, called Logegria, now England; Camber had Cambria, now Wales; and Albanact, Albania, now Scotland.

BRUTUS, in entomology, a species of papilio inhabiting Africa.

BRUYERE (John de la), a French writer of repute, was born in 1640, at a village of the Isle of France. When treasurer at Caen, by purchase, he was noticed by Bossuet, and placed about the person of the duke of Burgundy, whom he instructed in history, for which he was remunerated with a pension of one thousand crowns per annum. The rest of his life he passed as a courtier and a man of letters, admired equally for his urbanity and his philosophical mind. In 1693 he was elected one of the members of the French Academy, and died in 1696, by an apoplectic fit. Few works have been more popular than his *Characters of Theophrastus*, translated from the Greek, with the *Manners of the present Age*. He left behind him *Dialogues on Quietism*, which were edited and published by Dupin in 1699. The best editions of his *Characters* are those of Amsterdam and Paris, 1741, two volumes, 12mo., and that of 1765, one volume, 4to.

BRYAN (Michael), an author and connoisseur in the fine arts, was at one time a picture-dealer, in which profession he failed. But he was of most respectable character and connexions, having married a sister of the earl of Shrewsbury. He afterwards engaged in the composition of a *Biographical and Critical Dictionary of Painters and Engravers*, which was commenced in 1813, and published in 1816, in two volumes, quarto. Many of the sketches are original, and do him much credit. He died March 21st, 1821, at the age of sixty-four.

BRYANT (Sir Francis), a soldier, statesman, and poet, was born of a genteel family, and educated at Oxford. In 1522, the fourteenth of Henry VIII., he attended the earl of Surrey to the coast of Brittany; and commanded the troops in the attack of Morlaix, which he took and burnt. For this service he was knighted on the spot by the earl. In 1529 he was sent ambassador to France; and, in 1530 to Rome, on the subject of the king's divorce. He was gentleman of the privy chamber to Henry VIII., and to Edward VI., in the beginning of whose reign he marched with the protector against the Scots; and, after the battle of Musselburgh, was made banneret. In 1548 he was appointed chief

governor of Ireland, where he married the countess of Ormond. He died soon after, and was buried at Waterford. His works are, 1. *Songs and Sonnets*; some of which were printed with those of the earl of Surrey and Sir Thomas Wyatt. London, 1565. 2. Letters written from Rome concerning the king's divorce; MS. 3. *A Dispraise of the Life of a Courtier*, &c. London, 1548, 8vo. from the French of Alaygri, who translated it from the Castilian, in which it was originally written by Guevara.

BRYANT (Jacob), a writer distinguished for great extent of learning and depth of research, was born in 1715 at Plymouth, where his father held an appointment in the customs. Entered at Eton, he very soon distinguished himself by the rapidity of his classical attainments; and at King's College, Cambridge, he continued to prosecute his studies with remarkable assiduity and success. His reputation having reached the ears of the duke of Marlborough, he was first appointed private secretary to that celebrated nobleman, and afterwards accompanied his son to Eton, in the capacity of private tutor. The first work that Bryant gave to the world, here for its title, *Observations and Enquiries relating to various parts of Ancient History*, containing *Dissertations on the wind Euroclydon*, and the *Island Melite*; together with an account of Egypt in its most early state, and of the *Shepherd Kings*, 1767. The *New System, or Analysis of Ancient Mythology*, came out in 1774; a work of uncommon industry, and evincing the most profound acquaintance with the language and customs of antiquity. His *Dissertation on the Apamean Medal* was severely attacked in the *Gentleman's Magazine*; which attack he successfully repelled in a separate publication, inserted, we believe, in the last edition of his works. This medal is certainly a very remarkable relic of antiquity; and it deserves to be mentioned that professor Eckhel, the first medalist of his age, gave a decision on the controversy in favor of Mr. Bryant. Some time after, Bryant published a pamphlet, entitled *Vindiciæ Flavianæ*: the object of which was to remove certain difficulties attending the testimony which Josephus bears to Christ. This tract made little impression at first, and was in fact called in by its author, who contented himself with distributing copies among his particular friends; and it was not until Dr. Priestley had declared himself convinced by the reasoning which it contains, that Bryant ventured to send it forth again with his name. Bryant's attention seems to have been drawn about this period to the poems attributed to Rowley. From the communication of his friend Dr. Glynn, and his enquiries at Bristol, he received such information as convinced him, that these poems were not entirely of Chatterton's fabrication, and he accordingly took upon him the arduous task of proving their genuineness. In 1794 he produced a large volume, entitled *Observations upon the Plagues inflicted upon the Egyptians*, in which is shown the peculiarity of those judgments, and their correspondence with the rites and idolatry of that people; with a prefatory discourse concerning the Grecian colonies from Egypt. M. le Chevalier's *Description of the Plain of Troy*

having been published, Bryant, who several years before had written his sentiments on the Trojan war, now first set forth some observations on M. le Chevalier's treatise, and afterwards a dissertation on the Expedition of the Greeks, as it is given by Homer, with the intention of showing that no such expedition had ever taken place, and that no such city as Troy ever existed. In this notion he stood almost alone, though he was not without plausible arguments to support his opinion. Everything associated with the idea of Troy has been, for so many generations, consecrated in the minds of men by the powers of Homer's verse, and by an undefined veneration for the suffrages of antiquity, that it was held as a kind of sacrilege on the part of any scholar to call in question the events which accompanied the downfall of that celebrated city. In the following year Mr. Bryant submitted to the public a work of a different kind and character, under the title of *The Sentiments of Philo-Judaus concerning the ΑΓΟΡΕ*, or word. But learned and curious as this treatise unquestionably is, it appears to have excited less interest among general readers than perhaps any of his other productions. He closed his literary labors with a quarto volume of *Dissertations on the Prophecy of Balaam*; the standing still of the Sun in the time of Joshua; the Jaw-bone of the Ass with which Samson slew the Philistines; and the History of Jonah and the Whale; subjects in themselves exceedingly curious, and which he treated with great talents and ingenuity. Mr. Bryant was remarkably temperate in his habits, and his conversation was animated and sprightly when among particular friends. His liberality was not confined within narrow limits, and the spirit of religion diffused itself through all his works. He died at Cypenham near Windsor on the 14th of November, 1804, of a mortification in his leg, brought on by a hurt from the tilting of a chair, in reaching down a book from its shelf.

BRYDONE (Patrick), a recent traveller of some eminence, was born in Scotland in 1741, and was early in life engaged as travelling tutor to Mr. Beckford and some other gentlemen. On his return he published his celebrated *Travels in Sicily and Malta*, of which work a second edition in two volumes, octavo, was published in 1790. A flowing style, the vivacity of his remarks, and the general accuracy of his descriptions, rendered this production very popular, and procured him admission into the Royal Society. On the subject of the eruptions of Etna, he attacks, as he conceives, the Mosaic account of the creation, and appears to have been an unbeliever in mere ignorance of what Revelation contains. See the close of our article *ΑΕΤΝΑ*. Mr. Brydone received the appointment of comptroller of the stamp-office, which he held to his death in 1819. Besides his *Tour*, he was the author of several papers in the *Philosophical Transactions*.

BRYE (John Theodore de), an excellent engraver, a native of Liege, who resided chiefly at Frankfort. He acquired a neat, free style of engraving, excellently adapted to small subjects, with many figures, as processions, &c. His heads in general are spirited, and his back

grounds are touched with a masterly hand. He died in 1598. The two first parts of Boissard's collection of portraits were engraved by him, assisted by his sons, who afterwards continued it.

BRYENNIUS (Manuel), a Greek writer on music, is supposed to have flourished under the elder P'aleologus, about the year 1320. He wrote three books on Harmonics; the first is a kind of commentary on Euclid; the second and third on Ptolemy. Meibomius had given the public expectations of a translation of this work, but not living to complete it, Dr. Wallis undertook it: and it now makes a part of the third volume of his works, published at Oxford, in 3 vols. folio, 1699.

BRYENNIUS (Nicephorus), a prince distinguished by his courage, probity, and learning, was born at Orestia in Macedonia, where his father by rebellion provoked the emperor to send his general Alexis Comnenus against him, who ordered his eyes to be put out; but, being charmed with his son Nicephorus, he married him to his own daughter, the celebrated Anna Comnena. When Alexis came to the throne, he gave Bryennius the title of Caesar; but would not declare him his successor, though solicited by the empress Irene: and was therefore succeeded by his son John Comnenus, to whom Bryennius behaved with the utmost fidelity. Being sent, about A. D. 1137, to besiege Antioch, he fell sick, and returning, died at Constantinople. This prince wrote the *History of the Reigns of Isaac Comnenus and his three Successors*, which was published with a Latin version at Paris in 1661.

BRYGMOS, or **BRYGMUS**, in medicine, a grating noise made by the gnashing of the teeth.

BRYONIA, **BRYONY**, a genus of the syngenesia order, and monœcia class of plants; in the natural method ranking under the thirty-fourth order, cucurbitaceæ. The calyx of the male is five-toothed, with a quinquefid corolla, and three filaments. In the female the calyx is dentated, the corolla quinquefid, the style trifid, with a roundish many-seeded berry. There are nineteen species, the chief of which are, 1. *B. alba*, rough or white bryony with red flowers, a native of dry banks under hedges, in many parts of Britain. The roots of this plant have by impostors been brought into a human shape, and shown for mandrakes. The roots of this species are used in medicine. These are very large, sometimes as thick as a man's thigh; their smell, when fresh, is strong and disagreeable; the taste nauseously bitter, acrid, and biting; the juice is so sharp, as in a little time to excoriate the skin; in drying, they lose great part of their acrimony, and almost their whole scent. Bryony root is a strong irritating cathartic; and as such has sometimes been successfully exhibited in maniacal cases, in some kinds of dropsies, and in several chronic disorders, where a quick solution of viscid juices, and a sudden stimulus on the solids, were required. An extract prepared by water acts more mildly, and with greater safety than the root in substance: given from half a dram to a dram, it is said to prove a gentle purgative, and likewise to operate powerfully by urine. Bryony root, applied externally, is said to be a

powerful discutient. 2. *B. bonariensis*, bryony with hairy palmated leaves, divided into five parts, and obtuse segments. It is a native of warm countries; but merits cultivation on account of the pretty appearance it makes when full of fruit. 3. *B. racemosa*, bryony with a red olive-shaped fruit. It is a native of warm climates, and perennial; but the branches decay every winter. They flower in July, and in warm summers will perfect their seeds in Britain.

BRYONIA, in conchology, a species of strombus, color fuscous, variegated with white and blue in clouds. This shell is of a conic form, with a mucronate, eight-dentated lip, and knotty spire. This shell is extremely rare, and its native place is unknown.

BRYONIOIDES, a name given by some botanists to the single-seeded cucumber. See *Sicyos*.

BRYTIA, among ancient naturalists, the must of grapes, which remains after expressing the juice.

BRUYUM, in botany, a genus of the class cryptogamia, order musci. The anthera is operculated or covered with a lid, the calyptra polished; and there is a filament arising from the terminal tubercle. There are forty-seven species, most of them natives of Britain.

BRZESC, or **BRSEST**, the chief town of a circle in the province of Grodno, Russia, formerly the capital of a palatinate in Lithuania, stands on the river Bug, about 100 miles east of Warsaw. It is said to contain the largest Jewish synagogue in Europe, and a seminary, to which young Rabbies from all parts of Europe resort. Near this town an engagement took place between the Russians and Poles in 1794, which lasted eight hours. Population about 4000. Lat. $52^{\circ} 5' N.$, long. $23^{\circ} 30' E.$

BUA, an island of the gulph of Venice, on the coast of Dalmatia, near Trau; called also the Partridge Island, because frequented by those birds. It is called Bubus by Pliny. During the decline of the empire it was called Boas; and several illustrious men who fell under disgrace at court, were banished to it, particularly Florentius, master of the offices under Julian, Immentius de Valenti, and the heretic Jovinian. The emperors of Constantinople either were not acquainted with it, or were willing to treat the banished with great clemency. The climate is exceedingly mild; the air good; the oil, grapes, and fruit excellent; the sea around it abounds in fish, and the port is large and secure. It is ten miles in length, and twenty-five in circuit; but rather high and mountainous.

BUAT-NANCAY (Louis Gabriel, Count du), was born in Normandy, of a respectable family, in March, 1732. At an early age he entered into the Order of Malta; and became acquainted with the Chevalier Folard, author of the Commentaries on Polybius, who received him into his house, and watched over his education. Buat became successively Minister for France at Ratisbon and Dresden; retired from public life in the year 1776, and died at Nançay, in Berry, on the 18th of September, 1787. He was a man of considerable talent and learning, writing with great facility; but his style is unequal. His

works are: 1. *Tableau du Gouvernement actuel de l'Empire d'Allemagne*, translated from the German of Schmauss, with notes historical and critical. Paris, 1755, 12mo. 2. *Les Origines, ou l'Ancien Gouvernement de la France, de l'Italie, et de l'Allemagne*, published at the Hague, 1757, 4 vols. 12mo. 3. *Histoire Ancienne des Peuples de l'Europe*, Paris, 1772, 12 vols. 12mo. This is the largest, and perhaps the best work of Buat. 4. *Les Elements de la Politique, ou Recherches sur la vrais Principes de l'Economie Sociale*, 1773, 6 vols. 8vo. 5. *Les Maximes du Gouvernement Monarchique, pour servir de suite aux Elements*, 4 vols. 8vo. There is also ascribed to Buat a work entitled *Remarques d'un Français, ou Examen impartial du livre de M. Necker sur les Finances*, Geneva, 1785, 8vo. In his youth he composed a tragedy, entitled *Charlemagne, ou le Triumphe des Loix*, published at Vienna, 1764, 8vo. He also contributed several articles to the scientific and other journals, on points of literature, history, and political economy; in particular, some excellent observations on the character of Xenophon, &c. in the fourth volume of the *Variétés Littéraires*.

BUB, *v. & n.* *Dut. bobbelen*. Strong, foaming, bubbling liquor. Johnson says strong malt liquor.

Or if it be his fate to meet

With folks who have more wealth than wit,

He loves cheap port, and double *bub*,

And settles in the handrum club. *Prior.*

BUBALUS, in zoology, the trivial name of the buffalo. See *Bos*.

BUBASTIS, a name of Isis, or the moon. The Egyptians bestowed different names on the sun and moon, to characterise their effects and relations with respect to the earth. Theology, having personified Bubastis, formed a divinity, of whom a cat was the symbol. The priests fed it with sacred food; and when it died they embalmed its body, and carried it in pomp to the tomb prepared for it. The ancients have explained this worship variously. The Greeks pretended that, when Typhon declared war against the gods, Apollo transformed himself into a vulture, Mercury into an ibis, and Bubastis into a cat, and that the veneration of the people for cats took rise from that fable; but they ascribe their own ideas to the Egyptians, who thought very differently. The Greeks, who worshipped the moon by the name of Diana, bestowed it also on this Egyptian divinity. The Egyptians attributed to her the virtue of assisting pregnant women, as the Greeks and Latins did to Diana. A perfect resemblance, however, does not exist between the two deities. The Greeks constituted Diana goddess of the chase, an attribute the Egyptians did not acknowledge in Bubastis. Diana was the daughter of Jupiter and Latona, but Bubastis of Osiris and Isis. A question naturally arises here: how could Bubastis be called the daughter of Isis since she also was a symbol of the moon? The Egyptian theology easily explains this. Isis was the general appellation of the moon, Bubastis a particular attribute. The sun, in conjunction with the star of the night, formed the celestial marriage of Osiris and

Isis; the crescent, which appears three days after, was allegorically called their daughter. Accordingly, in the city of Ithiya, where Bubastis was adored under that title, the third day of the lunar month was consecrated by a particular worship; because, three days after the conjunction, the moon, disengaged from the rays of the sun, appears as a crescent, and is visible. The Egyptians, therefore, celebrated a solemnity in honor of Bubastis, which in their tongue signified new moon.

BUBASTIS, in ancient geography, a city of Egypt built in honor of the goddess, and where, according to Herodotus, the people annually assembled from all parts of Egypt, to celebrate her festival.

BUBBLE, *v. & n.* Lat. *bullabula*, Span. *burbul*, Swed. *bubla*, Belg. *bobble*, Sans. *bool*.
BUBBLING, }
BUBBLY, }
BUBBLE-GLASS, }
BUBBLE-BLOWING. } of air in water. Bubble is applied to that which will burst as easily as a bubble; to anything which wants solidity and firmness; to a puff, and thus to a cheat, a delusion, a fraud, and hence to bubble is to cheat, to cozen, to delude, to defraud.

For youth is a bubble blowne up with breath,
Whose witte is weakenesse, whose wage is death
Whose way is wilderness, whose ynné penaunce
And stoope gallaunt age the host of Greevaunce.

Spenser.

Alas! a crimson river of warm blood,
Like to a bubbling fountain stirred with wind,
Doth rise and fall. Shakspeare.

Then a soldier,
Seeking the bubble reputation,
Even in the cannon's mouth. Id.

War, he sung, is toil and trouble,
Honour but an empty bubble,
Fighting still, and still destroying. Dryden.

Still bubble on, and pour forth blood and tears. Id.
He tells me, with great passion, that she has
bubbled him out of his youth; and has drilled him on
to five and fifty. Addison.

He has been my bubble these twenty years, and, to
my certain knowledge, understands no more of his
own affairs, than a child in swaddling clothes.

Arbuthnot.

Cease, dearest mother, cease to chide;
Gany's a cheat, and I'm a bubble:
Yet why this great excess of trouble? Prior.

The nation then too late will find,
Directors' promises but wind,
South-sea at best a mighty bubble. Swift.

Not bubbling fountains to the thirsty swain,
Not showers to larks, or sunshine to the bee,
Are half so charming as thy sight to me. Pope.

What words can suffice to express, how infinitely I
esteem you, above all the great ones in this part of
the world; above all the Jews, jobbers, and bubblesters!
Digby to Pope.

Who sees with equal eye, as God of all,
A hero perish, or a sparrow fall;
Atoms or systems into ruin hurled;
And now a bubble burst, and now a world.

Pope's Essay on Man.

How fair, how young, how soft, so'er he seem,
Full from the fount of Joy's delicious springs,
Some batter o'er the flowers its bubbling venom flings
Byron.

BUBBLE, in commerce, a cant term given to a project for raising money on imaginary grounds. For examples, we may refer to France and England in 1719, 1720, and 1721, and to the latter country in 1825.

BUBBLE, in natural philosophy, a small drop or vesicle of any fluid filled with air, and formed either on its surface by an addition of more of the fluid, as in raining, &c.; or in its substance by an intestine motion of its component particles. Bubbles are dilatable or compressible, i. e. they take up more or less room as the included air is more or less heated, or more or less pressed from without; and are round because the included air acts equally from within all around.

BUBBL, in ornithology, a species of *turdus*: color brown, with a black longitudinal band behind the eye.

BUBBY. Ital. *poppa*, *boppa*. See PAP. A woman's breast.

Foh! say they, to see a handsome, brisk, genteel young fellow, so much governed by a doating old woman, why don't you go and suck the *bubby*?

Arbuthnot.

BUBO, *n. s.* Lat. from *βουβων*, the groin. That part of the groin from the bending of the thigh to the scrotum; and therefore all tumors in that part are called buboes.

I suppured it after the manner of a *bubo*, opened it, and endeavoured detersion. Wiseman.

BUBO, in medicine, a tumor which rises with inflammation, more particularly in the lymphatic glands of the groin and axilla. This disease may arise either from the irritation of local disorder, from the absorption of venereal poison, or from constitutional causes, as is the case in the plague, and in scrophulous swellings of the inguinal and axillary glands.

BUBON, Macedonian parsley: a genus of the digynia order, belonging to the pentandria class of plants; and in the natural method ranking under the forty-sixth order, umbellatæ. The fruit is ovate, striated, and villous. There are five species, which are propagated by seeds, and require the common culture of other exotic vegetables.

1. *B. galbanum*, or African ferula, rises with an upright stalk to the height of eight or ten feet, which at bottom is woody, having a purplish bark, covered with a whitish powder that comes off when handled. The top of the stalk is terminated by an umbel of yellow flowers; which are succeeded by oblong channelled seeds, having a thin membrane or wing on their border. When any part of the plant is broken, there issues out a little thin milk of a cream color, from which the galbanum of the *Materia Medica* is made. See GALBANUM.

2. *B. gummiferum*, with a mock chervil leaf, rises with a ligneous stalk about the same height; but the small leaves or lobes are narrow and indented like those of bastard hemlock. The galbanum of the shops is supposed to be procured from these two species.

3. *B. Macedonicum*, sends out many leaves from the root; the lowest grow almost horizontally, spreading near the surface of the ground. In the centre of the plant arises the flower-stem, which is little more than a foot high, dividing into

many branches, each terminated by an umbel of white flowers, which are succeeded by oblong hairy seeds. The seeds of this plant enter into the celebrated compounds mithridate and theraca.

4. *B. rigidum*, hard or rigid ferula, is a native of Sicily. It is a low perennial plant, with short, stiff, and very narrow leaves. The foot stalk rises a foot in height, and is crowned with an umbel of small white flowers, to which succeed small, oblong, channelled seeds.

5. *B. levigatum*, a native of the Cape. Mr. Masson introduced this species into England in 1774.

BUBONA, in ancient mythology, the tutelary goddess of the larger cattle.

BUBONIUM, a name given by some botanists to the aster atticus, or golden star-wort, because it was supposed to be efficacious in maladies of the groin.

BUBONIUS LAPIS, a figured stone, in shape resembling an owl's head, of a flinty substance, black within, and cineritious without; thus denominated by Dr. Plott.

BUBONOCELE, *n. s.* Lat. from *βυβων* the groin, and *κηλη*, a rupture. A particular kind of rupture, when the intestines break down into the groin. See **HERNIA INGUINALIS**.

When the intestine, or omentum, falls through the rings of the abdominal muscles into the groin, it is called *hernia inguinalis*, or if into the scrotum, *scrotalis*: these two, though the first only is properly so called, are known by the name of *bubonocoele*. *Sharp*.

BUBROMA, in botany, a genus of the dodecandria order, and polyadelphia class of plants: *cal.* perianth three-leaved; leaves ovate, concave, acute, reflected, deciduous: *cor.* petals five, concave, inserted into the nectary at the base: *stam.* filaments five, filiform, upright, bent outwards at the tip; antheræ three on each filament; the cells margined: *pist.* germ superior, roundish, hispid; style filiform; stigma simple: *pericarp.* capsule, subglobular, woody, muricated all round with clubshaped tubercles, five-celled; cells lined with a thin membrane: *seeds* numerous, angular, almost reniform. *B. guazuma*, bastard cedar, grows from forty to fifty feet in height; trunk nearly the size of a man's body, covered with a dark-brown, furrowed, bark; branches horizontal; leaves alternate; racemes corymbose; flowers small. A native of the East and West Indies. A decoction of the inner bark is very glutinous, and is said to be excellent in the elephantiasis, a disorder common among the negroes.

BUBUKLE, *n. s.* A red pimple.

His face is all *bubukles*, and whelks, and knobs, and flames of fire. *Shakspeare*.

BUBULCA, in ichthyology, a small freshwater fish, called by some *bouviere* and *petense*. It is small, flat, and very short, approaching to a round rather than a long shape, and of a fine silvery whiteness, seldom above two inches in length.

BUBULCUS, *Bubulus*, names of the constellation Bootes.

BUC (George), a learned English antiquary,

who flourished in the beginning of the seventeenth century. In the reign of king James I. he was made one of the gentlemen of the privy chamber, knighted, and constituted master of the revels. He wrote, 1. *The History of the Reign of Richard III.* in which he takes great pains to wipe off the bloody stains that have blotted his character, and represents the person and actions of that prince in a much less odious light, than other historians have done: 2. *A Treatise of the Art of Revels*; and 3. A work entitled *The Third Universitie of England*.

BUCARDIA, or **BUCARDITES**, in natural history, a name given by many authors to a stone, in some degree resembling the figure of an ox's heart. It is usually of the substance of the coarser stones, and is no other than a quantity of the matter of such stone, received while moist into the cavity of a large cockle, and thence, assuming the figure of the inside of that shell, the depression of the head of the cockle, where the cardo or hinge of this shell is, makes a long and large dent in the formed mass, which gives it a heart-like shape. Plott mentions a *bucardites*, which he found at Stretford in Staffordshire, which weighed twenty pounds, though broken half away, curiously reticulated, with a white-spar colored stone.

BUCARDIUM, in natural history, a name given by authors to a kind of heart shell, resembling an ox's heart in shape; it is of the genus of the cordiformes, or heart-shells, and differs from the other kinds, in being of a more globular figure.

BUCCA, in anatomy, the cheek.

BUCCÆ MUSCULUS, in anatomy, a name given by some to the muscle more usually called the buccinator, and *contrahens labiorem*.

BUCCA FERREA, in botany, a name given by Michaeli to a genus of plants, since called *rappia* by Linnaeus.

BUCCALES GLANDULÆ are small glands dispersed over the inner side of the cheeks and lips.

BUCCAN, the place where the Buccaniers smoke and dry their meat. The name is also applied to the grate or hurdle, made of Brasil wood, upon which the meat is hung above the fire.

BUCCANIERS', *n. s.* A name assumed by pirates on the coast of America, from boucan, a kind of wooden frame used by the savages of Cayenne for drying flesh or fish.

BUCCANIER, or **BUCANIER**, one who dries and smokes flesh or fish after the manner of the Indians. The name was particularly given to the first French settlers on the island of St. Domingo, whose sole employment consisted in hunting wild bulls or boars, in order to sell their hides and flesh. It has also been applied to those famous piratical adventurers, chiefly English and French, who joined together to make depredations on the Spaniards of America. The latter had not been long in possession of the West Indies and the continent of America, when other nations, especially the English and French, began to follow them. But though the Spaniards were unable to people such extensive countries

themselves, they were resolved that no other nation should join with them in it; and therefore made war on all those who attempted to settle in any of the Antilles or Carribee islands. The French, however, were at last fortunate enough to acquire some footing in the island of St. Christopher; but, by the time they began to form a regular government, the Spaniards found means to dislodge them. Upon this the fugitives, considering at how great a distance they were from their mother country, and how near to the island of Hispaniola or St. Domingo, the northern parts of which were then uninhabited and full of swine and black cattle, immediately resolved to take possession of that country, in conjunction with some adventurers from Great Britain. The Dutch had promised to supply them plentifully with all kinds of necessities they might require, in exchange for the hides and tallow they should procure by hunting. These new settlers obtained the name of buccaniers, from their custom of buccaning their beef and pork to preserve it for consumption. And upon some of them growing tired of this new way of life, and commencing planters, many more chose to turn open pirates, trusting to find among those who remained on shore a quick sale for all the plunder they could make at sea. The new body of adventurers were called free-booters, from their making free booty of whatever came in their way. Numbers of emigrants from France, soon joined the settlers in quality of indented servants, though they toiled like slaves during the three years for which they generally bound themselves. Thus the colony consisted of four classes: buccaniers; free-booters; planters; and indented servants; who began to call themselves the body of adventurers. They lived together in perfect harmony, under a kind of democracy; every freeman had a despotic authority over his own family; and every captain was sovereign in his own ship, though liable to be discarded at the discretion of the crew. The planters settled chiefly in the little island of Tortuga, on the northern coast of Hispaniola; but on some of them going to the great island, to hunt with the buccaniers, the rest were surprised by the Spaniards; and all, even those who had surrendered at discretion, were put to the sword or hanged. The Spaniards now resolving to rid the great island of the buccaniers, assembled a body of 500 lance men, who, by their seldom going fewer than fifty in a company, obtained the name of the fifties from their enemies. At first they met with great success; for the buccaniers hunting separately, every one attended by his servants, they were easily surprised. Hence the Spaniards killed numbers, and took many more, whom they condemned to a most cruel slavery. But whenever the buccaniers had time to put themselves into a state of defence, they fought like lions: there are many instances of single men fighting their way through numbers. These dangers, however, and the success of the Spaniards in discovering their boucans, where they used to surprise and cut the throats of them and their servants in their sleep, engaged them to assemble in great numbers, and even to act offensively, in hopes that by so doing they might at last induce the

Spaniards to let them live in peace. But their enemies were intent on their destruction: and the island was turned into a slaughter house. At length the Spaniards had recourse to their old method of surprise, which against enemies of more courage than vigilance was likely to succeed better. This put the buccaniers under a necessity of never hunting but in large parties, and fixing their boucans in the little islands on the coast, whither they retired every evening. The expedient succeeded: and the boucans, by being more fixed, soon acquired the air of small towns. Each boucan ordered scouts every morning to the highest part of the island, in order to reconnoitre the coast, and see if any Spanish parties were abroad. If no enemy appeared, they appointed a place and hour of rendezvous in the evening, and were never absent if not killed or prisoners. When therefore any one of the company was missing, it was not lawful for the rest to hunt again till they had got intelligence of him if taken, or avenged his death if killed. Things continued long in this situation till the Spaniards destroyed all their game, and put the buccaniers under a necessity of betaking themselves to another course of life, and some of them turned planters; and thereby increased some of the French settlements on the coast; others entered among the free-booters. France, who had hitherto disclaimed for her subjects these ruffians, whose successes were only temporary, acknowledged them, as soon as they formed themselves into settlements; and took measure for their government and defence. The hides, and boar-meat, in packs, were long considerable articles of trade in the neighbouring islands. See DOMINGO, St.

The habits of these people were in many respects singular. Their towns, as we have seen, were called boucans; their huts they termed Ajoupas, a word which they borrowed from the Spaniards, and the Spaniards from the natives. These ajoupas lay open on all sides, which was very agreeable to the hardy inhabitants, in a climate where wind and air are so very desirable. Having neither wives nor children, the buccaniers associated by pairs, and mutually rendered each other all the services a master could reasonably expect from a servant, living together in so perfect a community, that the survivor always succeeded his deceased partner. This kind of union or fellowship they called s'emateloter, insailing, and each other, matelot, or sailor, whence was derived the custom of giving, in some parts of the French Antilles, the name matelotage, sailorage, to any kind of society formed by private persons for their mutual advantage. They behaved to each other with the greatest justice and openness, we are told; it would have been a crime to keep any thing under lock and key; but on the other hand, the least pilfering was unpardonable, and punished with expulsion from the community. Indeed there could be no great temptation to steal, when it was reckoned a point of honor never to refuse a neighbour what he wanted; and where there was so little property, it was impossible there should be many disputes. If any happened, the common friends of the parties at variance interposed, and soon put an end

to the difference. As to laws, the buccaniers acknowledged none but some rules drawn up in conventions among themselves. They silenced all objections from strangers, by coolly answering that it was not the custom of the coast; and grounded their right of acting in this manner, on their baptism under the tropic, which freed them, in their opinion, from all obligations antecedent to that marine ceremony. The governor of Tortuga, when that island was again settled, though appointed by the French court, had very little authority over them; they contented themselves with rendering him from time to time some slight homage. They had in a manner shaken off religion. They even laid aside their surnames, and assumed martial names, which long continued in their families. On their marrying, which seldom happened till they turned planters; they took care to have their surnames inserted in the marriage contract; and this practice gave occasion to a proverb in the French Antilles, a man is not to be known till he takes a wife. Their dress consisted of a filthy shirt, dyed with the blood of animals they had killed; a pair of trousers of the same complexion, a thong of leather by way of belt, to which they hung a case containing some Dutch knives, and a kind of short sabre called manchette; a hat without any brim, except a little flap on the front; and shoes of hog skins. Their guns were two feet and a half in the barrel, and of a bore to carry balls of an ounce. Every man had his contract servants, more or fewer according to his abilities; besides a pack of twenty or thirty dogs, among which there was a couple of beagles. Their chief employment at first was ox-hunting; and, if at any time they chased a wild hog, it was rather for pastime, or to make provision for a feast, than for any other advantage. But, in process of time, some of them betook themselves entirely to hunting of hogs, whose flesh they buccaned in the following manner: First, they cut the flesh into very long pieces, an inch and an half thick, and sprinkled them with salt, which they rubbed off after twenty-four hours. Then they dried these pieces in stoves over the fire, made of the skin and bones of the beast, till they grew as hard as a board, and assumed a deep brown color. Pork prepared in this manner will keep in casks above a year; and, when steeped but a little while in lukewarm water, becomes plump and yields a most grateful smell. In hunting they continued the chase till they had killed as many beasts as there were heads in the company. The master was the last to return to the boucan, loaded like the rest with a skin and a piece of meat. Here the buccaniers found their tables ready: for every one had his separate table; which was the first thing, any way fit for the purpose, that came in their way, a stone, the trunk of a tree, and the like. No table-cloth, no napkin, no bread or wine, graced their board; not even potatoes or bananas, unless they found them ready to their hands. When this did not happen, the fat and lean of the game, taken alternately, served to supply the place. A little pimento, and the juice of an orange, was their only sauce; contentment, a good appetite, and abundance of mirth, made every thing agreeable.

Thus they lived till they had completed the number of hides, for which they had agreed with the merchants; when they carried them to Tortuga, or some port of the great island. As the buccaniers used much exercise, and fed only on flesh, they generally enjoyed a good state of health. They were indeed subject to fevers, but this they wholly slighted. The most considerate among them, however, after they had obtained money, turned planters. In their piratical expeditions the buccaniers formed themselves into small companies, consisting of 50, 100, or 150 men each. A boat, of a greater or smaller size, was their only armament. Here they were exposed night and day to all the inclemencies of the weather, having scarce room enough to lie down. A love of absolute independence, the greatest blessing to those who are not proprietors of land, rendered them averse from those mutual restraints which the members of society impose upon themselves for the common good. As the authority they had conferred on their captain, was confined to his giving orders in battle, they lived in the greatest confusion. Like savages, having no apprehension of want, nor any anxiety to preserve the necessaries of life, they were constantly exposed to the severest extremities of hunger and thirst. But deriving, even from their very distresses, a courage superior to every danger, the sight of a ship transported them to a degree of frenzy. They never deliberated on the attack, but it was their custom to board as quickly as possible. The smallness of their vessels, and the skill they showed in the management of them, screened them from the fire of the greater ships; they presented only the fore part of their vessels filled with fusileers; who fired at the port holes with so much exactness, that it entirely confounded the most experienced gunners. As soon as they threw out the grappling, the largest vessels seldom escaped them. In cases of necessity, they attacked the people of every nation, but fell upon the Spaniards at all times. Whenever they embarked on any expedition, they used to pray to Heaven for the success of it; and never came back from the plunder, it is said, but they constantly returned thanks to God for their victory! The ships that sailed from Europe to America seldom tempted their avidity; but they waited for their return, laden with gold, silver, and jewels; when they met a single ship, they were sure to attack her. The Spaniards, who trembled at the approach of the buccaniers, whom they called devils, immediately surrendered. Quarter was granted, if the cargo proved to be a rich one; if not, all the prisoners were thrown into the sea. At first the buccaniers, when they had got a considerable booty, held their rendezvous at the island of Tortuga, to divide the spoil; but afterwards the French went to St. Domingo, and the English to Jamaica. Each person, holding up his hand, solemnly protested, that he had secreted nothing of what had been taken. If any one was convicted of perjury, a case that seldom happened, he was left, as soon as an opportunity offered, upon some desert island, as a traitor unworthy to live in society. Such as had been maimed in any of their expeditions, were first

provided for. If they had lost a hand, an arm, a leg, or a foot, they received £26. An eye, finger, or toe, lost in fight, was valued at only half the sum. The wounded were allowed two shillings and sixpence a day for two months, to enable them to have their wounds taken care of. If they had not money enough to answer these demands, the company engaged in some fresh expedition, till they had acquired a sufficient stock. After this the remainder of the booty was equally divided; the commander only claiming a single share. Every share was determined by lot. If a person had been killed, his part was sent to his relations or friends when known, and when there were no friends or relations to claim it, it was distributed in charity to the poor, and to churches. These duties having been performed, the victors indulged themselves in gaming, wine, women, and every species of debauchery. The Spanish colonies, reduced almost to despair in finding themselves a perpetual prey to these ruffians, grew weary of navigation, and formed themselves into many distinct and separate states. They were sensible of the inconveniences arising from such conduct, but the dread of falling into the hands of these rapacious monsters, had greater influence over them than the dictates of honor, interest, and policy; and gave rise to a spirit of total inactivity. This despondency increased the boldness of the buccaniers. As yet they had only appeared in the Spanish settlements to carry off some provisions when they were in want of them. They no sooner found their captures begin to diminish, than they determined to recover by land what they lost at sea. The richest and most populous countries of the continent were plundered and laid waste. The culture of lands was equally neglected with navigation; and the Spaniards dared neither appear in their public roads, nor sail in the latitudes which belonged to them.

Among those who signalled themselves in this new species of excursion, was Montbar, a gentleman of Languedoc. Having, in his infancy, met with a circumstantial account of the cruelties practised by the Spaniards, in the conquest of the New World, he conceived an aversion which he carried to a degree of frenzy against that nation; and having heard that the buccaniers were the most inveterate enemies to the Spanish name, he embarked on board a ship to join them. In his passage he met with a Spanish vessel; attacked, and immediately boarded it. Hurrying twice from one end of the ship to the other, he levelled everything that opposed him. When he had compelled them to surrender, leaving to his companions the dividing of a rich booty, he contented himself with the savage pleasure of contemplating the dead bodies of the Spaniards, lying in heaps together. Fresh opportunities soon occurred that enabled him to glut his inveterate hatred. The ship arriving on the coast of St. Domingo, the buccaniers there informed him that their enemies had overrun the country, laid waste their settlements, and carried off all they could. Montbar immediately offered to join an expedition then preparing, 'not as commander,' said he, 'but as the foremost to expose myself to danger.' The buccaniers perceiving that he

was such a man as they wanted, cheerfully accepted his offer. The same day they overtook the enemy, and Montbar attacked them with an impetuosity that astonished the bravest. Scarce one Spaniard escaped the effects of his fury. The remaining part of his life was equally distinguished. The Spaniards suffered so much from him, both by land and at sea, that he acquired the name of the Exterminator.

Their associations now became more numerous. The first that was considerable was formed by Lolonois, who, from the abject state of a bondsman, had gradually raised himself to the command of two canoes, with twenty-two men. With these he took a Spanish frigate on the coast of Cuba. He then repaired to Port-au-Prince, in which were four ships, fitted out purposely to pursue him. He took them, and threw all the crews into the sea, except one man, whom he saved, in order to send him with a letter to the governor of the Havannah, acquainting him with what he had done, and assuring him that he would treat in the same manner all the Spaniards that should fall into his hands, not excepting the governor himself, if he should be so fortunate as to take him. After this he ran his canoes and prize ships aground, and sailed with his frigate only to Tortuga. Here he met with Michael de Basco, who had distinguished himself by having taken, even under the cannon of Porto Bello, a Spanish ship, estimated at £218,500, and by other actions equally brave and daring. These two soon collected together 440 men. This body, the most numerous the buccaniers had yet been able to muster, sailed to the bay of Venezuela, which runs up into the country fifty leagues. The fort that was built at its entrance was taken; the cannon spiked; and the whole garrison, consisting of 250 men, put to death. They then re-embarked, and went to Maracaybo, built on the western coast of the lake, at the distance of ten leagues from its mouth. This city, which had become rich by its trade in skins, tobacco, and cocoa, was deserted, but the inhabitants had retired with their effects to the other side of the bay. Exasperated at this, they set fire to Gibraltar. Maracaybo would have shared the same fate, had it not been ransomed. Besides the sum they thus received, they also carried off with them all the crosses, pictures, and bells, of the churches; intending, as they said, to build a chapel in the island of Tortuga, and consecrate this part of their spoils to sacred purposes.

About the same time Morgan, the most renowned of the English buccaniers, sailed from Jamaica to attack Porto Bello. His plan of operations was so well contrived, that he surprised the city and took it without opposition. The conquest of Panama was an object of much greater importance. To secure this, Morgan thought it necessary to sail in the latitude of Costa Rica; and procure some guides in the island of St. Catharine's, where the Spaniards confined their malefactors. This place was strongly fortified, and ought to have held out for ten years against a considerable army. Notwithstanding this, the governor, on the first appearance of the pirates, sent privately to concert measures how he might surrender himself with-

out incurring the imputation of cowardice. The result of this was, that Morgan in the night attacked a fort at some distance, and the governor sallied out of the citadel to defend the post, the assailants attacked him in the rear, and took him prisoner, which led to a surrender of the place. The buccaniers, after having totally demolished the fortifications, and put on board their vessels a prodigious quantity of ammunition which they found at St. Catharine's, steered their course towards the Chagre. At the entrance of this considerable river, a fort was built upon a steep rock, and this bulwark, very difficult of access, was defended by an officer whose abilities were equal to his courage. The buccaniers, for the first time, here met with a determined resistance; but while it was doubtful whether they would succeed, or be obliged to raise the siege, the commander was killed, and the fort took fire. They now therefore made themselves masters of the place, where Morgan left his vessels at anchor, and sailed up the river in sloops, till he came to Cruces, where it ceases to be navigable. He then proceeded by land to Panama, five leagues distant; though he met with a considerable body of troops in the neighbourhood, he put them to flight with the greatest ease, and entered the city, now abandoned. Here were found prodigious treasures, and several rich deposits in the neighbouring forests. Having burnt the city, they set sail with a great number of prisoners, who were ransomed in a few days; and came to the mouth of the Chagre with a prodigious booty.

In 1603 an expedition of the greatest consequence was formed by Van Horn, a native of Ostend, but who had served all his life among the French. His intrepidity would never let him suffer the least signs of cowardice among those who associated with him. In the heat of an engagement he went about his ship; observed his men; and immediately killed those who shrank at the sudden report of a pistol, gun, or cannon. This extraordinary discipline had made him become the terror of the coward, and the idol of the brave. He readily shared with the men of spirit and bravery the immense riches that were acquired by so truly warlike and diabolical a disposition, and he generally sailed in a frigate which was his own property. New expeditions requiring greater numbers to carry them into execution, he took to his assistance Gramont, Godfrey, and Jonque, three Frenchmen, distinguished by their exploits; and Lawrence de Graff, a Dutchman. These famous commanders were joined by 1200 buccaniers, and sailed in six vessels for Vera Cruz. The darkness of the night favored their landing, which was effected at three leagues from the place, where they arrived without being discovered. The governor, the fort, the barracks, and the posts of the greatest consequence, were all taken by the break of day. All the citizens, men, women, and children, were shut up in the churches, whither they had fled for shelter. At the door of each church were placed barrels of gunpowder to blow up the building. A buccanier with a lighted match was to set fire to it upon the least appearance of an insurrection. While the city was kept in such terror, it was

easily pillaged; and after the buccaniers had carried off what was most valuable, they made a proposal to the citizens in the churches, to ransom their lives and liberties at a contribution of £437,500. The unfortunate people, who had neither ate nor drank for three days, readily accepted the terms that were offered them. Half of the money was paid the same day; the other part was expected from the internal parts of the country; when there appeared on an eminence a considerable body of troops advancing, and near the port a fleet of seventeen ships from Europe. At the sight of this armament the buccaniers, without any marks of surprise, retreated quietly with 1500 slaves as hostages for the rest of the money. Their retreat was equally daring. They boldly sailed through the midst of the Spanish fleet; which let them pass without firing a single gun, and were in fact rather afraid of being attacked and beaten. The Spaniards would not probably have escaped so easily, if the vessels of the pirates had not been laden with silver, or if the Spanish fleet had been freighted with any other effects but such merchandise as was little valued by the buccaniers.

A year had scarce elapsed since their return from Mexico, when they were seized with the rage of plundering Peru. It is somewhat remarkable, that both the English and French associations had projected this plan at the same time, without any communication, or intercourse. About 4000 men were employed in this expedition. Some of them came by Terra Firma, others by the Straits of Magellan, to the place that was the object of their wishes. If the intrepidity of these barbarians had been directed by a skilful commander, they would doubtless have deprived the Spaniards of this important colony. But their character was an invincible obstacle to such an union: they always formed themselves into several distinct bodies, sometimes even so few in number as ten or twelve, who acted together, or separated, as caprice directed. Grogner, Lecuyer, Picard, and Le Sage, were the most distinguished officers among the French: David, Samms, Peter, Wilner, and Towley, among the English. Such of those adventurers as had come into the South Sea by the Straits of Darien, seized upon the first vessel they found upon the coast. Their associates, who had sailed in their own vessels, were not much better provided. Weak however as they were, they beat several times the squadrons that were fitted out against them. When there were no more ships to be taken, they made descents upon the coast for provisions, or went by land to plunder those cities where the booty was secured. They successively attacked Seppa, Puebla-Nuevo, Leon, Realejo, Puebla-Viejo, Chiriquita, Lesparso, Granada, Villa-Nicoya, Tecoaiteca, Muemeluna, Chilotea, New Segovia, and Guayaquil, the most considerable of all these places. Many of the towns were taken by surprise; and most of them deserted by their inhabitants, who fled at the sight of the enemy. As soon as the pirates took a town it was set on fire, unless a sum proportionate to its value was given to save it, and the prisoners were massacred without mercy, if not quickly ransomed. Silver being

too common, and too weighty for its current value, was often rejected.

While these piracies were committed in the southern ocean, the northern was overrun in a similar manner by Gramont, a native of Paris, who had distinguished himself in a military capacity in Europe; but his passion for wine, gaming, and women, had dissipated his fortune, and obliged him to join the pirates. He was polite, generous, and eloquent; had a sound judgment, and soon rose to be considered as the chief of the French buccaniers. Under his command they embarked in 1685 to attack Campeachy. They landed without opposition. But at some distance from the coast they were attacked by 800 Spaniards, who were beaten and pursued to the town; which both parties entered at the same time. The cannon found was immediately levelled against the citadel. As it had very little effect, they were contriving some stratagem to enable them to become masters of the place, when intelligence was brought that it was abandoned. There remained in it only a gunner, an Englishman and an officer of courage, who chose rather to expose himself to the greatest extremities, than basely fly. On the fall of the place the commander of the buccaniers received him with distinction, and gave him his liberty and effects, with some valuable presents. The conquerors of Campeachy spent two months in plundering the environs of the city, from twelve to fifteen leagues round. When all the treasure they had collected was deposited in the ships, a proposal was made to the governor of the province, who still kept the field with 900 men, to ransom his capital. His refusal determined them to burn it, and demolish the citadel. In 1697 buccaniers, to the number of 1200, were induced to join a squadron of seven ships that sailed from Europe under the command of Pointis, to attack the famous city of Carthagen. This was certainly one of the most difficult enterprises that could be attempted in the New World. The situation of the port, the strength of the place, the badness of the climate, were obstacles that seemed insurmountable to any but buccaniers. But every obstacle yielded to their valor; the city was taken, and booty gained to the amount of £1,750,000. Their rapacious commander, however, as soon as they set sail, offered £5,250 for the share of those who had been the chief instruments in procuring so considerable a spoil. The buccaniers, exasperated at this treatment, resolved immediately to board his vessel, the Sceptre, which was at that time too far distant from the rest of the ships to expect assistance, and he was upon the point of being massacred, when one of the malcontents proposed to return to Carthagen, and there obtain a further booty. The proposal was received with general applause, and without further deliberation all the ships sailed towards the city. They entered without resistance, and, having shut up the men in the great church, exacted payment of £210,750, the amount of the booty in dispute, promising to retreat immediately upon their compliance, but threatening the most dreadful vengeance if they refused. Upon this a priest of the city mounted the pulpit, and persuaded the people to yield up

all their gold, silver, and jewels. The collection however, not furnishing the sum required, the city was ordered to be plundered. After amassing all they could, these adventurers again set sail; when they were met by a fleet of Dutch and English vessels. Both nations were now in alliance with Spain, and several of the pirates were taken and sunk; the rest escaped to St. Domingo. Such was the last memorable event in the history of the buccaniers. The separation of the English and French interests in the war that ensued on account of the prince of Orange; the successful means they both made use of to promote the cultivation of land in their colonies, by the assistance of some of these men; and the prudence they showed in entrusting the most distinguished of them with civil and military employments, together with the protection they were both under a necessity of affording to the Spanish settlements, which till then had been a general object of plunder; these circumstances, and various others, beside the impossibility there was of supplying the place of those leaders, who were continually dropping off, concurred to put an end to a society as extraordinary as ever existed. Without any regular system, without laws, without subordination, and even without any fixed revenue, they became the astonishment of the age in which they lived.

BUCCATA, in entomology, a species of conops. Color ferruginous; abdomen hooked and gray; face white; wings clouded; inhabiting Europe.

BUCCATUS, a species of oestrus, color grisous; face white, and dotted with black; found in South Carolina.

BUCCELLARII, an order of soldiery under the Greek emperors, appointed to guard and distribute the ammunition bread. Authors differ however as to their office and quality. Some give the denomination to parasites in the courts of princes, some make them the body guards of emperors, and some fancy they were only such as emperors employed in putting persons to death privately.

BUCCELLATIO, in surgery, a term used by some for stopping the bleeding of an artery or vein, by lint.

BUCCELLATION, *n. s.* From Lat. *bucella*, a mouthful. In some chemical authors, signifies a dividing into large pieces.

BUCCELLATUM, in ancient military affairs, camp bread, or biscuit baked hard and dry, for lightness and keeping. Soldiers always carried with them enough for a fortnight, and sometimes much longer, during the time that military discipline was kept up. See **BAGGAGE**.

BUCCINA, an ancient musical and military instrument, usually taken for a kind of trumpet. Festus defines it a crooked horn, played on like a trumpet. Vegetius observes, that the buccina was bent in a semicircle, in which respect it differed from the tuba or trumpet. It is hard to distinguish it from the cornu, or horn, unless it was something less, and not quite so crooked. It certainly was different, as we never read of the cornu used by the watch. Besides, the sound of the buccina was sharper, and to be heard much farther than either the cornu or the tuba. In

Scripture a similar instrument, used both in war and in the temple, was called *kiren-jobel*, rams' horn, &c. It was used among the Jews to proclaim their feast-days, new moons, jubilees, sabbatic years, and the like. At Lacedemon, notice was given by the *buccina*, when it was supper time; and the like was done at Rome, where the *grandeas* had a *buccina* blown both before and after they sat down to table.

BUCCINA AURIS, in middle age writers, the drum of the ear.

BUCCINATOR, in anatomy, a muscle on each side of the face, common to the lips and cheeks, and making the inner substance of the latter.

BUCCINATOR NOMINUM, a slave, among the ancient Romans, who attended the public crier.

BUCCINUM, in conchology, the whelk, a genus of shell fish belonging to the order of *vermes testaceæ*. This animal is one of the snail kind. The shell is univalve, spiral, and gibbous. The aperture is oval, ending in a small strait canal, with a retuse beak or projection; pillar-lip expanded. A hundred and ninety species are scattered over the shores of the different parts of the globe. They are thus divided by Gmelin. *Ampullacea* inflated, rounded, thin, subdiaphanous, and brittle. *Cassidea caudata*, with a short, exserted, reflected beak; lip unarmed outwardly. *Cassidea unguiculata*, lip prickly outwards on the hind part; in other respects resembling the last division. *Callosa*, pillar-lip dilated and thickened. *Delrita*, pillar-lip appearing as if worn flat. *Lævigata*, smooth; and not enumerated in the former divisions. *Angulata*, angular; and not included in the former divisions. *Turrita*, subulate and smooth. The six following species are found in the British seas: 1. *B. lapillus*, or massy whelk, one of the British shells that produce the purple dye analogous to the *purpura* of the ancients. See *MUREX*. 2. *B. minutum*, or small whelk, with five spires, striated spirally, ribbed transversely; is less than a pea, and is found in Norway. 3. *B. pullus*, or brown whelk, with five spires, striated, waved, and tuberculated; aperture wrinkled; upper part replicated; and in length five-eighths of an inch. 4. *B. reticulatum*, with spires scarcely raised, and strongly reticulated, is of a deep brown color, and of an oblong form, and of the size of a hazel nut. The aperture is white, glossy, and denticulated. 5. *B. striatum*, has eight spires, with elevated striæ, undulated near the apex. It is nearly four inches long. 6. *B. undatum*, the waved whelk, with seven spires, spirally striated and deeply and transversely undulated. It is three inches long, and inhabits deep water.

BUCCLEUGH, a village of Scotland, in the county of Selkirk, from which the noble family of Scott have the title of Duke.

BUCCO, the barbet, in ornithology, a genus belonging to the order of *picæ*. The beak is cultrated, turned inwards, compressed on the sides, and emarginated on each side at the apex; and there is a long slit below the eyes. The nostrils are covered with feathers. The feet have four toes, two before and two behind. Ornithologists enumerate nineteen species, all found in Asia, Africa, or the southern parts of America.

BUCCULA, in anatomy, the fleshy part under the chin.

BUCCULA, in antiquity, the umbo or prominent part in the middle of a shield; thus called because usually made in the form of a mouth or face.

BUCENTAUR, a galeas, or large galley, of the doge of Venice, adorned with pillars on both sides, and a purple silk awning, and gilt over from the prow to the stern. In it the doge received the great lords and persons of quality that went to Venice, accompanied with the ambassadors, counsellors of state, &c. It served also in the magnificent ceremony of ascension day, on which the doge threw a ring into the sea to espouse it, and to denote his dominion over the gulph of Venice. Some ascribe the name to its being ornamented with the figure of a centaur; and trace its origin to the year 1177.

BUCEPHALA, or **BUCEPHALUS**, in ancient geography, a town built by Alexander, on the west side of the Hydaspis, a river of the Hither India, in memory of his horse.

BUCEPHALA, in ornithology, a species of *anas* found in North America. Color whitish; back and wings black; the head large, silky, and shining. This is the *petit canard*, a *grosse tête*, of Buffon.

BUCEPHALIA, in entomology, a species of *bombyx* commonly called the buff-top moth, found feeding on the oak, lime, and willow trees.

BUCEPHALON, in botany. See *TROPINUS*.

BUCEPHALUS, the horse of Alexander the Great, which was killed in the action with *Porus*, after crossing that river. Others say, this horse died of age, thirty years old; and not in the battle, but some time after. *Hesychius* says, his being marked on the buttock with the head of an ox, gave rise to his name. This animal, who had so long shared the toils and dangers of his master, had formerly received signal marks of royal regard. Having disappeared in the country of the *Uxii*, Alexander issued a proclamation, commanding his horse to be restored, otherwise he would ravage the whole country with fire and sword. This command was immediately obeyed. 'So dear,' says *Arrian*, 'was *Bucephalus* to Alexander, and so terrible was Alexander to the Barbarians!'

BUCEPHALUS, in entomology, a species of *cryptocephalus*. Color *cyaneus*; the mouth, margin of the thorax, and the legs, red.

BUCER (Martin), one of the first reformers at Strasburg, was born in 1491, in Alsace; and took the religious habit of St. Dominic at seven years of age: but meeting with the writings of Martin Luther, and comparing them with the Scriptures, he began to entertain doubts of the Romish religion. After some conferences with Luther at Heidelberg, in 1521, he adopted most of his sentiments; but in 1532 gave the preference to those of *Zuinglius*. He assisted in many conferences; and in 1548 was called to Augsburg to sign the agreement between the Papists and Protestants, called the *Interim*. His warm opposition to this project exposed him to many difficulties and hardships; the news of which reaching England, where his fame had already arrived, *Cranmer*, archbishop of Canterbury

gave him an invitation to come over, which he readily accepted. In 1549 an handsome apartment was assigned him in the university of Cambridge, and a salary to teach theology. King Edward VI. had the greatest regard for him. Being told that he was very sensible of the cold of the climate, and suffered much for want of a German stove, he sent him 100 crowns to purchase one. He died in 1551, and was buried at Cambridge with great funeral pomp. In the reign of Mary, five years after he was buried, his body was dug up and publicly burnt, and his tomb demolished; but it was afterwards re-built by order of queen Elizabeth. He composed many works, among which are Commentaries on the Evangelists and Gospels.

BUCERAS, in botany, fenugreek. See TRIGONELLA.

BUCEROS, in ornithology, a genus belonging to the order of picæ. The beak is convex, cultrated, very large, and serrated outwards: the forehead is naked, with a bony gibbosity. The nostrils are behind the base of the beak. The tongue is sharp and short. The feet of the gressarii kind, i. e. the toes are distinct from each other. The species belonging to this genus are, Bicornis, Abyssinicus, Africanus, Malabaricus, hydrocorax, rhinoceros, galeatus, panayensis, manillensis, nasutus, albus, and obscurus. The principal are: 1. B. bicornis, with a flat bony forehead, and two horns before. The body is black, and about the size of a hen; but the breast, belly, and thighs, are white. There is a white spot on the wing; the tail is long, with ten black prime feathers, and the four outermost on each are white. The feet are greenish, with three toes before and one behind. It is a native of China, and called Calao by Willoughby and other authors. The pied horn-bill, described by Latham from a living specimen which came from the East Indies, the author supposes to be the same species, differing merely in sex or age. The manners of this bird were peculiar: it would leap forwards or sideways with both legs at once, like a magpie: when at rest it folded its head back between the wings: the general air and appearance was rather stupid and dull, though it would sometimes put on a fierce look when surprised: it would eat lettuce, after bruising it with its bill, and swallow raw flesh; as well as devour rats, mice, and small birds: it had different tones of voice; sometimes a hoarse sound in the throat, most like oück, oück; at other times very hoarse and weak, not unlike the clucking of a Turkey hen. This bird used to display its wings and enjoy itself in a warm sun, but shivered in the cold; and, as the winter approached, died, unable to bear the severity of the climate, so different to its nature. Another variety, the calao, is about the size of a hen. It inhabits the Philippine islands, and has a cry more like that of a hog or a calf than of a bird. The Gentoos rank it among their gods, and worship it. It lives altogether in woods, feeding on fruits, such as the Indian fig, pistachios, &c. which it swallows whole; and after the external parts have been digested, it brings up the nuts again whole, with the kernels fit for vegetation. 2. B. hydrocorax, the Indian crow of Ray, has a plain bony fore-

head without any horns. The body is yellowish above, and black below. It inhabits the Molucca isles. Willoughby observes, that it resembles our raven in the bill, but is red on the temples like some kinds of turkies; has wide nostrils and ill-flavored eyes; and that it feeds chiefly on nutmegs, whence its flesh has a fine aromatic relish. In its native place it is frequently tamed, and is useful in destroying rats and mice in houses. 3. B. nasutus, has a smooth forehead, is about the size of a magpie, and is a native of Senegal. These birds are very common at Senegal, and other warm parts of the old continent, where they are called tock. When taken young they immediately become familiar. In their wild state they feed on fruits, but when domesticated eat bread, and almost any thing that is offered to them. 5. B. rhinoceros has a crooked horn in the forehead joined to the upper mandible. It is a native of India. It is said to feed on flesh and carrion; and to follow the hunters for the purpose of feeding on the entrails of the beasts which they kill. They chase rats and mice, and after pressing them flat with the bill in a peculiar manner, and tossing them up into the air, swallow them whole immediately on their descent.

BUCHAN, a district on the east coast of Scotland, lying partly in the county of Aberdeen and partly in that of Banff. The latter district extends northwards from the Ugie to the sea, and westward as far as the Deveron, comprehending a tract of twenty miles in length, and nine in breadth, and is more free from hills and mountains than any other county of the same extent in Scotland. That part which lies in Aberdeenshire, extends south to the river Ythan. It is inhabited chiefly by Lowlanders, and gives the title of earl to the family of Erskine; of which family, however, Erskine of Mar is the chief.

BUCHANAN, a parish of Scotland, in Stirlingshire, anciently called Inch-cailloch, about twenty-seven miles long and nine broad. A long tract of it lies on the north side of Loch-Lomond, and the Grampian hills stretch through it, from south-west to north-east. The river Forth has its rise in the upper end of the parish; and the Endrick runs through it. Some of the islands in Loch-Lomond belong to this parish, on one of which, Inch-cailloch, lately stood the parish church. There are besides three small lakes, and some very extensive oak-woods. In Craighrostan are several caves, one of which afforded shelter to king Robert Bruce, and is known by the name of king Robert's cave. A good limestone quarry has lately been opened. On the side of Loch-Lomond stands the seat of the duke of Montrose. At Inversnaid is a small fort, on which a guard is mounted by a detachment from Dumbarton castle.

BUCHANAN (George), a celebrated Latin poet, was born in February 1506. A small farm called the Moss, two miles from the village of Killearn, in Stirlingshire, was the property of his father, and the place of his nativity. George, however, might have been confined to toil at the lowest employments of life, if the generosity of his uncle, George Heriot, had not assisted him in his education, and enabled him to pursue for

two years his studies at Paris, after his father's death. But that short space had scarcely elapsed, when the death of his benefactor obliged him to return to his country, and forsake for a time the paths of science. He was yet under his twentieth year, and, in this extremity, he enlisted as a common soldier, under John duke of Albany, who commanded the troops which France had sent to assist Scotland in the war against England. But he was disgusted with the fatigues of one campaign; and fortunately, John Major, then professor of philosophy at St. Andrew's, hearing of his necessity and his merit, afforded him a temporary relief. He now became the pupil of Maiz, a celebrated teacher in that university, under whom he studied logic; and followed his tutor to Paris, where he was invited to teach grammar in the college of St. Barbe. In this occupation he was found by the earl of Cassilis, with whom, having remained five years at Paris, he returned to Scotland. He next acted as preceptor to the famous earl of Murray, the natural son of James V. While thus occupied, he suddenly found his life was in danger from his enemies, the Franciscan monks, who, enraged at the poignant satires he had written against them, branded him with the appellation of atheist. Cardinal Beaton gave orders to apprehend him, and king James V. was bribed with a considerable sum to permit his execution. He was seized accordingly; but escaping the vigilance of his guards, he fled into England. Henry VIII. at all times the slave of caprice and passion, was then burning at the same stake the Lutheran and the Papist. His court did not suit a philosopher or a satyrst. After a short stay, Buchanan crossed the sea to France; and, to his extreme disappointment, found at Paris, cardinal Beaton, as ambassador from Scotland. On this, he retired privately to Bourdeaux, and met with Andrew Govea, a Portuguese of great learning and worth, with whom he had formerly been acquainted, and who was employed in teaching a public school. He acted for some time as the assistant of his friend; and, during the three years he resided at this place, he composed the tragedies which do him so much honor. It was here also that he wrote some of the most beautiful of those poems, in which he rallied the Muses, and threatened to forsake them, as not being able to maintain their votary. About this time also, he presented a copy of verses to the emperor Charles V. who happened to pass through Bourdeaux. His enemies, meantime, were not inactive. Cardinal Beaton wrote to the archbishop of Bourdeaux, inviting him to punish this most pestilent of all heretics. The archbishop, however, on enquiry, declined molesting him. Meantime Govea being called upon by the king of Portugal, to establish an academy at Coimbra, entreated Buchanan to accompany him. He consented, but had not been a year in Portugal, when Govea died, and left him exposed to the malice of his inveterate enemies the monks. They loudly objected to him that he was a Lutheran; that he had written poems against the Franciscans; and had been guilty of the abominable crime of eating flesh in lent. He was confined to a monastery, till he should learn what

these men fancied to be religion; and they enjoined him to translate the Psalms into Latin verse; a task which every man of taste knows with what admirable skill and genius he performed. On obtaining his liberty, he had the promise of a speedy promotion from the king of Portugal; the issue of which, his aversion to the clergy did not allow him to wait. He hastened to England; but the perturbed state of affairs during the minority of Edward VI. not giving him the prospect of any security, he again set out for France. He had not been long there, when he published his *Jephthes*, which he dedicated to the marshal de Brissac. This patron did not want generosity, and sent him to Piedmont, as preceptor to his son Timoleon de Cossi, an employment in which he continued several years; and, during the leisure it afforded him, he fully examined the controversies which now agitated Europe, and finished many of his smaller poems. After this, he returned to Scotland, and made an open profession of the reformed faith; but soon once more quitted his native country for France. Queen Mary, however, having determined that he should have the charge of educating her son, recalled him; and, till the prince should arrive at a proper age, he was nominated principal of St. Andrew's. His success as James's preceptor is well known. When it was observed to him that he had made his majesty a pedant: 'it is a wonder,' replied he, 'that I have made so much of him.' During the misfortunes that befel the amiable but imprudent Mary, he joined the party of the earl of Murray, and, at his earnest desire, wrote the *Detection*, a work which his greatest admirers have read with regret. Having been sent with other commissioners to England, against his mistress, he was, on his return, rewarded with the abbacy of Cross Reguel; made director of the chancery; and some time after a lord of the privy council and privy seal. He was likewise rewarded by queen Elizabeth with a pension of £100 a-year. The last twelve years of his life he employed in composing the history of Scotland. After having vied with the most eminent of the Latin poets, he contested with Livy and Sallust the palm of eloquence and political sagacity; but, like the former of these historians, he was not always careful to preserve himself from the charge of partiality. He died at Edinburgh in 1582, aged seventy-six. Authors speak of him very differently, according to their religious and political principles. As a Latin writer, however, in prose as well as poetry, he has hardly been equalled since the reign of Augustus; nor is he less deserving of remembrance as a friend to the natural liberties of mankind, in opposition to usurpation and tyranny. 'The happy genius of Buchanan,' says Doctor Robinson, 'equally formed to excel in prose and in verse, more various, more original, and more elegant, than that of almost any other modern who writes in Latin, reflects, with regard to this particular, the greatest lustre on his country.' The following is a list of his works: 1. *Rerum Scoticarum Historia*, &c. 2. *Psalmorum Davidis Paraphrasis Poetica*. 3. *De Jure Regni Apud Scotos Dialogus*. 4. *Psalmus civ. Cum Judicio Barclaii*, &c. 5.

Psalmus cxx. Cum Analysi Organica Beuzeri. 6. Baptistes, sive Calumnia. 7. Jephthes, sive Votum, Tragedia. 8. Euripidis Medea et Alcestis, Tragedia. 9. De Caleto Recepto Carmen. 10. Franciscanus et Fratres. 11. Elegia, Silva, &c. 12. De Sphaera. 13. Poemata Miscellanea. 14. Satyra in Cardinalem Lotharingum. 15. Rudimenta Grammatices, Thomae Linacri ex Anglico Sermone in Latinum Versa. 16. An Admonition to the True Lords. 17. De Prosodi. 18. Chamaleon, 1572. 19. Ad Viros sui Seculi Epistolae. 20. Literae Reginae Scotiae ad com. Bothwelliae. 21. A Detection of the Doings of Mary Queen of Scots, and of James Earl of Bothwell, against Henry Lord Darnly. 22. Hendecasyllabi, et Tambi. 23. Fratres Fraterrimi. 24. Epigrammata. 25. Vita ab Ipso Scripta Biennio Ante Mortem. 26. Life of Mary Queen of Scots. These have been severally printed often, and in various countries. An edition of his whole works was printed at Edinburgh, in 1704, in two volumes folio. An elegant monument was erected to his memory in 1788, at Killearn.

BUCHANAN (Claudius), D.D., was born at Cambuslang, near Glasgow, in 1766, and entered the university of that city. In 1787 he came to London, and was articled as clerk to an attorney. But, through the recommendation of the Rev. John Newton, was sent by Mr. Thornton, of Clapham, to Queen's college, Cambridge. Being appointed, in 1798, chaplain to the East India Company at Bengal, he was chosen vice-provost and classical professor of the college founded by the Marquis of Wellesley at Fort William. In 1806 he returned to England, and was honored with a diploma by the Glasgow university, as also by that of Cambridge, to which he presented some valuable manuscripts. He died in 1815, while employed in preparing an edition of the Syriac Testament. His works are: 1. Christian Researches in Asia. 2. The First Four Years of the College at Fort William. 3. Memoir on the Expediency of an Ecclesiastical Establishment in India. 4. The Three Eras of Light, two discourses at Cambridge. 5. A brief View of the state of the Colonies of Great Britain and her Asiatic Empire, in respect to Religious Instruction. 6. Sermons on Interesting Subjects. 7. A Letter to the East India Company, in reply to the Statements of Mr. Buller, concerning the idol Juggernaut. 8. Address delivered at a special Meeting of the Church Missionary Society to four Ministers destined for Ceylon and Tranquebar.

BUCHAN-NESS, a promontory of Scotland, of which it is the farthest point, and the most eastern of all Scotland. It is near Peterhead.

BUCHNERA, in botany, a genus of the angiospermia order, in the didynamia class of plants: CAL. obsoletely five-toothed: COR. with a five-cleft border, equal; the lobes heart-shaped. The fruit is a capsule of an oblong oval figure, pointed at the end, containing two cells, and opening at the top into two parts. The seeds are numerous, and of an angular figure. There are fourteen species, natives of the Cape and India.

BUCHOREST, or BUCHAREST, a pretty large

town of Turkey in Europe, in Wallachia, and the ordinary residence of a hospodar. The houses are mean and very ill built, except a few that belong to the principal persons. In 1716 a party of Germans from Transylvania entered this town, and took the prince prisoner with all his court, and carried them off. The prince to regain his liberty, gave up that part of Wallachia, which lies between the river Aluth and Transylvania, to the emperor, in 1718. But after the fatal battle of Crotzka, in 1737, the emperor was obliged to restore this part of Wallachia to the hospodar by the treaty of Belgrade.

BUCCIDA, in botany, a genus of the order monogynia, in the decandria class of plants; natural order twelfth, holoracea: CAL. is indented in five segments: COR. none; and the fruit is a single-seeded berry. There are two species: 1. B. capitata; a native of Montserrat; with flowers in headed spikes; wedge-form leaves, with a villous ciliate margin. 2. B. buccera mangle; with elongated spikes; leaves wedge-form, with a villous ciliate margin. A native of Jamaica.

BUCK, *n. s.* } Goth. Swed. Teut. and Belg.
BUCKE'STALL, } *buck*; Sax. bucc; Sans. *bok*,
BUCK'ING. } Per. *svoz. Βηκη*; Welsh, *broch*;
Arm. *bouc*; Fr. *bouc*; Ital. *becco*. An animal, striking or butting with the horns; the male of deer and goats, of rabbits, and some other animals.

And many an hart and many an hinde,
Was both before me and behinde;
Of fawnes, sowers, *buckz*, does,
Was ful the wodde; and many roes.

Chaucer's Boke of the Duchesse.

Bucks, goats, and the like, are said to be tripping or salient, that is, going or leaping. Peacham.

The chief time of setting traps, is in their bucking time. Mortimer.

BUCK', *v. & n.* } Goth. *bauck*; Sax. *buc*; *BUCK'ET*, } Belg. *bac*; Teut. *bauch*,
BUCK'BASKET, } *lauch*, *laug*; which seem to
BUCK'WASHING. } be formed from *ach*, *auch*,
aug, water; verb Teut. *bauchen*; Swed. *byke*;
Fr. *buquer*; Arm. *buga*; Ital. *bucato*; Span. *bugodo*. A tub or cask; a lie for washing; urine: to wash with lie. The noun is applied both to things washed, and the liquor in which they are washed. Bucket is the diminutive of buck.

Now up, now down, as *boket* in a well. Chaucer.

Here is a basket; he may creep in here, and throw foul linen upon him, as if it were going to bucking. Shakspeare.

They conveyed me into a *buckbasket*; rammed me in with foul shirts, foul stockings, and greasy napkins. Id.

Buck! I would I could wash myself of the *buck*: I warrant you, *buck*, and of the season too it shall appear. Id.

Of late, not able to travel with her furred pack, she washes *bucks* here at home. Id.

Now is this golden crown like a deep well,
That owes two *buckets*, filling one another;
The emptier ever dancing in the air,
The other down unseen, and full of water. Id.

Buck, the male of the fallow deer; and also of rabbits and other animals. A buck the first year is called a fawn, the second a pricket, the

third a sore, the fourth a sore, the fifth a buck of the first head, and the sixth a great buck. See **DEER AND HUNTING.**

BUCKINGHAM, a county of the United States, in Virginia, bounded on the north by James river, which separates it from Fluvanna; on the south-east by Cumberland; on the south-west by Campbell; and on the south by the Appamattox, which divides it from Prince Edward County. It is sixty-five miles long and thirty broad.

BUCKINGHAMSHIRE, or BUCKS, is an inland county of England, bounded on the north by Bedfordshire and Northamptonshire; on the east by Bedfordshire, Hertfordshire, and Middlesex; on the west by Oxfordshire and Northamptonshire; and on the south by Berkshire, from which it is separated by the Thames.

Its figure is that of a crescent, with a jagged outline; its greatest length from north to south about forty-five miles, its breadth about eighteen, and its circumference 138 miles, containing 518,400 statute acres, according to the report of the Board of Agriculture, but only 478,720, according to the parliamentary returns of the poor's rate. It has fifteen market towns, and returns fourteen members to parliament: viz. two for the county; two for Buckingham; two for Aylesbury; two for Wycombe; two for Amersham; two for Wendover; and two for Marlow. There are seven deaneries in it. Though in the diocese of Lincoln, four parishes are in the peculiar jurisdiction of the archbishop of Canterbury, and four others are in the diocese of London, and in the jurisdiction of the archdeacon of St. Albans. The great tithes of ninety-two parishes are in lay hands, and most of the remainder are held by lay leases. The Summer assizes are held at Buckingham, the Lent assizes at Aylesbury. The quarter-sessions are always held at Aylesbury. Buckinghamshire contains many magnificent seats; among which the most celebrated are Stowe, the seat of the marquiss of Buckingham; Bulstrode, formerly belonging to the Rutland family; Dropmore, the seat of lord Grenville, Taploe house, and Wycombe abbey.

Its principal rivers are the Thames, the Ouse, and the Colne. The Colne forms a part of its eastern boundary, separating it from Middlesex; it passes near Denham and Iver, through Colnbrook, to which it gives its name, and near Horton and Wyradesbury, and falls into the Thames between Ankerwyke and Staines.

The Ouse slow winding through a level plain
Of spacious meads, with cattle sprinkled o'er,
enters the west side of the county, and passing Water Stratford, pursues an irregular course to Buckingham, whence it winds through a fertile meadow tract, in the neighbourhood of Stony Stratford, Newport Pagnell, and Olney, and then turning to the east, leaves the county near Snelson, in the parish of Lavendon. Old father Thames forms part of the boundary, and is the chief ornament of the southern part of the county, dividing it from Berkshire, during a course of about thirty miles. In its progress it passes Medmenham, Great Marlow, Heddesford, Taplow, Boveney, Eton, and Datchet, and is

navigable throughout. The Grand Junction Canal enters the county near Wolverton, where it is carried across the valley, over the river Ouse, by a magnificent aqueduct, of about three quarters of a mile in length; thence flowing to the south, it passes Fenny Stratford, Stoke-Hammond, Cinslade, and Ivinghoe, into Hertfordshire. From a branch of the canal at Old Stratford, a cut has been made to Buckingham; and another from Bulbourne to Wendover.

The southern part of this county, beyond the Thames, is principally occupied by the Chiltern Hills, having a chalk soil, intermixed with flints. They stretch across the country from Bedfordshire to Oxfordshire, forming a part of that great chain which extends from Norfolk to Dorset. On the west side of Buckinghamshire, adjoining Oxfordshire, is a range of hills of calcareous stone. In that part of the county which borders on Bedfordshire, about Wavenden, Broughton, and the Brickhills, the soil is a deep sand. The fertile vale of Aylesbury lies under the Chiltern Hills, occupying the middle of the county, and is formed of a rich black loam, on a calcareous subsoil. In the northern parts the soil is chiefly clay; but on the Bedfordshire border the surface rises into gentle sand-hills. The Chiltern district is said to have been once a forest; the western part, occupied by that of Bernwood, was disforested in the reign of James I. At present, the chief woodlands lie to the south of the Chiltern Hills. On a tract of land, extending across Little Kimble parish into that of Great Kimble, there are about 100 acres of box-wood, apparently the growth of the soil. The black cherry abounds in the neighbourhood of Chesham.

The prevailing timber in the southern part of the county is beech; one wood of which, in the parish of Wycombe, is said to contain 700 acres; nearly one-sixth part of the land between the road to Oxford and the Thames is supposed to be covered with this wood. Some antiquarians have derived its name from Buccan, A.S. beech. Whaddon Chase is the principal woodland in the northern part of the county, containing 2200 acres of coppices.

At Newport Pagnell is a good quarry of marble, at a considerable depth. At Wavenden are the celebrated fullers' earth pits, one of which only is now occasionally worked. Pennant thus describes the strata: 'The beds over the marl are, first, several layers of reddish sand to the thickness of six yards; then succeeds a stratum of sandstone, of the same color, beneath which, for seven or eight yards more, the sand is again continued to the fullers' earth, the upper part of which being impure, or mixed with sand, is flung aside; the rest taken up for use. The earth lies in layers, under which is a bed of rough white freestone, and under that sand, beyond which the laborers have never penetrated.' The only rare plant known to botanists as indigenous to this county, is the dentaria bulbifera, which grows abundantly in its south-east corner. The great snail, or pomatia, Mr. Pennant was informed, is found in the woods near Gotherst; and he regards this as its most southern residence in England.

This county has long been remarkable for its corn and cattle. 'Buckinghamshire bread and beef,' was an old proverb. As far back as the time of Camden, fine flocks of sheep were fed in the vale of Aylesbury, which yielded great profit from their wool; see *AYLESBURY*. At present this vale feeds oxen for the London market, to which it also sends weekly immense supplies of butter. There is a small proportion of arable land in the northern division of the county; and not much in any other part, except the Chiltern districts, which are usually cultivated with wheat, barley, oats, beans, and sainfoin. In the neighbourhood of Aylesbury, ducks are reared very early in the spring, and sometimes at Christmas, which, being sent to London, sell at a high price. The ducks are prevented from laying, by artificial means, till October or November. A few weeks before they lay, they are fed highly; the eggs are hatched by hens, which are frequently exhausted to death, by sitting on three broods successively. As soon as the ducklings break the shell, they are nursed with care at the fire side.

It has long been an old proverb in Bucks, 'more live by the lands than the hands': the only manufactures of consequence here are those of bone-lace and paper. The former is carried on at Olney, Newport Pagnell, and Hanslope, a village about five miles north-west from Newport Pagnell. Here, in the year 1801, 800, out of a population of 1275, were employed in this manufacture. The lace sells from sixpence to two guineas a yard. But, since it has been made on the frame at Nottingham, Loughborough, and other places, this manufacture of Buckinghamshire has been on the decline. In the neighbourhood of Wycombe the manufacture of paper has been carried on for more than a century. On a part of the small river Wyke, which passes through this parish, there are fifteen corn and paper-mills. At Amersham there is a manufacture of sacking, and white cotton goods. Manufactures of paper and black silk lace are found at Marlow; large works of copper, brass, and brass-wire, and mills for making thimbles, and pressing rape and linseed. The principal markets in the county are those of Aylesbury, Buckingham, and Wycombe. Marlow fair is much celebrated for its horses.

Roman roads penetrate this county, and there are some remains of the military stations of that nation. A considerable mound, called Grimes-dike, which seems a common appellation for an ancient rampart, traverses part of it in a direction from east to west. The remains of a circular camp, with a double vallum and ditch, appear on the top of the hill at West Wycombe, and those of another at High Wycombe. A cross, on the side of a hill near the hamlet of Whiteleaf, is supposed to be intended to commemorate a battle fought by Edward the Elder against the Danes. In the churches at Chetwode, Chesham Bois, Hitcham, and Hillesden, are some of the earliest and most elegant specimens of stained glass in the kingdom; and the church of Stukeley is deserving of notice, as affording one of the most complete specimens of Saxon architecture now remaining. Happily no part of

it, externally or internally, has been much altered or defaced; nor have any additions been made to it, except the porch on the south side, and the pinnacles of the tower. The date of 1106 is said to have been observed on a stone by some workmen who were repairing the roof of the chancel. The chancel of the church of Chetwode, supposed to have been founded in the year 1244, has lancet-shaped windows, with slender pillars, the capitals of several of which are highly enriched with foliage and figures of animals. Hillesden church, which was rebuilt about the year 1493, affords a rich specimen of the later Gothic. Some of the most ancient and elegant specimens of stained glass in the kingdom, remain in the chancel of Chetwode church; as there is little doubt that this glass was coeval with the erection of the church, in 1244, it may be considered as one of the oldest specimens of the kind in England.

BUCKINGHAM, the county town, is sixteen miles and a half north from Aylesbury, and fifty-five from London, by Uxbridge; seated on the Ouse, over which it has three stone bridges. It is a very ancient town, and fortified with a rampart and turret, by Edward the Elder, in the year 918. Formerly it had a castle on a hill which divides the town, on the site of which a handsome new church, with a tower and spire 150 feet high, has been lately built; but the burying-ground is continued at the former church-yard. The inside of the church is fitted up in an elegant style; the altar-piece, representing the transfiguration of Christ, after Raphael, was presented to the parish by the marquis of Buckingham. The town consists of one long irregular street, the houses in which are meanly built, and some of them thatched. The manufacture, which is lace-making, and the trade of the town generally, is but small. In the reign of Edward III. one of the staples for wool was fixed here; and there still remains an old house called the wool-hall. On the banks of the river are several corn and paper-mills. It sends two members to parliament. Queen Mary incorporated it with a bailiff and twelve burgesses, who are the sole electors of its members. All the county business was formerly transacted at Aylesbury, but, by a late act of parliament, the summer assizes are held at Buckingham. Sessions also are held here twice a year, in the town-hall, and it has a court for the recovery of small debts. Here are a grammar-school, several places of worship for dissenters, and various excellent charitable institutions. The town has given the title of duke to several illustrious families. In the neighbourhood is Stowe, the celebrated seat of the marquis of Buckingham. This place suffered greatly by fire, in March, 1725, by which 138 families lost nearly £38,000. It is a great thoroughfare to Chester, Ireland, &c. The market on Saturday is well attended, and here are several fairs.

BUCKLE, *v. & n.* } Goth. *baug*; Teut.
BUCK'LING, } *auglein*; Swed. *bukkel*,
BUCK'LER, *v. & n.* } *buckla*; Welsh and Arm.
boucl; Irish, *bucka*; Fr. *boucle*; from Goth. *boga*,
to bow, or curve, whence Fr. *boguer*. Buckler is
supposed to be cognate with buckle in the sense

of circular, as Goth. round was a shield; but Goth. *bog*, and Swed. *bog*, signified the shoulder; and *leder*, a skin, leather, was contracted into *ter*; bel leer. See Bow. To buckle is to bend, to yield to pressure; to fasten or close; to adhere to; to keep closely engaged in. A buckle is a fastening; a buckler is a shield or protection fastened with leather from the shoulder; to buckler, is to cover with a buckler; to guard or defend.

Richesse a girdle had upon;
The *bokill* of it was of ston,
Of virtue grete and mekil might
For who so bore the stone so bright,
Of venim durst him nothing doubt,
While he the stone had him about.

Chaucer's Romance of the Rose.

Knights of retenu, and eke 'squieres,
Nailing the speres, and helmes *bokeling*.

Id. Canterbury Tales.

The Saracen, this hearing, rose amain,
And catching up in haste his three-square shield,
And shining helmet, soon him *buckled* to the field.

Spenser.

Like saphire, pearl, in rich embroidery,
Buckled below fair knighthood's bending knee.

Shakspeare.

Fair lined slippers for the cold,
With *buckles* of the purest gold, *Id.*

The wretch, whose fever-weakened joints,
Like strengthless hinges, *buckle* under life,
Impatient of his fit, breaks like a fire
Out of his keeper's arms. *Id.*

Fear not, sweet wench, they shall not touch thee,
Kate;

I'll *buckler* thee against a million. *Id.*

Now a covetous old crafty knave,
At dead of night, shall raise his son, and cry
Turn out, you rogue, how like a beast you lie!
Go, *buckle* to the law. *Dryden.*

He took my arms, and while I forced my way
Through troops of foes, which did our passage stay;
My *buckler* o'er my aged father east,
Still fighting, still defending, as I past. *Id.*

Three seal-rings; which after, melted down,
Formed a vast *buckle* for his widow's gown. *Pope.*

The chlamys was a sort of short cloak tied with a
buckle, commonly to the right shoulder. *Arbutnot.*

The greatest beau was dressed in a flaxen periwig;
the wearer of it goes in his own hair at home, and
lets his wig lie in *buckle* for a whole half year.

Spectator.

Thus ever, when I *buckle* on my helmet,
Thy fears afflict thee. *Philips.*

BUCKLE, in heraldry, is considered as a token
of the surety, faith, and service of the bearer:

it is an ancient and honorable bearing. It is necessary to describe the shape of the buckle, whether it be round, oval, square, &c. as, 'He beareth sable a chevron between three oval buckles *argent*, by the name of *Mallet*.'

BUCKLERS were composed of wickers woven together, or wood of the lightest sort, covered with hides, and fortified with plates of brass or other metal. The figure was sometimes round, sometimes oval, and sometimes almost square.

VOL. IV.

Most bucklers were adorned with figures of birds, beasts, gods, celestial bodies, &c.; a custom derived from the heroic times, and from them communicated to the Grecians, Romans, and barbarians. The scutum, or Roman buckler, was of wood, the parts being joined together with little plates of iron, and the whole covered with a bull's hide. An iron plate encompassed it without, to keep off blows; and another within, to prevent damage by lying on the ground. In the middle was an iron boss, umbo, jutting out, to glance off stones and darts; and sometimes to press violently upon the enemy, and drive all before them. The clypeus were less, and quite round, belonging more properly to other nations, though for some time used by the Romans. The scuta were of two kinds; the ovata, of a plain oval figure; and the imbricata, oblong, and bending inward like half a cylinder. Polybius makes the scuta four feet long, and Plutarch calls them *πρόσθους*, reaching down to the feet. And it is probable that they covered almost the whole body, for in Livy we find that soldiers on guard sometimes slept with their head on their shield, having fixed the other part of it in the earth. Bucklers were often hung up in their temples, either in commemoration of some hero, or as a thanksgiving for a victory obtained over an enemy; whose bucklers, taken in war, were offered as a trophy.

BUCKLER-THORN, *n. s.* Christ's thorn.

BUCK-MAST, *n. s.* The fruit or mast of the beech tree.

BUCKRAM, *n. & adj.* Fr. *bourgrain*, Ital. *bugrane*, Dut. *buckerael*. A kind of cloth stiffened with gum; but formerly called trellis, from its lattice-like texture.

I have peppered two of them; two, I am sure, I have paid, two rogues in buckram suits. *Shakspeare.*

BUCKRAM is more generally, if not always, stiffened with glue, and used in the making of garments to keep them in the form intended. It is used in the bodies of women's gowns; to make wrappers to cover cloths, serges, and other merchandise, &c. to preserve them, and keep them from the dust. Buckrams are sold wholesale by the dozen of small pieces or remnants, each about four ells long, and broad according to the piece from which they are cut. Sometimes new pieces of linen cloth are used to make buckrams, but most commonly old sheets and old pieces of sails.

BUCKRAMS, *n. s.* The same with wild garlic.

BUCKS, a populous and well-cultivated county of the United States, in Pennsylvania; bounded on the north-east, east, and south-east, by the Delaware; which separates it from Hunterdon County; on the south-west by Philadelphia and Montgomery Counties, and on the north-west by Northampton. Its greatest length is forty-one miles, and breadth twenty-one. On the south it is fertile, but the land on the north is rather poor: but it abounds in lime-stone. Lead and iron ores have also been discovered in it. Newton is the chief town.

BUCKS. See BUCKINGHAM.

BUCKSHORN PLANTAIN, in botany, Lat. *coronopus*, from the form of the leaf. A plant. See **PLANTAGO**.

BUCKS-HORN, WARTED. See **COCHLEARIA**.

BUCK-STALL, a toil to take deer, which must not be kept by any person who has not a park of his own, under penalties.

BUCKTHORN, *n. s.* in botany, Lat. *rhamnus*, supposed to be so called from the Saxon bucc, the belly. A tree that bears a purging berry. See **RHAMNUS**.

BUCK-THORN, SEA. See **HIPPOPHAE**.

BUCKWHEAT, *n. s.* in botany, Germ. *buckweitz*, Lat. *fagopyrum*. A plant. See **POLYCONUM**.

BUCOLICA, the art of managing cattle.

BU'COLICK *adj.* *Βουκολικα*, from *βουκολος*, a cowherd. Pastoral.

BUCOLICS, in ancient poetry, poems relating to shepherds and country affairs, which, according to the most generally received opinion, originated in Sicily. Bucolics, says Vossius, have some conformity with comedy. Like it, they are pictures and imitations of ordinary life; with this difference, that comedy represents the manners of the inhabitants of cities, and bucolics the occupations of country people. Sometimes, this last poem is in form of a monologue, and sometimes of a dialogue. Sometimes there is action in it, and sometimes only narration; and sometimes it is composed both of action and narration. The hexameter verse is the most proper for bucolics in the Greek and Latin tongues. Moschus, Bion, Theocritus, and Virgil, are the most renowned of the ancient bucolic poets.

BUCTON, in anatomy, a word used by Severinus and others for the hymen.

BUD, *v. & n.* Sax. *buta*, Teut. *butz*, Belbot, Wel, bot, Fr. *bouton*. Verb Belg. *botten* Teut. *baussen*, Fr. *boutonner*. The first shoot of a plant; a germ. To put forth the germ of leaves; to put forth young shoots or germs. To rise as a germ from the stalk; to be in the bloom or growing. To inoculate; to graft, by inserting a bud into the rind of another tree.

Bud forth as a rose growing by the brook of the field. *Ecd.*

Seest not thilke same hawthorne studded,
How bragley it begins to *buddle*,
And utter his tender head.

Spenser's Shepherd's Calendar.

All so my lustfull leafe is dry and seare;
My timely *buds* with wayling all are wasted. *Id.*

Young *budding* virgin, fair and fresh and sweet,
Whither away, or where is thy abode? *Shakespeare.*

Be as thou wast wont to be,
See as thou wast wont to see:
Dian's bud o'er Cupid's flower
Hath such force and blessed power. *Id.*

Writers say, as the most forward *bud*
Is eaten by the canker ere it blow,
Even so by love the young and tender wit
Is turned to folly, blasting in the *bud*,
Losing his verdure even in the prime. *Id.*

Heaven gave him all at once, then snatch'd away,
Ere mortals all his beauties could survey;
Just like that flower that *buds*, and withers in a day.

Pryden.

Though laboring jokes on their own necks they feared,
And felt for *budding* horns on their smooth foreheads reared. *Id. Silenus.*

Of apricots, the largest is much improved by *budding* upon a peach stock. *Temple.*

Insects wound the tender *buds*, with a long hollow trunk, and deposit an egg in the hole, with a sharp corroding liquor that causeth a swelling in the leaf, and closeth the orifice. *Bentley.*

The hawthorn whittens, and the juicy groves

Put forth their *buds*, unfolding by degrees,
Till the whole leafy-forest stands displayed
In full luxuriance to the sighing gales. *Thomson.*

BUD. See **BOTANY**, Index.

BUDA, or **OFFEN BUDA**, a city of Hungary, in the county of Pillisch, is situated on the west bank of the Danube, and is the capital of Lower Hungary. Sometimes it is regarded, in conjunction with Pesth, from which it is separated only by a bridge of boats, as the metropolis of the kingdom. The length of this bridge, which consists of forty-seven large boats, connected with chains, is about 300 yards. Buda is the residence of the Palatine, and contains 30,000 inhabitants. Its situation is on the right bank of the Danube, and is commanding and majestic. The fortress, which occupies a high rock, contains the palaces of the palatine, and of the nobles, the public arsenal and theatre, with many churches and streets. At the foot of this eminence, and along the side of the river, runs a street, while others, with gardens, surround it in different directions: a second rocky eminence, called the Blocksberg, hangs over the river at a short distance to the south, on which a new observatory is constructed. The Danube is nowhere seen to more advantage; and the town has been considerably improved since a recent fire, which consumed the greater part of the lower division. Buda was the residence of the Hungarian monarchs, till the Turks took it in 1526, and destroyed a celebrated library, founded by Matthias I. Ferdinand, archduke of Austria, recovered it in 1527, but in 1529 the Turks took it again. In 1684 the Christians laid siege to it, but were obliged to raise it soon after, though they had an army of 80,000 men. In 1686, however, they took it by assault, in the sight of a very numerous army. The booty that they found it was almost incredible, the Turks having lodged their treasures in it as a place of safety. After this they augmented its fortifications, to which the pope contributed 100,000 crowns, Buda being considered as the key of Christendom. In the neighbourhood excellent wine is made, and the town itself contains numerous baths, which are resorted to in paralytic complaints. It is 125 miles E. S. E. of Vienna, and 150 N. N. W. of Belgrade.

BUD/EUS (William), a learned critic of France, in the fifteenth century, was born at Paris in 1467. His parents sent him to the university of Orleans to study law; where he passed three years in dissipation. His parents sending for him back to Paris, found his former reluctance to study and love of gaming much increased. But the fire of youth beginning to cool, he was at length seized with an irresistible passion for learning. He immediately disposed of his hunting

equipage, and abstracted himself from all business, to apply to study; in which he made, without any assistance, a very rapid and amazing progress, particularly in the Latin and Greek languages. The work which gained him greatest reputation was his *Treatise de Asse*. He afterwards became librarian to the French king, Francis I., who at his persuasion, and that of Du Bellay, founded the Royal College of France, for teaching the languages and sciences. The king sent him to Rome, as his ambassador to Leo X. and in 1552 made him master of requests. The same year he was chosen provost of the merchants. He died at Paris in 1540. His principal works are, 1. *De Asse*, 4to.; 2. *Notes on the Pandects*; 3. *Commentarii Græcæ Linguae*, fol.

BUDDÆUS (John Francis), a celebrated Lutheran divine, was born in 1667, at Anclam in Pomerania. At the age of eighteen he was sent to the university of Wittenberg, where he took his master's degree in 1687; and two years afterwards became assistant professor of philosophy. He removed from thence to Jena, next to Copenhagen, and afterwards to Halle, but returned to Jena to take the chair of theology in 1705. He died in 1729. His principal works are, 1. *A large Historical German Dictionary*; 2. *Historia Ecclesiastica Veteris Testamenti*, 2 vols. 4to.; 3. *Elementa Philosophiæ Practicæ, Instrumentalis, et Theoreticæ*, 3 vols. 8vo. In most universities of Germany the professors take this work for their text book. 4. *Selecta Juris Naturæ et Gentium*. 5. *Miscellanea Sacra*, 3 vols. 4to. 6. *Isagoge Historico-Theologica ad Theologiam Universans, Singulasque ejus Partes*, 2 vols. 4to. 7. *A Treatise on Atheism and Superstition*.

BUDDLE, in mineralogy, a large square frame of boards used in washing the tin-ore.

BUDDLEIA, in botany, a genus of the monogynia order, in the tetandria class of plants. The calyx and corolla are quadrid; the stamina placed at the incisures of the corolla. The capsule is bisulcated, bilocular, and polyspermous. There are eleven species, mostly from the Cape and the East and West Indies. The most beautiful are, *B. Americana*, a native of Jamaica and most of the other American islands. It rises to the height of ten or twelve feet, with a thick woody stem covered with gray bark; and sends out many branches towards the top, which come out: opposite, at the ends of the branches, the flowers are produced in long close spikes branching out in clusters, which are yellow, consisting of one leaf cut into four segments: these are succeeded by oblong capsules filled with small seeds. *B. occidentalis*, a native of Carthage. It rises much higher than the other.

BUDDLING-DISH, a small, shallow vessel, like the basin of a pair of scales, for washing ores of metals by the hand.

BUDDLING OF CALAMINE, the operation of cleansing it from filth, by washing and picking it, preparatory to the baking of it in the oven.

BUDGE, *v., n. s., & adj.* } Goth. *buga*, Sax.

BUD'GER. } *bugan*, Swedish
botja, Dan. *boge*, Fr. *bouger*. From Goth. *bolg*, Sax. *baig*, *bolg*, Wel. *balch*, puffed up, angry, arrogant. Thus to budge is to stir, to move off slowly and doggedly; surly, stiff, formal.

The mouse ne'er shunned the cat, as they did budge
From rascals worse than they. *Shakespeare.*

Let the first budge die the other's slave,
And the gods doom him after. *Id.*

I thought th' hadst scorned to budge
For fear. *Hudibras.*

O foolishness of men! that lend their ears
To those budge doctors of the stoick fur. *Milton.*

BUDGE BACHELORS, a company clothed in long gowns, who attend the lord mayor of London during his inauguration.

BUDGE BARRELS, among engineers, small barrels well hooped, with only one head; on the other end is nailed a piece of leather, to draw together upon strings like a purse. Their use is for carrying powder along with a gun or mortar; being less dangerous and easier carried than whole barrels. They are likewise used upon a battery of mortars for holding meal powder.

BUDGELL (Eustace), Esq. the son of Gilbert Budgell, D. D. was born near Exeter about 1685. He was educated at Christ Church College, Oxford; from which he removed to the Inner Temple, London: but instead of studying the law, for which his father intended him, he applied to literature, and contracted an intimacy with Mr. Addison, who was first cousin to his mother, and who, on being made secretary to the lord-lieutenant of Ireland, took him with him as one of the clerks of his office. Mr. Budgell, who was then about twenty years of age, and had read the classics, and the works of the best English, French, and Italian authors, now became connected with Sir Richard Steele and Addison in the production of the *Tatler*, as he had, soon after, in that of the *Spectator*, in which all papers written by him are marked X. He was likewise a contributor to the *Guardian*, where his performances are marked with an asterisk. He was afterwards made under-secretary to Mr. Addison, chief secretary to the lord justice of Ireland, and deputy-clerk of the council. Soon after, he was chosen a member of the Irish parliament; and in 1717, Addison having become principal secretary of state in England, procured him the place of accountant and comptroller general of the Irish revenue. But next year, the duke of Bolton being appointed lord-lieutenant, Mr. Budgell lampooned both the duke and his secretary, and was in consequence removed from his post: upon which, returning to England, he published his case in a pamphlet, entitled *A Letter to the Lord * * **, from Eustace Budgell, Esq. accountant-general, &c. His attempts to gain the favor of the English court were constantly repressed by the duke of Bolton. In 1720 he lost £20,000 by the South Sea scheme, and afterwards spent £5000 more in unsuccessful attempts to get into parliament. This completed his ruin. He at length employed himself in writing pamphlets against the ministry, several papers in the *Craftsman*, &c. In 1733 he began a weekly pamphlet, called *The Bee*; which he continued for above 100 numbers, or eight volumes, 8vo. During its progress Dr. Tindal died, and a will of Budgell's making, contained a bequest of £2000 to the maker; but it was contested and ultimately set aside. This ruined his reputation. It was thought also that he assisted

Tindal in the composition of Christianity as old as the Creation. He now produced a translation of Theophrastus's characters. Becoming again embarrassed, after the cessation of the Bee, and having been called to the bar, he attended for some time in the courts of law, but finding himself unable to obtain practice, he resolved on suicide. Accordingly in 1736, after filling his pockets with stones, he took a boat at Somerset-stairs, and threw himself into the river under the bridge. Upon his bureau was found a slip of paper, on which were these words :—

What Cato did, and Addison approved,
Cannot be wrong.

BUDGET. Fr. *bougette*, Dan. *buget*, from Goth. *balg*, Teut. *balg*, barb. Lat. *bulga*, Ital. *bolgia*, *volgia*, *bolgetta*. A wallet, a sack. It is used for a store or stock.

If tinkers may have leave to live,

And hear the sowskin *budget*;

Then my account I well may give,

And in the stocks avouch it. *Shakspeare.*

Sir Robert Clifford, in whose bosom, or *budget*, most of Perkin's secrets were laid up, was come into England. *Bacon.*

It was nature in fine, that brought off the cat, when the fox's whole *budget* of inventions failed him.

L' Etrange.

Nor did I ever winch or grudge it,
For thy dear sake! Quoth she, mum *budget*.
Think'st thou 'twill not be laid i' the dish
Thou turn'st thy back? Quoth Echo, Pish.

Hudibras.

His *budget* with corruptions crammed,

The contributions of the damned. *Swift.*

BUDGET, in parliamentary language, means the minister's proposed plan of taxation for the subsequent year; and comprehends not only the new taxes and an estimate of their probable amount, but a general view of the national debt, income and expenditure, ways and means of raising supplies, &c. with the real product of the last *budget*.

BUDIURS, in ichthyology, a name given by the Irish to a large species of trout, resembling the red gillaroo.

BUDINGEN, a town of Germany in the grand duchy of Hesse, the capital of the county of Upper Isenberg, ten miles north-east of Frankfurt.

BUDINUS, in ancient geography, a mountain of Sarmatia Europæa, from which the northern spring of the Borysthenes is said to take its rise, according to Ptolemy. But this is contradicted by later accounts. It is now called Podolia.

BUDLEY, a sea-bathing town of Devonshire, near the mouth of the Otter. It had once a market on Monday, and is now recovering its former respectability; distant three miles from Exmouth.

BUDNEANS, in ecclesiastical history, a sect of the sixteenth century, who not only denied all kind of religious worship to Jesus Christ, but asserted that he was begotten like other men, and in the natural way.

BUDNEUS (Simon), the founder of the above-mentioned sect, was a clergyman, deposed from his ministerial functions in the year 1584, and publicly excommunicated, with all his disciples, but afterwards, abandoning some of his

peculiar sentiments, he was admitted to the communion of the Socinians.

BUDOA, a small maritime town of the Austrian empire in Dalmatia. It is seated between the gulf of Cattaro, and the city of Dulcigno, on the coast of Albania; and was once an important fortress, where the Venetians kept a strong garrison. In 1665 it suffered greatly by an earthquake; and in 1686 was besieged by Soliman, basha of Scutari: but Cornaro obliged him to raise the siege.

BUDUN, one of the Ceylonese gods, who is fabled to have arrived at supremacy, after successive transmigrations from the lowest state of an insect, through the various species of living animals. There are three deities of this name, each of whom is said to reign till a bird shall have removed a hill of sand, half a mile high and six miles round, by carrying off a single grain once in 1000 years. See *CEYLON*.

BUDUKSHAUN, a range of mountains in Asia, extending northwards from the great ridge of Hindoo Coosh to the source of the Oxus. It thus forms the western boundary of the territory of Kanskaur; and is covered with snow during the greater part of the year; but there is only one point of perpetual snow, being that from which the Oxus and Kama take their rise. The neighbourhood is watered also by a considerable river, called the Koocha, which falls into the Oxus. These mountains contain valuable mines of silver, iron, antimony, and lapis lazuli. Budukshaun has also been celebrated for its rubies, situated on the lower hills, near the Oxus; but they are no longer wrought. From its inaccessible situation, this country has generally maintained its independence. The present chief, Sultaun Mahommed, is said to be absolute over his own subjects, and has a revenue of about £60,000. The capital is Fyzabad, a considerable place.

BUDWEIS, a circle and mining town of Bohemia, containing nine towns, twenty-six market boroughs, twenty-seven lordships, 860 villages, and 170,000 inhabitants. Here are the sources of the Moldau, and very extensive forests and sheep-walks. The town is large and well built, surrounded with walls, and partially fortified. It was taken by the king of Prussia in 1744, but he did not keep it long. Here are manufactures of salt-petre and cloth. Population 4600. Distant sixty-six miles south of Prague.

BUDZIAC TARTARY. See *BESSARABIA*.

BUENAVENTURA, a Spanish settlement and mission on the coast of New California, visited by Vancouver in 1793. He says that the buildings of the mission, the arrangement of the gardens, and the cultivation of the land in the immediate vicinity, is in a style superior to that of any of the settlements to the north. It was founded in 1788, and contains about 1000 inhabitants. Long. 241° 2' E., lat. 34° 16' N.

BUENOS AYRES, an independent state of South America, and one of the United Provinces of the southern hemisphere, was, until the late revolution, a vice-royalty of the dominions of Spain, and sometimes called the vice-royalty of La Plata. At that period it was described as extending from the Rio Desaguadero to the most

northern settlements on the Paraguay, upwards of 1600 miles in length; and, from the mouth of the Rio de la Plata to Chili, nearly 1000 in breadth; forming the most important part of the Spanish possessions in the New World. It was erected into a distinct vice-royalty so late as the year 1778, and consisted of five provinces, viz. Buenos Ayres, or Rio de la Plata, Paraguay, Tucuman, Los Charcas, or Potosi, and Cuyo. We can feel no such apprehensions for the cause of liberty, as to imagine that these provinces will ever again fall under the dominion of the mother country (if, indeed, it be not a sort of profanation to apply such a term to Spain); but having sketched (see our article SOUTH AMERICA) the general features of this important portion of the new continent, and the union of these provinces being, at present, far from settled, we devote this article to a description of Buenos Ayres Proper, always the chief of them, and the channel through which their principal productions have reached Europe.

The province or state of Buenos Ayres, then, is now bounded on the east by the river Paraná, and its continuance the La Plata; on the north by the stream Arroyo de en Medio, which divides it from Santa Fé; and on the south and west by the Solado, which empties itself into the bay of Somborombon. The extravagant claims of the Spanish government included the territory southward, nearly to 47° of latitude, and attempts have been lately made to extend the actual boundaries further in that direction. In fact, at different periods, the grazing grounds of the province have stretched as far as 37° south latitude; but it seems more than doubtful whether the Indians, who have become alarmed at this advance, and who frequently penetrate to the neighbourhood of the capital, will sanction it by any treaty. In the year 1740, a line was run across the continent, in latitude 35°, to the southward of which it was understood the various hordes of Indians were to confine themselves. On the sea-coast the Europeans have had much less difficulty in extending the limits of their possessions, than more in the centre of the country. It is calculated that this territory contains about 1520 square leagues.

The mighty La Plata, formed of the united streams of the Pilcomayo, Paraguay, Paraná, and Uruguay, is the chief geographical feature of this province, and the great outlet, or central basin, of this part of South America. The waters of the western side of the mountains of Brasil, and those of the eastern side of the Andes, as well as those of the intermediate ranges of Cordova and Tucuman, have no estuary but in this direction.

The geological formations on each side of this great stream are interesting, as it appears to separate the primitive from the newest secondary formations in a remarkable manner. On the north, or Montevideo side, the rocks are granite, gneiss, claystone, and primitive trap (greenstone); while on the south side, a new stalactiform limestone, of a brownish white color, is found lying upon beds of a stiff clay. These clay beds extend a considerable distance into Patagonia; and little farther is known of the

geology of that country. Round Buenos Ayres the upper soil is chiefly of a light nature, approaching to marl, covering a stiff clay subsoil, which the natives call *fosca*.

Immense advantages in the way of trade are already connected with, and still more are promised by, this stream. In fifteen days vessels can proceed up the Paraná and Paraguay as far as Asuncion, where the river is a mile and a half in breadth. The back voyage nearly occupies as much time, as, for several degrees of latitude, the fall in the river does not exceed one foot in a thousand. The course of the river Uruguay is also very extended, but, on account of numerous falls, it would not afford the same facilities to navigation as the Paraguay. A branch of it, the Rio Negro, may be navigated about forty miles from its junction.

The Tercero, which runs into the Paraná under the name of the Carcaranal, might be rendered navigable at a moderate expense, and would furnish an outlet from Cordova, San Jago, and the provinces of Mendoza and San Juan. It rises in the mountains to the west of Cordova, and pursues an easterly course, leaving that city about thirty leagues to the north. It was surveyed as far back as the year 1811, with a view to this object, and the report was favorable. It is remarkable, that not one of the many streams which descend from the Cordillera, west of Buenos Ayres, reaches the sea. They spread over so large a surface of flat country, that they either become evaporated by heat, or form lakes of small dimensions. In the Pampas, the want of water is often severely felt. This flatness of the country also precludes the probability of springs; the wells of Buenos Ayres are obliged to be dug of great depth, and perforate the clay bed.

The climate is remarkably fine and healthy. During the summer months, the general range of the thermometer is from 75° to 84° of Fah. On the 21st of February, 1821, the mercury stood for many hours at 91° in the shade. The mean temperature of the three summer months of 1822, was 71° 9'. In winter the thermometer varies from 55° to 60°. Blasts from the Cordilleras will sometimes sweep over the country, and cause the mercury to fall in an extraordinary way. These blasts will strike the arm, or any other exposed part of the body, and produce a numbness, which sometimes remains for several days. Heavy rains fall in July, August, and September. The rains during the summer are extremely irregular, they have the character of thunder-showers; hail-storms at this period of the year are common. These storms are frequently attended with the most fatal consequences. In one of them, which happened in the year 1793, the lightning struck the town of Buenos Ayres in thirty-seven different places, and killed nineteen persons.

The most common disease in the capital and its neighbourhood is consumption (arising it is supposed from the chilling gusts already named), bowel complaint, and gout; but the latter is not very frequent. In the country, disease, even in the swampy districts, is hardly known. The small pox has appeared in the four provinces, but vaccination has almost exterminated it. The

white inhabitants generally reach a good old age, more particularly the females, who seem to possess strong constitutions in very advanced years.

The Pampas are covered with immense efflorescences of salt, and formerly a considerable party of salt-collectors used to leave the capital about the month of September, with much ceremony, to obtain that article after the waters had subsided and deposited it on the surface. It was very impure, and even found unfit for the preservation of jerked beef, making it hard and of bad flavor. A small traffic in bags of salt is still carried on with the Indians, but this is said to be collected from the lakes, being regularly crystallised in cubes. The domestic consumption of salt is very limited.

The former vice-royalty of Buenos Ayres was rich in the silver mines of Potosi, La Paz, and others long celebrated in Europe. Previous to the separation of the provinces, the mine of Famatina in the valley of the same name, to the north of San Juan, was also within the jurisdiction of Buenos Ayres. It was singularly rich: the silver being, according to the Spanish phrase, *chiselled* out of the gangue, which was a carbonate of lime. And, in 1814, some English merchants entertained an idea of renting it; but upon mature reflection, considering the country in too unsettled a state, they prudently relinquished their plan. The province, at present, is singularly deficient in mineral productions.

It is also almost entirely destitute of timber. One of the few indigenous trees is the umbú, but this is only found in the neighbourhood of the capital; while some species of cactus, the cardon or thistle with blue flowers, and a few more, constitute the native vegetable productions. The Spaniards introduced the olive and the hard peach with some success; they grow quickly, particularly where a little shelter is afforded by the taller trees from the bleak winds that sweep the surface of the country; the cherry tree is also common, but has never been known to produce any fruit, the blossoms being cut off by the wind. The sauce, or willow, is met with on the banks of the Canada. Grasses thrive; and the apple and melon are abundant, but not fine. Most of the vegetables of Europe have been cultivated with success, but their use is confined to Europeans; for the Gauchos, or people of color, view them with eyes of ridicule, and consider a man who would eat them as little superior to the beasts. Gourds are the only edible plants with them. The government has lately turned its attention to the formation of public forest-plantations, which furnish young plants to cultivators at a moderate price; in a few years it is expected they will become a source of considerable wealth to the state. The islands in the Parana abound in indigenous vegetation: and with the trefoil and cardon of the immense plains of Buenos Ayres, its stormy breezes evidently agree.

The species of quadrupeds are not numerous, nor peculiar: the quantity of cattle it is well known is immense, though since the revolution it has been much diminished. Horses also are bred by thousands. In the neighbourhood of the capital, a curious little animal is also found in great numbers, the *biscachia*, *lepus fiscan*. It

is not unlike our rabbit in shape and size, it burrows and surrounds its hole with abundance of bones: an owl is said generally to be hovering near. The armadillo is common in the Pampas, a small species of unpleasant smelling deer, and the ounce.

The nandu, (South American ostrich) and swan, are also found in considerable numbers. The former is about half the size of the African species, it runs very fast, and is taken by the Gauchos with balls of stone attached to a leather thong, which they generally throw round its neck. Several females, it is said, lay their eggs in one nest, and the male hatches them. The swan is a most majestic and beautifully shaped bird; the body is perfectly white, and the head and part of the neck black. A considerable trade is carried on in its plumage and skin. It is taken by being followed into the water and entangled by a leather thong, in the same manner as the ostrich. There are two kinds of partridges here; the one small, and similar to the quail of Europe, and the other considerably larger. They are taken in various ways. The more usual method is that of galloping round the covey, continually fixing the eyes on them, and, by closing the circle, they at last allow themselves to be taken up by a noose at the end of a stick. It is said that they subsist on animal food. On the banks of the rivers great variety of water-fowl subsist on the fish. In the city the mosquito is common, but not so troublesome as in some other parts of South America. Fleas abound; and seem, as Dobrizhoffer says, to live in the grass, for on lying down in some places, the body becomes covered with them. Reptiles are not common.

Bones of the *Megatherium* have been found here, and an almost entire skeleton was sent home by the viceroy in 1789. It was found on the shores of the Lugan, about fifteen leagues from Buenos Ayres. In the same direction, a soldier found a tooth within the last few years.

The larger farms are chiefly occupied with cattle and horses: of the latter 6000 head have been sometimes owned by one breeder, besides a due proportion of horned cattle. The grazing grounds are many miles in circumference, and the cattle in excellent condition. Horses cannot now be said to be found absolutely wild; but, prior to the revolution, public officers went annually round the country and seized all unmarked cattle for the king: it has therefore been the custom to mark them early, and for a purchaser to countermark them, or they may be at any time reclaimed. Such is the abundance of these animals that the greater part are reared only for their hides. In Buenos Ayres, a superior horse will sometimes sell for eighteen or twenty dollars; but if purchased in the country, at a distance from a market, not above four or five. In 1821 the government paid, for the army, at the rate of three dollars per horse. Mules are little attended to in this province, though in the neighbourhood, at Cordova and Mendoza, they are a chief object of commerce. The horned cattle are so numerous, and meat so cheap, that a whole ox may be purchased for three or four dollars at any time; the hide alone being worth three and

a-half. So abundant is flesh meat, that the domestic poultry are said to be fed with it. But the late civil troubles have affected no feature of the country more than this. Their numbers, according to Mr. Caldeleugh are diminished since the revolution full one-half. M. Rivadavia, one of the ablest ministers of this republican government, observing this, has recently caused a decree to pass the house of representatives, prohibiting any cows to be slaughtered, excepting in those districts which approached the Indian frontier, and where, in case of sudden irruption, it would be found impossible to drive them off. 'Should the country,' says our traveller, 'remain quiet for any length of time, and recover from the effects of devastation committed by the various chiefs and by the Indians, there can be no doubt, with such rich pasture, the number of cattle will reach its former extraordinary limits.'

Wheat, which was formerly obliged to be imported, now flourishes here best of any grain; but a good deal of barley is grown. The former is exported in considerable quantities up the Paraná and to Brasil. It has a small bearded grain, and is full of flour. There are two crops annually, in September and February. A temporary enclosure being made, the earth is raised with a rude plough, or the bone of an ox, and thinly sprinkled with seed. Threshing is performed by placing the wheat in an enclosure, and forcing a number of horses to gallop over it. Indian corn is cultivated in two varieties, the one with the grain perfectly white and tender; the other of a deep yellow, and much harder. The system of agriculture is on the whole wretched, and in nothing may the advantages of peace and closer intercourse with enlightened nations be expected to make a more rapid improvement. Insects and heavy rains often destroy immense crops.

The poncho, an oblong piece of cloth, with a hole in the middle, for the head, is the common dress of the lower classes, and a principal article of manufacture throughout the province. To this if we add a few Indian articles, made from hides and ostrich feathers, some coarse woollen cloths, and cotton goods, we shall have enumerated the only manufactures worth naming. But the poncho is a superior article in point of texture. The chief articles of export are hides, tallow, horns, hair, jerked beef, wool, Vicuna wool (for hat making), Chinchilli and Neutre skins. 957,600 horse and cow hides, arrived in England alone in the year 1822. Until 1816 the chief article of internal trade, was the Paraguay yerba, or tea, of which in 1814, 20,000 bales, worth at least a million sterling, came down the river. It is as universally drunk here as tea in England; but of late the dictator of Paraguay has prohibited its leaving that country. The method of preparing it is to put a small quantity of the leaves into a gourd, or cup, in which is placed a reed, or silver tube, called bombilla; hot water is then poured on it, and the infusion is sucked through the tube. Sugar is generally mixed with it, and it possesses excellent stomachic qualities. On leaving the country, travellers miss it exceedingly. An inferior kind called the palo, or Portuguese yerba is also used. Little attention has

as yet been paid to the state of the roads, which extend but a short distance in any regular way into the interior. They are traversed either by single mules or waggons; the wheels of which, in order to pass through the pantanos, or sloughs, are of immense dimensions. They travel together in numbers, with one for a conductor, and his family, and traverse the plains to the shores of the Pacific.

The commerce of this country has fluctuated a good deal since the revolution. In the year ending the fifth of January, 1817, the English merchants shipped to Buenos Ayres, goods to the value of £388,487; while in the year ending January the 5th, 1823, their value was £1,164,745, showing an unprecedented increase. During the year 1822, 167 English vessels sailed from various ports for Buenos Ayres, carrying thither every description of manufactured goods, beer, &c. In 1814 there were 20,000 tons of shipping employed by Buenos Ayres; but such was the distressed state of the country during the years 1819 and 1820, that the amount sunk again as low as 8,000 tons. From that period the increase has been steady. It should be observed that our commerce with Buenos Ayres far exceeds that of any other nation.

The following exhibits a picture of the trade of the port of Buenos Ayres at a very recent period:—

I. An Account of Vessels which have arrived in the Port of Buenos Ayres.

1823.	Number.	Nations.	Tons.
January.	9	Belonging to the Province	424
	10	English	1574
	5	North-Americans	984
	4	Brasilians	463

	1 Dutch		150
	31 vessels.		3515
Total 93 vessels.			13,914

The government is republican and representative. It may be said, after many changes, to have taken its present form in August, 1821. At this period the chamber of representatives was declared extraordinary and constituent, and made the following regulations:—It was decreed that the number of representatives for the city and the country should be doubled, and that one should be added for Patagonia, thus making the number forty-seven. Secondly, That at the commencement of each session, half of the members should go out, and fresh elections take place. Thirdly, That no members should receive pay from government. And lastly, That a president and vice-president should be chosen in turn annually. At first the distinction of deputy was not an honor much sought for: it was an elevation to what appeared a dangerous height, and from which men might be precipitated, they knew not how soon: such little confidence could then be put in the stability of the government. At the last election this feeling had considerably worn away, and the electors and candidates seemed aware of that distinction which, in all countries, where a proper feeling exists, is viewed with eager eyes. The sessions of the chamber commence about May or June, and last until December, when it is prorogued on account of the summer heats. The style of the chief executive officer of the state now is, Governor and Captain General of the Province of Buenos Ayres.

All the comforts of the common people here are concentrated in their abundant animal food, and their yerba matté: drink has very little of their attention. The poncho before mentioned covers the shoulders, and the skin of the hind leg of a horse produces for the man an elegant natural

boot: the addition of immense spurs, and a large knife at the girdle, completes his dress. On particular occasions his drawers are ornamented about the knees. The better classes adopt the Spanish cloak; and the ladies the French or English costume. The bull fights, once so frequent, have been discouraged by the new authorities; a license must be procured for every exhibition, and the animal, for we know not what reason, be deprived previously of his horns.

Horses are the great delight and common possession of all classes. On the trappings of his steed the Buenos Ayrean spends what the beaux of other countries bestow on their own dress. He is ever on horseback, and could not think of crossing a street on foot: in the river the nets are drawn from the saddle; the common bather plunges from his horse, and swims round it; and the beggar at the corner of the street stoops mounted from his horse, and asks your charity!

The greatest general defect of character here is indolence, which pervades all ranks. To sit in a pulperia, or spirit shop, and play at some game which requires no personal exertion—to drink as fortune becomes unfavorable—and, in a fit of passion, to stab the more fortunate—is no uncommon way of spending the day among the lowest of the inhabitants. Crosses about the doors of these places, and in various other situations, attest the fatal quarrels which have thus taken place. The poncho at the moment of irritation is wrapped round the left arm, and the knife flourishes in the right. No people are more dexterous with this weapon, and though fortunately few of these disputes, in comparison with their number, end fatally, when they mean to kill they almost uniformly pierce the heart. To the credit of the new legislators, knives, swords, and other weapons of the kind (*armas blancas*), are of late forbidden to be carried about the person; and heavy licences are imposed to decrease the number of pulperias.

'Deliberate murder, however,' says Mr. Caldecleugh, 'rarely occurs. The disposition of the people is decidedly good, and their honesty has never been called in question. Industry is all that is wanting. The man attends to the horse, and will take charge of nothing else. The wife is the slave, and has to exercise her reflecting faculties as well as her hands for the husband. The cow is placed under her care; she milks what is required for the family and no more, butter and cheese she is little acquainted with. On entering their huts the woman puts the stool or the head of an ox for a seat, but the husband never rises: he is pleased with the visit of the stranger, but would cease to enjoy it if it cost him the least bodily exertion. The visitor may proceed to the hearth and use the small copper vessel in which the water is boiled for the mattés; he may even take the meat off the wooden spit—but he must do all this himself; to ask the gaucho for any exertion would be to run the risk of displeasure, and he would after all only call to his wife, without turning his head. Nothing excites their surprise more than to see a foreigner bustling about his own baggage, and looking after every thing

himself. Pity seems the prevailing feeling. This is the character of the gaucho round Buenos Ayres, which few foreigners had a better opportunity of witnessing than myself, considering the shortness of my residence in the country. Most of their faults must be deduced from their mode of life. They are probably in the employ of men who own large estancias, or grazing farms, who allow them their subsistence, and little more, and whose service they leave, and move to another part of the country without difficulty or even notice. They consequently acquire wandering and frequently predatory habits; and it is not easy in the pampas to exercise the law with vigor. The various commotions in the country have tended much to give the lower classes a distaste to a regular life and industrious habits. Still the demoralisation is not nearly to that extent which all these causes might have produced; and upon the whole I cannot help thinking favorably of the Buenos Ayrean. He is free from deceit—would be most obliging were it not for his indolence—and most amiable if he had the slightest command over his passions.

In 1821 the attention of the new government was first directed to its present plan of finance, principally by a Mr. Wylde, an Englishman, who drew up several papers and projects for the re-modelling of the custom-house. After this the new tariff made its appearance. It is dated 21st August, and enjoins, that quicksilver, machines of every description, agricultural implements, scientific instruments, prints, statues, wool, skins, watches, trinkets, woods and articles for manufactures, shall pay five per cent. of custom-house duties: that arms, powder, silk rough and manufactured, shall pay ten per cent.: all other articles not included in the above, fifteen per cent.; excepting sugar (Chinese), coffee, cocoa, and yerba matté, which are to pay twenty per cent.; and carriages, furniture, saddles, wines and liquors of all sorts, which are to pay twenty-five per cent. The export duties are as follow: one real on each ox hide, half a real on horse or mule hides, one per cent. on gold in coin, two per cent. if worked; three per cent. on silver in coin, and four per cent. if worked or in pina; productions of the country four per cent.; grain and flour if exported in national vessels, and all manufactures of the country, and hair, free from duty; yerba matté imported by land to pay ten per cent. The new tariff at once and decidedly improved the revenue. Previous to this the taxes levied were as numerous and oppressive as the mode of gathering them was irregular and capricious. The alcabala, a duty of three, four, or five per cent. on all sale and resale, was one that created most discontent, and which has been abolished by all the new governments, except that of Paraguay. But the tonnage dues, sales of papal bulls, tithes, and the royal fifths on gold and silver, were all severely felt.

In 1812 the tithes were abolished, and the existing regulations for the church published; the dignitaries of which are composed of a dean, with a salary of 2000 dollars, and four presbyters, with 1600 dollars of salary. The cloistered clergy have been diminished by law, and no one is permitted to take the vows until he is twenty-

five years of age; even then an express license from government was required. The pope, we are sorry to add, being solicited in 1815, finally to arrange the ecclesiastical affairs of the province, declined the task. The attendance on the forms of religion is considerable, but rather on the decrease: heretics are by no means underrated in return for the lessons of civil liberty which they have taught here; and a great and uniform spirit of toleration is abroad.

The inhabitants of this province, who do not exceed 170,000, are divided into the Old Spaniards and European residents, the Creoles and mixed races, the native tribes and slaves. A census, taken in 1821, was, for some reason not ascertained, never published. The population has certainly decreased of late years, and this may have furnished one motive for suppressing the authorised account. The Pampa Indians are said to be on the increase: they are a very bold and acute race. Of late their hostile attacks on Buenos Ayres have been frequent; and, in 1822, they came so often close up to the city, that the governor sallied forth and drove them back: such, however, is the nature of the country, that a few hours place an enemy that has fled, close on the heels of a retiring conqueror. The eyesight of these tribes is described as being peculiarly strong. On the borders of their territories, they are said to have a platform elevated about twenty feet, on which a lad constantly stands and examines the horizon with his eye; and by this means, time is given them either to escape or, prepare the means of defence. A line of forts has been lately drawn to the south-east of Buenos Ayres, from a spot called Tandil, to the Sierra de Ventana, to suppress these incursions.

Formerly, when the native tribes were supposed to be diminishing in their numbers, an importation of negroes was commenced by the English, French, and Dutch, who had settlements on the coast of Africa. The number imported was never great, being but just sufficient to supply the city. Buenos Ayres and the neighbouring states are now enjoying the advantages of this; and by it alone have a decided superiority over the Brazilians. During the first years of the revolution, when a great deficiency of men for the armies was felt, the state purchased several thousands of negroes from their owners: these purchases were continued until 1822, when it was determined that no more public money should be thus spent. And it was nobly decreed at the meeting of the National Congress, in January, 1813, that all children of slaves born after that day should be free. The feelings of the people, we are happy to add, are averse from any recommencement of the vile traffic in slaves.

BUENOS AYRES, the capital of the foregoing province, stands in south latitude $34^{\circ} 36' 28''$, about 200 miles from the mouth of the La Plata, and where it is about thirty miles wide. It was founded in the year 1535. Its general appearance is neat, though not imposing. It is very regularly built, on a bank considerably elevated above the level of the water, as you approach it from the sea, and occupies a large space of ground. The steeples of the various churches

and convents, as they rise successively to view, add much to its appearance. The fort occupies the centre of the side next the river, commanding on one side the landing, and the parade or great square, on the other. The port is subject to much inconvenience from the difficult navigation of the La Plata, and the want of a commodious harbour near the town. No vessels of large burden can approach nearer than the bay of Barragan, which is seven leagues distant. But, while the northern states send down here their tobacco and cotton, and San Juan and Mendoza their wines and brandies, which, together, form an important trade with Great Britain, although the Paraguay yerba should still be withheld, and dissension suspend the intercourse with the rich mineral district of Peru, Buenos Ayres will ever take the lead among her neighbours as a commercial port of deposit.

The public buildings are few, and scarcely worth distinguishing. The unfinished cathedral, the Dominican church, the Franciscan, and that of St. Nicholas, together with the new theatre and the state-house, are the most remarkable. The streets are wide, paved at the side, and tolerably clean. The houses are covered with a flat roof, called *azotea*, and have no upper stories; but almost all of them have gardens, and are surrounded with balconies of lattice-work, containing shrubs and flowers. All the older ones are of mud, but, at a comparatively modern date, brick and lime were brought into use here by the Jesuits. In the centre of most houses is a court, containing a tank for water, that from the river being considered prejudicial to health. Game, fish, and all other provisions, are plentiful in the market; but fowls are exceedingly scarce and dear. The population is taken at about 50,000.

Household furniture here is rarely handsome, or even what an Englishman would call comfortable; but the inhabitants are of a very domestic and contented disposition. Families of respectability have night after night their *tertulia*, or evening party, which includes a certain number of persons in the habit of frequenting the house; and at which strangers are received with great kindness and urbanity. It is not only wholly under the direction of the female part of the family, but the gentlemen of the house generally form part of another *tertulia*, or are in the coffee-houses talking politics. The amusements are Spanish country dances of a superior kind; waltzing, minuets, and a dance accompanied with words, in which the lady first advances, and sings, '*cielito, mi cielito*,' thence termed *cielito*, or little heaven. Refreshments of all kinds are offered; music also is introduced, and many of the ladies are superior performers. The party breaks up about eleven o'clock.

Music is, throughout the province, cultivated with some success, and it is the only one of the fine arts of which the remark can be made. In 1778 orders came out from the home government for the establishment of an university here, on the plan of that of Lima: but until 1819 the project remained dormant; it was then partially agitated, but the public disturbances in that year, and in 1820, put a stop to the plan. On the 9th August, 1821, however, a decree came out

for the formation of an university, with liberal provision for the payment of professors, &c. The Spanish spoken in Buenos Ayres is colonial, or rather provincial; many of the words in common use being vilely altered from their true pronunciation.

The public library, which originally consisted of about 12,000 volumes, and was founded principally by English merchants, has been much encouraged and increased by the government. It is under very good regulations, and by the printed returns, it appears that between the 21st March, and 31st December, 1822, it was visited by 2,260 persons, of whom 369 were foreigners. Books are exempted from all port dues and duties. There are, besides the *Registro Oficial*, several other gazettes published; such as the *Argos* and the *Centinela*, and all are well conducted.

The various courts of justice of late have been entirely remodelled, the salaries of the judges raised; and monthly lists of all the cases decided, or in progress, have been regularly published. The establishment at present consists of four counsellors of justice, at a salary of 2,000 dollars. The *consulado* takes cognizance of questions purely commercial, and of the enforcement of debts: juries are not as yet introduced, but the constitution has provided for this being in due time effected. The *cabildo*, or municipal body, has a charge over the city; and one of the *alcaldes* of it is termed 'the defender of the poor.' Each party to a civil action pays his own costs. The crimes that are punished with death are high treason, murder and robbery; and of late the military have been rendered amenable to the civil law.

We have traced the events of the revolution in the article SOUTH AMERICA. At present there seems to be great and unhappy jealousies between the original parties to the confederation, entitled the United Provinces; and since 1822 they have only, in reality, connected Santa Fé, Entre Rios, Corrientes, and Buenos Ayres, who are conjoined by a treaty, offensive and defensive, signed on the 8th February of the same year. And, although in the July preceeding, the court of Rio de Janeiro thought proper to recognise the state of Buenos Ayres; as at that period the incorporation of Montevideo and the Banda Oriental with the Brasil empire took place, the act was considered as proceeding rather from a desire to stifle the complaints of this republic, than from any feeling of kindness or liberality towards it. War, long threatened, has recently broken out between Brasil and Buenos Ayres. The recognition of Buenos Ayres by the government of the United States of North America, and by Great Britain, was viewed in a different manner, and hailed with the greatest enthusiasm.

We hope to have to record, under the article UNITED PROVINCES OF SOUTH AMERICA, the more entire final union of these rising and most interesting states.

BUEREN, a town of Holland, on the south of the Rhine, which was the general rendezvous of the British troops in December 1794 and January 1795. It is situated north-east from Leerdam.

BUET, a mountain in the department of Mont Blanc, 10,106 feet high.

BUFALMACCO, or **BONAMICO**, an Italian painter; the first who put labels to the mouths of his figures, with sentences; since followed by many bad masters, but most frequently and successfully in caricatura engravings. When a boy he was a scholar of Andrew Tasi, who was accustomed to rise before light to his painting; but early rising having no charms for Bufalmacco, he resolved to put in practice the following expedient, to detain his master in bed till daylight. Having provided twenty or thirty black-beetles, he fastened small pieces of lighted wax taper on their backs, and sent them thus equipped into his master's room through a small hole under the door. This mysterious procession of moving light so alarmed the old man that he prayed and recommended his soul to mercy, and hid his face under the bed clothes. In the morning he told Bufalmacco he had seen ten thousand devils, and that his thoughts were so disturbed he could not rise to pursue his profession. On the succeeding night Bufalmacco diminished the number of the beetles; but the repetition produced the same effect; and for the future Tasi always remained in bed till daylight. Being engaged to paint a picture of a Madonna and child, for a citizen of Florence, when the painting was finished his employer disputed the payment, on which Bufalmacco went away and prepared some water-colors, with which, early the next morning, he effaced the child, and painted a young bear in its stead, on the lap of the virgin; which excited so much ridicule against the employer, that he supplicated earnestly to have the work restored to its original condition; and, when he had paid the stipulated sum, Bufalmacco washed away the additional bear with a wet sponge. He died in 1340.

BUFF', *v. & n.* } Swed. *boff*, Bel. *boff*,
BUFFET, *v. & n.* } Dan. *puff*, Fr. *bouffe*, barb.
BUFFETER, } Lat. *buffo*, πᾶω, Lat. *pavio*,
BUFFETING. } a blow or stroke. The verb is derived from the noun, to beat, to cuff, to box on the ear. Puff is a sound as well as a blow; and Chaucer has buf, an extra part of speech, in which he attempts to spell the inarticulate noise which escapes in eructation.

— of the foule spitting that met spitten in his face, of the *buffetes* that then gave him.

Chaucer. *The Persones Tale.*

My feeble vessel, crazed and crackt,
 Through thy strong *buffets* and outrageous blows,
 Cannot endure, but needs it must be wrackt
 On the rough rocks or on the sandy shallows.

Spenser.

If I might *buffet* for my love, I could lay on like a butcher.

Shakspeare. *Henry V.*

Our ears are cudgelled; not a word of his
 But *buffets* better than a fist of France. *Id.*

The torrent roared, and we did *buffet* it
 With lusty sinews; throwing it aside. *Id.*

O, I could divide myself, and go to *buffets*, for moving such a dish of skimmed milk with so honourable an action. *Id.*

Go, baffled coward, lest I run upon thee,
 And with one *buffet* lay thy structure low. *Milton.*

There was a shock,
 To have *buff'd* out the blood
 From aught but a block. *Ben Jonson*
 Disguised in all the masks of night,
 We left our champion on his flight,
 At blindman's *buff*, to grope his way,
 In equal fear of night and day.

Butler's *Hudibras*.

Instantly I plunged into the sea,
 And *buffeting* the billows to her rescue,
 Redeemed her life with half the loss of mine.

Otway.

BUFF', *n.* From be off, as doff, for do off. A put off; a refusal. He would neither buff nor stay; he was undecided.

BUFF', *n. & adj.* } Lat. *bubulus*, Ital. *buf-*
BUFFALO, } *falo*, Fr. *buffle*, βαβυλος,
BUFFLE, } Buffalo is a kind of wild
BUFFLING. } bull; buff is leather made
BUFFLE-HEADED. } of the skin of that animal;
 buffle is applied to a human animal, dull, thick-headed, and stupid. Buff is used by some writers in the sense of naked; stripped to the skin.

A fiend, a fairy, pitiless and rough,
 A wolf, nay worse, a fellow all in buff.

Shakspeare.

Become the unworthy browse
 Of *buffaloes*, salt goats, and hungry cows.

Dryden.

A rosy chain of rheums, a visage rough,
 Deformed, unfeatured, and a skin of buff. *Id.*

Thy soul which, through thy hide of buff,
 Scarce glimmers like a dying snuff. *Swift.*

This was the utter ruin of that poor, angry, *buffling*, well-meaning mortal, Pistorides, who lies equally under the contempt of both parties. *Id.*

Were I to taunt a *buffalo* with this
 Cloven foot of thine, or the swift dromedary
 With thy sublime humps, the animals
 Would revel in the compliment.

Byron's *Deformed Transformed*.

BUFF, in anatomy, signifies that size, viscid, tough mass, which forms on the upper surface of the blood; and which physicians call the coagulable lymph. See **BLOOD**.

BUFFET', *n. s.* Fr. *buffet*. A kind of cupboard; or set of shelves, where plate is set out to show, in a room of entertainment.

The rich *buffet* well-coloured serpents grace,
 And gaping Tritons spew to wash your face. *Pope.*

BUFET was anciently a little apartment, separated from the rest of the room by slender wooden columns, for the disposing of china, glass ware, &c. It now properly implies a large table in a dining-room, called also a side-board, for the plate, glasses, bottles, basins, &c. to be placed on, as well for the service of the table as for magnificence. In houses of citizens of distinction in France, the buffet is a detached room, decorated with pictures relative to the subject, with fountains, cisterns, and vases. It is commonly faced with marble or bronze.

BUFFIER (Claude, a French writer, who was born in 1661, became a jesuit in 1679, and died at Paris in 1737. He wrote many works, which show deep penetration and accurate judgment. The principal is, *Un Cours des Sciences*, &c. A Course of Sciences, upon principles new and simple, in order to form the Language, the Understanding, and the Heart. 1732, folio.

BUFFON (George Lewis le Clerc, Count de), the celebrated naturalist, was born at Montbard, in Burgundy, the 7th of September, 1707: his father was a counsellor of the parliament of Dijon, who lived to the age of ninety-three; and his family were remarkable for longevity. His mother's maiden name was Merlin. Buffon studied the law at Dijon; and his robust constitution, his eager activity, his acuteness and his penetration, gave early promise of success in whatever should be finally the pursuit of his choice. His early passion was for the mathematics, and he was never without Euclid in his pocket. At the age of twenty he is said to have discovered the binomial theorem, without knowing that he had been anticipated by Newton; and when at a future period of his life he was asked by M. Hérault de Sechelle why he had never published this fact, he replied, 'because nobody was obliged to believe it.' At the same period the young lord Kingston coming to Dijon, Buffon accompanied him and his tutor into Italy, where, amidst the choicest remains of art, and the most interesting monuments of antiquity, he was attracted only by those charms of nature which he was destined hereafter to pourtray. He lingered in the valleys, and would pass whole hours contemplating the beauties of the evening sky of this delightful region; or be the leader of a mountain expedition, and industriously explore the torrents of lava, ancient and modern, or the bowels of a mine; but statues and paintings had no attractions for him; the most exquisite works of human skill, nor the most celebrated memorials of Roman greatness.—Natural history was the constant subject of his meditation and speculations—the cherished idol of his heart.

In his twenty-second year he succeeded, through his mother, to an ample fortune, and, returning to France, settled for a short time at Angers; but having here quarrelled with an English gentleman, and wounded him in a duel, he returned to Paris, and passed from thence to England. He stayed in this country but three months, and immediately on his return home entered upon that remarkable career of close and unwearyed study of which, in his rank of life and with his relish for society, we have scarcely another example. His first published work was a translation of Hales' *Vegetable Statics*, which appeared in 1735, and was followed in 1740 by a translation, from the Latin, of Newton's *Fluxions*. The prefaces to these translations were written in the same polished and noble style that distinguishes all his subsequent publications. The strength of timber was a subject that now engaged his attention; and he recommends that, for securing the consistency of the alburnum, the bark of a tree should be stripped from the feet at the time of the sap, when it should be allowed to dry and wither. He also investigated the ancient account of the burning mirrors of Archimedes, and endeavoured to construct an instrument approaching in its efficacy to the celebrated inventions of the Syracusan sage. He proposed, in the year 1748, a lamp à échelons, which was executed about

thirty years afterwards by the abbé Rochon, and of which the reader will find a description in our article *BURNING GLASSES*.

In 1739 he obtained the appointment of intendant of the royal garden and cabinet at Paris, the treasures of which were considerably augmented under his management, while the situation afforded him great facilities for the prosecution of his researches into every department of natural history. He now, therefore, arranged the materials and commenced the composition of his great work *Histoire Naturelle, générale et particulière*. The first portion, containing the Theory of the Earth, and the History of Man and Quadrupeds, in 15 vols. 4to. was begun in 1749 and completed in 1767. This was followed by seven supplemental volumes; after which appeared the History of Birds, 9 vols., the History of Minerals, 5 vols., the History of Oviparous Animals and Serpents, 2 vols., which, with an Atlas, 1 vol. completes the splendid original edition. In the anatomical details he was assisted by M. Daubenton, and in the history of birds, it is said, by M. Gueneau de Montbeillard; the rest is a monument of his own genius and industry. During its progress, the author (in 1743) was admitted a member of the French Academy, and delivered on this occasion a discourse, entitled, *Philosophical Remarks upon Style*, which is regarded as one of the most elegant of his compositions. In 1752 he married Mademoiselle de Saint Belin, by whom he had a son, who afterwards fell in the revolution. This young man delighted his father by the erection of a column to his honor in the gardens of Montbard, having this inscription:—

Excelsæ turri humilis columna
Parenti suo filii Buffon, 1785.

Buffon burst into tears on seeing it, and said—'Son, this will do you honor.' When this unfortunate gentleman was led to the scaffold by the minions of the revolutionary tribunal, he exclaimed with great dignity and composure 'My name is Buffon.' On the publication of his *Natural History*, the freedom, or rather absence, of religious sentiments, which appears in his works, having excited the indignation of the Sorbonne, he had the good sense to endeavour to dissipate their fears, by an explanation with which they were completely satisfied. France has done ample justice to this great work in her numerous and splendid editions of it; and into every considerable language of Europe it has been repeatedly translated. Louis XIV. to mark his sense of its merits, erected the estate of Buffon into a comté, and granted him the smaller customs; he even expressed a desire for his personal acquaintance, invited him to Fontainebleau, where he frequently consulted him respecting the cultivation of wood, and offered him the administration of all the forests in his dominions, a situation which Buffon declined. Buffon's application to study is said to have been so great in early life, that when he frequented the evening parties of Paris, and did not return to Montbard till two in the morning, he would be called at five, and ordered his servant to drag him out upon the floor if he showed the least unwilling-

ness to rise. When dressed, he dictated letters, and regulated his domestic affairs; and at six o'clock entered upon his studies at the pavilion, called the tower of St. Louis. This was situated at a remote part of his garden, about a furlong from the house; the only furniture which it contained being a large wooden secretary and a single arm-chair. Neither books nor pictures relieved the naked appearance of the apartment. Its entrance was secured by green folding doors, the walls were painted green, and the interior, from the elevation of the roof, had the appearance of a chapel. Within was another cabinet, where Buffon resided the greater part of the year, on account of the coldness of the outer apartment, and here he composed the greater part of his works. It was a small square building, situated on the side of a terrace, and ornamented with drawings of birds and beasts. Prince Henry of Prussia called it the cradle of natural history; and Rousseau, before he entered it, was accustomed, it is said, to fall on his knees and kiss the threshold. At nine o'clock Buffon usually paused for an hour; and his breakfast, which consisted of a piece of bread and two glasses of wine, was brought to the pavilion. Having passed two hours after breakfast in study he returned to his house. To his dinner he devoted a considerable time, and indulged in all the usual gaieties of the table. After dinner he slept an hour, then took a solitary walk, and during the rest of the evening either conversed with his family or guests, or sat at his desk examining papers. At nine he went to bed: and in this uniform manner spent not less than fifty years of his life. His labors were even continued to within a few hours of his decease, which took place 16th April, 1788, in the eighty-first year of his age.

The eulogies that have been pronounced upon the count de Buffon are numerous; and warm enough to have satisfied even his own vanity. The sustained dignity of his style, and the general accuracy and brilliancy of his descriptions, have been universally admitted: as a minister of the temple of nature he is always instructive and engaging; as a philosopher often profound. But his great work is throughout deficient in what the Greeks called *μεθοδος*—scientific method. He arranges nothing upon principle: he has no principle. He groups, and accumulates, and notes marks of likeness; but he does not distinguish, nor analyse, nor observe the unity of nature. Nor are the shining qualities of his style, considering it a work for the perusal of young people, a sufficient recompense for its occasional licentiousness and needless indelicacies. This work is a singular epitome of his whole character. Here, too, was dignity, gaiety, and cleverness pervading all he said and did; and in his conversation he was brilliant, and often profound in his remarks. But the want of all moral principle was as obvious in his life as that of philosophic method in his writings: and we do not consider that the interests of philosophy are served by disguising this. He condescended to be a hypocrite in a diligent attention upon the external forms of that religion which in heart he detested, and against which his biographers record him to

have uttered many bitter sayings to his confidential friends: and to his wife, as to his God, he was for a series of years a constant infidel—'violating all the principles of morality,' as no illiberal modern writer characterises him, 'especially in his commerce with women.' His vanity, we are told, was great enough to allow him to say, 'The writings of eminent geniuses are few; they are only those of Newton, Bacon, Leibnitz, Montesquieu, and my own.'

BUFFONIA, in ornithology, a species of falco, the Cayenne ringtail of Latham. Color, cere blue; legs yellow; body dark brown above, red buff beneath; tail variegated with pale and dark brown. Found at Cayenne.

BUFFONIA, in botany, a genus of plants, class tetrandria, order digynia: cal. four-leaved: cor. petals four: pericarp. capsule, containing two seeds in one cell. There is but one species; a native of England.

BUFFOON, *v. & n.* Ital. *buffone*, Fr. *buffon*, Ital. *buffa*, *buffa*, seem to be Teut. *affen*, *beaffen*, to ape, to mimic; but Span. *momo*, *jofa*, *gofo*, *bifo*, are all perhaps from *Μῶμος*, Lolian *δομος*, which signified, indecency, scandal, obloquy, obscenity, and all such mirth as delighted the gods of the Greeks. In Lombardy, however, *bifo*, from Lat. *bucca*, signified the mouth, and was applied to those who made comic grimaces to excite laughter. The Italians believe it to be from the Lat. *bufo*, a toad, which in anger is said to puff and swell. A buffoon, Junius says, is a shrewd and crafty court-fool, a fool of pleasure, such as kings and great men love to entertain. The calling, however, is disreputable, and, like that of players in general, subjects its professors to the imputation of being rogues and vagabonds.

It is the nature of drolls and buffoons, to be insolent to those that will bear it, and slavish to others.

L'Estrange.

Where publick ministers encourage buffoonery, it is no wonder if buffoons set up for publick ministers. *Id.*

As Killigrew buffoons his master, they

Droll on their god, but a much duller way.

Marvell.

I'll wholly abandon all publick affairs,
And pass all my time with buffoons and players,
And saunter to Nelly when I should be at prayers.

Id.

A colony of French possess the court,
Pimps, priests, buffoons, in privy-chamber sport. *Id.*

And whilst it lasts, let buffoonery succeed,

To make us laugh; for never was more need.

Dryden.

Bombastry and buffoonery, by nature lofty and light, soar highest of all, and would be lost in the roof [of the theatre], if the prudent architect had not with much more foresight contrived for them a fourth place, called the twelpenny gallery, and there planted a suitable colony, who greedily intercept them on their passage.

Scribt.

Courage, in an ill-bred man, has the air, and escapes not the opinion, of brutality; learning becomes pedantry, and wit buffoonery.

Locke.

The bold buffoon, whenever they tread the green,
Their motion mimicks, but with jest obscene.

Garth.

BUTTOON is derived by Menage, after Salmasius, from *Buffo*; a name given to those who appeared on the Roman theatre with their cheeks

blown up; that, receiving blows thereon, they might make the greater noise, and set the people laughing. Rhodiginus and others make the origin of buffoonery more venerable; deriving it from a feast instituted in Attica by king Erechtheus, called buphonia. Buffoons are also denominated *scurræ*, *gelasiani*, *mimologi*, *ministelli*, *goliardi*, *joculatores*, &c. Their chief scenes were at the tables of great men. Gallienus never sat down to meat without a second table of buffoons by him; Tillemont also renders pantomimes by buffoons; in which sense he observes, the shows of the buffoons were taken away by Domitian, restored by Nerva, and finally abolished by Trajan.

BUFO, in entomology, a species of bombyx, found in Germany. The wings are yellow, with a broad brown band, and yellow spots.—Also a species of curculio, inhabiting Siberia. Color fuscous; wing-cases slightly reticulated, with a white stripe in the middle.

BUFO, in zoology, the specific name of a species of rana, commonly called, in English, the toad. The body is lurid and fuscous; back marked with tubercles; eyes red. The eye of the toad has always been noticed for its beauty. Toads have been often remarked by physiologists, as possessed of a capability of living for a long time without air or aliment. Of this the most astonishing instances are given by different authors. 'In the foot of an elm, of the bigness of a pretty corpulent man, three or four feet above the root, and exactly in the centre, has been found a live toad, middle-sized, but lean, and filling up the whole vacant space: no sooner was a passage opened, by splitting the wood, than it scuttled away very hastily: a more firm and sound elm never grew; so that the toad cannot be supposed to have got into it. The egg whence it was formed must, by some very singular accident, have been lodged in the tree at its first growth. There the creature had lived without air, feeding on the substance of the tree, and growing only as the tree grew.' This is attested by M. Hubert, professor of philosophy at Caen. Ambrose Paré, chief surgeon to Henry III. king of France, a sensible writer, relates the following fact, of which he was an eye-witness:—'Being,' says he, 'at my seat, near the village Meudon, and over-looking a quarryman, whom I had set to break some very large and hard stones, in the middle of one we found a huge toad, full of life, and without any visible aperture by which it could get there.' In the account of the proceedings of the Academy of Sciences at Paris, there are two or three accounts of the discovery of toads in the centres of elms, oaks, &c. which have been since repeatedly confirmed by observation. Observations of living toads, found in very hard and entire stones, occur in several authors, particularly Baptist Fulgosa, Doge of Genoa; the famous physicians, Agricola and Horstius, and Lord Verulam. An instance similar to these, of the truth of which we have no reason to doubt, was observed in this country in 1773; when a large toad was found in the middle of a piece of coal, having not the least visible crack or fissure. The toad appears to be confined exclusively to the European continent. It inhabits woods, gardens, fields, and

damp shady places, and frequently makes its way into cellars. In the early part of spring it retires to the waters, where it continues during the breeding season, and deposits its ova or spawn in the form of double necklace-like chains or strings of beautifully transparent gluten, and of the length of three or four feet, in each of which are disposed the ova in a continued double series throughout the whole length, having the appearance of so many small jet-black globules or beads. These globules are, in reality, no other than the tadpoles, and waiting for the period of their evolution, or hatching, which takes place in the space of about fourteen or fifteen days, when they break from the surrounding gluten, swim about in the water, and are nourished by various animalcules, gluten, leaves of aquatic plants, &c. When these have arrived at their full growth, the legs are formed, the tail gradually becomes obliterated, and the animals leave the water, and betake themselves to the surface of the ground. This generally happens early in the autumn. The notion of its being a poisonous animal has been opposed by Mr. Pennant, but it is a fact too generally known to admit of any question. Dogs, on seizing a toad, and carrying it for some little time in their mouth, will appear to be affected with a very slight swelling of the lips, accompanied by an increased evacuation of saliva; the mere effect of the slightly acrimonious fluid which the toad, on irritation, exudes from its skin, and which seems at least to be productive of no dangerous symptoms in such animals as happen to taste or swallow it. For a further account of this creature see the articles TOAD, and RANA.

BUFONITA, in natural history, the toad-stone. This has been received not only among the list of native stones by the generality of authors, but even has held a place among the gems, and is still worn in rings by some people; though undoubtedly it is an extraneous fossil. It was anciently believed that it was found in the head of an old toad; and that this animal voided it at the mouth on being put upon a red cloth. The general color of the bufonitæ is a deep dusky brown; but it varies greatly in this respect in several specimens, some of which are quite black, others of an extremely pale simple brown, a chestnut color, liver color, black gray, or whitish. The bufonitæ are usually found immersed in beds of stone, and there is now no doubt that they have originally been the petrified teeth of the *lupus piscis*, or wolf-fish, part of the jaw of the fish being sometimes found with the teeth petrified in it. The bufonitæ are said to be cordial and astringent: many other fanciful virtues are ascribed to them, which the present practice has rejected.

BUG', } Ital. *bozza*, *pozza*, Arm. *pug*,
BUG'GY, } Fr. *punaise*, from Lat. *puleo*. A
BUG'GINS. } stinking insect. In the following passage wings are erroneously ascribed to it.

Yet let me flap this *bug* with gilded wings,
This painted child of dirt, which stinks and stings.
Pope.

BUG', } Bug signifies primarily big, and
BUG'BEAR, } is applied to any ugly, monstrous
BUG'ANO. } object, that affrights children, both

of small and larger growth. In Gothic it is *bugg*, from *ugg*, in Saxon *oga*, terror. In Swedish *puke* means the devil, and in Icelandic it signifies demon; so that the general acception of the word bug is fear, terror, fright. Bugbear is a frightful object; from *bug*, terror, and *be ogre*, a frightener; a walking spectre, imagined to be seen: generally now used for a false terror to frighten babes.

Each trembling leaf and whistling wind they hear,
As ghastly *bug* their hair on end does rear,
Yet both do strive their fearfulness to feign.

Færie Queene.

Sir, spare your threats

The *bug* which you would fright me with, I seek.

Shakspeare.

Hast not slept to-night? would he not, naughty man, let it sleep? a *bugbear* take him.

Id.

Who would believe what strange *bugbears*

Mankind creates itself, of fears

That spring like fern, that insect weed,

Equivocally without seed.

Butler's Hudibras.

Such *bugbear* thoughts, once got into the tender minds of children, sink deep, so as not easily, if ever, to be got out again.

Locke.

To the world, no *bugbear* is so great,

As want of figure, and a small estate.

Pope.

BUG, in entomology. See **CIMEX**. For the destruction of the house-bug, or cimex lectularius, several methods have been tried, and several remedies proposed as perfect. The following recipe is the best with which we are acquainted: 'Mix one ounce of arsenic and one ounce of common smelling salts with one gallon of human urine, and diligently wash floors, bedsteads, &c. in it, until they disappear. Early in spring, even in February, the larvæ of these creatures begin to burst from the eggs; and it is at this season that attention is chiefly requisite. The bed ought to be stripped of all its furniture; which should be washed, and even boiled, if linen; if woollen, it should be hot-pressed. The bedstead should be taken to pieces, dusted, and washed with this mixture in the joints; for in those parts the females lay their eggs. Corrosive sublimate (hydrargyrus muriatus) and lard, has also been found efficacious, in the proportion of half an ounce of the former to six ounces of the latter. The sublimate should be first rubbed extremely fine in a marble mortar, adding a few drops of common oil, till its particles are minutely divided. The lard should then be added by little and little, till the whole is well mixed; and, lastly, as much more oil as will make the mixture of the consistence of a very thick paint.

BUGA MARBLE, in natural history, a name given by the Spaniards to a species of black marble, called by our artificers the Namur marble, and known among the ancient Romans by the name of marmor Luculleum. It is common in many parts of Europe, and is used by the Spaniards in medicine as well as in building; the powder of it being said to be an excellent styptic applied to fresh wounds.

BUGBANE, in botany. See **MENYANTHES**.

BUGEE, in zoology, a species of Indian monkey, very rare even in the Indies. It is about the size and color of a beaver, but its tail and claws are wholly of the monkey kind.

BUGELUGEY, in zoology, a large species of lizard, called by Clusius, and some others, *lascertus Indicus*. It grows to four feet long, and nine inches round; the tail is very long, and ends in an extremely slender point.

BUGEY, a ci-devant province of France, bounded on the east by Savoy, on the west by Bresse, on the south by Dauphiné, and on the north by Gex and Franche Comté. It was about forty miles long and twenty-five broad. It has many hills and rivers, which abound with trout and all sorts of game. Belley was the capital. It is now comprehended chiefly in the departments of the Ain and Cher.

BUGGASINES, buckrams made of calico.

BUGGE (Thomas Chevalier, a learned Danish astronomer, distinguished himself in a trigonometrical survey of the island of Zealand, undertaken in the middle of the last century, and in 1761 was sent to Drontheim to observe the transit of Venus, in conjunction with Maupertius and others who went to Lapland. In 1780 he superintended the re-erection of the royal observatory at Copenhagen; and shortly after went to France to assist the French philosophers in their new system of weights and measures. He published in 1800 an account of this journey. His work was translated into English, and published in one volume 12mo. He also wrote a Treatise on Mathematics, of which there is a German translation extant, and died at Copenhagen, January 1815, aged seventy-four.

BUGGENHAGH, in ichthyology, a species of cyprinus, having nineteen rays in the anal fin. The body is blackish above; compressed on the sides, with large silvery scales; white flesh. Found in the lakes of Sweden and Germany.

BUGGEIS, **BULGARII**, anciently signified a kind of heretics, otherwise called Paterini, Cathari, &c. The word is formed of the French Bougres, and that from Bougria or Bulgaria, the country where they chiefly appeared. Among other opinions, they held that men ought to believe no Scripture but the New Testament; that baptism was not necessary to infants; that husbands who conversed with their wives could not be saved; and that an oath was absolutely unlawful. They were strenuously refuted by Fr. Robert, a Dominican, surnamed the Bugger, as having formerly made profession of this heresy. They are mentioned by Matthew Paris, in the reign of Henry III.

BUGGERY, or Sodomy, is a sin against God and nature, first brought into England by the Lombards. As to its punishment, the voice of nature and of reason, and the express law of God (Levit. xx. 13, 14.) determines it to be capital. Our ancient law commanded such miscreants to be burnt to death; though Fleta says, they should be buried alive; either of which punishments was indifferently used for the crime among the ancient Goths. But now the general punishment of all felonies is the same, viz. hanging; and this offence, being in the times of popery only subject to ecclesiastical censures, was made felony without benefit of clergy, by stat. 25 Hen. VIII. c. 6, revived and confirmed by 5 Eliz. c. 17. The law is, that, if both parties are arrived at the years of discretion, agentes et consentientes

pari pæna plectantur, 'both are liable to the same punishment.'

BUGIE, a town of Egypt, situated on the west shore of the Red Sea, almost opposite to Ziden, the port town of Mecca, and about 110 miles west of it.

BUGINVILLÆA, in botany, a genus of plants; class octandria, order monogynia. Gen. char. cal. none: cor. tubular, permanent, four-toothed; eight filaments, inserted on the receptacle: germ. superior, oblong: pericarp one-seeded. Species, 1 B. spectabilis, a fine evergreen shrub growing in Brasil.

BUGGY. Goth. and Dan. *bugge*; a cradle; a large basket; a small wheeled carriage.

BUGLE, *n. s.* } From bugen, Sax. to bend,

BUGLEHORN. } Skinner; from *bucula*, Lat. a heifer, Junius; from *bugle*, the bonasus, Lye. A hunting horn. Chaucer uses it in the sense of a drinking vessel. Gloss. Urry derives it from *bucula cornu*; Gloss. to Anc. Scott. Po. explains *bougles* to mean a buffalo. I have been told that now, in some parts of the north, a bull is called a boogle.

Janus sits by the fire with double berd,
And drinketh of his *buglehorn* the wine
Before him slant braune of the tusked swine.

Chaucer's *Canterbury Tales*.

The king set a *buglehorn* to his mouthe,
And blese bothe loude and shrille;
And soone came lords, and soone came knights,
Fast ryding over the hille. *Old Song*.

Then took that squire an horny *bugle* small,
Which hung a down his side in twisted gold,
And tassels gay. *Faerie Queene*.

I will have a recheate winded in my forehead, or
hang my *bugle* in an invisible baldrick. *Shakspeare*.

He gave his *buglehorn* a blast,
That through the woodland echoed far and wide.
Tickell.

There's rest for the rover;
But his armour is rusty,
And the veteran grows crusty,
As he yawns in the hall.
He drinks,—but what's drinking?
A mere pause from thinking!
No *bugle* awakes him with life-and-death call.

Byron. *Deformed Transformed*.

BU'GLE, *n. s.* A shining bead of black glass, longer than the common bead, and now chiefly used for trimmings.

Bugle bracelets, necklace amber,
Perfumed for a lady's chamber. *Shakspeare*.

'Tis not your inky brows, your black silk hair,
Your *bugle* eye-balls, nor your cheek of cream,
That can entame my spirits to your worship. *Id.*

BU'GLE, *n. s.* in botany, from *bugula*, Lat. A plant. See *ΔΥΓΑ*.

BU'GLE, *n. s.* A sort of wild ox.
BUGLOSS, *n. s.* in botany, from *buglossum*, Lat. The herb ox-tongue. See *ΑΝΧΥΣΑ*.

BUGLOSS, in botany.

BUGLOSS, SMALL WILD. See *ΑΣΠΕΡΥΓΟ*.

BUGLOSS, VIPER'S. See *ΕΧΙΟΥ*.

BUGLOSSUS, in ichthyology, a name used by many authors for the soal fish.

BÜHL, a small fortress of Suabia, on the lines of Stollhoffen, seventeen miles north-east of Strasburg.

BUILD', *v.* } Goth. *bua*, *bulada*; Swed.
BUILD'ER, *n.* } *bua*, *bylja*, to construct an edi-
BUILD'ING, } fice; Sax. bolt, an edifice,
BUILT. } bygean; Ang.-Sax. to build. To
raise from the ground; to make a fabric or an edi-
fice; to raise in any labored form; to raise any
thing on a support or foundation; to play the
architect (Met.); to depend; to rest on.

Thou shalt not *build* an house unto my name.
Chronicles.

But they ran doubten hir rentall,
To bigge hem castles. *Chaucer's Ploverman's Tale*.

Thomas! nought of your treson I desire
As for myself; but that all our covent
To pray for you is, ay, so diligent;
And for to *bilden* Cristes owen chirche.
Thomas, if ye wal lernen for to wirche,—
Of *bilding* up of chirches, may ye finde
If it be good in Thomas lif of Inde.

Id. Canterbury Tales.

Deepe in the bottome of the sea, her boure
Is *built* of hollow billowes heaped hye,
Like to thick clouds that threat a stormy showre,
And vaulted all within like to the skye,
In which the gods doe dwell eternally. *Spenser*.

Thou findest fault where ays to be found,
And *buildest* strong worke upon a weak ground. *Id.*

When usurers tell their gold in the field,
And whores and bawds do churches *build*.

Shakspeare.

By a man's authority, we here understand the force
which his word hath for the assurance of another's
mind, that *buildeth* upon it. *Hooker*.

But fore-accounting oft makes *builders* miss;
They found, he felt, they had no lease of bliss.

Staney.

Some *build* rather upon the abusing of others, and
putting tricks upon them, than upon soundness of their
own proceedings. *Bacon*.

I would endeavour to destroy those curious, but
groundless structures, that men have *built* up of
opinions alone. *Boyle*.

Forts, lines, and sconces, all the bay along,
They *build* and act all that can make them strong.

Marcell.

As is the *built*, so different is the fight;
Their mountain shot is on our sails designed;
Deep in their hulls our deadly bullets light,
And through the yielding planks a passage find.

Dryden.

Even those who had not tasted of your favours, yet
built so much on the fame of your beneficence, that
they bemoaned the loss of their expectations. *Id.*

When the head-dress was *built* up in a couple of
cones and spires, which stood so excessively high on
the side of the head, that a woman, who was but a
pigmy without her head-dress, appeared like a Colos-
sus upon putting it on. *Spectator*.

Warburton took it in his noddle

This *building* was designed a model,
Or of a pigeon-house or oven,

To take one leaf or keep one dove in. *Swift*.

There is hardly any country which has so little ship-
ping as Ireland; the reason must be the scarcity of
timber proper for this *built*. *Temple*.

Her wings with lengthened honour let her spread,
And, by her greatness, shew her *builder's* fame.
Prior.

To *build*, to plant, whatever you intend,
To rear the column, or the arch to bend. *Pope*.

Turn to the mole which Hadrian reared on high,
Imperial mimic of old Egypt's piles,
Colossal copyist of deformity,
Whose travelled phantasy, from the far Nile's
Enormous model, doomed the artist's toils
To build for giants. *Byron's Child Harold.*

BUILDING is also used for the art of constructing and raising an edifice. See ARCHITECTURE. The principal statutes relating to building are, 19 Car. II. c. 3; 22 Car. II. c. 11; 5 Eliz. c. 4; 35 Eliz. c. 6; 6 Ann. c. 31; 7 Ann. c. 17; 33 Geo. II. c. 30; and 6 Geo. III. c. 37. Those for regulating all buildings in the cities of London and Westminster, and other parishes and places in the weekly bills of mortality, the parishes of St. Mary-le-bone, and Paddington, St. Pancras, and St. Luke at Chelsea, for preventing mischiefs by fire, are reduced into one act by statute 44 Geo. III. c. 78. The regulations of this law are very minute and technical.

BUILDING OF SHIPS. See SHIP-BUILDING.

BULB. See BEAL.

BUIS, a ci-devant territory of France, in Dauphiné. It is mountainous, but tolerably fertile.

BUIS, a town of France, in the department of the Drome, and ci-devant territory of Buis, eight miles south-east of Nions.

BUKHARIA, BOKHARIA, or BUCHARIA, (Great and Little) is the name of two considerable divisions of Independent Tartary, originally introduced into our maps from Russia. As it is generally applied, it describes rather a race or races of eastern merchants, who have called themselves Bogars, i.e. Bukharis, in the neighbourhood, and stated that they came from BALKH (which see), Cashghar, Yarkind, &c. than any specific countries or states. For no one country, but what we shall have hereafter to describe as Bukhara or Bucharia Proper (and which is distinct from both of those districts which modern geographers have called Great and Little Bukharia) ever bore this name. Europeans who have received these statements of the traders, respecting their country, have transferred to the regions in question the name of Bukharia, as inhabited by the Bukharis.

Thus understood, Great Bukharia is said to extend between the 35° and 44° of north lat., and from the 59° to the 73° of east long. being bounded on the north by the river Sirr, Sihon, or Saihun, and on the south by the Amu or Jaihun, known also as the Jaxartes and as the Oxus of the ancients, and a chain of mountains on the frontiers of Persia and Hindostan. On the east is Little Bukharia. Great Bukharia comprehends the three states of Balkh, Samarcand, and Bukharia Proper; and includes the Sogdiana and Bactria of the ancients. There is an agreeable variety in its geographical features: the climate is said to be temperate and healthy; and the soil the most productive of any part of Northern Asia, especially in the plains near the Sirr and the Amu. Rice and corn are cultivated here; but the country is principally laid out in pasturage, which rears so large a breed of sheep and horses, that of the latter 60,000, and of the former 10,000, have been sent annually into Russia. The mountains are rich in mineral productions, particularly in the state of BALKH, to

which we refer; in Fergana, a northern province, gold, quicksilver, iron, copper, and vitriol, are found. The inhabitants, however, generally content themselves with gathering the grains of gold and precious stones, as they are washed down by the torrents, when the snow begins to melt; and appear to have no inclination to any further improvement of their advantages. So irregularly has this region been described, under its present name, that sometimes we find a country lying northward, and called Mawerahnahr (or the land beyond the river) and corresponding with the ancient Transoxana, though extending far beyond the Sirr, included in it; as Balkh, on the other hand, certainly lies to the south of the Amu or Oxus. Both the province and town of Balkh, we have described. Samarcand, once considered the capital of Great Bukharia, stands in a fertile valley, on the banks of the river Sogd, which afterwards joins the Oxus or Amu. Here Tamerlane resided, and made it one of the most renowned cities of the east. It was famed for its learning, and contained one of the most celebrated of the Mahomedan universities, while it surpassed most other places of the east, at the middle of the seventh century, in the manufacture of silk and paper; but its days of splendor are gone by. Some of the houses are built of stone, others of an inferior brick; but the whole place is environed with ramparts, which are said, in the fifteenth century, to have included a population of 150,000 persons. See SAMARCAND. It still conducts a brisk trade in the fruits of the district, and under Shah Murad Bey, who took it from the Tartar tribe of Yuz, has recovered some of its former greatness. The inhabitants may be said to consist of three distinct tribes, the native race of Buchars, the Moguls, and the Usbeck Tartars. The first, or the Buchars, who inhabit the towns and villages, are quiet and inoffensive in their manners: they are devoted to trade and commerce; and are said never to carry a weapon; both the other tribes are of violent and warlike character, delighting in martial exercises; and constantly engaged in quarrels and hostilities with the Persians or Hindoos. The Usbeck Tartars are the rulers of the country, which is governed by khans, to whom the inhabitants pay a tribute, gathered yearly. The original race carry on most extensive commercial intercourse with Russia, China, and Tibet; some have conjectured their origin to be Jewish, and connected with the obscure history of the lost ten tribes, others that they are of Persian or Scythian origin. Be this as it may, they are diffused throughout all the east, and have a great general resemblance; are of fair complexion, with black, expressive eyes, a Roman nose, fine general features, and a profusion of black hair and beard. Their women are remarkably beautiful. The Usbecks are for the most part short and stout; their complexion is clear and ruddy, the hair black, and the beard thin. They have a broad forehead, high cheek bones, and small eyes. The men dress in a cotton shirt and trowsers, over which is a coat or tunic of silk or woollen cloth, bound by a girdle, and a gown of felt or woollen. The national head dress is a large white turban over a kalpac or pointed silken cap. Boots are worn

by all classes and by both males and females, and bandages round the legs, instead of stockings. The general dress of the latter differs little from that of the men, except that it is longer. Gold and silver ornaments are also used in profusion by both sexes. The Usbecks are said to prefer horse flesh to beef, and to fatten a number of horses annually for food; but, as this is expensive, they are forced to content themselves with beef on common occasions. These people pride themselves on being the bravest, most robust, and most hardy of the Tartar race. They make excellent light cavalry, and advance with shouts, drawn up in three lines; till the third has given way, they never consider themselves defeated. The rapidity of their movements is only equalled by their patience of thirst, hunger, and fatigue. Their laws of war are those of unqualified barbarians: infidel captives are sold as slaves; and this treatment being unlawful in regard to enemies of their own faith, they suffer a more cruel fate, and are butchered without mercy. Yet in private intercourse they are said to be open, hospitable, and sincere; quarrels are rare, and a murder is scarcely known amongst them. Mr. Elphinstone considers Bukhara as that country of Asia through which a traveller may pass most securely of any. This was the Sogdiana of the progress of Alexander the Great to Kojend, on the Sirr. When Persia was overrun in the seventh century by the Mahomedans, it attracted the notice of historians, and we find it conquered and reconquered several times in the course of the ninth, tenth, and eleventh centuries. A regular succession of khans may be traced until 1494, when sultan Baher, a descendant of Tamerlane, was expelled from Bukharia, and, proceeding to Hindostan, founded the great empire of the Moguls. About the beginning of the sixteenth century, the descendants of Timur were finally driven from this territory by the Usbecks, who, crossing the Jaxartes, carried every thing before them, till stopt by the central barrier of mountains. They thus established themselves here in small sovereignties, and have ever since remained the rulers of Bukhara, Balkh, Fergannah, &c. Other principal places besides those we have mentioned, are, Badakshan, Osrushna, Kotlan, Termed, Anderab, and Gaur. See *Peuchet Dictionnaire*, &c. *Recueil de Voyages au Nord*, tom. x. p. 127; *Gibbon's Roman Empire*, vols. iv. xi. xii; and *Elphinstone's Cabul*, &c.

BUKHARIA, LITTLE, was formerly known as the kingdom of Cashgar, and is supposed to include part of ancient Scythia. It is not inferior in extent to the former, reaching from 73° to 100° of E. long. and from 36° to 44° N. lat. but is so in the nature of its soil, climate, population, and the number of its towns. The Great Alchain forms its boundary on the north, China on the east, and a chain of mountains, the frontier of Tibet, on the south. It is about 1000 miles in length, and nearly 500 in its greatest breadth; almost surrounded and occupied with lofty mountains and sandy deserts. In some of the valleys, however, cotton, flax, hemp, vines, and the oriental fruits, are abundant. The inhabitants, in their manner and dress, resemble

those of Great Bukharia; and their chief trade is with China, Persia, and the north part of Asia. This was that part of ancient Scythia, which extended beyond the Imaus. Its rivers are, Yarkand, which is represented as issuing from Lochnor Lake, and passing through immense deserts, in a line of not less than 500 English miles, supplies the Koton, Orankash, &c.; the Chaidu, which proceeds from the same lake; and the Karia, which has its origin in a lake in the desert of Sultus. The manners, dress, and appearance, of the inhabitants are nearly the same as in Great Bukharia; the women wear a greater profusion of ornaments, and dye their nails with henna, and the whole are a darker race. The principal towns of Little Bukharia are, Cashgar, Yarkand, Koton, Karia, Chialish, and Turfan. The Calmucks, on their conquest of Great Bukharia, had obtained quiet possession of this country also, until the beginning of the eighteenth century, when a gold mine discovered in these mountains, brought on them an army of Mongales and Chinese, who completely defeated the Calmuck forces and pursued them into the deserts. The emperor of China now sent a powerful reinforcement hither, well furnished with artillery, under the command of his son, and attended by a Jesuit of Peking. This prince boldly passed the deserts, by the route which the Calmucks had taken, and entered the extensive plains of Turfan and Hami; but, being unwilling to risk his army in an engagement, contented himself with erecting a chain of forts here, under the protection of which forts, the Chinese kept possession of these provinces, until the Calmucks, unable to drive them out without the aid of cannon, had recourse to the assistance of Russia. In 1720 they offered to pay an annual tribute to that power, upon condition that it would supply an army of 10,000 regular troops, well equipped with cannon, to enable them to meet the Mongales and Chinese: but Peter the Great, who was at that time at war with Sweden, did not listen to their proposals. Consequently the Chinese remained masters of these provinces, which Kien Long in 1759 brought into final subjection, and they remain tributary to the Chinese empire.

BUKHARIA PROPER, or the state of Bukhārā, is the most westerly of the three states which form the province of Great Bukharia, and is bounded on the north by a chain of low barren hills, called Sū-sez-kari, on the east by Samar-cand, on the south by the Amú or Oxus, and on the west by Khwārizm. It was in a very flourishing state in the fourteenth and fifteenth centuries, well known for the excellence of the climate and productions, and for the philosophers, poets, and historians, who here enjoyed the patronage of the descendants of Timur. Its present condition is just the reverse of this; at least politically considered. Hardly any part of Asia is less known to Europeans, and has undergone a more complete change.

The whole productive territory may perhaps, according to the recent accounts of Dr. Eversmann, a German traveller, be estimated at 50,000 square miles. It commences at a small distance north of Samarcand, where low hills, the out-

works of the Imaus, stretch from north to south, and separate the fertile parts of the country from the deserts. The country is watered by the Sihron on the north, and by the Oxus on the south, with a lake called Taran in the centre. The water, however, of each is said to be brackish; and a considerable portion of the country has a flat and sandy surface. There are several chains of mountains, from which torrents descend to join the larger rivers during the melting of the snows; at the bottom of which gold is occasionally found.

The inhabitants of Bukharia consist of two classes: the Tanjiks, or citizens; and the Usbecks, a tribe of Tartars. Some have supposed them to have been of Jewish origin, and others that they are the descendants of the ancient Scythians. In Bukharia all persons pursue some occupation; some employing themselves in mechanical trades, others in foreign commerce. The tribe of the Usbecks, though usually esteemed the most civilised of the Tartars, are more fond of warfare and feudatory habits than agriculture or the arts. All classes, both men and women, wear boots; and to general appearance, both sexes dress very much alike. The Usbecks prefer horse-flesh to any other food; and for this purpose horses are kept to breed and fatten, like oxen and sheep in other countries. This country has for many ages been celebrated for its literature, but with very little claim to this character.

Bukharia was anciently known, during the marches of Alexander the Great, by the name of Sogdiana, or the river Sirr. It has undergone many changes in its government, though a regular succession of khans may be traced to the year 1494, when the sultan Bahar, a descendant of Tamerlane, was expelled from Bukharia, and proceeding to Hindostan, there founded the Mogul empire.

The Tartar Usbecks established a powerful monarchy here, under Shah Bakt, whose successor was defeated by Ismael in 1529. His posterity continued for 200 years. In 1747 Raheem Bey usurped the government of Bukharia. At the close of the eighteenth century, a chief, named Ameer Daniel, possessed the post of authority. At his death he divided his immense wealth among his offspring, and nominated his son, Begge Jan, to the supreme dignity. This man, who in early life was excessively dissipated, converted himself all at once into an ascetic; and from the air of sanctity which he assumed, and the austerities which he practised, attracted the multitude to him from all quarters, whose devotion to him supplied the place of a legal title to the crown. Affecting great moderation, he divested his government of all its splendor; and himself presided over the deliberations of justice. Though commanding an army of 60,000 soldiers, he rode on a poney, fed on the meanest provisions, and was clad like one of the poorest classes. Thus furnished, he invaded Khorassan, and conquered all the countries between the Oxus and Jaxartes. After his death, occurring about the beginning of the nineteenth century, his eldest son, Hyder Furrals, ascended the throne of Bukharia, and assumed the name and dignity of sovereign over the empire.

BUKHARIA, BOKHARA, or BOGAR, a city of Asia, the capital of Great Bukharia, situated on a river, flowing into the Oxus, from which latter it is distant about fifty miles, and from Samarcand about 100 miles. It occupies a rising ground, and, in the year 1741, was surrounded by an earthen wall and a dry ditch. The houses are low, and for the most part built of mud; but the mosques and caravanseries are built of stone. There are colleges here which are capable of containing from 60 to 600 students each; and in that of Kokul Taush in particular, a fine edifice for the education of Mahomedan priests, there are 300 apartments for the accommodation of students. Bukharia has always been celebrated for the study of Mahomedan theology and law; and the inhabitants have been reckoned superior to those of the neighbouring districts in civilisation. They are engaged in manufactures of cotton yarn, calicoes, and soap, which are exported to Persia, while from that country they receive velvet, silk sashes, shalloons, indigo, cochineal, and coral. Rhubarb, musk, and castor, are obtained from Taschkand, and precious stones and lapis lazuli from Badakshan. The trade of Bukharia has latterly declined. A portion of European manufactures is consumed, which gave rise to a plan, so long ago as 1557, and repeated in 1741, for supplying the city with English commodities. On each occasion English merchants travelled to this spot, and were hospitably received, but it was found that the expected price was inferior to the hazard of bringing the goods. Merchants of all kinds now meet with encouragement, and all religions are tolerated. The population is supposed to exceed 100,000.

BUL, in the ancient Hebrew chronology, the eighteenth month of the ecclesiastical, and second of the civil year: since called Marševan. It answers to our October, and has twenty-nine days.

BUL, in ichthyology, the flounder.

BULAC, a town of Egypt, situated on the east shore of the Nile, about two miles west of Grand Cairo, of which it is the port town. It is a place of trade, as all the vessels going up and down the Nile make some stay in it. The baths here are excellent.

BULEUS (Cæsar). See BOULAY.

BULAFO, a musical instrument, used by the negroes of Guinea, consisting of several pipes of wood tied together with thongs of leather, so as to form a small interstice between each pipe.

BULAM, BULAMA, or BULLAM, is the best known of the Bissagos islands, on the western coast of Africa, between the Gambia and Sierra Leone, at the mouth of the Rio Grande. It is directly opposite the entrance of that river; about nine leagues long east and west, and five broad. From the shore it rises gradually to some hills in the middle, which are covered with wood, and from which descend numerous streams. Horses, horned cattle, buffaloes, and goats, are found wild on it, as well as elephants, hyenas, deer, and wild dogs. In the vicinity of many navigable rivers, which extend far into the continent, and would greatly facilitate a trade with the internal parts of Africa; and possessing a deep and luxuriant soil adapted to every species of cultiva-

tion, it seems to offer a most desirable settlement to any European nation. Cotton, indigo, and rice, are its spontaneous productions; and pine-apples, limes, oranges, grapes, plums, cassada, guava, India wheat, melons, pumpkins, tamarinds, bananas, and many delicious fruits, grow here, it is said, in great abundance. Sugar and tobacco, and indeed all the other productions of our West India islands, may also be cultivated in equal perfection; and, considering the richness of the soil, to much greater advantage. When the English attempted an establishment on this island in 1792, the inhabitants of the neighbouring islands cultivated rice and millet here. West of Bulam is Gallina island, so named from abounding in Guinea fowls, inhabited, fertile, and well cultivated. Arcas, or Bow Island, north of Bulam, has no fresh water. Mantere Island, south of Bulam, forms the south point of the entrance to the Rio Grande, and is only separated from the main land by a narrow channel or creek.

The Bulama, or Sierra Leone Association, in 1792, was composed of gentlemen who, anxious for the final termination of the slave trade, and the civilisation of this quarter of Africa, determined to attempt the formation of a settlement on this island, as a means of promoting both objects. The plan failed, but the efforts made brought us better acquainted with the Archipelago; and from the narrative of captain Beaver, who finally commanded the expedition, we shall transcribe a few details:—

The expedition, entrusted to the command of captain Dalrymple, and a council of twelve gentlemen, consisted of three vessels, the *Calypso*, *Hankey*, and *Beggar's Benison*, with the colonists on board, consisting of about 280 souls, men, women, and children. It sailed from the Downs 6th of April, 1792. On the 25th of May, the *Calypso*, parting from her consorts, anchored off Bulama. Unaccustomed to the confinement of a sea-voyage, the colonists were here not only eager to get on shore; but instead of calmly endeavouring to conciliate the *Bijugas*, or natives of the island, they landed without order or precaution; some erected huts, others wandered through the woods in search of game and fruit, and returned to the ship or not as they thought proper at night. During the first night, their tents, and whatever they had left on shore, were carried off. At mid-day on Sunday the 3d of June, while some of the colonists were asleep, and others hunting and fishing, they were attacked by the former inhabitants, who fired a volley into the hut which contained the arms of the new colony. Those within, being roused from their sleep, rushed out and were immediately shot. The rest, unprepared and unarmed, upon hearing the firing, hid themselves among the rocks, or attempted to gain the beach; by which the greater number escaped, while others were intercepted and taken prisoners. The English in this affair had five men and one woman killed, four men wounded, and four women and three children taken prisoners; and the savages retired with a rich booty of sixty stand of arms, and a quantity of ammunition, besides kitchen utensils, wearing apparel, &c. After landing a party of armed men (under a discharge

of cannon from the ship) to bring off their water-casks, the *Calypso*, early the following morning got under weigh for Bissao, where she was joined by the *Hankey* and *Beggar's Benison*. Irritation and reproaches now broke out between the colonists and the members of the council, and each attributed their misfortunes to the other. These complaints, and the fever which appeared in the *Calypso*, and had been communicated to the *Hankey*, reduced the majority to despondency; but ashamed of relinquishing their design without another attempt, they returned to Bulama, and having redeemed their captives, purchased the island from the kings of Carnabol for the value of 473 bars in goods, about £79 sterling. No sooner, however, was this transaction concluded, than, instead of availing themselves of the right which they had acquired, the council determined to abandon the enterprise as at present impracticable, and communicated their determination to the colonists in the following resolution: 'That seeing the rainy season has already commenced, and it appearing, from every information we can collect, that we cannot land because of the rains and fogs at least for four months, and that with every precaution there will probably be a considerable mortality among the settlers during that time, and considering withal, that a great proportion of the adventurers in each ship are solicitous to return to Europe, it is the opinion of the council, that the two ships and the sloop should be removed to Sierra Leone to water, and there the expediency of proceeding to England, or of returning hither after the rains, shall be taken into consideration.' Against this captain Beaver entered his protest; and declared to the council that he was determined to remain on the island, with his servant, though every one else should leave it; and in this determination he was joined by one of the council, and between eighty and ninety of the colonists. It was then agreed that the *Hankey* and *Beggar's Benison* should remain at Bulama, and that the *Calypso* should proceed to Sierra Leone, with those who wished to return to England. The settlers were thus reduced to a third of their number, and when mustered by captain Beaver, who was unanimously chosen their president, were found to consist of forty-eight men, thirteen women, and twenty-five children. Having adopted proper regulations for maintaining subordination, sobriety and discipline, in the colony, and established a friendly communication between Bulama and the Portuguese settlement on the island of Bissao, the first care of the colonists was to protect themselves from the heat of the sun, and the violence of the rains, by covering the ship with a wooden roof. They then set about clearing a piece of ground for a garden, and built a block-house, which was to serve as a habitation, magazine, and citadel. Both tropical and European plants and seeds succeeded beyond their expectations; and all vegetable productions quickly arrived at maturity. Several free negroes had been hired; who, being well treated, and allowed to leave the island, whenever dissatisfied, worked well. During the residence of the English at Bulama, 196 of these Africans had been employed on the island. Many of the surrounding tribes also

visited the colony, with a view to trade. The colonists, in all their dealings with the negroes, observing the strictest integrity; and rigorously adhering to their determination of never being concerned in the purchase of slaves; soon gained the good-will and confidence of the neighbourhood. Sickness and disaffection, however, at length spread among the settlers, and their numbers were daily diminished by desertion or disease. To such a state were they sometimes reduced, that there was scarcely an European fit for work, or to give directions; and out of the eighty-six which staid, after the sailing of the *Calypso*, within nine months ten only were left. These, when at last reduced to nine, became so dispirited, that the whole affairs and business of the colony rested with captain Beaver; and whatever the energy and perseverance of one man could perform, was now done. He encouraged his countrymen to exertion by his example, supplied their wants, and soothed their distresses. Fear, however, and despondency had completely prostrated their minds. They saw only certain death before them if they remained; and after strong solicitations to return to England, and frequent threatenings to abandon him, captain B. was compelled at last to accede to their request, and quitted the island, 29th November, 1793. Thus terminated this laudable, but ill-concerted scheme; and others of a similar character, we fear, must yield to the torrid climate of the neighbourhood.

BULAPATHUM, in botany, the dock. See *RUMEX*.

BULARCHUS, a Greek painter, who first introduced (among the Greeks at least) different colors in the same picture. He flourished about A.A.C. 770.

BULATMAI, in ichthyology, a species of cyprinus, the anal fin of which contains eight rays; the second dorsal fin is large and not serrated; cirri four. It is a rare fish, of the size of the carp. Color steel blue, gold above, and silvery, with a golden hue beneath: the scales are of the middle size, and imbricated; flesh white and good. It is found in the Caspian Sea.

BULATWELA, in botany, a name by which some authors have called the betel.

BULB', *n.* } *Lat. bulbos, bulbaceus.*
BULBACEOUS, *adj.* } A round body, or root.
BULBOUS, *adj.* } Bulbous, having round, or roundish knobs.

There are of roots, *bulbous* roots, *fibrous* roots, and *hirsute* roots. And t take it, in the *bulbous*, the sap hasteneth most to the air and sun. *Bacon.*

Set up your traps for vermin, especially amongst your *bulbous* roots. *Evelyn's Kalendar.*

Take up your early autumnal tulips and *bulbs*, if you will remove them. *Id.*

If we consider the *bulb* or ball of the eye, the exterior membrane, or coat thereof, is made thick, tough, or strong, that it is a very hard matter to make a rupture in it. *Ray.*

BULB, in the anatomy of plants, is defined by Linnaeus to be a species of *hybernaculum*, produced upon the descending caudex or root; consisting of stipulae, petioli, the rudiments of the former leaves, and scales or bark. To elucidate this definition it is proper to remark, that every

bud contains, in embryo, a plant in every respect similar to the parent plant upon which it is seated. Plants, therefore, are perpetuated in the buds, as well as in the seeds; and the species may be renewed with equal efficacy in either way. The tender rudiments of the future vegetable, of which the bud is composed, are enclosed, and during winter defended from cold and external injuries, by a hard rind, which generally consists of a number of scales placed over each other like tiles, and fastened together by means of a tenacious, resinous, and frequently odiferous, substance. Thus defended, the buds remain upon different parts of the mother plant till spring; and are therefore, with propriety, denominated by Linnaeus the *hybernaculum*, or winter quarters, of the future vegetable. Buds are situated either upon the stem and branches, or upon the roots: the former are styled *gemmae*, or buds properly so called; but, as they subsist several years by their roots, may be furnished with the other species of *hybernaculum* called *bulbs*. Trees which are perennial, with a woody and durable trunk, have generally proper buds, but no bulbs. In bulbous plants, as the tulip, onion, or lily, what we generally call the root is in fact a bulb, which encloses and secures the embryo or future shoot. At the lower part of this bulb may be observed a fleshy knob, whence proceed a number of fibres. This knob, with the fibres attached to and hanging from it, is, properly speaking, the true root; the upper part being only the cradle or nursery of the future stem, which, after the bulb has repaired it a certain number of times, perishes; but not till it has produced at its sides a number of smaller bulbs or suckers for perpetuating the species. One part of Linnaeus's definition still remains obscure:—The bulb, says he, is composed of the remains or rudiments of the former leaves of the plant; e *rudimento foliorum prateritorum*. It is easy to comprehend that buds contain the rudiments of the future leaves; but how can bulbs be said to contain the rudiments of leaves that, to all appearance, are already perished? To explain this, let it be observed, that, in the opinion of very eminent botanists, the root, in a very great number of perennial herbs, is annually renewed or repaired out of the trunk or stalk itself; in which sense only, roots are properly said to descend. In the perennials alluded to, the basis of the stalk continually, and by insensible degrees, descends below the surface of the earth, and is thus changed into a true root; which root, by the continuance of the said motion of the stalk, also descends; and thus, according to the durability of its substance, becomes a longer or shorter root; the elder or lower part rotting off in proportion as the upper is generated out of the stalk. Thus, in brownwort, the basis of the stalk, sinking down by degrees till it is hid under the ground, becomes the upper part of the root; and, continuing still to sink, the next year becomes the lower part, and the following year rots away. This is exactly what obtains in bulbous roots, as well as in the far greater number of other herbaceous perennials; as arum, valerian, tansy, samphire, primrose, wood-sorrel, iris, and others. The immediate visible cause of this descent is the string-roots which this kind of trunks frequently

put forth; which, descending themselves directly into the ground, serve like so many ropes for pulling the trunk after them. Hence the tuberous roots of iris are sometimes observed to re-ascend a little upon the rotting or fading away of the string-roots which hang at them. In bulbous roots where the stalk and former leaves of the plant are sunk below, and formed into what is called the bulb, or wintering of the future vegetable, the radicles or small fibres that hang from the bulb, are to be considered as the root; that is, the part which furnishes nourishment to the plant: the several rinds and shells, of which the bulb chiefly consists, successively perish, and shrink up into so many dry skins, betwixt which, and in their centre, are formed other leaves and shells, and thus the bulb is perpetuated. What has been said of the descent of roots by the sinking of the stalk, is further confirmed by the appearance of certain roots; as of valerian, plantago major and devil's bit, in which the lower part appears bitten or chopped off. In these the lower part rotting off as the upper descends, the living remainder becomes stumped, or seems bitten. All bulbous roots, says Dr. Grew, in his anatomy of plants, may be considered as hermaphrodite roots, or root and trunk both together: for the radicles only are absolute roots; the bulb actually containing those parts which springing up make the body or leaves of the plant; so that it may be regarded as a large bud under ground. Bulbous roots are said to be solid, when composed of one uniform lump of matter; tunicated, when formed of multitudes of coats surrounding one another; squamose, when composed of, or covered with, lesser flakes; duplicate, when there are only two to each plant; and aggregate, when there is a congeries of such roots to each plant.

BULBINE, a synonyme of the anthericum.

BULBOCASTANUM. See **BUNUM**.

BULBOCODIUM, mountain saffron, a genus of the monogynia order, and hexandria class of plants; natural order ninth; spathaceæ: cor. funnel-shaped, and hexapetalous, with the heels narrow, supporting the stamina. There is but one species, which grows naturally. It has a small bulbous root, which sends forth a few long narrow leaves, something like those of saffron, but narrower.

BULBOSUS, from *bulba*, a bulb, bulbous; applied in anatomy to soft parts which are naturally enlarged, as the bulbous part of the urethra.

BULBUS VOMITORII, in the materia medica, the name used for the root of the muscari.

BULCARD, an English name for the galectia, or *alauda non cristata*, of Rondeletius; a small sea-fish caught among the rocks on the Cornish and other shores.

BULEF, in botany, a name for the willow.

BULEPHORUS, an officer in the court of the eastern emperors, called also *summæ rei rationalis*.

BULETÆ, in Grecian antiquity, were magistrates answering to the *decuriones* among the Romans. See **DECURIO**.

BULLFINCH, in ornithology. See **LOXIA**.

BULGA, in old records, a budget; a mail.

BULGAR, a mountain of Nætolia, on the coast of Caramania.

BULGARIA, a small province of Turkey, in Europe, bounded on the north by Walachia, on the east by the Black Sea, on the south by Romania or Rum-ili, and on the west by Servia. It is very narrow, but 325 miles long on the side of the Danube, from Servia till it falls into the Black Sea. It is divided into four sanjaks; Byden, or Vidin, Sophia, Nicopolis, and Silistria. The chief towns are of the same names. The Bulgarians anciently inhabited the plains of Sarmatia that extended along the banks of the Volga. Thence they migrated, about the middle of the seventh century, in quest of new settlements. A large body of them passed the Danube, and took possession of the country adjacent to the western coast of the Euxine Sea. Several attempts were made by the Romans to dispossess and extirpate them; but they defended themselves with equal resolution and success. Constantine III. being defeated and intimidated, concluded an ignominious peace with them, A.D. 678, and purchased their friendship by the payment of an annual tribute. Justinian II. refused to comply with these dishonorable terms, and invaded their territories, A.D. 687; but he was defeated, and constrained to renew the treaty. War was carried on, almost without interruption, between them and the eastern emperors, for several centuries. After a long and doubtful struggle, the Romans prevailed; and the emperor Basil III. reduced Bulgaria to the form of a province, A.D. 1019. From this time the Bulgarians remained in subjection, and were governed by Roman dukes, until the reign of Isaac Angelus, when they revolted, A.D. 1186. Some time after, Stephen IV. king of Hungary, having defeated the Bulgarians, obliged them to acknowledge him as their sovereign. His successors were styled kings of Hungary and Bulgaria; and this title was transmitted, with the kingdom of Hungary, to the house of Austria. By the aid of the eastern emperors they threw off the Hungarian yoke; and, in return, they assisted their ally in an attempt to recover Adrianople, A.D. 1369. Provoked by this combination, Amurath invaded their country; and Bajazet, his successor, completed the conquest of it, A.D. 1396. Bulgaria still remains a province of the Ottoman empire. The inhabitants are Christians, but so extremely ignorant, that they seem to know nothing of Christianity, but baptism and fasting.

BULGARIAN LANGUAGE, the same with the **SLAVONIC**, which see.

BULGE, *v.* Goth. *bulga*; Swed. *bulgja*; Sax. *bilrg*, a bladder. It was originally written *bilge*; *bilge* was the lower part of the ship, where it swelled out. To *bulge* is to jut out, to swell out, to burst from inward pressure, as a bladder; applied to the cause of a ship's foundering at sea, from being over-filled with water; to leak from outward fracture.

Thrice round the ship was tost,
Then *bulged* at once, and in the deep was lost.

Dryden.

The side, or part of the side of a wall, or any timber that *bulges* from its bottom or foundation, is said to batter, or hang over the foundation.

Mozon's Mechanical Exercises.

BULIMY, *n. s.* Βουλμία, from βας an ox, and λιμος hunger. An enormous appetite, attended with fainting and coldness of the extremities.

BULIMY is also called fames canina, canine appetite. See MEDICINE, Index.

BULITIOS, or BULITHUS, a stone found in the gall-bladder, kidneys, or urinary bladder of an ox. See BEZOAR.

BULK', *n.* } Goth. *bulke*; Swed. *bol*k;
BULK'HEAD, *n.* } Belg. *bulke*, *buik*; Span.
BULK'INESS, *n.* } *buque*, from Goth. *bol*. Large.
BULKY, *adj.* } massive; magnitude, quantity; the gross, the majority; the main fabric; of great size. Bulkhead is a partition made across a ship with boards, whereby one part is divided from another.

The sweet and quiet sleep that wearied limbs oppress,
Beguile the night in diet thin, and feasts of none excess:

But waker lie the rich; whose lively heat with rest
Their charged bulks with change of meats cannot so soon digest.

He raised a sigh so piteous and profound,
That it did seem to shatter all his bulk,
And end his being.
Here stand behind this bulk. Straight will he come:

Wear thy good rapier bare, and put it home. *Id.*

The Spaniards and Portuguese have ships of great bulk; but fitter for the merchant than the man of war, for burden than for battle.

There our sick ships, unrigged, in summer lay,
Like moulting fowl a weak and easy prey;
For whose strong bulk earth scarce could timber find,
The ocean water, or the heavens wind.

But crowded on with so much haste,
Until they had blocked the passage fast,
And barricadoed it with haunches
Of outward men, and bulks and paunches.

Things, or objects, cannot enter into the mind as they subsist in themselves, and by their own natural bulk pass into the apprehension; but they are taken in by their ideas.

Latreus, the bulkiest of the double race,
Whom the spoiled arms of slain Halesus grace.

Wheat, or any other grain, cannot serve instead of money, because of its bulkiness, and change of its quantity.

Change in property, through the bulk of a nation, makes slow marches, and its due power always attends it.

Four steeds that spurn the rein, as swift as shy,
Hurl the dark bulk along, scarce seen in dashing by.

BULK OF A SHIP, the whole content in the hold for the stowage of goods.

BULKHEAD AFORE, the partition between the forecastle and the gratings in the head.

BULL (George), bishop of St. David's, was born at Wells in 1634, and educated at Exeter College, Oxford. His first benefice was that of St. George's, near Bristol; whence he rose successively to be rector of Saddington in Gloucestershire, prebendary of Gloucester, archdeacon of Llandaff, and, in 1705, bishop of St. David's. In the time of Cromwell he adhered steadily to the church of England; and in the reign of

James II. preached very strenuously against the errors of popery. He wrote, 1. A Defence of the Nicene Faith. 2. Apostolical Harmony. 3. Primitive Apostolical Tradition; and other works. He died in 1709.

BULL (John), a celebrated musician and composer, was born in Somersetshire about A.D. 1563, and was of the Somerset family. He was educated under Blitheman. In 1586 he was admitted at Oxford bachelor of music, having practised in that faculty fourteen years; and in 1592 was created doctor in the university of Cambridge. In 1591 he was appointed organist of the queen's chapel. Dr. Bull was the first Gresham professor of music, and was recommended to that station by queen Elizabeth. But however skilful he was in his profession, he was not able to read his lectures in Latin; and therefore, by a special provision, made A.D. 1597, his lectures were permitted to be in English. In 1601 he went abroad for the recovery of his health. Dr. Ward, in his lives of the Gresham professors, states that, upon the death of Elizabeth, he became chief organist to king James; and in 1613 quitted England to reside in the Netherlands, where he was admitted into the service of the archduke. Wood says, that Dr. Bull died at Hamburg; others say at Lubeck. The only works of Bull in print, are lessons in the Parthenia, or the Maidenhead of the first Music that ever was printed for the Virginals. An anthem of his is to be found in Bernard's Collection of Church Music. Dr. Ward has given a long list of compositions of Dr. Bull in MS. in the collection of the late Dr. Pepusch, by which it appears that he was equally excellent in vocal and instrumental harmony. He also possessed great power of execution on the harpsichord. His lessons, in the estimation of Dr. Pepusch, were superior, not only for harmony and contrivance, but for air and modulation, to those of Couperin, Scarlatti, and other modern composers.

BULL', in composition, generally notes the large size of any thing, as bull-head, bulrush, bull-trout; and is therefore only an augmentative syllable, without much reference to its original signification.

And, Falstaff, you carried your guts away as nimbly and roared for mercy, and still ran and roared, as ever I heard a bull-calf.

There is in Northumberland a trout, called a bull-trout, of a much greater length and bigness than any in these southern parts.

These fulminations from the Vatican were turned into ridicule; and, as they were called bull-beggars, they were used as words of scorn and contempt.

BULL', } Lat. *bul*la; Ital. *bol*la; Fr.
BULL'ARY, } *bul*le, signifying originally a seal;
BULL'ISH, } but, when applied to a mandate
BULL'IST, } of the pope, supposed to be
BULL'ETIN. } βουλῆ, counsel. Bulletin is a diminutive of bull.

Min holy pardon may you all wanie,
So that ye offre nobles or starlings,
Or elles silver broches, spones, ringes,
Boweth your hed under this holy bulle.

Bulles of popes, and of cardinals,
Of patriarchs, and bishops, I shew,
And in Latin I speak a word or two.

Id. Canterbury Tales.

A *bull* is letters called apostolick by the canonists, strengthened with a leaden seal, and containing in them the decrees and commandments of the pope or bishop of Rome.

Aglyffe.

It was not till after a fresh *bull* of Leo's had declared how inflexible the court of Rome was in the point of abuses.

Atterbury.

BULL, Irish *bul*: phrase or fashion, may be cognate with Welsh *brau*: peculiar. An equivocal expression, a blunder, a contradiction.

I confess it is what the English call a *bull*, in the expression, though the sense be manifest enough.

Pope's Letters.

BULL, *n.* } Sans. *bual*; Hind. *buel*;
BULL-BAITING, } Per. *bahal*; Ara. *bu*, *bukal*,
BULL-BEER, } *bakar*; Ba: Lat. *bubalus*;
BULL-LOCK. } Sax. and Belg. *bull*; Welsh
bual; Goth. *bu*, *bcl*; Swed. *bul*, signified properly farming cattle, including oxen. Properly the male of black cattle; the husband of the cow. Met. a fierce, violent, and powerful enemy. One of the twelve signs of the zodiac.

Many *bulls* have compassed me: strong *bulls* of Bashan have beset me round.

Psalms.

Whan that Phoebus doth his bright bemies spread
Right in the white *bole*; right so it betidde,
As I shall singe, on Mayes day the thriddle.

Chaucer's Troilus and Crescide.

A gentlewoman, Sir, and a kinswoman of my master's.—Even such kin as the parish heifers are to the town *bull*.

Shakspeare.

Why, that's spoken like an honest drover: so they sell *bullocks*.

Id.

They want their porridge and their fat *bull-becces*.

Id.

Bulls are more crisp upon the forehead than cows.

Bacon.

— that when they see
Law, can discover sin, but not remove,
Save by those shadowy expiations weak,
The blood of *bulls* and goats, they may conclude
Some blood more precious must be paid for man.

Milton.

Who made the balance, or whence came
The *bull*, the lion, and the ram? *Buller's Hudibras.*

What am I the wiser for knowing that Trajan was
in the fifth year of his tribuneship, when he entertained the people with a horse-race or *bull-baiting*?

Addison.

Drops follow drops, the clouds on clouds arise,
And carnage clogs their hands, and darkness fills their eyes.

As when a slaughtered *bull's* yet reeking hide
Strained with full force, and tugged from side to side,
The brawny carriers stretch. *Pope's Homer's Iliad.*

At last from Aries rolls the bounteous sun,

And the bright *Bull* receives him. *Thomson.*

The dew-lapped *bull* now chafes along the plain,
While burning love ferments in every vein;
His well-armed front against his rival aims,
And by the dint of war his mistress claims. *Gay.*

On foams the *bull*, but not unsathed he goes,
Streams from his flank the crimson torrent clear;
He thies, he wheels, distracted with his throes;
Dart follows dart; lance, lance, loud bellowings
speak his woes. *Byron.*

BULL, in zoology. See *Bos*.

BULL AND BOAR. By the custom of some places, the parson is obliged to keep a bull and a boar for the use of his parishioners, in consideration of his having tithes of calves and pigs, &c.

BULL, signifying a letter, is applied to the letters of princes as well as of the popes. The bull, however, properly speaking, signifies the seal appended to the letter, and which has been made of gold, silver, and lead, as well as of wax. Thus:

BULL, GOLDEN, an edict, or imperial constitution, made by the emperor Charles IV. reputed to be the magna charta, or the fundamental law of the German empire. It is called golden, because it has a golden seal, tied with yellow and red cords of silk: upon one side is the emperor, represented sitting on his throne, and on the other the capitol of Rome. It is also called Caroline, from Charles IV. Till the publication of the golden bull, the form and ceremony of the election of an emperor were dubious and undetermined, and the number of electors not fixed. This edict regulated the functions, rights, privileges, and pre-eminences, of the electors. The original, which is in Latin, on vellum, is preserved at Frankfort. This ordinance, containing thirty articles, was approved of by all the princes of the empire.

BULLS, LEADEN, were sent by the emperors of Constantinople to despots, patriarchs, and princes; and were also used by the grandes of the imperial court, as well as by the kings of France, Sicily, &c. and by bishops, patriarchs, and popes; and on one side had the name of the pope or bishop inscribed. Polydore Virgil makes pope Stephen III. the first who used leaden bulls, about 772. The latter popes, besides their own names, strike the figures of St. Peter and St. Paul on their bulls; a practice first introduced by pope Paschal II.

BULLS OF THE POPE are despatched by order of his holiness, from the Roman chancery, and sealed with lead, being written on parchment, by which they are partly distinguished from briefs. See *BRIEF*. The pope's bull is a kind of apostolical rescript, or edict; and is chiefly used in matters of justice or grace. If the former be the intention of the bull, the lead is hung by a hempen, if the latter, by a silken thread. This lead is impressed on one side with the heads of St. Peter and St. Paul; and on the other with the name of the pope, and the year of his pontificate. The bull is written in a round Gothic letter. These instruments, besides the lead hanging to them, have generally a cross, with some text of Scripture, or religious motto, about it. They are granted for the consecration of bishops, the promotion to benefices, and the celebration of jubilees, &c. Bull in cana Domini, is a particular bull read every year, on the day of the Lord's supper, or Maunday Thursday, in the pope's presence, containing excommunications and anathemas against heretics, and all who disturb or oppose the jurisdiction of the holy see. After the reading of the bull, the pope throws down a burning torch, to denote the thunder of this anathema.

BULLS, SILVER, were not in so frequent use, though instances of them might be produced.

BULLS, WAXEN, are said to have been first brought into England by the Normans. They were in frequent use among the Greek emperors, who thus sealed letters to their wives, mothers, and sons. Of these there were two sorts, viz. red and green.

BULLA, in antiquity, a kind of ornament much in use among the ancient Romans. Whitaker is of opinion, that the bullæ were originally formed of leather among all ranks of people; and it is certain that they continued so to the last among the commonality. He also imagines that at first the bulla was intended as an amulet, rather than an ornament; as a proof of which, he tells us, that the bullæ were frequently impressed with the figure of the sexual parts. It is universally asserted by the critics, that the bullæ were made hollow for the reception of an amulet; but this Whitaker contradicts, from the figure of a golden one found at Manchester, which had no aperture whereby an amulet could have been introduced. Pliny refers the original of the bullæ to the elder Tarquin, who gave one with the prætexta to his son, because, at the age of fourteen, he had, with his own hand, killed an enemy; and in imitation of him it was afterwards assumed by other patricians. Others affirm that the bulla was given by that king to the sons of all the patricians who had borne civil offices. Lastly, others allege that Romulus first introduced the bulla, and gave it to Tullus Hostilius, the first child born of the rape of the Sabines. As to the form of the bullæ, they were originally made in the shape of hearts, though they did not always retain that form. As the wealth of the state and the riches of individuals increased, the young patrician distinguished himself by a bulla of gold, while the plebeians wore the amulets of their ancestors. The figure of the heart then became so generally round, some even have the impression of an heart upon them, that there are not many of the original form to be found in the cabinets of the curious. The form is naturally varied from a complete circle to that of a segment; and this was the shape of the above-mentioned bulla found at Manchester. When the youths arrived at fifteen years of age, they hung up their bulla about the necks of their gods lares. The bullæ were also not only hung about the necks of young men, but even of horses. They were likewise sometimes hung upon statues, whence the phrase 'statuæ bullatæ.' Bulla was also the denomination given to divers other metalline ornaments made after the same form; and in this sense bullæ seems to include all gold and silver ornaments of a roundish form, whether worn on the habits of men, the trappings of horses, or the like. Such were those decorations used by the ancients on their door and belts. The bullæ of doors were a kind of large headed nails fastened on the doors of the rich, and kept bright with great care. The doors of temples were sometimes adorned with golden bullæ. Mr. Baudelot takes the bullæ worn by soldiers on their belts to be something more than mere ornaments. They seem to have been considered as preservatives from dangers and diseases, and even means of acquiring glory, and other advantages. The like may perhaps be extended to the bullæ on

doors, which were probably placed there as a security to them from being broken or violated.

BULLA denoted also a table hung up in the public courts to distinguish which days were fasti, and which nefasti; answering in some measure to our calendar.

BULLA, or Dipper, in conchology, a genus belonging to the order of vermes testaceæ. It is an animal of the snail kind: the shell consists of one valve, convoluted, and without any prickles; the aperture is narrowish, oblong, longitudinal, and entire at the base; the columella is smooth and oblique. The species of this genus are, volva, ovum, spelta, birostris, gibbosa, verrucosa, aperta, naucum, ampulla, hydatis, physis, lignaria, ficus, amplustra, canaliculata, rapa, fontinalis, conoidea, turrita, hypnorum, terebellum, gelatinosa, virginea, cypræa, strigata, fasciata, exarata, striatula, ambigua, bifasciata, achatina, zebra, ovata, hyalina, velum, ferruginosa, cylindrica, vesica, voluta, oliva, purpurea, dominicensis, solida, spreta, scabra, steropusculum, soluta, akera, carnea, and truncate.

BULLA, in medicine, a clear vesicle or blister, which arises from burns or scalds; or other causes.

BULLACE, *n. s.* A wild sour plum.

Medlars, plommes, peres, chesteines,
Cherise of which many one faine is
Notes, and aleis, and bolas.

Chaucer's Romant of the Rose.

In October, and the beginning of November, come services, medlars, bullaces; roses cut or removed, to come late; hollyoaks, and such like. *Bacon.*

BULLACE, in botany. See **CHRYSOPHYLLUM** and **PRUNUS**.

BULLARY, bullarium, a collection of papal bulls. A general bullary of all the papal constitutions, from Gregory VII. to Sixtus V., was compiled by order of pope Sixtus V. in 1586; since which has been published a great bullary by Laert. Cherubin, containing the bulls of all the popes from Leo in 440, to Paul V. in 1559; since continued by Ang. Cherubin to 1644, and by Ang. a Lantusca, and Jo. Paulus to 1676; and lastly, by an anonymous editor, to the time of Benedict XIII., under the title of Bullarium Magnum Romanum. We have the same digested in a new method by Bouchardus: a commentary on it begun by Vinc. Petra, and a summary of it by Novarius.

BULLATA, in conchology, a species of voluta; shape cylindrical, reddish, with somewhat livid belts; spire obtuse; pillar-lip with four plaits within; aperture effuse. Found in the Indian seas.

BULLATED, bubbling; boiling.

BULLATUS, a species of solen; shape rotund, and striated slightly; anterior part of the shell retained open by the crenatures with which it is beset. This sort inhabits the American seas. Also a species of conus, the shell of which is yellow, clouded with white.

BULL-BAITING, the inhuman and unmanly sport of setting bull-dogs on a bull, who is tied to a stake, with the points of his horns muffled; thus depriving him of the use of his natural weapons of defence, and then exposing him to be torn to death for the mere amusement of those

who take a delight only in cruelty. The first bull-bait in this country is said to have taken place at Stamford in 1209. The introduction of it was as follows:—‘William, earl Warren, lord of this town, standing upon the walls of the castle, saw two bulls fighting for a cow in the castle meadow, till all the butchers’ dogs pursued one of the bulls, maddened with noise and multitude, clean through the town. This sight so pleased the earl, that he gave the castle meadow, where the bull’s duel began, for a common to the butchers of the town, after the first grass was mowed, on condition that they should find a mad bull, the day six weeks before Christmas-day, for the continuance of that sport for ever.’

BULL-DOG, *n. s.* From bull and dog. A dog of a particular form, remarkable for his courage, and the savage pertinacity with which he provokes and continues the fight. When he has once fastened his bite on his antagonist, he cannot be taken off without much difficulty. He is a species of mastiff, on a smaller scale, with a somewhat flatter snout, a more ferocious aspect, pendulous lips, and a short thick neck. He is used in baiting the bull; and this species is so peculiar to Britain, that they are said to degenerate when they are carried to other countries.

All the harmless part of him is that of a *bull-dog*; they are tame no longer than they are not offended.

Addison.

BULLEN (Anne). See **BOLEYN**.

BULLENGER, in old statutes, a boat or a small ship.

BULLERS BUCHAN, THE POT OF, or the BOILERS OF BUCHAN, a large oval cavity in the rocks on the coast of Aberdeenshire, 150 feet deep, round which there is a foot-path. Boats sail into it from the sea, under a natural arch, resembling a large Gothic window. Near this, there is a vast insulated rock, divided by a narrow and very deep chasm from the land. About the middle of this rock, many feet above the level of the water, there is a large triangular aperture, through which the waves, when agitated, rush with tremendous noise.

BULLET, *n. s.* Fr. *boulte*; Goth. *boll*; Arm. *bolot*. See **BALL** and **BOWL**. A round ball of metal, usually shot out of guns.

As when the devilish iron engine, wrought
In deepest hell, and framed by furies skill,
With windy nitre and quick sulphur fraught,
And rammed with *bullet* round, ordained to kill.

Spenser.

Giaffer, their leader, desperately fighting amongst
the foremost of the janizaries, was at once shot with
two *bullets*, and slain.

Knolles.

And as the built, so different is the fight;
Their mounting shot is on our sails designed;

Deep in their hulls our deadly *bullets* light,
And through the yielding planks a passage find.

Dryden.

— Not even

A guard in sight; they wisely keep below,
Sheltered by the grey parapet, from some
Stray *bullet* of our languenets, who might
Practise in the cool twilight.

Byron. Deformed Transformed.

BULLET-BORE is a steel shank, having a globe at one end, wherewith to bore the inside of a bullet-mould clean, of the size intended.

BULLET IRON, a denomination given by some to Spanish or Swedish bars of iron.

BULLET-MOULDS, iron moulds for casting bullets. They consist of two concave hemispheres, with a handle whereby to hold them; and between them is a hole, called the gate, to pour in the melted metal. The chaps or hemispheres of bullet-moulds are first punched, being blood-red hot, with a round ended punch, of the shape and nearly of the size of the intended bullets. To cleanse the insides a bullet-bore is used.

BULLEYN (William), a learned physician and botanist, born in the Isle of Ely, in the former part of the reign of Henry VIII., and educated at Cambridge. He travelled through various parts of England, Scotland, and Germany, chiefly with an intention to improve his knowledge in botany. In the reign of Edward VI., or queen Mary, Mr. Bulleyn appears, from his remarks on the natural productions of that country, to have resided at Norwich, or near it, and to have spent some time at Bloxhall in Suffolk: but he afterwards removed into the north, and settled at Durham, where he practised physic with reputation. His great patron was Sir Thomas Hilton, knight baron of Hilton, who was governor of Teignmouth castle in the reign of Philip and Mary. In 1569 he came to London, and, soon after his arrival, was accused by William Hilton of Bidick, of having murdered his brother Sir Thomas, our author’s friend and patron. He was arraigned before the duke of Norfolk, and honorably acquitted. This Hilton afterwards hired some villains to assassinate the doctor; but the attempt proving ineffectual, he had him arrested on an action for debt, and he remained for a long time in prison. During this confinement, Dr. Bulleyn composed several of those works which raised his reputation as a medical writer. He died in January, 1576, and was buried in St. Giles’s, Cripplegate, in the same grave with his brother the divine, who died thirteen years before, and in which John Fox, the martyrologist, was interred eleven years after. Dr. Bulleyn appears from his writings to have been well acquainted with the works of the ancient Greek, Roman, and Arabian physicians. He was a man of genius and fertile imagination, and his works are by no means barren of entertainment, though his practice is obsolete. He wrote, 1, *The Government of Health*, 1559, 8vo. 2. *A Regimen against the Pleurisy*, 8vo. London, 1562, &c.

BULL-FEAST. See **BULL-FIGHTING**.

BULL-FIGHTING, a sport or exercise much in use among the Spaniards and Portuguese, consisting in a kind of combat of a cavalier or torreadore against a wild bull, either on foot or on horseback, by riding at him with a lance. The Spaniards have bull-fights in honor of St. John, the Virgin Mary, &c. This sport the Spaniards received from the Moors, among whom it was celebrated with great eclat. The practice was prohibited by pope Pius V., under pain of excommunication incurred *ipso facto*. But succeeding popes have granted several miti-

gations in behalf of the torreadores. The following account of a bull-feast in the Coliseum at Rome, in 1332, extracted from Muratori by Mr. Gibbon, may give some idea of the early pomp, ceremonies, and danger, which attended these exhibitions:—‘A general proclamation, as far as Rimini and Ravenna, invited the nobles to exercise their skill and courage in this perilous adventure. The Roman ladies were marshalled in three squadrons, and seated in three balconies, which on this day (the 3d Sept.) were lined with scarlet cloth. The fair Jacova di Rovere led the matrons from beyond the Tiber, a pure and native race, who still represent the features and character of antiquity. The remainder of the city was divided between the Colonna and Ursini families: the two factions were proud of the number and beauty of their female bands: the charms of Savella Ursini are mentioned with praise; and the Colonna regretted the absence of the youngest of their house, who had sprained her ankle in the garden of Nero’s tower. The lots of the champions were drawn by a respectable citizen; and they descended into the arena or pit, to encounter the wild bulls, on foot, as it should seem, with a single spear. Amidst the crowd, our annalist has selected the names, colors, and devices, of twenty of the most conspicuous knights. . . Several of the names are the most illustrious of Rome and the ecclesiastical state; Malatesta, Polenta, della Valle, Cafarello, Savelli, Cappoccio, Conti, Annibaldi, Altieri, Corsi. The colors were adapted to their taste and situation; and the devices, expressive of hope or despair, breathed the spirit of gallantry and arms. ‘I am alone, like the youngest of the Horatii,’ the confidence of an intrepid stranger: ‘I live disconsolate,’ a weeping widower: ‘I burn under the ashes,’ a discreet lover: ‘I adore Lavinia or Lucretia,’ the ambiguous declaration of a modern passion: ‘My faith is as pure,’ the motto of a white livery: ‘Who is stronger than myself?’ of a lion’s hide: ‘If I am drowned in blood, what a pleasant death!’ the wish of ferocious courage. The pride or prudence of the Ursini restrained them from the field, which was occupied by three of their hereditary rivals, whose inscriptions denoted the lofty greatness of the Colonna name: ‘Though sad, I am strong:’ ‘Strong as I am great:’ ‘If I fall (addressing himself to the spectators) you fall with me:’—intimating (says the writer), that while the other families were the subjects of the Vatican, they alone were the supporters of the Capitol. The combats of the amphitheatre were very dangerous and bloody. Every champion successively encountered a wild bull; and the victory may be ascribed to the quadrupeds, since no more than eleven were left on the field, with the loss of nine wounded and eighteen killed on the side of their adversaries. Some of the noblest families might mourn; but the pomp of the funerals, in the churches of St. John Lateran, and St. Maria Maggiore, afforded a second holiday to the people. It was not in such conflicts that the blood of the Romans should have been shed; yet, in blaming their rashness, we are compelled to applaud their gallantry; and the volunteers, who display their magnificence, and risk their

lives under the balconies of the fair, excite a more generous sympathy than the thousands of captives and malefactors who were reluctantly dragged to the scene of slaughter.’ We extract the description of a modern Spanish bull-fight, from the travels of a literary friend:—

‘In honor of Lord Wellington a bull-fight was exhibited at St. Mary’s, Cadiz, at which I attended. This diversion, peculiarly belonging to the Spanish nation, has fallen into disuse, and lately has been restricted by orders from the government, though under new regulations it is still sometimes permitted. The Plaza de Toros is a large amphitheatre, capable of holding 14,000 persons. On this occasion it was not full, and I suppose that not more than 10,000 people were present. The appearance of the assembly was striking, and a degree of interest was excited in every countenance, which, I should previously have thought, a much more important contest would scarcely have called forth. I entered the place at the moment when the first bull was killed, and horses, gayly decorated, were dragging him from the circle, amid the sounds of music, and the applauding shouts of the people.

‘Preparations were made for a fresh conflict: three men were posted behind each other, about ten yards asunder, mounted on small, but active horses, and armed with a spear about fifteen feet long; and five or six men on foot, dressed in scarlet cloaks, were placed in other parts of the arena. The gates were thrown open, and the bull rushed in. He made towards the first horseman, who received him on the point of his spear, and wounded him between the shoulders; this turned him, and he attacked the second horseman with great fury; but from the want either of dexterity in the rider, or agility in the animal, the horse was dreadfully gored in the body, and his bowels fell on the ground. The combatants were soon disentangled, and the bull attacked the third horseman, who received him like the first, and wounded him severely. He now became furious, and galloped round the circle; but either from the loss of blood, or the pain he endured, he was fearful of facing the horsemen; the men on foot then began to irritate him, by sticking small darts in his body, and, whenever he made a push at them, threw the cloak over his eyes, and with great dexterity avoided his thrust.

‘This irritation was continued some time, till the animal, streaming with blood, became exhausted. The matador, or principal actor, then made his appearance, armed with a small sword and cloak: he advanced towards the bull, which ran and pushed at him, but the man received the thrust on his cloak, and stepping nimbly aside, withheld his blow, because the animal did not present himself in the exact attitude which the matador required for despatching him with grace; he then made a second advance towards the animal, and, while he was in the act of pushing at him, plunged the sword up to the hilt between his shoulders; the bull ran a few paces, staggered, and dropped dead. The trumpets sounded a flourish: horses galloped in, were fastened to the carcass, and

the standard silver of such countries. According dragged it away, amid the applauding shouts of the spectators.

Six or seven other bulls were then in succession despatched in a similar manner, with only such variations as were occasioned by the different degrees of courage which the animals possessed. When the last bull was fighting, the matador so contrived it that he gave him the coup de grace immediately under the box in which Lord Wellington and the English party were seated. Before this operation, he addressed himself to his Lordship, and said, with much dignity, that he should kill that bull to the health of King George the Third, which was quickly performed. His Lordship threw him some money, after which the entertainment closed.

This bull-fight was represented to me as a very inferior exhibition, owing to the coolness of the weather, the bulls having much more courage during the intense heat of summer than at the present season. It is certainly a cruel amusement both to the bulls and to the horses, though attended with little danger to the men. One horse was destroyed, by having his belly lacerated: after he was wounded, and his bowels trailing on the ground, the rider continued the fight, and galloped round the circle, while the poor animal literally trampled on his own entrails at every step, a sight more disgusting than this can scarcely be conceived, and even the bull, though streaming with blood, had not nearly so repulsive an appearance. The men were secured from much danger by their own agility, by the dextrous application of their cloaks, when the animal charged them, and by the barriers placed round the circle, behind which they retired when pressed by the bull.

However repugnant this diversion may appear to every delicate and feeling mind, it is more frequented and admired by the ladies than by the gentlemen; they attend these exhibitions in their gayest dresses, applaud the address of the inhuman combatants, and feel the greatest solicitude at the different critical turns of the fight. Many of the young country gentlemen may trace their ruin to these spectacles, as decidedly as Englishmen of the same class may trace theirs to Newmarket. In fact, it is the great object which engages the attention of that description of men distinguished by the term Majos.

BULL-FINCH, n. s. Rubicilla. A small bird that has neither song nor whistle of its own, yet is very apt to learn, if taught by the mouth.—See RUBICILLA.

The blackbird whistles from the thorny brake,
The mellow bull-finch answers from the groves.

Thomson.

BULL-FLY, n. s. } A species of fly.
BULL-BEE. }

BULL-FROG, in zoology. See RANA.

BULL-HEAD, n. s. From *bull* and *head*. In ichthyology, the name of a fish, sometimes called the miller's thumb. See ANGLING, and COTIUS.

BULLIALDUS (Ismael), an eminent astronomer, born at Houdon in France, in 1605. He

travelled in his youth for improvement; and afterwards published several works, among which are: *De Natura Lucis*; *Philolaus*; *Astronomia Philolaica*, *Opus Novum in quo Motus Planetarum per Novam et Veram Hypothesin Demonstrantur*; *Astronomia Philolaica Fundamenta Clarius Explicata et Asserta, Adversus Sethi Wardi Impugnationem*; *Delineis Spiralitris*, *Opus Novum ad Arithmeticum Infinitorum*, fol. &c. In 1661 he paid Hevelius a visit at Dantzic, for the sake of seeing his optical and astronomical apparatus. Afterwards he became a priest at Paris, and died there in 1694.

BULLIMONG, or **BULLIMONY**, a mixture of several sorts of grain, as oats, peas, and vetches, called also maslin or mong corn.

BULLINGER (Henry), born at Bremgarten, in Switzerland, in 1504, was an eminent Zuinglian minister, and a great supporter of the Reformation. He was educated first at Emmeric, and afterwards at Cologne, where he applied to the study of divinity and the canon law. In 1528 he accompanied Zuinglius to the disputation at Berne, and the following year was called to the ministry at his native place. The victory gained by the Romish cantons over the Protestants in 1531, obliged him to fly with his family to Zurich, where he was chosen pastor in the room of Zuinglius, who had fallen in that battle. He died in 1575. His works are numerous, and it is remarkable that his sermons were ordered to be read by the clergy of the church of England.

BULLION. Fr. *billon*; Sp. *billon*; Ital. *bol-lone*, from Lat. *bullā*, signified every kind of metal ornament worn by the people, which was collected by agents for the use of the mint. Something of the same kind seems to have occurred in Spain, where it was called *vellon*.

But for to tell the sumptuous array
Of that great chamber, should be labour lost;
For living wit, I wene cannot display
The roiall riches and exceeding cost
Of every pilour and of every post,
Which all of purest bullion framed were,
And with great perles and precious stones embost;
That the bright glister of their beames cleare
Did sparkle forth great light, and glorious did appeare.

Spenser.

The balance of trade must of necessity be returned in coin or bullion.

Bacon.

A second multitude,
With wondrous art, found out the massy ore,
Severing each kind, and scummed the bullion dross.

Milton.

In every vessel there is stowage for immense treasures, when the cargo is pure bullion.

Addison.

BULLION. The term bullion is applied to the precious metals, either when smelted from the ore, and not perfectly refined, or when refined, and melted down in bars, or ingots; or any unwrought body of a certain degree of fineness. In order to render gold and silver fit for use, it is necessary to reduce and harden them by an alloy of some baser metal: and the quantity of this alloy is ascertained by the legislative regulations of different countries, so that the proportion of the one to the other may constitute

to the laws of England all sorts of wrought plate should be made in conformity to the legal standard: and the prices of standard gold and silver regulate the value of the bullion, consisting of ingots, bars, dust, or foreign specie; consequently, in order to ascertain the value of bullion, it is first assayed. See ASSAY, GOLD, and SILVER.

Silver as well as gold bullion is sometimes also denominated plate.

Silver and gold, whether coined or uncoined, though used for a common measure of other things, are no less in modern times a regular commodity of trade than wine, tobacco, or cloth; and may, in many cases, be exported to as much national advantage.

Bullion is alternately imported and exported, from this and every country of considerable commerce, for the purposes of assisting foreign trade; and in the same manner as the national coin circulates in every particular country, bullion may be considered as the money of the great mercantile republic.

Both are employed in facilitating exchanges, the one between different individuals of the same, the other between those of different nations, and bullion, by thus opening new and inexhaustible markets to all the commodities of Europe, gives occasion to new divisions of labor and improvements of art, which, in the narrow circle of the ancient commerce, must have remained for ages discovered or unknown.

According to Mr. Locke, gold and silver are the most solid and substantial part of the movable wealth of a nation; and to multiply these metals should, he thinks, on that account, be the great object of its political economy. Countries that have political connexions with foreign nations, and are obliged occasionally to carry on foreign wars, and to maintain fleets and armies in distant countries, to subsidize foreign princes, &c. are under a necessity of sending money in some form or other abroad; and therefore it has been said that in time of peace it should endeavour to accumulate gold and silver, that when occasion requires, it may possess the means of carrying on war. Upon these principles all the different nations of Europe formerly studied, though to little purpose, to accumulate gold and silver in their respective countries. Spain and Portugal, the proprietors of the principal mines which supplied Europe with those metals, either prohibited the exportation of them under the severest penalties, or subjected them to a considerable duty. The like prohibition seems anciently to have made a part of the policy of most other European nations. But, when those countries became commercial, the merchants found this extremely inconvenient, and remonstrated against it, as hurtful to trade.

The prohibition of exporting gold and silver was now therefore restricted in France and England to the coin of these respective countries. The exportation of foreign coin and bullion was made free; the first law for this purpose in England was passed 1663. In Holland, and in some other places the liberty was extended even to the coin of the country. A country that has no mines of its own, must

undoubtedly draw its gold and silver from foreign countries; and, on account of their small bulk and great value, they are as easily transported as obtained. When the quantity of gold and silver imported into any country exceeds the effectual demand, no vigilance of government can prevent their exportation. But the sanguinary laws of Spain and Portugal are not sufficient for keeping their gold and silver at home. And as they are easily transported from places where they abound, to those where they are wanted, their price does not admit of the same fluctuation with that of many other commodities, that are not so conveniently and speedily removed. The changes which take place in their value are generally slow, gradual, and uniform.

Instead of accumulating gold and silver, with a view to the augmentation of the real wealth of the country, Dr. Adam Smith (*Wealth of Nations*, vol. ii. p. 157.) recommends their being considered, under whatever form they exist, as utensils; and increasing the use for them, by increasing the consumable commodities, which are to be circulated, managed, and prepared by means of them, as the most effectual and most certain method of increasing their quantity, which will ever keep pace with the use to which they are applied; and beyond this no law he insists can ever prevent their being immediately sent out of the country. He adds, that it is not always necessary to accumulate gold and silver, in order to enable a country to carry on foreign wars, and to maintain fleets and armies in distant countries. Fleets and armies are maintained, not with gold and silver, but with consumable goods; and the nation which, from the annual produce of its domestic industry, from the annual revenue arising out of its lands, labor, and consumable stock, has wherewithal to purchase those consumable goods in distant countries, can maintain foreign wars there.

Such has been the doctrine with regard to bullion which has been expressed in modern times, and the subject has derived more importance of late from its obvious connexion with the great questions of our PAPER and GOLD CURRENCY.

No topic has been more elaborately discussed in parliament or has been the subject of greater consideration amongst both practical and speculative political economists and merchants. In February, 1810. Mr. Horner obtained what was called his Bullion Committee, or a Committee of the House of Commons to enquire into the cause of the high price of gold bullion, and to take into consideration the state of the circulating medium of exchanges. This committee was named with considerable impartiality, and was engaged during two months in the examination of evidence; which consisted chiefly of the testimony of bullion dealers, merchants, bankers, and bank directors. The leading members in the committee, next to Mr. Horner, are understood to have been Mr. Huskisson, and Mr. Henry Thornton.

As complete a practical view as we can give of the important topics connected with these questions will arise out of an epitome of the Report that was now published.

It begins with a statement of the extraordinary

rise of bullion in our market, and of the endeavours of the committee to ascertain what cause, in the opinion of mercantile men, had led to this irregularity. To the notion entertained by several witnesses, that it was owing to a rise of gold on the continent, the committee could by no means subscribe. The sudden rise in our foreign exchange formed the next topic of enquiry; and here, as in the other point, the committee differ from the opinions of practical men, the majority of whom attributed it to the foreign expenses of government, and to the excess of our imports in 1809 above our exports. Two merchants, however, if they did not go so far as the committee, in declaring a depreciation of our bank-notes, were of opinion, that their nonconvertibility into cash had been materially instrumental in preventing a re-establishment of the rate of exchange. The committee, in arguing that a considerable part of the inequality of the exchange must be owing to a fall in our paper currency, enter into a very instructive explanation of the distinction between real and nominal exchange; but they are less successful in an attempt to calculate the relative amount of our exports and imports for the year 1809.

The third topic of investigation, the enquiry into the rules of the bank in respect to their issues, gave rise to some anxious answers. The bank directors appear to have become by this time suspicious of the intentions of the committee, and fought hard to ward off (Evidence, p. 79 and 89,) some of their probing questions. The point on which they were chiefly at variance, was, whether the amount of their issues ought or ought not to be regulated by a reference to the price of bullion, and the condition of the foreign exchange. The committee contend for the affirmative, while the bank assert, that the validity of the bills presented to them for discount, should form almost the only subject of consideration. The bank also oppose the idea, that the irregular state of the exchange is owing, in any degree, to a degradation of their paper; an allegation which leads the committee into a series of arguments to show that depreciation has been known to exist in cases where the currency was, like that of the Bank of England, of undoubted character as to ultimate solvency. The early part of the history of the bank of England itself, the case of the Scotch banks in 1763, and the more recent example of the bank of Ireland in 1809, are all adduced in support of this position. The committee then conclude this part of the Report, with a mixture of praise and censure on the bank directors. Their conduct, in not attending to the price of bullion and state of exchange, is said to involve great practical errors; while their moderation in limiting the amount of their issues, is declared to entitle them to a continuance of the confidence so long reposed in them by the public. The fourth and last division of the Bullion Report, regards the progressive increase of our paper currency. After exhibiting a list of the annual quantity of bank of England notes in circulation since 1793, and commenting on the bank advances to government, as well as to the mercantile body for discounts, the committee are led into an enquiry into the circulation

of country banks. Here, from the scantiness of materials, the greatest caution was necessary; and from the want of it the committee came to various conclusions which have since proved fallacious. They sum up the Report by declaring the existence of an excess in our paper currency; by ascribing this excess to the absence of the salutary check of cash payments; by lamenting the evils attendant on depreciated currency; by dissuading the adoption of any indirect schemes to limit our paper circulation; and by recommending an act of parliament to resume cash payments within the space of two years.

Such was the fruit of the wide researches and close investigation of the ablest of our statesmen into this subject at a recent period. Strong efforts it is said were made by ministers, in the progress of the enquiry, to negative the proposition, that bank paper was understood to be depreciated, but in vain; the majority of the committee having made up their minds to an opposite conclusion: and the calamities that have since attended every branch of the paper system but too fully corroborate the truth of their opinion: but see CURRENCY.

BULLITION. Lat. *bullire, ebullire*; Fr. *bouillir*, to boil. See **BOIL**.

There is to be observed in these dissolutions, which will not easily incorporate, what the effects are, as the *bullition*, the precipitation to the bottom, the ejaculation towards the top, the suspension in the midst, and the like. *Bacon*.

BULLOCK. See **BOS**.

BULL'S EYE, in astronomy. See **ALDEBARAN**.

BULL'S EYE, a sort of small pulley, in the form of a ring, having a rope spliced round the outer edge of it, and a large hole in the middle for another rope to slide in. It is seldom used by English seamen.

BULL'-WEED, *n. s.* in botany, the same with knap-weed. See **CENTAUREA**.

BULL'-WORT, or **BISHOPS'-WEED**, *n. s.* Lat. *ammi*. A plant, of which there are two species, *sison ammi*, and *ammi majus*.

BULTERS, in fishing, strong lines used on the coast of Cornwall in the fishery of congers.

BULLY, *v. & n.* } Belg. *bulleman*. See **BULL**
BULLY'BACK, } and **BUG**. Either from bull,
BULLY'ING, *n.* } the animal, fierce, savage, and bellowing; or from the pope's bull, which is arrogant, blustering, and authoritative. **Bully** is a noisy blustering fellow, one who endeavours to inspire others with fear. To bully is to threaten, to domineer, to bluster, to inspire terror by insolence and vulgar noise, by the appearance of a courage foreign to his heart.

Mine host of the garter!—What says my *bully* rock? Speak scholarly and wisely. *Shakspeare*.

'Tis so ridiculous, but so true withal,

A *bully* cannot sleep without a brawl. *Dryden*.

A scolding hero is, at the worst, a more tolerable character than a *bully* in petticoats. *Addison*.

The little man is a *bully* in his nature, but, when he grows choleric, I confine him till his wrath is over. *Id.*

But when the *bully* with assuming face
 Cocks his broad hat, edged round with tarnished lace,
 Yield not the sway; defy his strutting pride
 And thrust him to the muddy kennel's side. *Gay*.

BULLY'-TREE, the English name of the *achras sapota*.

BUL'RUSH, the English name of the *scirpus lacustris*.

To make fine cages for the nightingale,
And baskets of *bulrushes*, was my wont. *Spenser*.
All my praises are but as a *bulrush* cast upon a
stream; they are born by the strength of the current.
Dryden.

BUL'WARK, *v. & n.* Goth. *bolwerk*; Swed. and Belg. *bolwerk*; either from *bol*, great, or Goth. *bol*, the trunk of a tree; Fr. *boulevard*; Ital. *bolvardo*, have Goth. *ward*, defence, instead of *wark*. To fortify, to secure. A bulwark is what is now called a bastion; generally a fortification; a skreen; a shelter.

The other five, five sondry ways he sett,
Against the five great *bulwarks* of that pyle,
And unto each a *bulwarke* did arret,
T' assaile with open force or hidden guyle,
In hope thereof to win victorious spoile. *Spenser*.

Some making the wars their *bulwark*, that have be-
fore gored the gentle bosom of peace with pillage and
robbery. *Shakespeare*.

They oft repair
Their earthen *bulwarks* 'gainst the ocean flood. *Fairfax*.

And yet no *bulwarked* town, or distant coast,
Preserves the beauteous youth from being seen.
Addison.

Our naval strength is a bulwark to the nation. *Id.*
Taking away needless *bulwarks*, divers were de-
molished upon the sea coasts. *Hayward*.

The unworthy successor of Julian shamefully sur-
rendered to the barbarians the important city of Nisi-
bis, the firmest *bulwark* of the provinces of the east.
Gibbon.

BUM, *v. & n.* } Belg. *bom*; Per. Swed.
BUM'BLE, } Welsh, and Irish, *bom*; Dutch
BUM'P. } *bommen*, *bombannen*. Its pri-
mary meaning is a noise which some things make
when fallen, or struck upon or against another;
it is also applied to the natural sounds made by
the bittern and the bee. From sound its mean-
ing has been transferred to bulk; thus bump
describes the swelling or bump which is pro-
duced by a blow; and bum the very ample sub-
stance on which we sit, more plainly called the
buttocks. It is probably contracted from bottom.

And as a bitore *bumbleth* in the mire,
She laid her mouth unto the water down.
Chaucer's Canterbury Tales.

Troth, and your *bum* is the greatest thing about you,
so that in the beastliest sense you are Pompey the
great. *Shakespeare*.

It had upon its brow a *bump* as big as a young
cockrel's stone; a perilous knock, and it cried bitterly.
Id.

The wisest aunt telling the saddest tale,
Sometime for three-foot stool mistaketh me,
Then slip I from her *bum*, down topples she. *Id.*

This said, he gently raised the knight,
And set him on his *bum* upright. *Hudibras*.

So learned Taliacotius, from
The brawny part of porter's *bum*
Cut supplemental noscs, which
Wou'd last as long as parent breech;
But when the date of nock was out,
Off dropt the sympathetic snout. *Id.*

From dusty shops neglected authors come,
Martyrs of pies and relics of the *bum*. *Dryden*.

Then to the water's brink she laid her head,
And as a bitour *bumps* within a reed,
To thee alone, O lake, she said — *Id.*
Not though his teeth are beaten out, his eyes
Hang by a string, in *bumps* his forehead rise. *Id.*

BUMALDA, in botany, a genus of the di-
gynia order, and pentandria class of plants;
cal. five parted: cor. five-petalled; styles
villous; capsule two celled, and two-beaked.
One species only: a shrub of Japan.

BUMBAILIFF, *n. s.* This is a corruption
of *bound bailiff*, pronounced by gradual corrup-
tion *boun*, *bun*, *bum* bailiff. A bailiff of the
meanest kind; one that is employed in arrests.

Go, Sir Andrew, scout me for him at the corner of
the orchard, like a *bumbailiff*. *Shakespeare*.

BUMBARD, *n. s.* Wrong written for Bom-
bard, which see. A great gun; a black jack; a
leathern pitcher.

Yond same black cloud, yond huge one looks
Like a foul *bumbard*, that would shed his liquor.
Shakespeare.

BUMBAST, *n. s.* Falsely written for *bom-
bast*; *bombast* and *bombasine* being mentioned,
with great probability, by Junius, as coming from
boom a tree, and *sein* silk; the silk or cotton of a
tree. Mr. Steevens, with much more probability,
deduces them all from *bombycinus*. See Bom-
BAST.

We have received your letters full of love,
And, in our maiden council, rated them
As courtship, pleasant jest, and courtesy,
As *bumbast*, and as lining to the time.
Shakespeare.

The usual *bumbast* of black bits sewed into ermine,
our English women are made to think very fine.
Grew.

BUMELIA, a bastard bully-tree, in bo-
tany, a genus of the class pentandria, order
monogynia: cal. perianth, five-leaved: cor.
five-cleft; nectary, five-leaved; drupe, seed
single. Twelve species, all shrubs and trees of
South America, or the West Indies.

BUMICILLI, a sect of Mahomedans in Egypt
and Barbary, who pretend to fight with devils,
and commonly appear in a fright and covered
with wounds and bruises. About the full moon
they counterfeit a combat in the presence of all
the people, which lasts for two or three hours,
and is performed with assagaia, or javelins, till
they fall down quite spent.

BUMKIN, or BOOMKIN, in sea language, is
a short boom or bar of timber, projecting from
each bow of a ship, to extend the lower edge of
the fore-sail to windward. It is secured by a
strong rope, which confines it to the ship's bow.

BUMM, a city of Persia, the capital, and
formerly a frontier town, of the province of
Kerman, situated in a plain in the vicinity of high
mountains. It is regarded as one of the strongest
towns in Persia, and has a very thick and high
mud wall, with six large bastions on each face,
exclusive of others more lofty at the corners.
A dry ditch, very deep and broad, surrounds the
walls. The only access to the town, which
stands on an eminence, is between the two
centre bastions, on the southern face. The citadel,
also fortified by its own walls and towers,
occupies the highest part of the eminence, and

contains the governor's palace. This city has formerly been much larger, but its fountains are still celebrated as the finest in Persia, and the bazaar is tolerably large, and well supplied with provisions. The gardens of the neighbourhood are famous for pomegranates. The Afghans, when they invaded Persia in 1719, are said to have first settled this place. Since this period it has undergone many revolutions. Hitherto Looft Ali Khan, the last of the Zund dynasty, fled from the city of Kerman, and was treacherously seized in the year 1794, while in the act of mounting his horse to escape. Being sent to Mahomed Aga Khan, the king of Persia, he, with his own hands, put out Looft Ali's eyes, and afterwards ordered him to be strangled at Teheran. On the spot of his capture was raised a pyramid formed of 900 of the heads of his followers.

BUMP'ER, Belg. *borboord*. Above the border or edge. A glass filled to the brim. Any place or thing over-filled.

Places his delight

All day in playing *bumpers*, and at night

Reels to the bawds.

Dryden's Juvenal.

He cherished his friend, and he relished a *bumper*; Yet one fault he had, and that one was a thumper.

Goldsmith's Retaliatio.

BUMP'KIN, } Perhaps from *boobykin* says
BUMP'KINLY. } Thomson. This word, says Johnson, is of uncertain etymology; Henshaw derives it from pumpkin, a kind of worthless gourd, or melon. This seems harsh; yet we use the word cabbage-head in the same sense. Bump is used amongst us for a knob, or lump: may not bumpkin be much the same with clodpate, loggerhead, block, and blockhead? An awkward heavy rustic; a country lout.

The poor *bumpkin*, that had never heard of such delights before, blessed herself at the change of her condition.

L'Estrange.

A heavy *bumpkin*, taught with daily care,
Can never dance three steps with a becoming air.

Dryden.

In his white cloak the magistrate appears;

The country *bumpkin* the same livery wears.

Id.

It was a favor to admit them to breeding; they might be ignorant *bumpkins* and clowns, if they pleased.

Locke.

He is a simple, blundering, and yet conceited fellow, who, aiming at description, and the rustick wonderful, gives an air of *bumpkinly* romance to all he tells.

Clarissa.

BUNCH', *v. & n.* } Goth. *bunds*; Dan. *bundt*;
BUNCHY, } Swed. *bunt*; Swed. *bunke*,
BUNCH'BACKED. } from Isl. *bunga*, to swell.
Thus, its first sense is a cluster, a knot tied together, a bundle; its next meaning is a hump, or boss; a hard lump, or knob. To tie, to bind as in a cluster; to swell out, to grow out in protuberances.

They will carry their treasures upon the *bunches* of camels, to a people that shall not profit them.

Isaiah, xxx. 6.

His locks, like faded leaves, fallen to ground,
Knotted with blood in *bunches* rudely ran;
And his sweet lips, on which before that stound
The bud of youth to blossome faire began,
Spoiled of their rosy red, were waxen pale and wan.

Spenser.

Upon the top of all his lofty crest

A *bunch* of heaves discoloured diversely.

With sprinkled pearly and gold full richly drest,
Did shake, and seemed to daunce for iollity.

Id.

And on his arms a *bunch* of keys he bore.

Id. Faerie Queene.

The day shall come, that thou shalt wish for me,

To help thee curse this poisonous *bunchbacked* toad.

Shakspeare.

All! I know not what ye call all; but if I fought not with fifty of them, I am a *bunch* of raddish.

Id.

Vines, with clustering *bunches* growing.

Id.

Titian said that he knew no better rule for the distribution of the lights and shadows, than his observations drawn from a *bunch* of grapes.

Id.

For thee, large *bunches* load the bending vine,

And the last blessings of the year are thine.

Dryden.

Ancient Janus, with his double face

And *bunch* of keys, the porter of the place.

Id.

The mother's *bunch* of keys, or any thing they cannot hurt themselves with, serve to divert little children.

Locke.

He felt the ground, which he had wont to find even and soft, to be grown hard, with little round balls or *bunches*, like hard boiled eggs.

Boyle.

It has the resemblance of a champignon before it is opened, *bunching* out into a large round knob at one end.

Woodward.

He is more especially distinguished from other birds, by his *bunchy* tail, and the shortness of his legs.

Greiv.

BUNCOMB, a county of the United States, in North Carolina, situated in Morgan district. It is the largest and most westerly county in that state; and is bounded on the east by those of Rutherford and Burke; on the south by South Carolina, and on the north and west by the New State of Tennessee. This county having been formed from those of Burke and Rutherford, since the general census was taken, its present population is not known. It is hilly, the Blue Mountains passing through it to South Carolina. Its principal rivers are the Catawba, Pacolet, and Broad River.

BUNDELCUND, or BANDELKHAND, a Hindostan district in the province of Allahabad, lying principally between 24° and 26° of north latitude, between the rivers Cane and Betwah, and occupying an extent of about 11,000 square miles. In general, this country is mountainous and badly cultivated; the face of it being a heavy close jungle, abounding with tigers. The hills are covered with small coppice wood, there being few timber trees of a large size; in the neighbourhood of Adjyghur, the whole of the Ghants, and almost every hill is a table land, and the country one of the strongest in the world, the hills being from their great height and steepness, natural fortresses. The soil in some places is rich, and produces a number of teak trees, which are, however, of stunted growth.

The diamond mines of Pannah are in this district; in the time of Acber they were valued at eight lacks of rupees, and produced £100,000 per annum, but are not now so productive; in 1750 they were not worth more than £50,000 per annum: their value since has never been regularly ascertained. The chief towns besides Pannat, late the residence of an independent

rajah, are Chatterpoor, Teary, and Jyghtpoor, Callinjer, Jhanse, Dulteen, and Bejaour. The Pannah mines are situated in a range of hills called Bund-Ahill by the natives, extending above twenty miles in length by between two and three in breadth, and are said to be partitioned into twenty-one divisions. Of these, the mines of Maharajepoor, Rajepoor, Kimmerah, and Guddaseah, contain the finest diamonds; one dug from the last has been reputed the largest now known.

The inhabitants, called Bondelas, are proud, brave, and warlike, ever acting under the full impulse of those violent passions which sway the inhabitants of the east. A catastrophe occurred not long ago, when the fortress of Adjglur was evacuated to the British, which fully elucidates this:—The removal of the family of the Zemindar, who had occasioned hostilities, having been directed, his father-in-law was desired to prepare the females for it. Instead of doing so, however, he murdered the whole family, and their children, eight in number, and then put an end to his own existence. What was still more extraordinary, the perpetration of his horrible deed was apparently with the consent, and at any rate without any complaint on the part of the sufferers. The Bondelas are either Bramins or Rajpoots.

Under the former chiefs the government was denominated the Hindupati of Bundelcund, the rajahs being of the Bundela tribe of Rajpoots. Their founder was Rajah Beer Singh, from whom the family of the Oorchia chief is descended. Bundelcund was from a remote period divided into several petty sovereignties. Rajahs of Callinger are mentioned by Mahomedan writers so early as the eleventh century, but it does not appear to have been incorporated with Bundelcund for several centuries afterwards. In the sixteenth century, a bondela, living in Benares, removed, we are told, to a fort in the district of Ouncha, then governed by a rajah, whose confidence he obtained. This bondela had a daughter of great beauty, of whom the rajah became enamoured, and demanded her in marriage. Consent being obtained, the rajah was invited to the house of her father, where the ceremony was to be performed, and where a splendid entertainment was prepared, of which he partook plentifully, but, poison having been treacherously administered, when the victims became incapable of defence, the prince and his attendants were all basely massacred. The bondela then placed himself on the musnud of the rajah, which he enjoyed with undeserved peace until his death. He was succeeded by Ber Sing Deo, his son, whose descendant is the rajah of Ouncha, accused of being a great plunderer, and he gained an accession of power by his services to the Soubahdar of Allahabad. His history is stained by the assassination of the celebrated Abul Fazel, prime minister of Ackbar, in which it is said he acted in compliance with the wishes of Jehangeer, the emperor's son, who was jealous of Abul Fazel's influence over his father, and who, on his accession to the throne of Delhi, entrusted Ber Sing Deo with the government of all Bundelcund, then called Dun-

VOL. IV.

gush. About the middle of the last century, during the government of the Rajah Chattersaul, this territory was invaded by the chief of Furruckabad; when the rajah, to aid him in repelling the enemy, obtained the support of the Peshwa, Sewai Bajerow, on the condition of adopting him. Having driven off the invader, he partitioned Bundelcund between him and two of his own sons, allotting him a third of his dominions, the land revenue of which was estimated at about £1,300,000 sterling. He left also a numerous race of dependent children. Civil wars soon ensued from this state of things, and the weakness of the chiefs afforded a temptation for other invasions. Rajah Himmut Bahaudar, who commanded a great body of cavalry, and was the spiritual head and military leader of a numerous sect of devotees called Gosseins, united with Ali Bahaudar, an illegitimate grandson of Bajeroci, in 1786, in a project of this kind. The actual invasion took place in 1789, when Ali Bahaudar, acting in the name of the peshwa, conquered much of the district.

Several years elapsed before the establishment of the Mahratta authority; and though an arrangement was made whereby the Peshwa was acknowledged lord paramount of all the conquests effected in Bundelcund by Ali Bahaudar, and tribute assigned to him accordingly, the latter contrived to evade all the conditions of the treaty. He was succeeded in 1802 by his eldest son, Shumshere Bahaudar, then absent at Poonah, and a regent of Bundelcund was appointed until his return.

A war now broke out between the British and the Mahrattas, and Himmut Bahaudar, a chief of great power here, endeavoured to accomplish the transference of this district to the former. Colonel Powell, in September 1823, accordingly crossed the Jumna for the purpose of entering Bundelcund, and was joined by Himmut with a body of 13,000 or 14,000 men.

A proposal was at this juncture made by the Mahrattas, for the cession of a portion of the territory of Bundelcund to the British, in lieu of certain districts in the Deccan, which had been previously ceded. Troops were also stationed in Bundelcund for the protection of other parts, and successive arrangements of a conciliatory nature were made with Shumshere, and the rest of the chiefs, whereby the British authority soon became established. It was thought expedient however, in 1807, to bestow a considerable tract of country on a descendant of the regent Chattersal, on condition of his guarding the passes; arrangements were also made, conceding to the chief of Calpee, on the confines of Bundelcund, a portion of the interior, in lieu of the city and district of Calpee, and several villages on the Jumna. Meantime the fortress of Callinger was besieged, and though, assailed more than once in vain, finally carried: and Bundelcund was ultimately formed into a British district, subordinate to the Benares court of circuit, and a civil establishment appointed for the administration of justice, and collection of the revenue.

In 1805 the estimated revenue derived by the British from Bundelcund was as follows, viz.

The several districts then actually possessed by government, including Calpee, and part of Rypoor, on the banks of the Jumna . . .	1,400,000
The territory of rajah Himmuto Bahader . . .	1 533,184
The districts of Callinjer, Jeypoor, Huldei, and part of Cutolce, below the Ghauts, estimated at five lacks of rupees, but chargeable with Jaghires and provisions for the native leaders . . .	500,000
The city and diamond mines of Panmah, with a portion of territory adjacent, the probable revenue being . . .	200,000
	<hr/>
Rupees	3,633,184

BUNDLE, v. & n. Goth. *bindel*; Swed. *byndel*; Belg. *bondel*. See TO BIND. Various things tied together, a package; a roll, any thing rolled up. To bundle, is to tie; to fasten together; to roll up; to vulgarly to take ones' self off.

As to the *bundles* of petitions in parliament, they were, for the most part, petitions of private persons.

Hale.

Try lads, can you this *bundle* break;—

Then bids the youngest of the six

Take up a well-bound heap of sticks. *Swift.*

See how the double nation lies,

Like a rich coat with skirts of frize;

As if a man, in making posies,

Should *bundle* thistles up with roses. *Id.*

She carried a great *bundle* of Flanders lace under her arm; but finding herself overladen, she dropped the good man, and brought away the *bundle*.

Spectator.

BUNDLES, records of the chancery, lying in the office of the rolls; in which are contained the files of bills and answers; of Hab. Cor. cum causa; certiorari's; attachments, &c. seire facias's; certificates of statute-staple; extents and liberates; supersedeas's; bails on special pardons; bills from the Exchequer of the names of sheriffs; privy seals for grants; bills signed by the king; warrants of escheators, &c.

BUNG *v. & n.* } Dan. *bundt*; Fr. *boudon*.

BUNG *nole.* } See BUNCH. A bunch; a plug; a stopper. Bung-hole is the hole in a cask to receive the bung; but the vulgar bung is supposed to mean the aperture. Bung is by the common people frequently used as a verb; to bung up, in boxing, is to close up the eyes.

Why may not imagination trace the noblest dust of Alexander, till he find it stopping a *bung-hole*?

Shakspeare.

After three nights are expired, the next morning pull out the *bung*, stick, or plug. *Mortimer.*

BUNGALOW, an Indian term for a house with a thatched roof.

BUNGAY, a market town of Suffolk, in the hundred of Wangford, situated on the river Waveney. The town consists of two parishes, St. Mary's and the Holy Trinity, and is well built. The river Waveney enables the inhabitants to carry on a considerable trade in corn, malt, coals and lime. Numbers of women are also

employed in knitting stockings. St. Mary's church is a handsome structure. The church of the Holy Trinity was appropriated to the priory of Barlynch, in Somerset, but now belongs to the bishop of Ely. Here are the ruins of a castle, supposed to have been built by the Bygods, earls of Norfolk, which was formerly fortified. A fire which happened in 1683, consumed the whole town, with the exception of one street. Market on Thursday. Fairs, 14th May and 25th September.

BUNGISHAT, a district of Afghaunistaun, in the province of Cabul, situated about the thirty-third degree of north latitude. It is bounded on the east by the river Indus, and intersected by the Cowmul, along the south side of which Sey-lax is conjectured to have built his vessels, and from thence to have sailed down the Indus. The principal towns are Gawhaut, Kohaut, and Bunnoo. The tribe of Bungish emigrated from Tirah.

BUNGLE, v. & n. } Welsh *bwngler*; q. *bôn*
BUN'GLER, } *ygler*, i. e. the last or
BUN'GLINGLY. } lowest of the profession.—

Davies. A bad workman; a clumsy performer; a man without skill. To make a botch; to manage clumsily; to conduct awkwardly.

Other devils, that suggest by treasons,

Do botch and *bungle* up damnation,

With patches, colours, and with forms, being fetcht

From glistening semblances of piety. *Shakspeare.*

When men want light

They make but *bungling* work. *Dryden.*

Hard features every *bungler* can command;

To draw true beauty shews a master's hand. *Id.*

To see the *bungler* thus distrust

The very fishes sneer and jest,

Even gudgeons join in ridicule

To mortify the meddling fool. *Gay's Fables.*

A *bungler* thus, who scarce the nail can hit,

With driving wrong will make the pannel split.

Swift.

Errours and *bungles* are committed, when the matter is inapt or contumacious. *Ray on the Creation.*

To denominate them monsters, they must have had some system of parts, compounded of solids and fluids, that executed, though but *bunglingly*, their peculiar functions. *Bentley.*

BUNGO, a district or kingdom of Japan, in the island of Ximo. The king was baptised by the name of Francis Civan, and sent an embassy to Pope Gregory XIII. in the year 1582. Its capital is Funay. Long. 132° E., lat. 32° 40' N.

BUNIAS, in botany, a genus of the order stliquosa and tetradynamia class of plants: The siliqua is deciduous, four sided, muricated, or shagreened, with unequal pointed angles, without valve, two or four celled. There are eight species; all annual plants, and natives of the north of Europe.

BUNUM, PIG-NUT, or EARTH-NUT, in botany, a genus of the dignia order, and the pentandria class of plants: natural order, forty-fifth umbellata. Cor. uniform, the umbel thick, and the fruit ovate. There are but four known species. B. bulbocastanum is the chief. It grows naturally in moist pastures in Britain, and has a tuberous solid root, which lies dead on the

ground. The roots of this sort are frequently dug up, and by some people eaten raw. They have much resemblance in taste to a chestnut, whence their specific name.

BUNKER'S HILL, a high ground in the state of Massachusetts, which over-looks the whole city of Boston; rendered memorable by the redoubt erected upon it by the Americans, and consequent action fought, in the beginning of the American war. See AMERICA.

BUNN'. Ital. *bugna*; Fr. *bignet*, Span. *bu-nela*; *Bovv* was a honey cake offered to the gods; and Sax. *beon*, bread, honeycomb. French *big-nets* are little round loaves, or lumps, made of fine meal, oil, or butter, and raisins. In English *bunn* is a kind of sweet bread.

Thy songs are sweeter to mine ear,
Than to the thirsty cattle rivers clear,
Or winter porridge to the laboring youth,
Or *bunns* and sugar to the damsel's tooth.

Gay's Pastorals.

BUNT', } Goth. *bogt*, Sax. *bugunt*; Dan. *BUNT'ER*, } *bug*, *bugt*; Belg. *bogt*. See *To BEND*. Bunt is the middle part of a sail when filled with the wind; bending, swelling out. Bunt, says the Encyclopædia Metropolitana, are perhaps bent or broken bits; and he infers if this be correct, bunter may have been originally applied to one who picks up bits of any thing about the streets or ways, and then to any low woman. But it is far more probable that this offensive term is from the Belgic *roden hoer*, from *rod*, a rag, a *wead*, that is, a ragged wench, a slut. The Saxon *butan lure*, signifies a hedge-whore, or outlier.

The wear is a frith, reaching slopewise through the ooze, from the land to low water mark, and having in it a *bunt*, or cod, with an eye-hook. *Carew.*

Having not flint evermore readie at hand to smite and kindle fire withall, they make shift for to rub and grate one wood against another, and by this attrition there flie out sparkles, which lighting upon some tinder, made either of drie rotten touchwood or of *bunts* and withered leaves, very quickly catch fire, and burne not out. *Holland's Plinie*, vol. i. fol. 490.

See how she's dressed, as fine as hands and pins can make her, while her two marriageable daughters, like *bunters* in stuff gowns, are now taking sixpenny-worth of tea at the White Conduit-house.

Goldsmith. The Bee, No. 2. *On Dress.*

BUNT LINES, are small lines made fast to the bottom of the sails, in the middle part of the bolt rope, to a cringle, and are so reeved through a small block, seized to the yard. Their use is to trice up the bunt of the sail for the better furling it up.

BUNT OF A SAIL, the middle part of it, formed designedly into a bag or cavity, that the sail may gather more wind. It is used mostly in top-sails, because coursers are generally cut square, or with but small allowance for bunt or compass. The bunt holds much to leeward wind; that is, it hangs much to leeward.

BUNTING. Welsh *bontinawg*, fat rump, Belg. *bunting*, however signified speckled. Its first application is to a kind of lark; the vulgar name of the emberiza miliaria. Its next reference is to a kind of the open stuff used for ships' colors, corrupted from boiling cloth.

BUNTING, in ornithology. See EMBERIZA.

BUNTINGFORD, a market town of Hertfordshire, in the hundred of Edwintree, ten miles north from Ware, and thirty-one west from London. The church is situated about half a mile from the town; and is a handsome ancient building. There is also an alms-house and a free-school. Market-day, Monday.

BUNTZLAU, a circle and town of Bohemia, is bounded on the east by the circle of Koningsgratz, on the south by that of Kaurzim, on the west by Leutmeretz, and on the north by Silesia and Lusatia. The northern part is mountainous, and includes a portion of the Reischneberg; several large forests, and many flourishing manufactories of linen, glass, and wool. The rivers which flow from these mountains yield different kinds of precious stones. The level tracts are in general dry and gravelly, but yield noble crops of corn and flax, and an abundance of hops, wine, and fruits. The rivers also afford various precious ores. The whole circle contains 1880 square miles, thirty-eight lordships, thirty-one market boroughs, twelve towns, and 1000 villages, with a population of 280,000 inhabitants. Buntz-lau, the capital, has some good manufactures of leather, cloth, iron, and soap, together with a respectable manufactory, and about 1000 inhabitants. It is twenty-eight miles N. N. E. of Prague, and fifty-eight north-east of Dresden. Old Buntzlau is a smaller place of the same circle.

BUNTZLAC, Silesia, is a town of Silesia, capital of a circle in the province of Jauer. Here are manufactured linen, pottery ware, and woollen cloths. Population 3300. It is twenty-six miles north-west of Jauer, and forty-two west of Schweidnitz.

BUNWOOT, an island lying off the west coast of Mindanao in the Eastern seas, opposite to Mindanao river. It is about eighteen miles in circuit, and has on the north side a harbour called Ubal, almost circular, which is conjectured to have been the crater of a volcano. The island is remarkably healthy and fruitful, and nearly covered with tall timber. Here is a vine, the thickest part of which is about the size of a man's leg, and, being bruised with a hard mallet, it yields a kind of juice which is converted into a useful lee. Wild hogs, monkeys, lizards, and a brown spotted snake, about eighteen inches long, said to be poisonous, are found here. This island was granted to the East India Company, by the sultan of Magindanao, in 1775.

BUNYAN (John), author of the well-known Pilgrim's Progress, was born at Elstow near Bedford, in 1628. He was the son of a tinker; and in the early part of his life a soldier in the parliamentary army. He for some years led a very dissolute life, but at length began to study the Scriptures, and about 1655 was admitted a member of a Baptist congregation at Bedford, of which he was soon after chosen pastor; but, in 1660, being taken up for presuming to preach, was committed to jail, where he supported his family by making tagged laces. In this unjust and cruel confinement he wrote his Pilgrim's Progress, a religious allegory, which has passed through some hundreds of editions, and been translated into most of the languages of Europe.

He was also the author of another work of a similar nature, entitled *The Holy War*. Here he was detained twelve years and a half, and during that time wrote many of his tracts; but was at length discharged by the humane interposition of Barlow, bishop of Lincoln. When King James's declaration for liberty of conscience was published, he resumed his sacred duties. He at length died of a fever in London, 1688, aged sixty. His works have been collected together, and printed in 2 vols. fol.

BUONAPARTE (Napoleon). See *NAPOLEON*.

BUOY', *v. & n.* Bel. *boci*, Fr. *boye*, Ital. BUOY'ANCE, } *boya*, Dan. *bage*, Belg. *boci-*
BUOYANT. } *jen*, *opboeijen*. The noun is applied to a float set in the water; a kind of tub fastened to the anchor of a ship to mark where it lies. The verb signifies to float, to bear on high, to elevate, to sustain, as the float swims, upheld by the water. Buoyancy is lightness, elasticity, alacrity in swimming and keeping up.

The fishermen, that walk upon the beach,
Appear like mice; and yon tall anchoring bark
Diminished to her cock; her cock a buoy,
Almost too small for sight. *Shakspeare. King Lear*.

All art is used to sink episcopacy, and launch presbytery, in England; which was lately buoyed up in Scotland, by the like artifice of a covenant.

King Charles.

All the winged tribes owe their flight and buoyancy to it.

Derham's Physico-Theology.

The water which rises out of the abyss, for the supply of springs and rivers, would not have stopped at the surface of the earth, but marched directly up into the atmosphere, wherever there was heat enough in the air to continue its ascent, and buoy it up.

Woodward's Nat. Hist.

Like buoys that never sink into the flood,

On learning's surface we but lie and nod.

Pope's Dunciad.

Rising merit will buoy up at last.

Id. Essay on Criticism.

His once so vivid nerves,

So full of buoyant spirit now no more

Inspire the course. *Thomson's Autumn.*

Buoy, in sea affairs, a sort of close cask, or block of wood, fastened by a rope to the anchor, to determine the place where the anchor is situated, that the ship may not come too near it, to entangle her cable about the stock or flukes of it. Buoys are of various kinds; as,

Cable buoys are common casks employed to buoy up the cables in different places from rocky ground. In the harbour of Alexandria in Egypt every ship is moored with at least three cables, and has three or four of these buoys on each cable for this purpose.

Can or cone buoys, these are in the form of a cone; and of this construction are all the buoys which are floated over dangerous banks and shallows, as a warning to passing ships, that they may avoid them. They are extremely large, that they may be seen at a distance; and are fastened by long chains to the anchors which are sunk for that purpose at such places. See the diagram annexed.

Nun buoys are shaped like the middle frustum of two cones, abutting upon one common base, being casks, which are large in the middle, and tapering nearly to a point at each end. See the annexed diagram.

The following diagram of an anchor with its buoys and ropes complete will best show their use. A is the great cable buoy, B the buoy-rope with the buoy floating at the surface of the water, C the sustaining ball to prevent the buoy-rope from getting foul of the flukes, &c. of the anchor and cutting; but except on rocky shores this ball is seldom used.

Mr. Peache, of Lambeth, took out a patent for a floating buoy on a new construction in April, 1807. It is formed by pieces of wood longitudinally applied to each other, after the manner of staves; but instead of making the joints to consist of flat surfaces, evenly or squarely applied to or against each other, they are rabbetted together, by making the half thickness of each piece to overlap the other. The faces are to be tarred, and applied to each other, and upon one of them is spread a covering of hair, &c. and upon this is applied, in a melted state, a coat of pitch and tar, after which the joints are put together, and secured by screws, pins, bolts, and by hoops enveloping the whole. The heads of the buoys are put in by rabbetting the same in with the staves: the fitting is made good by several steps or successive faces in the joints, between which, pitch, tar, hair, &c. are applied, and, for greater security, there are sometimes two, or even more, additional heads, fixed within the external heads.

BUOY-ROPE, the rope which fastens the buoy to the anchor: it should be little more than equal in length to the depth of the water where the anchor lies, as it is intended to float near, or immediately above, the bed of it, that the pilot may at all times know the situation. The buoy-rope is often extremely useful in drawing up the an-

chor when the cable is broke. It should always, therefore, be of sufficient strength for this purpose, or else the anchor may be lost through negligence.

BOOY, SLINGS OF THE, the ropes which are fastened about it, and by which it is hung: they are curiously spliced around it, something resembling the braces of a drum.

BOUY, TO STREAM THE, is to let it fall from the ship's side into the water; which is always done before they let go the anchor, that it may not be retarded by the buoy-rope as it sinks to the bottom.

BUPALUS, a celebrated sculptor, a native of the island of Chios. He had a brother, named Athenis, of the same profession. They flourished about the sixtieth Olympiad; and were contemporary with Hipponax, a deformed poet. Our sculptors diverted themselves in representing him under a ridiculous form, upon which Hipponax wrote so sharp a satire against them, that they hanged themselves. Pliny, however, says, that they made several fine statues after Hipponax had taken his revenge; particularly a Diana at Chios, which was placed very high, and appeared with a frowning countenance to those that came in and with a pleasant one to those that went out. There were several statues at Rome made by them; they worked only in the white marble of the Isle of Paros. Pausanias mentions Bupalus as a good architect as well as sculptor; but says nothing of Athenis.

BUPARIA, in entomology, a winged species of pimelia, the tenebrio buparius of Forster; color black, and glabrous; thorax lunated; jaws strong, toothed, and as long as the head. It inhabits Spain.

BUPHAGA, in ornithology, a genus belonging to the order of picæ. The beak is straight and quadrangular; the mandibles are gibbous, entire, and the gibbosity is greater on the outside. The feet are of the ambulatory kind. The body is grayish above, and of a dirty yellow below; the tail is shaped like a wedge. There is but one species, viz. *B. Africana*, the African beef-eater, a native of Senegal. It frequently perches upon oxen to pick out the larva of the oestri from their backs.

BUPHONIA, from *βεγ*, ox, and *φωνη*, slaughter; in antiquity, an Athenian feast. We are told it was forbidden, by the laws of Attica, to kill an ox; but it once happened, at the feast of the dipolia, that an ox ate the corn, others say the cakes, which had been dressed for the sacrifice. Thaulon the priest, enraged at this, immediately killed him, and fled for it. On which the Athenians, fearing the resentment of the gods, and feigning themselves ignorant as to who had committed the fact, brought the bloody axe before the judges, where it was solemnly arraigned, tried, found guilty, and condemned! In memory of the event this feast was instituted, in which it was customary for the priest to fly, and judgment to be given about the slaughter of the ox.

BUPHTHALMIUM, ox-eye; a genus of the polygamia superflua order, and syngenesia class of plants; natural order forty-ninth, compositæ. The receptacle is paleaceous; the pappus an in-

different rim; the seeds, especially those of the radius, emarginated on the sides; the stigmata of the hermaphrodite florets undivided. There are twenty species; the most remarkable are: *B. arborescens*, rising with several woody stems to the height of eight or ten feet, with pale yellow flowers. 2. *B. helianthoides*, a native of North America.

BUPHTHALMUS, in botany, a name given by some of the ancients to the great house-leek, or sedum majus, from the manner of its growing in clusters resembling the eyes of large animals.

BUPLEURUM, hare's ear, or thoroughwax; a genus of the digynia order, and pentandria class of plants; natural order forty-fifth, umbellatæ. The involucre of the partial umbels are large in proportion, and pentaphyllous; the petals involuted, or rolled inwards; the fruit roundish, compressed, and striated. The principal species is the *B. fruticosum*, or shrubby Ethiopian hartwort. It rises with a shrubby stem, dividing into numerous branches, forming a bushy head five or six feet high, adorned with oblong, oval, entire leaves, placed alternate, with yellow flowers in umbels at the ends of the branches, which appear in July and August, and are sometimes succeeded by ripe seeds. It may be propagated by cuttings. This plant was formerly celebrated for curing ruptures, mixed into a poultice with wine and oatmeal.

BUPRESTIS, in entomology, a genus of insects belonging to the order of coleoptera. The antennæ are setaceous and serrated, and as long as the thorax: the head is half drawn back within the thorax: the mouth is armed with jaws, and furnished with palpi: the elytra are margined, and cover the abdomen; and the tarsi have five articulations: the feet are saltatory. Linnaeus, Fabricius, and Gmelin, describe the following species:—*unidentata*, *bicolor*, *gigantea*, *vittata*, *fastuosa*, *punctatissima*, *corrusca*, *decora*, *berolinensis*, *obscura*, *lurida*, *punctata*, *fasciata*, *striata*, *rauca*, *ritulans*, *octoguttata*, *icnita*, *lineata*, *aerosa*, *ocellata*, *maculosa*, *maculata*, *striata*, *sternicornis*, *chrysis*, *violacea*, *aegyptiaca*, *mariana*, *farinosa*, *fulminans*, *cyanipes*, *modesta*, *blanda*, *aurata*, *elegans*, *tripunctata*, *chrysostigma*, *dorsata*, *impressa*, *ornata*, *taeniata*, *Cayennensis*, *cylindrica*, *trochilus*, *scabra*, *decastigma*, *canaliculata*, *rustica*, *acuminata*, *plcbeja*, *Tranquebarica*, *lugubris*, *cariosa*, *undata*, *Austriaca*, *splendens*, *sibirica*, *fusca*, *tenebrionis*, *aurulenta*, *fascicularis*, *variolaris*, *onopordi*, *hirta*, *deaurata*, *rubi*, *nitidula*, *lata*, *cyanea*, *salicis*, *discoidea*, *quadrifasciata*, *bimaculata*, *novem-maculata*, *tristis*, *anea*, *euprea*, *nobilis*, *barbarica*, *umbellatarum*, *quadrifasciata*, *cruciata*, *manca*, *pygmaea*, *meditabunda*, *minuta*, *viridis*, *atra*, *biguttata*, *elata*, *ruficollis*, *linearis*, *festiva*, *granularis*, *depressa*, *calcarata*, *fuliginosa*, *hæmorrhoidalis*, *quercus*, *hirsuta*, *11-maculata*, *sex-maculata*, *varicornis*, *acuta*, *naevia*, *picta*, *inaurata*, *tatarica*, *Virginica*, *nana*, *marginata*, *nigra*, *rosacea*, *ungarica*, *nebulosa*, *bruttia*, *stephanelli*, *rugosa*, and *coccinea*.

BUPRESTOIDES, in entomology, a species of attelabus; color black; shells nervous; thorax globular. This is the buprestis ater of Linnaeus. Also a species of carabus; color black; antennæ

and feelers ferruginous; legs piceous. Inhabits the south of Europe.

BUR, BOUR, BOR, come from the Sax. *bup*, an inner chamber, or place of shade and retirement.

BUR', *n. s.* Lat. *lappu*, Fr. *bouvre*, is down; the bur being filled with a soft tomentum or down. A rough head of a plant, called a burdock, which sticks to the hair or clothes.

Nothing teems

But hateful docks, rough thistles, keeksies, *burs*,
Losing both beauty and utility.

Shakespeare. Henry V.

Hang off, thou cat, thou *bur*; vile thing, let loose;
Or I will shake thee from me like a serpent. *Id.*

Dependents and suitors are always the *burs*, and sometimes the briars, of favourites. *Wotton.*

And where the vales with violets once were crowned,
Now knotty *burs* and thorns disgrace the ground.

Dryden.

A fellow stuck like a *bur*, that there was no shaking him off. *Arbuthnot's Hist. of John Bull.*

BUR, in chivalry, a broad ring of iron behind the place made for the hand on the spears used formerly in tilting; which bur was brought to rest when the tilter charged his spear.

BURBER, an Egyptian piece of copper money; thick and as broad as a sixpence; twelve of them make a medine.

BURBOT, *n. s.* A fish full of prickles. It is the English name of the *mustela fluviatilis*, a fish common in the Trent and other rivers in England. It is also called the eel-pout and is the *gadus lota* of Linnæus.

BURCA, among the Turks, the name of the rich covering of the door of the house at Mecca; it is ten feet long and five wide; and there are several figures and Arabic letters on it, very richly embroidered in gold, on a ground of red and green. It is carried about in their solemn processions, and is often stopped that the people may touch it.

BURCKHARDT (J. Lewis), was the son of Colonel Gideon Burckhardt, born at Lausanne in Switzerland, in 1784. He was educated at Leipzig and Göttingen, and in 1806 visited England; where he offered his services to the African Association. His proposals were accepted, and he went to Cambridge to study Arabic, and acquire other necessary knowledge. In March, 1809, he sailed for the Mediterranean and Aleppo, where he adopted the name of Ibrahim, and assumed the character of a Mussulman. He continued two years and a half in Syria, and made himself familiar with all the spoken dialects of the country. He set off for Nubia in the beginning of 1813; crossed the Red Sea; and, after visiting Mecca and Medina, arrived at Cairo in June 1815. The following spring he took his journey to mount Sinai, and, returning to Cairo, proposed to join one of the trading caravans to Timbuctoo; but the caravan was delayed by the disturbed state of the country. When the opportunity at last arrived he was seized with dysentery, and died, after a short illness, at Cairo. His papers were sent to the African Association, who published, in 1819, his *Travels in Nubia*; and afterwards his *Travels in Syria and the Holy Land*.

BURDEGALA, or BURDIGALA, in ancient geography, a trading port town of Aquitania, the birth place of Ausonius. It is now called Bourdeaux.

BURDELAIS, *n. s.* A sort of grape.

BURDEN, <i>v. & n. or</i>	} Per. <i>burdon</i> , Sax. byrden, Goth. <i>burd</i> , Swed. <i>borda</i> , Sax. beart, from bear, to carry, as φορτω from φερω. Thus it signifies
BUR'THEN,	
BUR'DENING,	
BUR'DENER,	
BUR'DENOUS,	
BUR'DENSOME.	

a load, a weight that is borne. It has another sense, namely the purport or bearing of a song; perhaps from Ital. *bordone*, Fr. *bourdon*, Welsh *byrdon*, the bass or drone in music, Goth. *bijar dyn*, the sound of bees. Burden is sometimes used not only to signify what is borne, but the capacity to bear, as the capacity of a ship; thus we say a ship of 100 tons burden. It is metaphorically descriptive of grief, oppression, weariness, and misery.

Burden not thyself above thy power.

Ecclesi. xiii. 2.

I mean not that other men be eased, and you *burdened*. *Corinthians viii. 13.*

And thei would bind on folke alwaie

(That ben to be begiled able),

Burdons that ben importable.

Chaucer. Romaunt of the Rose.

Long time ye both in armes shall beare great sway,
Till thy wombes *burden* thee from them do call,
And his last fate him from thee take away,
Too rathe cut off by practice criminall
Of secret foes, that him shall make in mischief fall.

Spenser.

So on a morrow forth, unwist of any wight,
I went to prove how well it would my heavy *burden*
light,

And when I felt the air so pleasant round about,
Lord! to myself how glad I was that I had gotten out.
Earl of Surrey.

Camels have their provender

Only for bearing *burdens*, and sore blows

For sinking under them. *Shakespeare. Coriolanus.*

Make no jest of that which hath so earnestly pierced me through, nor let that be light to thee which to me is so *burdenous*. *Sidney.*

So once the cradle of that light,
Whereof one rules the night, the other the day,
Till sad Latona, flying Juno's spite,
Her double *burthen* there did safely lay.

Fletcher's Purple Island.

It is of use in lading of ships, and may help to shew what *burden*, in the several kinds, they will bear.

Bacon's Physical Remains.

Couldst thou support

That *burden*, heavier than the earth to bear?

Milton.

His leisure told him that his time was come,
And lack of load made his life *burdensome*. *Id.*

At every close she made, the attending throng
Replied, and bore the *burden* of the song.

Dryden's Fables.

Assistances always attending us, upon the easy condition of our prayers, and by which the most *burdensome* duty will become light and easy. *Rogers.*

None of the things that are to learn, should ever be made a *burden* to them, or imposed on them as a task. *Locke.*

Deaf, giddy, helpless, left alone,
To all my friends a *burden* grown.

Swift.

BERTHA. That back of thine may bear its *burthen*,
'tis
More ligh, if not so broad as that of others.

ARNOLD. It bears its *burthen*;—but my heart!
will it

Sustain that which you lay upon it, mother?

Byron's Deformed Transformed.

BURDEN, or **BURDON**, *bourdon*, French, in music, the drone or bass, and the pipe or string which plays it: hence the burden of a song. A chord which is to be divided to perform the intervals of music, when open and undivided, is also called the burden.

BURDEN OF A SHIP, is its contents, or the number of tons it will carry. It may be determined thus: multiply the length of the keel, taken within board, by the breadth of the ship, within board, taken from the midship-beam, from plank to plank; and multiply the product by the depth of the hold, taken from the plank below the keelson, to the under part of the upper deck plank; and divide the last product by ninety-four; the quotient is the content of the tonnage required. See **FREIGHT**.

BURDEN, SHIPS OF, denote those of a larger and heavier sort, carrying 500 tons, or upwards.

BURDO, in physiology, a mongrel beast of burden, produced by a horse and she-ass, by which it is distinguished from the mule, which is that produced by a male ass of a mare.

BURDOCK, *n. s. Persnoota*. A plant. See **ARCTIUM**.

BURDON (William), was born in 1764, at Newcastle-upon-Tyne, and educated at Emanuel College, Cambridge, where he took his degrees in arts, and obtained a fellowship, which, as he would not enter into orders, he resigned. He died in London in 1818. His works are: 1. Life and Character of Buonaparte. 2. Examination of the Pursuits of Literature, 8vo. 3. Materials for Thinking, 2 vols. 8vo. 4. Three Letters to the Bishop of Llandaff. 5. Letters on the Affairs of Spain. 6. Thoughts on Politics, Morality, and Literature, 8vo. 7. A Vindication of Pope and Grattan. 8. Treatise on the Privileges of the House of Commons; and several miscellaneous essays and papers in the periodical publications.

BURDWAN, a fertile district of Bengal, between the twenty-second and twenty-fourth degrees of north latitude, and on the west side of the Baggarutty or Hoogly river. It is about seventy-three miles long and forty-five broad. In the year 1790 this district yielded an annual revenue of £400,000 sterling. The family of the present rajah have been in possession of the zemindary for about a century.

BURDWAN, the capital of the above district, was often taken and retaken during the contests between the Afghans and the Moguls for the possession of Bengal, and for several years, in the end of the seventh century, was the residence of prince Azeem Oosshan, the grandson of Aurungzebe, then governor of Bengal. He much improved the city, and built there a mosque. In this place is the tomb of Ibrahim Sukka, a celebrated Mahomedan saint. There was formerly a citadel here of no great strength. It stands on the north bank of the Dummoodah river.

BURE (William de), a Paris bookseller, and bibliographer of great reputation. His principal work, which is a standard performance, is *Bibliographie Instructive ou Traité des Livres rares et singulieres*, Paris, 1763, 7 vols. 8vo. He also published a *Catalogue of the Library of M. de la Valliere*, 1767, 2 vols. and *Museum Typographicum*, 1775, 12mo. He died respected in 1782.

BUREAU, *n. s. Fr. bureau*. A chest of drawers with a writing-board. It is pronounced as if it were spelt buro.

For not the desk with silver nails,
Nor bureau of expense,
Nor standish well japanned, avails,
To writing of good sense. *Swerf.*

BURGE ,	} Arab. <i>boorj</i> , Chald. <i>burgadh</i> , <i>Ποργος</i> , Swed. <i>borg</i> , Goth. <i>burg</i> , <i>biarg</i> , Sax. <i>beorg</i> , Goth. <i>borg</i> , Sax. <i>Teut. Bel. burg</i> , Arm. and Irish <i>burg</i> , Welsh <i>bourg</i> , Fr. <i>bourg</i> , Ital. <i>borgo</i> . A tower, a mount, a hill, a walled town; sometimes confounded with borough, which apparently has the same root in Goth. <i>berga</i> , to defend. 'Burgage is a tenure proper to cities and towns, whereby men of cities or burrows hold their lands or tenements of the king, or other lord, for a certain yearly rent.'— <i>Cowell</i> . A burgess and burgher, is a citizen; a freeman of a city or corporate town, with the privilege of the elective franchise, a representative of such a town. A burromaster is one who governs or defends a fortified town or city.

BURGHMASTER ,	
BURGRAVE .	

It irks me, the poor dappled fools,
Being native *burghers* of this desert city,
Should in their own confines, with forked heads,
Have their round haunches gored.

Shakspeare. As you Like it.

The gross of the borough is surveyed together in the beginning of the county; but there are some other particular *burgages* thereof, mentioned under the titles of particular men's possessions.

Hale's Origin of Mankind.

Four knights and a knave who were *burgesses* made,
For selling their consciences were liberally paid.

Mareell.

The portly *burgess* through the weather hot,
Does for his corporation sweat and wot. *Id.*

Could this be,
Case why, their *burghomaster* of the sea
Ram'd with gunpowder, flaming with brand wine,
Should raging hold his linstock to the mine? *Id.*

The fish oft times the *burgher* dispossessed,
And sat not as a meat but as a guest. *Id.*

It is a republick itself, under the protection of the eight ancient cantons. There are in it an hundred *burgeois*, and about a thousand souls. *Addison on Italy.*

They choose their councils and *burgomasters* out of the *burgeois*, as in the other governments of Switzerland *Addison.*

Many towns in Cornwall, when they were first allowed to send *burgesses* to the parliament, bore another proportion to London than now; for several of these *burghs* send two *burgesses*, whereas London itself sends but four. *Graunt.*

The Forester

Hunts not the wretched coney, but the boar,
 Or wolf, or lion, leaving paltry game
 To petty *burghers*, who leave once a year
 Their walls, to fill their household cauldrons with
 Such scullion prey.

Byron's Deformed Transformed.

BURGAGE, or TENURE IN BURGAGE, is only a kind of town soccage; as common soccage, by which other lands are holden, is usually of a rural nature. A borough is distinguished from other towns by the right of sending members to parliament; and, where the right of election is by burgage tenure, that alone is a proof of the antiquity of the borough. Tenure in burgage, therefore, or burgage tenure, is where houses or lands which were formerly the site of houses in an ancient borough, are held of some lord in common soccage, by a certain established rent. And they seem to have withstood the shock of the Norman encroachments, principally on account of their insignificance, which made it not worth while to compel them to an alteration of tenure, as 100 of them together would scarce have amounted to a knight's fee. Besides, the owners, being chiefly artificers, and persons engaged in trade, could not with any propriety be put on such a military establishment as the tenure in chivalry was. The free soccage, therefore, in which these tenements are held, seems to be plainly a remnant of Saxon liberty; which may also account for the great variety of customs affecting many of these tenements so held in ancient burgage; the principal and most remarkable of which is that called Borough English. See BOROUGH ENGLISH.

BURGANET, or BUR'GONET, *n. s.* From *Fr. burginote*. A kind of helmet.

Upon his head his glistering *burganet*,
 The which was wrought by wondrous device,
 And curiously engraven, he did fit.

Spenser's Muirpotmos.

This day I'll wear aloft my *burgonet*,
 Even to affright thee with the view thereof.

Shakspeare.

I was page to a footman, carrying after him his pike
 and *burganet*.

Shakspeare on Providence.

BURGAU, in natural history, the name of a large species of sea-snail, of the lunar or round-mouthed kind. It is very beautifully lined with a coat, of the nature of mother-of-pearl; and the artificers take this out, to use under the name of mother-of-pearl, though some call it after the name of the shell they take it from, *burgaudine*.

BURGAU, an open town of Suabia, on the Mindel, formerly the chief town of the margraviate of that name; has a population of 2400: it is nineteen miles north-west of Augsburg, and twenty E. N. E. of Ulm.

BURGAU, a margraviate of Suabia, on the Danube, between the Lech and the Iller, now belonging to Bavaria, to whom it was ceded by Austria, at the peace of Presburg. It is about thirty-six miles square, and included in the Bavarian circle of the Upper Danube. A small portion, however, belongs to the district of Ursberrig, in the circle of the Iller.

BURGER (Godfred Augustus), a German

poet, principally known in this country as the author of *Leonora*, was born at Wolterswende, in the principality of Halberstadt, in 1748. His father, a Lutheran minister, gave him a good education, but Burger was averse from study, and passed his early life in dissipation; occasionally producing a few popular ballads. He also translated some of our old English ballads into German with considerable effect. In 1787 he lectured on the philosophy of Kant, and in 1789 was appointed professor of belles lettres in the university of Göttingen. He died in 1794. His *Leonora* has been several times translated into English; and Sir Walter Scott has executed an admirable version of his *Wild Huntsman's Chase*.

BURGESS signifies one who possesses a tenement in a borough. The word is also applied to the magistrates of some towns; as the bailiff and burgesses of Leominster. Anciently, burgesses were held in great contempt; being reputed servile, base, and unfit for war; so that the gentry were not allowed to intermarry in their families, or fight with them; but, in lieu thereof, were to appoint champions. A burgess's son was reputed of age when he could distinctly count money, measure cloth, &c.

BURGESSES, in the parliamentary sense, are supposed to represent the mercantile part, or trading interest of a nation. They were formerly allowed, by a rate established in the reign of Edward III. two shillings a-day as wages. It is to be regretted, that the members for boroughs, and, what is worse, decayed or rotten boroughs, bear above a quadruple proportion to those for counties. The right of election of burgesses depends on several local charters and customs: though, by 2 Geo. II. c. 24, the right for the future shall be allowed according to the last determination of the House of Commons concerning it; and by 3 Geo. III. c. 15, no freeman, except such as claim by birth, servitude, or marriage, shall be entitled to vote, unless he hath been admitted to his freedom twelve months before. This is called the Durham act, and it was occasioned by the corporation of Durham having, upon the eve of an election, in order to serve one of the candidates, admitted 215 honorary freemen. Some corporations have the power of admitting honorary freemen, viz. persons who, without any previous claim or pretension, are admitted to all the franchises of the corporation. The Durham act is confined to persons of that description solely. As every knight of a shire shall have a clear estate of freehold or copyhold, or mortgage, if the mortgagee has been seven years in possession, to the value of £600 per annum, so every representative citizen and burgess must have a clear estate to the value of £300; except the eldest sons of peers, and of persons qualified to be knights of shires, and except the members for the two universities. Stat. 9 Ann. c. 5; and of this qualification the member must make oath, and give in the particulars in writing, at the time of his taking his seat. But this act does not extend to Scotland nor Ireland.

BURCH (James), an ingenious political writer, born at Maderty, in Perthshire, in 1714. He

studied at St. Andrews, with the intention of becoming a clergyman; but bad health obliged him to turn to the linen trade; which not proving successful, he went to England, and commenced corrector of the press to Mr. Bowyer, for whom he also made indexes. After this he removed to Great Marlow, as assistant at a school; where, in 1746, he first commenced author, by writing a pamphlet, entitled *Britain's Remembrancer*; which went through five editions in two years; was reprinted in England, Ireland, and America; was ascribed to several bishops, and quoted by churchmen and dissenters from the pulpit. In 1747 he opened an academy at Stoke-Newington, in Middlesex; and his scholars increasing rapidly, he removed, in 1750, to a large house at Newington Green, where he remained for nineteen years. In 1751 he married Mrs. Harding, a widow lady, who concurred with him in his laudable undertakings. After a very laborious life, he retired to Islington in 1771, with the view of finishing a work he had long collected materials for, entitled *Political Disquisitions*, which came out in 1774 and 1775, in 3 vols. although he was then severely afflicted with the stone. Of this complaint he died, August 26th, 1775, aged sixty-one. His other works were: 1. *Thoughts on Education*, 1747. 2. *An Hymn to the Creator*; with an *Idea of the Creator* from his Works, in prose, 1750. 3. *A Warning to Dram-Drinkers*, 1751. 4. *The Dignity of Human Nature*, 1754, 4to. and 1767, 2 vols. 8vo. 5. *The Art of Speaking*, 1762 (fifth edition in 1782); with other tracts too numerous for insertion.

BURGH-BOTE signifies contribution towards the building or repairing of castles, or walls, for the defence of a borough or city. By the law of king Athelstan, the castles and walls of towns were to be repaired, and burgh-bote levied every year, within a fortnight after rogation days. No person whatever was exempted; the king himself could not exempt a man from burgh-bote: yet, in after times, exemptions appear to have been frequently granted.

BURGH-BRECH, a fine imposed on the community of a town, or burgh, for the breach of peace among them.

BURGH-SECEDERS, a numerous and respectable class of dissenters from the church of Scotland, who were originally connected with the associate presbytery; but some difference of sentiment arising about the lawfulness of taking the burgess oath, a separation ensued in 1739; in consequence of which, those who held for the affirmative, obtained the appellation of burgher, and their opponents that of antiburgher seceders. The antiburghers have, however, been recently re-united to the brethren. See **SECEDERS**.

BURGHMOTE, the court of a borough. By the laws of king Edgar, the burghmote was to be held thrice in the year: by those of Henry I. twelve times.

BURGLAR, } From *burg* a house, and
BURGLARY, } *larron*, a thief, or Goth. and
BURGLARER, } Sax. *bur*, a dwelling, and
BURGLARIOUS. } Goth. *lecka*, to break; but
 Norm. *Fr. lary*, from Lat. *latrocinium*, house-
 breaking, or the robbing or plundering a house.

Disperse lampoons, the only wit
 That men like *burglary* commit.

Butler's Hudibras.

Love is a burglarer, a felon,

That at the windore-eyes does steal in. *Id.*

In the natural signification, is nothing but the robbing of a house; but, as it is a term of art, our common lawyers restrain it to robbing a house by night, or breaking in with an intent to rob, or to do some other felony. The like offence, committed by day, they call house-robbery, by a peculiar name. *Correll.*

What say you, father? *Burglary* is but a venial sin among soldiers. *Dryden's Spanish Friar.*

BURGLARY, *burgo latrocinium*, nocturnal housebreaking, by the ancient English law, was called *hamesucken*, a word still used in the law of Scotland, but in a sense somewhat different, has always been looked upon as a very heinous offence: not only because of the terror that accompanies it, but also as it is a forcible invasion of that right of habitation, which every individual might acquire, even in a state of nature: an invasion which, in such a state, would be sure to be punished with death, unless the assailant were stronger. But, in civil society, the laws come in to the assistance of the weaker party: and, besides that they leave him this natural right of killing the aggressor, if he can, they also protect and avenge him in case the assailant is too powerful. And the law has so particular and tender a regard to the immunity of a man's house, that it styles it his castle, and will never suffer it to be violated with impunity; agreeing herein with the sentiments of ancient Rome. For this reason no outward doors can in general be broken open to execute any civil process; though in criminal causes the public safety supersedes the private. See **ARREST**. Hence also in part arises the animadversion of the law upon eaves-droppers, nuisances, and incendiaries: and to this principle it must be assigned, that a man may assemble people together lawfully (at least if they do not exceed eleven in number) without danger of raising a riot, rout, or unlawful assembly, in order to protect his house; which he is not permitted to do in any other case.

Sir Edward Coke's definition of a burglar, is, 'that by night breaketh and entereth into a mansion-house, with intent to commit a felony.' In this definition there are four things to be considered; the time, the place, the manner, and the intent. 1. The time must be by night, and not by day; for in the day-time there is no burglary; i. e. if there be day-light or crepusculum enough, begun or left, to discern a man's face withal. But this does not extend to moon-light; for then many midnight burglaries would go unpunished: and besides, the malignity of the offence does not consist so much in its being done in the dark, as at the dead of night; when all the creation, except beasts of prey, are at rest; when sleep has disarmed the owner, and rendered his castle defenceless. 2. As to the place, it must be, according to Sir Edward Coke's definition, in a mansion or dwelling-house: for no distant barn, warehouse, or the like, are under the same privileges, nor looked upon as a man's castle of defence; nor is a breaking open of houses wherein no man resides, and which for the time being are not mansion-

houses, attended with the same circumstances of midnight terror. A house, however, wherein a man sometimes resides, and which the owner hath left only for a short season, animo revertendi, is the object of burglary, though no one be in it at the time of the fact committed. And if the barn, stable, or warehouse, be parcel of the mansion-house, though not under the same roof or contiguous, a burglary may be committed therein; for the capital house protects and privileges all its branches and appurtenants, if within the curtilage or homestall. A chamber in a college, or an inn of a court, where each inhabitant hath a distinct property, is to all other purposes as well as this, the mansion-house of the owner. So also is a room or lodging in any private house, the mansion for the time being of the lodger; if the owner doth not himself dwell in the house, or if he and the lodger enter by different outward doors. But if the owner himself lies in the house, and hath but one outward door at which he and his lodgers enter, such lodgers seem only to be inmates, and all their apartments to be parcel of the one dwelling-house of the owner.

If a man hath two houses, and resides, sometimes in one of the houses, and sometimes in the other, if the house he doth not inhabit is broken in by any person in the night, it is burglary. *Poph. 52.*

A part of a house divided from the rest, having a door of its own to the street, is a mansion-house of him who hires it. To break and enter a shop, not parcel of the mansion-house, in which the shop-keeper never lodges, but only works or trades there in the day-time, is not burglary, but only larceny; but if he, or his servant, usually or often lodge in the shop at night, it is then a mansion-house, in which a burglary may be committed. 1 H. II. P. C. 557, 558.—But see stat. 13 Geo. III. c. 38, respecting burglary in the work-shops of the plate-glass manufactory, which is made single felony, and punishable with transportation for seven years.—If the shop-keeper sleep in any part of the building, however distinct that part is from the shop, it may be alleged to be his mansion-house; provided the owner does not sleep under the same roof also. *Leach's Hawk. P. C. i. c. 38, sect. 16 in. n.*

A lodger in an inn hath a special interest in his chamber, so that if he opens his chamber-door, and takes goods in the house, and goes away, it seems not to be burglary. And where A enters into the house of B in the night, by the doors open, and breaks open a chest, and steals goods, without breaking an inner door, it is no burglary by the common law, because the chest is no part of the house; though it is felony, ousted of clergy, by statute 3 W. & M. c. 9; and if one break open a counter or cupboard, fixed to a house, it is burglary. 1. *Hale's Hist. P. C. 554.*

All out-buildings, as barns, stables, warehouses, &c. adjoining to a house, are looked upon as part thereof, and consequently burglary may be committed in them. And if the warehouse &c. be parcel of the mansion-house, and within the same, though not under the same roof, or contiguous, a burglary may be committed

therein.—But an out-house occupied with, but separated from, the dwelling-house by an open passage eight feet wide, and not within or connected by any fence, enclosing both, is not within the curtilage or homestall.

It is certainly a dangerous, if not an incurable fault, to omit the word dwelling-house in an indictment for burglary in a house. But it seems not necessary or proper, in an indictment for burglary in a church, which, by all the ancient authorities, is taken as a distinct burglary. See 1 *Hawk. P. C. c. 38, sect. 10*, and the authorities there cited.

3. As to the manner of committing burglary there must be both a breaking and an entry to complete it. But they need not be both done at once; for if a hole be broken one night, and the same, breakers enter the next night through the same they are burglars. There must be an actual breaking; as, at least, by breaking or taking out the glass of, or otherwise opening, a window; picking a lock, or opening it with a key; nay, by lifting up the latch of a door, or unloosing any other fastening which the owner has provided. Where thieves had bored a hole through the door, with a centre-bit, and part of the chips were found in the inside of the house, yet as they had neither got in themselves, nor introduced a hand or instrument for the purpose of taking the property, the entry was ruled incomplete. But if a person leave his doors or windows open, it is his own folly and negligence, and if a man enter therein, it is no burglary; yet, if he afterwards unlock an inner or chamber door, it is so. But to come down a chimney is held a burglarious entry: for that is as much closed as the nature of things will permit. So also, to knock at a door, and, upon opening it, to rush in with a felonious intent; or under pretence of taking lodgings, to fall upon the landlord and rob him; or to procure a constable to gain admittance in order to search for traitors, and then to bind the constable and rob the house; all these entries have been adjudged burglarious, though there was no actual breaking, for the law will not suffer itself to be trifled with by such evasions, especially under the cloak of legal process. As for the entry, any the least degree of it, with any part of the body, or with an instrument held in the hand, is sufficient: as, to step over the threshold, to put a hand or hook in at a window to draw out goods, or a pistol to demand one's money, are all of them burglarious entries. The entry may be before the breaking, as well as after; for by statute 12 Ann. c. 7. if a person enters into the dwelling house of another, without breaking in either by day or by night, with an intent to commit any felony, or, being in such house, shall commit felony; and shall in the night break out of the same; this is declared to be burglary. When several come with a design to commit burglary, and one does it while the rest watch near the house, here his act is, by interpretation, the act of all of them. And, upon a like ground, if a servant confederating with a rogue, let him in to rob a house, it has been determined by all the judges, upon a special verdict, that it is burglary both in the servant and the thief. *Leach's Hawk. P. C. i. c. 38, sect. 9.*

and *n.* 4. As to the intent; it is clear that such breaking and entry must be with a felonious intent, otherwise it is only a trespass. And it is the same, whether intention be actually carried into execution, or only demonstrated by some attempt or overt act, of which the jury is to judge. And therefore such breaking and entry, with intent to commit a robbery, a murder, a rape, or any other felony, is burglary. Nor does it make any difference, whether the offence were felony at common law, or only created so by statute. One of the servants of the house opened his lady's chamber-door, which was fastened with a brass bolt, with design to commit a rape; and it was ruled to be burglary, and the defendant was convicted and transported. *Stran.* 481. *Kel.* 67. A servant embezzled money intrusted to his care; left ten guineas in his trunk; quitted his master's service; returned; broke and entered the house in the night, and took away the ten guineas; and adjudged no burglar. *Leach's Hawk. P. C. i. c. 38. sect. 18. n.*

To encourage the prosecution of offenders it is enacted by stat. 10 & 11. W. III. c. 23. that whoever shall convict a burglar shall be exempted from parish and ward offices where the offence was committed. To this, stats. 5 Ann. c. 31. and 6 Geo. I. c. 23. have superadded a reward of £40. And if an accomplice, being out of prison, shall convict two or more offenders, he is entitled also to a pardon of the felonies as enumerated in the act. See stats. 25 Geo. II. c. 36. 27 Geo. III. c. 19. which provide, that the charges of prosecuting and convicting a burglar shall be paid by the treasurer of the county where the burglary was committed, to the prosecutor and poor witnesses. A certificate granted upon the conviction of an offender for burglary, exempts the party from serving the office of petty constable for a township within, but not co-extensive with the parish where the burglary was committed. *7 East's Rep.* 174.

To remove one inducement to the frequent commission of burglaries, stat. 10 Geo. III. c. 48. provides that buyers or receivers of stolen jewels, gold, or silver plate, where the stealing shall have been accompanied by burglary, or robbery, may be tried and transported for fourteen years, before the conviction of the principal. And to check this offence in its progress, stat. 23. Geo. III. c. 88. enacts, that any person apprehended, having upon him any pick-lock key, &c. or other implement with intent to commit a burglary, shall be deemed a rogue and vagabond, within stat. 17 Geo. II. c. 5.

Burglary is a felony at common law, but within the benefit of clergy. Burglary in any house belonging to the plate-glass company, with intent to steal the stock or utensils, is by statute 13 Geo. III. c. 38. declared to be single felony, and punished with transportation for seven years.

BURGOMASTER, BURGERMASTER, BOURGERMASTER, or BURGMESTER, is the chief magistrate of the great towns in Flanders, Holland, and Germany. The power and jurisdiction of the burgo-master is not the same in all places, every town having its particular customs and regulations: at Amsterdam, there are, (or at least were before

the revolution) four chosen by the voices of all those people in the senate who have either been burgomasters or *cehevis*s. They dispose of all under offices that fall in their time, keep the key of the bank, and enjoy a salary of only 500 guilders; all feasts and public entertainments, &c. being defrayed out of the common treasury.

BURGOO, or BURGOOR, a sea-faring dish, made of grits boiled in water till they burst, and then mixed with butter. Burgoo, otherwise called *loblolly*, is held by Cockburn very proper to correct that thickness of humors and costiveness to which the other diet of sailors much disposes them. Yet it is the least liked of all their provisions, because of the scanty allowance of butter to it.

BURGOS, a city of Spain, the capital of Old Castile, was erected into an archbishop's see in 1574. It was the residence of the counts and kings of Castile. It is surrounded with mountains, which render the air very cold nine months in the year, and during the other three months excessively hot. It is seated on the declivity of a hill, on the top of which was a strong castle, now in ruins; and the lower part of the town is watered by the Arlançon. The principal avenue to the city is by a handsome bridge over this river, which leads to a beautiful gate, adorned with the statues of several kings and heroes of Spain. The town is built in the form of a crescent, and is large and populous; but the houses are ill built, and the streets narrow and dirty, except some few, and especially that which leads to the cathedral. There are several squares, adorned with fountains and statues. The great square in the middle of the city is surrounded with excellent houses, with piazzas to each. Here are also a college, a school for the fine arts, and a physical institute. The cathedral church is a masterpiece of Gothic architecture, and one of the finest in all Spain. It was built at the beginning of the thirteenth century, by Ferdinand III., and is of such extent, that divine service can be performed in eight chapels at a time, without causing confusion. The church of the Augustines is also remarkable for its beautiful and rich chapel of the holy crucifix. There are several fine convents and nunneries; one of which is for nuns of noble extraction. Burgos, now containing about 9000 inhabitants, is said to have been very flourishing in former times. The only manufactures in existence are blankets, flannels, worsted stockings, and other woollen stuffs; and the only branch of active commerce is the exportation of the wool of Old Castile, most of which passes through the city. The suburb Debeza, on the other side of the river, and communicating with the town by three stone bridges, is more healthy and agreeable, and has a variety of beautiful gardens. Burgos was besieged unsuccessfully by the British in 1812, but surrendered to them without resistance the following year. It is 142 miles north of Toledo, and 112 north of Madrid.

BURGOYNE (John), an English general, and dramatic writer, was the natural son of Lord Bingley, and entered early into the army. In 1762 he commanded a force sent into Portugal, and distinguished himself in the American war

by the taking of Ticonderoga, but was at last obliged to surrender to general Gates, at Saratoga. Refusing to return to America pursuant to his convention, he was dismissed the British service. He was some time member of parliament for Preston, and published several pamphlets in defence of his public conduct; but is more distinguished for his dramas of the Maid of the Oaks, the Heiress, and other pieces.

BURGUNDY, a district of France, a *ci-devant* province of government, but now divided into the departments of Cote d'Or, Saone and Loire, Ain and Yonne. It derived its name from the ancient Burgunds, a German nation, by whom it was settled, about the commencement of the fifth century. In the progress of its history, it acquired great influence among the states of Europe; and some of the dukes of Burgundy were raised to the throne of France. It is between forty and fifty leagues in length, and about thirty in breadth, traversed by a mountainous ridge, which extends from Dijon to Lyons. On the east of this ridge a wide and fertile plain is bounded by the mountains of Franche-Comté and Savoy; and on the west the country is hilly and less cultivated. The soil is various, but generally rich; the Seine, the Yonne, the Ain, the Saone, the Rhone, and other large streams, all of which are navigable, are the principal rivers; and the province, being traversed by canals, enjoys the advantage of extended inland navigation. Grain, fruits, tobacco, hemp, and flax, are abundant here, the sheep reared in the more elevated parts afford excellent wool, great part of which is manufactured in the country; and the average produce of its wines (highly esteemed for their flavor) is stated at 100,000 hogshheads. The population is about 1,000,000, and the inhabitants are chiefly employed in the woollen manufactures, and those of paper, and delft-ware; in the working of coal mines; and in the melting and manufacturing of iron. The chief towns are Dijon, Auxerre, and Autun.

BURGUNDY PITCH. See **PINTUS ATRIS**.

BURIAMPOUR, a city of Hindostan, the capital of the country or district of Candeish, is situated on the river Taptee, and is of large extent, but a straggling place, occupying an uneven surface; the houses are mostly built of earth, and covered with varnished tiles. There is a strong castle here, with lofty walls and battlements, strengthened by large towers. A large trade is carried on in different kinds of cotton goods. Distant 100 miles north of Aurungabad, and 452 south of Delhi.

BURIAL. The rights of burial have been looked upon in all countries, and at all times, as a debt so sacred, that such as neglected to discharge it were thought accursed: hence the Romans called them *justa*, and the Greeks *νομμα ζκατα, οσια*, words implying the inviolable obligations laid upon the living to take care of the obsequies of the dead. Nor can we wonder, that the ancient Greeks and Romans were anxious about the interment of their friends, since they were persuaded that their souls could not enter the Elysian fields till their bodies were committed to the earth; and if they never obtained burial, they were excluded from those

happy mansions for 100 years. For this reason it was esteemed a duty incumbent upon all travellers who should meet with a dead body, to cast three handfuls of earth upon it; and particularly one upon the head. The ancients likewise considered it as a great misfortune if they were not laid in the sepulchres of their fathers; for which reason such as died in foreign countries had usually their ashes brought home, and interred with those of their ancestors. But there were some persons whom they thought unworthy of burial: such as, 1. Public or private enemies. 2. Such as betrayed or conspired against their country. 3. Tyrants, who were always looked upon as enemies to their country. 4. Villains guilty of sacrilege. 5. Such as died in debt, whose bodies belonged to their creditors. And 6. Some particular offenders, who suffered capital punishment. Of those who were allowed the rites of burial, some were distinguished by particular circumstances of disgrace attending their interment: thus persons killed by lightning were buried by themselves, being thought odious to the gods; those who wasted their patrimony forfeited the right of being buried in the sepulchres of their fathers; and those who were guilty of self-murder were privately deposited in the ground, without the accustomed solemnities. Among the Jews, the privilege of burial was denied only to self-murderers, who were thrown out to rot upon the ground. The place of burial among them was never particularly determined. They had graves in the town and country, upon the highways, in gardens, and upon mountains. Among the Greeks, the temples were made repositories for the dead in the primitive ages; yet the general custom in latter ages, with them, as well as with the Romans and other heathen nations, was to bury their dead without their cities, and chiefly by the highways. The primitive Christians were not, like the heathens, so concerned for their bodies, as to think it any detriment to them, if either the barbarity of an enemy, or some other accident, deprived them of this privilege. The church denied the more solemn rites of burial only to unbaptised persons, self-murderers, and excommunicated persons, who continued obstinate and impenitent, in contempt of the church's censures. Burying in cities was not allowed for the first 300 years, nor in churches for many ages after, the dead bodies being first deposited in the atrium or church-yard, and porches and porticoes of the churches; hereditary burying-places were forbidden till the twelfth century. See farther on this subject under **FUNERAL RITES**.

Burying alive was the punishment of a vestal who had violated her vow of virginity. The unhappy priestess was let down into a deep pit, with bread, water, milk, oil, a lamp burning, and a bed to lie on. But the moment she was let down, they began to cast in the earth upon her till the pit was filled up. See **VESTALS**. Some middle age writers seem to make burying alive, (*defossio*), the punishment of a woman thief. This barbarous punishment has even been used in our own country under the fendal tyranny. Lord Bacon gives instances of the resurrection of persons who have been buried alive. The fa-

mous Duns Scotus is of the number; who, having been seized with a catalepsy, was thought dead, and laid to sleep among his fathers, but raised again by his servant in whose absence he had been buried. The emperor Charles V. after his abdication, took it into his head to have his burial celebrated in his lifetime, and assisted at it. See CHARLES V.

BURIALS, REGIMENTAL. The following orders for regimental burials are taken from the army regulations:—The funeral of a field-marshal shall be saluted with three rounds of fifteen pieces of cannon, attended by six battalions, and eight squadrons.—Of a general, with three rounds of eleven pieces of cannon, four battalions, and six squadrons.—Of a lieutenant-general, with three rounds of nine pieces of cannon, three battalions, and four squadrons.—Of a major-general, with three rounds of seven pieces of cannon, two battalions, and three squadrons.—Of a brigadier-general, three rounds of five pieces of cannon, one battalion, and two squadrons.—Of a colonel, by his own battalion, or an equal number by detachment, with three rounds of small arms.—Of a lieutenant-colonel, by 300 men and officers, with three rounds of small arms.—Of a major, by 200 men and officers, with three rounds of small arms.—Of a captain, by his own company, or seventy rank and file, with three rounds of small arms.—Of a lieutenant, by one lieutenant, one serjeant, one drummer, one fifer, and thirty-six rank and file, with three rounds.—Of an ensign, by an ensign, a serjeant, and drummer, and twenty-seven rank and file, with three rounds.—Of an adjutant, surgeon, and quartermaster, the same party as an ensign.—Of a serjeant, by a serjeant, and nine rank and file, with three rounds of small arms.—Of a corporal, musician, private man, drummer, and fife, by one serjeant, and thirteen rank and file, with three rounds of small arms.—All officers, attending the funerals of even their nearest relations, shall, notwithstanding wear their regimentals, and only have a black crape round their left arm.—The pall to be supported by officers of the same rank with that of the deceased; if the number cannot be had, officers next in seniority are to supply their place.—The expense of a regimental burial is charged against the captains of the respective troops.

BURIDAN (John), a native of Bethune, in Artois, was one of the most celebrated philosophers of the fourteenth century. He was rector of the university of Paris, about A. D. 1320, and wrote commentaries on logic, morality, and Aristotle's metaphysics. Being expelled Paris by the power of the Realists, he went into Germany, where he established the university of Vienna. From him came the proverb of the Ass of Buridan, so famous in the schools. Buridan supposed an hungry ass fixed at an exactly equal distance between two bushels of oats; each of them acting equally on his senses, and desired to know what the ass would do? If he was answered, that he would remain immovable, then he concluded he would die of hunger, with food in reach. This appeared absurd, and brought the laughter on his side; but if it was replied, that the ass would not be so stupid as to die of

hunger in such a situation, then (said he), the ass has free will, or is it possible that of two equal weights, one should outweigh the other. These two consequences appeared equally absurd; and thus Buridan, by this sophism, became famous in the schools.

BURIS, a name given by Avicenna, and some other old authors, to a scirrhus hernia.

BURKE (Edmund), a distinguished writer, orator, and statesman, was born in the city of Dublin, on the 1st of January, 1730. His father, a protestant, exercised the profession of an attorney, first at Limerick, and afterwards in Dublin. Young Edmund received the rudiments of his classical education at Ballymore, in the county of Kildare, under the direction of Abraham Shackleton, a quaker of considerable talents and reputation. Under his tuition, Burke devoted himself to his studies with great ardour and perseverance, and laid the foundation of that extensive and elegant scholarship, which was alone sufficient to have illustrated his name. Mr. Shackleton lived to see his favorite pupil attain a high degree of reputation; and for near forty years that Burke paid an annual visit to Ireland, he never failed to pass a few days at Ballymore. From this respectable seminary he was sent, at the age of sixteen, to the university of Dublin. Here, however, he does not appear to have distinguished himself either by application or talents. His character, as a student, was merely negative. He exhibited no symptoms of early genius, obtained no palms in the academic race, and departed even without a degree. During this period, however, he commenced author. His first essays were of a political nature; among them were essays in ridicule of the celebrated demagogue, Dr. Lucas; but he soon afterwards directed his mind to other pursuits, particularly logic and metaphysics; and is said to have planned a refutation of the systems of Berkeley and Hume. While thus employed in treasuring up the means of attaining a species of celebrity, which far different avocations prevented him afterwards from attaining, he was not inattentive to the grand object of securing a suitable settlement in life; for his family was not opulent, and he already panted after independence. He accordingly became a candidate for the logical chair in the university of Glasgow. The immediate reason of his failure is not known; but being disappointed he repaired to the metropolis, and entered himself as a student of the Inner Temple. It is evident from his speeches, his writings, and his conversation, that he studied the grand outline of our municipal jurisprudence with particular attention; but it may be doubted whether he ever entered into the minutæ. Indeed, the versatility of his talents, and his numerous avocations, were but little calculated for that dull and plodding application which can alone lead to an intimate knowledge of our laws. Besides, if he had been gifted with the necessary application, both time and opportunity were wanting; for it is well known, that at this period of his life, the narrowness of his circumstances did not permit him to dedicate his attention solely to this, or indeed to any other single object. The limited and precarious state of his

finances called frequently for a speedy supply ; and instead of perusing the pages of Bracton, Fleta, Littleton, and Coke, he was obliged to write essays, letters, and paragraphs, for the publications of the day. But if these pursuits diverted his attention from graver studies, they enabled him to acquire a facility of composition, and a command of style and of language, which proved eminently serviceable in the subsequent part of his life. His health, however, became at length impaired, and a nervous fever ensued. This circumstance induced him to call in the aid of Dr. Nugent, one of his own countrymen, a medical man of the most amiable manners, and benevolent heart, who had travelled on the continent, and was himself an author. He at once discovered the source of his malady, and, by removing him from books and business to his own house, soon effected a cure. That event is also said to have been hastened, if not entirely completed, by a physician of another kind ; the accomplished daughter of his host. This lady was destined to become his wife ; a circumstance particularly fortunate for him, as her disposition was mild and gentle, and she continued, through a long series of years, and many vicissitudes of fortune, to soothe and tranquillise passions always violent, and often tumultuous.

Burke seems at length to have determined once more to endeavour to distinguish himself as an author ; and he accordingly took advantage of the death of lord Bolingbroke, to write a work after his manner ; in which, by exaggerating his principles, he should be enabled to bring them into contempt. In 1756 he accordingly published, without his name, *A Vindication of Natural Society*, which was so complete an imitation of the style of Bolingbroke, as for a time to impose upon the friends of that writer. Its sale, however, was not extensive. His *Essay on the Sublime and Beautiful* was attended with different success, and secured for him at once a high degree of reputation, and the countenance of several powerful friends. In addition to the profits of the publication, he is said on this occasion to have received a present from his father of £100. But his circumstances, notwithstanding, must have been greatly embarrassed, as he was obliged to sell his books. A periodical work on a new plan, first suggested in 1750, and by some attributed to the Dodslays, and by others to Mr. Burke, became, for some time, a considerable source of emolument to him. This was called the *Annual Register* ; a publication that rapidly obtained celebrity, and of which he had the superintendence for several years. In 1761 he accompanied to Ireland the gentleman well known by the name of single-speech Hamilton. Burke filled no public situation in his native country, but of both the speeches which his friend Hamilton pronounced, he was generally, though erroneously, esteemed the author. On his return from Dublin with a pension of £300, it was no longer necessary for him to write for booksellers. He, however, furnished occasional contributions to the *Public Advertiser*, the excellence of his writings in which introduced him to the notice of the marquis of Rockingham, while Mrs. Woffington recommended him to the

duke of Newcastle. He accordingly very soon became secretary to the marquis ; and having obtained a seat in parliament for Wendover, through the interest of lord Verney, he commenced his career as a leading and eloquent statesman. Nor did he spare any pains to fit himself for the situation which he was now called to fill. In point of talent and political knowledge he was already sufficiently qualified ; but he was ignorant of the forms of business, and had still to acquire the habit of expressing with ease his sentiments before a public assembly. The first of these he attained by unremitting application to the study of usages and precedents ; and the facility of giving utterance to his conception was attained by frequenting the debating clubs of the day. Among other sources of improvement, we are told, he disdained not to study the writings of the fathers, to dive into the subtleties of the school divines, and to engage in the rhetorical combats of the Robin Hood Society. At the time when Burke entered on public life, the public mind was a good deal agitated by the measures of government relative to Wilkes, and by the growing discontents of America. Of the two parties who were opposed to each other, Mr. Pitt's being the more inflexible, as to the necessity of diminishing the influence of court favorites and secret advisers, the duke of Newcastle's, with the marquis of Rockingham as its ostensible leader, came into power : on this occasion Mr. Burke seceded from the interests and friendship of Hamilton, resigning the pension which he owed to his patronage. The nature and extent of the favors he received from the marquis of Rockingham have been variously represented ; but it is believed that a considerable portion, if not the whole, of the purchase-money for his villa at Beaconsfield, was advanced, either as a loan or a gift by that nobleman. The first speech which Burke made in the house of commons was on the famous stamp act ; and it was so eloquent and masterly as to attract the attention and command the applause of Mr. Pitt. Mr. Burke was principally consulted by the Rockingham administration in the affairs of America, and the moderate course which they followed was adopted in conformity to his advice. The weakness of the party, however, and the tame and feeble policy which they pursued, soon brought its administration to a close. On this occasion Mr. Burke produced his *Short Account of a Short Administration*. Mr. Pitt now came into power, having made, as he imagined, his own terms with the court ; but his views so little accorded with those of the executive, that he held the reins of government only a very short time. The Grafton administration succeeded, and Burke, being re-elected for Wendover, became the principal orator of opposition.

The period of lord North's premiership forms the most brilliant epoch of Mr. Burke's life. He was hostile to the expulsion of Mr. Wilkes ; an act which the house of commons afterwards rescinded from its records. About this period he published his *Thoughts on the Present Discontents*, in which his sentiments on the nature of the constitution are fully stated. On the application of the Dissenters for relief, he took up

their cause, and expressed his resentment, in very animated terms, against that misguided policy, which permits all those not within the pale of the establishment to enjoy liberty, less by right than by connivance. But perhaps the noblest part of his conduct consisted in his steady and uniform opposition to the American war, and his marked and declared hostility to the abettors of it. His speech against the Boston port bill was one of the most noble specimens of oratory that have ever been exhibited in the British senate. On the 19th of April, 1774, on a motion for the repeal of the tea duty, he also spoke admirably; and when, in reply to a member who had observed, 'That the Americans were our children, and it was horrible for them to revolt against their parent!' the orator uttered the following passage—the whole house was electrified:—'They are our children, it is true; but when children ask for bread, we are not to give them a stone. When those children of ours wish to assimilate with their parent, and to respect the beautiful countenance of British liberty, are we to turn to them the shameful parts of the constitution? Are we to give them our weakness for their strength; our opprobrium for their glory; and the slough of slavery, which we are not able to work off, to serve them for their freedom?' The people of Bristol, gratified by the exertions of Mr. Burke in behalf of civil and religious freedom, put him in nomination for their city, and sent into Yorkshire to request his immediate personal attendance. After consulting with his patron concerning an offer so flattering and unexpected, accompanied at the same time with assurances, most punctually fulfilled, that he should be put to no expense whatever, he immediately set out for the west of England, and found that no less than three candidates had started before him. The first was lord Clare, afterwards lord Nugent, one of the former representatives, whose unpopularity was such, that he soon discovered the necessity of resigning all his pretensions. The new candidate did not appear on the hustings until the afternoon of the sixth day's poll, on which occasion he addressed the electors in a very able speech; and, on the conclusion of the election in his favor, made the most brilliant address on the occasion that had ever been heard within the walls of a provincial city. Mr. Burke immediately returned from his new constituents to parliament with increased vigor, reputation, and zeal. The earl of Chatham having failed, notwithstanding his reputation for wisdom, in an attempt to adjust the troubles of the colonies, by means of a conciliatory bill introduced by him into the house of peers for that purpose, the obstinacy of the ministry now became apparent to every one. This circumstance, which would have appalled an inferior man, did not, however, discourage the member for Bristol from a similar attempt in another place; and, accordingly, March 22d, 1775, he brought forward his thirteen celebrated propositions, which were intended to close the fatal breach, and heal all the differences between the mother country and her colonies. His plan, on this occasion, embraced not only an immediate conciliation, by a repeal of the late coercive

acts, but also the creation of an independent judicature, and the regulation of the courts of admiralty. The whole, however, was quashed by a large majority on the side of the minister, who moved the previous question. Parliament was dissolved in 1780, but Mr. Burke was not re-elected for Bristol, an event which is said to have made a deep impression on his mind. This must, however, have been obliterated by the important events that speedily ensued, for the minister now tottered on the treasury bench, being abandoned by many of his staunchest supporters, and but little confident in his own schemes, all of which had proved eminently unsuccessful. The opposition unceasingly assailed him, until on March 28th, 1782, lord North assured the house of commons that his administration was at an end. The day had now arrived when the ministry and opposition were to change places, and the former to be arrayed in the spoils of the latter. Of this rich booty, Mr. Burke, whose services had been so conspicuous in hunting the enemy into the toils prepared for them, had his portion; for he was made a privy counsellor, and invested with the lucrative appointment of paymaster-general of the forces. He was now at length enabled to enforce his plan of political economy, tendered before in vain; and the board of trade, the board of works, and the offices of the six clerks of the board of green cloth, third secretary of state, treasurer of the chamber, cofferer of the household, the lords of police in Scotland, the master of the harriers, the master of the stag hounds, and the paymaster of the pensions, were abolished. At length the reins of government were confined to the hands of the marquis of Lansdowne, then earl Shelburne; and this event gave such offence to those who wished to place the duke of Portland at the head of affairs, that Mr. Fox, lord John Cavendish, and Mr. Burke, immediately resigned. In the mean time, the critical state of the English East India Company, which had long agitated the public mind, became occasionally a subject of discussion in parliament. The seizure, imprisonment, and confinement of lord Pigot, by a faction in the council of Madras; the conduct of Mr. Hastings, in respect to several of the native powers; the grand question of sovereignty, relative to the territorial possessions of the Company in Asia, were subjects which had, at different times excited the attention of the nation. No sooner did Mr. Fox behold himself and his friends in possession of power, than he brought in a bill to remedy the various abuses in the government of British India. Of this bill Mr. Burke is well known to have been the principal penman; and he certainly defended its principles and provisions with all the zeal of a parent. In a speech of considerable length he exhibited an able retrospect of the system, both political and commercial, of the Company; after which he proceeded to state the benefits likely to result from the plan under contemplation, which he considered as calculated to effect 'the rescue of the greatest number of the human race that ever were so grievously oppressed, from the greatest tyranny that ever was exercised.' In short, he contemplated it as a measure that would 'secure

the rice in his pot to every man in India.' 'I carry my mind,' (adds he), 'to all the people, and all the names and descriptions that, relieved by this bill, will bless the labors of this parliament, and the confidence which the best house of commons has given to him who best deserves it.' This celebrated bill, notwithstanding much opposition both within and without, was carried triumphantly through the house of commons; but in the house of peers it experienced a far different fate, and with it fell the power and consequence of its authors, framers, and supporters.

In the course of the next year (February 28th, 1785,) Mr. Burke made an eloquent speech relative to the nabob of Arcot's debts, and described one of his creditors, who had taken an active share in the late elections, 'as a criminal who long since ought to have fattened the region kites with his offal: the old betrayer, insulter, oppressor, and scourge of a country (Tanjore) which had for years been an object of an unremitted, but unhappily an unequal struggle, between the bounties of Providence to renovate, and the wickedness of mankind to destroy.' But there appeared to Mr. Burke to be a still greater delinquent, on whom he was determined to inflict all the wounds of his eloquence, and sacrifice, if possible, the powerful offender himself at the shrine of national vengeance. This was Mr. Hastings; and, soon after the arrival of that gentleman in England, the orator gave notice of his intentions. On the 17th of Feb. 1785 he opened the accusation by a most eloquent speech; in which he depicted the supposed crimes of the late governor-general, in the most glowing and animated colors. The result of this trial, however, was far different from his hopes and expectations; while the length of it failed not to involve both himself and his party in great reproach.

During the debate on the commercial treaty with France (January 23d, 1787,) Mr. Burke pointed his ridicule with no common success at Mr. Pitt, who, according to him, contemplated the subject with a narrowness peculiar to limited minds:—'He seems to consider it,' (adds he), 'as an affair of two little counting houses, and not of two great nations. He seems to consider it as a contention between the sign of the fleur-de-lis, and the sign of the old red lion, for which should obtain the best custom.' The next public event of importance in which we find Mr. Burke engaged, occurred in consequence of his majesty's indisposition. On this occasion he is supposed to have penned a letter for one, and a speech for another, branch of the royal family. When Mr. Pitt moved his declaratory resolutions relative to the provisional exercise of the royal authority, he attacked him with much asperity of language, and was particularly severe on the manner in which the royal assent was to be given to all future acts of parliament. The men who held most of the high places under the government were treated as 'jobbers, old hacks of the court, and the supporters and betrayers of all parties; and it was a mock crown, a tinsel robe, and a sceptre from the theatre, laced over and unreal,' which were about to be conferred on the prince of Wales.

But other scenes and connexions now awaited our orator. The opposition, though lessened by a few occasional desertions, had hitherto acted as a great public body, supposed to be united in general principles, for the common welfare and prosperity of the state; but the French revolution thinned their ranks, diminished their consequence, and, by sowing jealousy between the chiefs, spread consternation and dismay among their followers. It was on the 2d of March, 1790, when Mr. Fox moved for leave to bring in a bill to repeal the corporation and test-acts, that this disunion became evident; and soon after this Mr. Burke declared, 'that his honorable friend and he were separated in their politics for ever.' The ministry now seemed anxious to provide for their new associate; and he, on his part, certainly appeared deserving of some remuneration at their hands, for he had abandoned all his old friends, and, as his enemies maintained, not a few of his old principles. In addition to this, his Reflections on the Revolution in France had afforded some degree of countenance, and even popularity, to the measures of administration: and, not content with his own exertions, he had enlisted his son on the same side, and even sent him to Coblenz. Mr. Burke followed up this publication by a Letter to a Member of the National Assembly, in 1791; An Appeal from the New Whigs to the Old; Letter to a Noble Lord on the Subject in Discussion with the Duke of Bedford; Thoughts on a Regicide Peace; and several private memorials; all displaying his usual vigour of mind, connected occasionally with the infirmity of attempting to enforce truth by temper. In 1792 he published a Letter to Sir Hercules Langrishe, on the Propriety of admitting Roman Catholics to the Elective Franchise; and in 1794 withdrew from parliament. The royal munificence at length gratified his warmest wishes; for by a warrant dated September 24th, 1795, and made to commence January 5th, 1793, he received a pension of £1200 for his own life, and that of his wife, on the civil list; while two other pensions of £2500 a-year for three lives, payable out of the four and a half per cent. fund, dated October 24th, 1795, were made to commence from July 24th, 1793. Honors as well as wealth seemed also now to await him, for he was about to be ennobled; but the untimely death of an only child put an end to all his dreams of ambition, and contributed not a little to hasten his own, which occurred at his house at Beaconsfield, July 8th, 1797, in the sixty-eighth year of his age.

We are not ourselves removed to a sufficient distance from the political whirlpool in which Burke was involved, to estimate his public character, perhaps, fairly. By one class of writers he has been eulogised extravagantly: and we are said to be indebted to his later writings for our very monarchy, and our political existence. To them every thing is clear, and oracular in his arguments; every thing in his conduct patriotic and becoming. Others have represented him as at best but a splendid declaimer and time-server; whose oratory was dazzling and delusive, never logical, never addressed to the judgment, and often wearisome to his warmest friends. His

published works will be the best resource of the reader to form his judgment on the latter point; and the whole of his political career will long form a useful study, and the best illustration of his character.

As a private individual, he was benevolent and humane. By his liberality and extensive influence, a school was established in his neighbourhood, for the education of those whose parents were unable to afford them useful tuition; and he warmly encouraged, and frequently superintended, benefit clubs among the laborers and mechanics. He was a fond and attentive husband, an affectionate and indulgent father, a sincere, fervid, and active friend, a liberal and kind master. Throughout his whole life he was extremely temperate and studious, consecrating to the improvement of his faculties, and the extension of his knowledge, the greater part of those hours which were not employed in public business. As a literary character, his dissertation on the Sublime and Beautiful will always rank him among the classical authorities of our language. His political tracts exhibit boundless reading, deep thought, and uncommon sagacity; and there is hardly any species of composition which he has not attempted. His first and his last days, it is remarkable, were equally dedicated to literature. We cannot conclude this sketch of Burke, without inserting the well-known epitaph written for him by Goldsmith:—

Here lies our good Edmund, whose genius was such,
We scarcely can praise it or blame it too much;
Who, born for the universe, narrowed his mind,
And to party gave up what was meant for mankind.
Though fraught with all learning, yet straining his throat

To persuade Tommy Townshend to lend him a vote;
Who, too deep for his hearers, still went on refining,
And thought of convincing while they thought of dining;

Though equal to all things, for all things unfit,
Too nice for a statesman, too proud for a wit;
For a patriot too cool; for a drudge disobedient;
And too fond of the right, to pursue the expedient.
In short, 'twas his fate, unemployed or in place, Sir,
To eat mutton cold, and cut blocks with a razor.

The entire works of this great man have been published by his executors in 5 vols. 4to., and 10 vols. 8vo.

BURKE, a mountainous county of North Carolina, in the district of Morgan; bounded on the north by Wilkes, on the east by Iredell, on the south by Rutherford, and on the west by Buncomb, counties. Morgantown is the chief town.

BURKITT (William), a celebrated commentator on the New Testament, was born at Hittcham in Northamptonshire, July 25th 1650, and educated at Cambridge. He entered very early upon the ministry, at Milden in Suffolk, where he continued twenty-one years, first as curate, and afterwards as rector of that church. In 1692 he was appointed to the vicarage of Dedham, in Essex, where he continued till his death, October 1703. He made great collections for the French Protestants in the years 1687 &c. and procured a

VOL. IV.

minister to go and settle in Carolina. Among other charities, by his last will he bequeathed the house wherein he lived, with the lands belonging to it, in perpetuity, to the lecturer at Dedham. Besides his Commentary, he wrote a work entitled, *The Poor Man's Help*, and *Rich Man's Guide*.

BURL', } *Fr. bourreler*; to raise the nap on
BURLER. } *cloth with a bur or thistle.* Johnson says to dress cloth, as fullers do.

BURLAMAQUI (John James), an illustrious civilian, born at Geneva, and professor of civil law there. Prince Frederick of Hesse-Cassel, being his pupil, took him with him in 1734, and detained him several years. On his return to Geneva, he was named counsellor of state, and died there in 1743. His *Principles of Natural Law* first raised his fame; and are said to contain the essence of Puffendorf, Grotius, and Barbeyrac. He wrote also *The principles of Political Law*. Both are written in French.

BURLESQUE', *v., n. s., & adj.* } *Ital. bur-*
BURLETTA. } *lesco, Fren.*
burlesque, from *Ital. burlare*, *Swed. burla*, to jest, to amuse. Ridicule, lampoonery; tending to raise laughter by unnatural or unsuitable language or images. *Burletta*, a theatrical amusement of a light kind.

When a man lays out a twelvemonth on the spots in the sun, however noble his speculations may be, they are very apt to fall into *burlesque*.

Addison on Ancient Medals.

Would Homer apply the epithet divine to a modern swineherd? if not, it is an evidence that Eumecus was a man of consequence; otherwise Homer would *burlesque* his own poetry. *Broomie's Notes on the Odyssey.*

The new *burletta*'s now the thing!

Pray did you never hear me sing?

'Never indeed.' *Cambridge. The Intruder.*

BURLESQUE, in composition, is distinguished into *burlesque* that excites laughter merely, and *burlesque* that excites derision or ridicule. A grave subject, in which there is no impropriety, may be brought down by a certain coloring to be risible, as in *Virgil Travestie*; the author first laughs at every turn in order to make his readers laugh. The *Lutrin* is a *burlesque* poem of the other sort, laying hold of a low and trifling incident to expose the luxury, indolence, and contentious spirit, of a set of monks. Boileau, the author, turns the subject into ridicule, by dressing it in the heroic style, and affecting to consider it as of the utmost dignity and importance. Though ridicule is the poet's aim, he always carries a grave face, and never once betrays a smile. The opposition between the subject and the manner of handling it, is what produces the ridicule; and therefore, in a composition of this kind, no image professedly ludicrous ought to be admitted, because such images destroy the contrast. Though the *burlesque* that aims at ridicule produces its effects by elevating the style far above the subject; yet the poet ought to confine himself to such images as are lively, and readily apprehended. A strained elevation, soaring above the ordinary reach of fancy, makes

not a pleasant impression. The mind is disgusted by being kept long on the stretch.

BURLINGTON, or **BRIDLINGTON**, is a seaport and bathing town of the east riding of Yorkshire. It is built on the shore of a bay, to which it gives name, which is found to be a safe harbour for vessels, when the wind is strong from the N. N. W. and north-east, being secured by two projecting piers of considerable extent, running out obliquely into the sea, and rendering the entrance narrow. The principal trading vessels are colliers. Here was formerly a priory of black canons, founded in the reign of Henry I. by Walter de Gaunt. What remains of the church shows it to have been a noble structure; but the choir, transepts, and steeple, have been entirely destroyed. A Mr. William Hustler was a considerable benefactor to the town; and in the sixteenth of Charles II. Richard Boyle baron Clifford, received the title of earl from this town. In the eighth of William III., and first George I. acts of parliament were obtained to repair the piers, &c. of the harbour. Burlington quay, to which genteel company resort for bathing, constitutes of itself a small town, and has a brisk and handsome appearance. The houses are in general well built, and the principal street, that opens directly on the harbour, is remarkably broad. The northernmost pier has an agreeable platform, commanding a delightful view of Flamborough Head, which is often crowded with coasting vessels. The mineral springs here are reckoned efficacious for several diseases. There is a weekly market at Burlington on Saturday, at which a great deal of corn is sometimes sold. It lies at about ten miles south-west of Flamborough Head, forty east of York, and 206 north from London.

BURLINGTON, a large maritime county of the United States, in New Jersey, fifty-five miles in length from the mouth of Mullicus river to Trenton, and twenty-eight in breadth. It is bounded on the north-east by Middlesex and Monmouth counties, north-west by Hunterdon, and Delaware river, which separates it from Pennsylvania, south-east, by the Atlantic, south and south-west by Gloucester county; and is divided into eleven townships, viz., Chesterfield, Nottingham, Little Egg-harbour, Evesham, New-Hanover, Chester, Springfield, Northampton, Mansfield, Burlington, and Williamsborough. The north-east boundary of this county was the old divisional line of East and West Jersey. The interior part of the county is one extensive forest of pine trees, and the whole is abundant in grain and provisions. It also carries on a considerable commerce in hides, oil, whalebone and fish.

BURLINGTON city, the capital of the preceding county. It is situated partly on an island so called, and partly on the south-east side of the Delaware, and extends, according to its charter, one mile back, and three miles along the river. The island, which is the most populous part of the town, is a mile and a quarter in length, and three quarters of a mile in breadth. It communicates with the main land by four bridges and causeways, two of which, York and London bridges, are respectable structures. Few of the blacks are slaves; the main streets are regular

and spacious, and generally ornamented with trees in the front of the houses. The Delaware, opposite the town, is nearly a mile wide, and under shelter of Muttiniecunck, and Burlington island, affords a safe and convenient harbour. It is advantageously situated for trade, but is too near Philadelphia to admit of an extensive commerce. The public buildings are the market-houses, a court-house, and jail, which is reckoned the strongest in the state; besides several places of public worship. The Friends are numerous here. The academy is under the direction of seven trustees, and two preceptors.

The island of Burlington was laid out, and the first settlement established about the year 1677, five years after Muttiniecunck or Free School island was given for the use of the island of Burlington. The city was a free port under the state government; but has been established by Congress a port of entry, and a collector appointed for it. However, carrying on little foreign trade, its principal intercourse is with Philadelphia. It is twenty miles north-east of Philadelphia by water, and seventeen by land.

BURLINGTON, the capital of Chittendon county, Vermont, is beautifully situated on Lake Champlain at the confluence of Onion river. A law was passed by the legislature of Vermont, the 2nd of November, 1791, for founding a university in this town. Large subscriptions and donations of land and other property, have been made by individuals, for the purpose of erecting convenient buildings, and establishing a fund. From the agreeableness of the situation, and the salubrity of the climate, there is little doubt but it will become an institution of much utility. It is 130 miles north of Bennington, 320 north by east of New York, and 425 N. N. E. of Philadelphia.

BURLY, *n.* & *adj.* } Swed. *orolig*, *be orolig*,
BURLINESS. } the contrary of *ro bero*,
 repose, quietness. Big, rustic, rude. Properly
 boorly.

Thanne Jupiter right faire and amiable
 God of the sterres in the firmament,
 And norice to all thing generable,
 Fro his father Saturne fare different
 With *burly* face, and browes bright and brent.

Chaucer. The Testament of Cresseide, fol. 195.

His *burly* brand that helped him oft in need,
 Right privily he hid it under that weed.

Henry the Minstrel, in Ellis.

Steel, if thou turn thine edge, or cut not out the
burly boned clown in chins of beef, ere thou sleep in
 thy sheath, I beseech Jove, that thou mayest be turned
 into hobnails.

Shakespeare.

It was the orator's own *burly* way of nonsense.

Cowley.

Her husband being a very *burly* man, she thought
 it would be less trouble for her to bring away little
 Cupid.

Addison.

And some ascribe the' invention to a priest,
Burly and big, and staidous of his ease.

Cowper. Task, bk. i.

BURMAN (Francis), a protestant minister, and professor of divinity at Utrecht, was born at Leyden in 1626; and died on the 10th of November, 1679, after having published a course of divinity, and several other works. His son Francis was also an author.

BURMAN (Peter), son of the preceding, professor of history and eloquence, in the university

of Leyden, and rector magnificus of that university. He first began to study the law, and, after a year's application, took his degree of doctor in that faculty, on which occasion he published a dissertation *De Transactionibus*. In 1691 he was appointed collector of the tithes, and in 1696 was chosen professor of eloquence and history at Utrecht, to which was afterwards added the Greek professorship. The university of Leyden now invited him to the professorships of history, eloquence, and Greek, vacant by the death of Perizonius, which he accepted. He filled the office of rector twice, and when the professorship of history of the United Provinces became vacant, it was conferred upon him, together with the post of chief librarian. He died in 1741. He was the author of several noted editions of the classics, the principal of which are—1. *Phædrus*, 4to. 2. *Quintilian*, 2 vols. 4to. 3. *Valerius*

Flaccus, 12mo. 4. *Ovid*, 4 vols. 4to. 5. *Poeta Latine minores*, 2 vols. 4to. 6. *Velleius Paterculus*, 2 vols. 8vo. 7. *Virgil*, 4 vols. 4to. 8. *Suetonius*, 2 vols. 4to. 9. *Lucan*, 4to. 10. *Buchanani Opera*, 2 vols. 4to.

BURMANNIA, in botany, a genus of the monogynia order, and hexandria class of plants; natural order, tenth, coronarie. The flower is small, and consists of three minute, ovated, oblong petals, situated at the mouth of the cup; the fruit is an involuted capsule, of a cylindraceo-trigonal figure, formed of three valves, with three cells, containing many small seeds. There are two species.

BURMANNIANA, in entomology, a species of phalæna, tortrix. The wings are pale, with four black spots on the anterior pair. Found in Surinam.

BURMHAN EMPIRE.

THE BURMHAN, or Birman Empire, called also from its former capital, the kingdom of Ava, is an important modern state of India, beyond the Ganges, lying between the ninth and twenty-sixth degrees of north latitude, and between the 92d and 104th degree of east longitude. It is composed of the original territory of the Burmese, surrounded by the subjugated provinces of Arracan on the west, Pegu, Martaban and Tenasserim on the south, part of Siam east and north, and Cassay on the north-west, the whole being bounded by the empire of China and British India north and west, by the Siam coast and the Indian Ocean south. It is described, by the most recent account, as about 1000 miles in length, and 700 in breadth, containing 194,000 square miles, and forming the most extensive native sovereignty of India.

On the frontiers of Chittagong, between the Nauf and the northend of the Negrais, are several excellent harbours, as well as in the Mergui archipelago: amongst these, Negrais and Rangoon are mentioned as the best. Its principal rivers are the Airavati, or Erawadi, the Lokiaing, the Kendenwen, the Pegue, and the Martaban; but it has many others of less note. Between the last two is a lake, whence two other streams proceed, one of which runs northward to Old Ava, and the other south to the ocean.

The Erawadi, or Airavati, the Elephantine River, so called from its noble size, or the vast herds of elephants which crowd its banks, is the the Kiang-nà, or Great Fish River, of China. It enters the Burmhan empire, receives a branch of the Brahma-putra, and proceeds to the south-east till it joins another stream from Chû-dzong, in about the twenty-sixth degree of north latitude. Below Ava it receives another accession of some magnitude, in the K'h'yén-dwen, a stream which rises in the lower range of mountains on the confines of Assam. The Erawadi now flows west, and round to the south, then in a south and easterly direction, till within 130 geographical miles from the sea it forms a Delta of low lands, the basis of which, between Syriam

and the western mountains of Môdén, is nearly 110 geographical miles. This stream is inferior only to the Ganges in importance. It is subject in the hot summer months to extraordinary inundations; the wise economy of Providence providing, in the melting of the snows of the mountains throughout this season, a fertilising and powerful current for the refreshment of those vast regions here which are rarely visited with rain. The Lokiaing is a powerful stream, though far inferior to the Erawadi, to the north-west of which it rises, in the Chinese provinces, running through Pegu, and falling into the sea of Martaban.

Exclusive of the Delta of the Erawadi there are few low lands in these dominions. A range of hills stretches on the western side from about thirteen degrees north, to nearly nineteen degrees north and south; eastward another ridge, beginning on the Chinese limit, near the banks of the Erawadi, between Ava and B'hánmò, runs southward till it nearly reaches the sea. Dr. Buchanan speaks of this range as attaining an altitude of nearly 5000 feet, in the neighbourhood of Amarapura, or Ummerapoor, the present capital of this empire. Tracts of hilly country also extend on each side of the Mekong river; and another chain rises opposite to Old Ava, and traverses the country northward, separating Cassay from Siam.

The climate is comparatively healthy and dry, and the seasons pretty regular. Just before the rains commence the heat is most intense. Colonel Symes found the thermometer at 98° about noon at this season. There are occasionally rapid transitions from cold to heat, and, as in all warm countries, the air in the forests and their vicinity is frequently charged with pestilential vapors.

The soil of the southern provinces is remarkably fertile, producing as luxurious crops of rice as are to be found in any part of India; but extensive plains are seen, on which the feeble traces of cultivation are contrasted with the deeper impressions of barbarous warfare, and the

ruinous haunts of wild beasts. In the more northern and mountainous parts of the empire, the teak and the fir tree abound; the latter is valued only for its turpentine, but the former, which is also found on the margin of all the great streams southward, is the monarch of the forest here, and for hardness, if for not durability, exceeding our English oak. The plains and valleys every where, but particularly near the rivers, are exceedingly fruitful, and yield good wheat, and the various kinds of small grain and legumes of Hindostan. Sugar-canes, tobacco of superior quality, indigo, cotton, and the different tropical fruits, are all indigenous. In a district named Palongmion, to the north-east of Ummerapoor, the tea-leaf grows, but it is very inferior to that of China, and is seldom used but as a pickle.

This empire is abundant in minerals. Near the Chinese frontier, at Badouem or Bodwin, six days journey from Bamoo, are mines of gold and silver; and in the neighbourhood of Ummerapoor, in the Woobolootan mountain, are the largest ruby and sapphire mines, perhaps, in the world. Precious stones are found in every part of the empire, together with iron, copper, lead, tin, antimony, arsenic and sulphur. Gold is also sifted from the mountain streams; and very fine amber, dug up in large quantities near the Erawadi. Quarries of the most beautiful marble, equal to the finest Italian specimens, are open within a few miles of the seat of the government, which monopolises it as sacred, and the petroleum of the Yanangum wells, is an article of very extensive use and commerce.

These wells are situated in N. lat. 20° 26', and E. long. 94° 25'. 'The wells we saw,' says Captain Cox, 'are scattered irregularly about the downs at no great distance from each other; some, perhaps, not more than thirty or forty yards. At this particular place, we were informed, that there are 180 wells; and four or five miles to the north-east there are 340 more. In making a well, the hill is cut down, so as to form a square table of fourteen or twenty feet for the crown of the well, and from this table a road is formed by scraping away an inclined plane for the drawers to descend, in raising the excavated earth from the well, and subsequently the oil. The shaft is sunk of a square form, and lined as the miner proceeds with squares of cassia wood staves; these staves are about six feet long, six inches broad, and two thick, and are rudely jointed and pinned at right angles to each other, forming a square frame about four feet and a half in the clear for the uppermost ones, but more contracted below. When a miner has pierced six or more feet of the shaft, a series of these square frames are piled on each other, and regularly added to, at top; the whole gradually sinking as he deepens the shaft, and securing him against the falling in of the sides. The soil or strata to be pierced is, first, a light sandy loam intermixed with fragments of quartz, siliceous, &c. Secondly, a friable sand-stone easily wrought, with thin horizontal strata of a concrete of martial ore, talc, and indurated argil, at from ten or fifteen feet from the surface, and also from each other, as there are several of these veins in the great body of free-stone. The talc

has this singularity; it is denticulated, its lamina being perpendicular to the horizontal lamina of the argil on which it is seated. Thirdly, at twenty cubits, more or less, from the surface, and immediately below the free-stone, a pale blue argillaceous earth (schista) appears, impregnated with the petroleum, and smelling strongly of it. This, they say, is very difficult to work, and grows harder as they get deeper, ending in schist and slate, such as is found covering veins of coal in Europe. Below this schist, at the depth of 130 cubits, is coal. I procured some, intermixed with sulphur and pyrites, which had been taken from a well deepened a few days before my arrival; but deemed amongst them a rarity, as they are seldom obliged to proceed to such a depth. They were piercing a new well when I was there; and had got to the depth of eighty cubits, and expected oil at ten or twenty cubits more.

'The machinery used in drawing up the rubbish, and afterwards the oil, from the well, is an axle crossing the centre of the well, resting on two rude forked stanchions, with a revolving barrel on its centre, like the nave of a wheel, in which is a score for receiving the draw-rope; the bucket is of wicker work, covered with dammer; and the labor of the drawers, consisting in general of three men, is facilitated by the descent of the inclined plane, as water is drawn from deep wells in Hindostan. To receive the oil one man is stationed at the brink of the well, who empties the bucket into a channel made on the surface of the earth leading to a sunken jar, from whence it is laded into smaller ones, and immediately carried down to the river, either by coolies or on hackeries, common carts. When a well grows dry, they deepen it. They say, none are abandoned for barrenness. Even the death of a miner from mephitic air does not deter others from persisting in deepening them when dry. Two days before my arrival, a man was suffocated in one of the wells; yet they afterwards renewed their attempts without further accident. I recommended trying the air with a candle, &c., with seemingly little effect. The oil is drawn pure from the wells in the liquid state, as used, without variation: possessing all the properties of coal tar, being in fact the self-same thing; the only difference is, that Nature elaborates, in the bowels of the earth, that for the Burmese, for which European nations are obliged to the ingenuity of Lord Dundonald.'

The average produce of each well, according to Captain Cox, appears to be 793 hogsheads, or 49,957 gallons per annum; there are 520 wells registered by government: the gross amount therefore of the whole annual produce will be 412,360 hogsheads, worth, on the spot, 889,737 siccah rupees, or £111,212.

In their agriculture, the Burmese are very careless and superficial; but their draft cattle are remarkably good, and well attended to. Two are employed at plough, which turns up the earth but a few inches: in their large carts are put four strong oxen, which the girls generally drive, and with considerable dexterity.

The commerce of the empire is very extensive. Between the capital and Yunnan in China, a con-

considerable export trade is carried on in cotton, of which there are two kinds, one of a brown color, of which nankeens are made, the other white, like the cotton of India. It is transported up the Erawadi in large boats, as far as a place called Bamoo, where it is bartered with the Chinese merchants, who convey it forward partly by land and partly by water. Amber, ivory, precious stones, betel nut, and the edible nuts, brought from the eastern archipelago, are also articles of commerce. In return the Burmese procure raw and wrought silks, gold leaf, preserves, paper, and hardware utensils. The inland commerce is also brisk, particularly in provision. Several thousand boats are employed in transporting rice and salt from the south, to supply the capital and the northern districts. The Erawadi is the great channel of importation. Here arrive European broad cloth and hardware, coarse muslins and silk handkerchiefs, and china and glass from Bengal. Small quantities of silver, lac, and precious stones are also exported. The teak timber forms the most important article of commerce between Ava and the British dominions. The quantity imported into Calcutta and Madras in 1795, according to Col. Symes, was valued at £200,000. All the forests that yield this timber being the exclusive property of the royal family, the trade is monopolised, and the prices liable, consequently, to great fluctuations. The Shinbin teak planks, in 1812, were sold for three times the sum that had been previously demanded for them. Ships are built and sent out for sale at Negrais, Rangoon, &c. of this timber; the Burmese possessing the whole of the eastern side of the bay of Bengal, as well as other convenient places for ship building. Col. Symes saw several vessels on the stocks at Rangoon of from 600 to 1000 tons burden. The tonnage of vessels annually built in the empire has been taken at 3000 tons.

The Burmese, like the Chinese, merchants have no coin: silver in bullion and lead being the current monies of the country. What foreigners call a tackle, properly *kiat*, is the most general silver piece in circulation: it weighs ten pennyweights, ten grains and three-fourths. The subordinate currency is lead, in which all common market articles, such as fish, flesh, rice, greens, &c. are paid for. Lead and silver, being royal monopolies, are often raised in the markets far above their intrinsic value. It is necessary for every merchant to have a banker to manage his money transactions, who is responsible for the quality of the metal, and charges a commission of one per cent., but the currency fluctuates in value so much, that the utmost watchfulness cannot secure anything like a steady profit to the inexperienced foreign merchants.

A tenth of all produce is exacted as the authorised due of the government, and one-tenth is the amount of the king's duty on all foreign goods imported. The revenue, arising from customs on imports, is mostly taken in kind. A small part is converted into cash, the rest is distributed and received in lieu of salaries to the various departments of the court. Bullion, except on pressing occasions, is never disbursed from the royal coffers. To one man the fees of an office

are allowed; to another, a station where certain imports are collected, and a third has land in proportion to the importance of his employment. They are all called the slaves of the king; and, in their turn, have vassals denominated their slaves. Although it seems almost impossible, under such a system, to ascertain in any standard currency the amount of the royal revenue, yet the riches of the Burmhan sovereign are said to be immense, which is rendered probable by the circumstance, that a very small portion of what enters his exchequer, ever again returns into circulation—the hoarding of money being a favorite maxim of oriental state policy.

The manufactures of this empire consist chiefly of cotton and silk goods, saltpetre, gunpowder, pottery, and the marble statues of their idols. Colonel Symes saw thirty or forty large yards in a village crowded with statues at work on images of Godama, various sizes, sitting cross-legged on a pedestal. The quarries from which they obtain the materials, were only a few miles distant. It was brought thither in blocks. The smallest exceeded the human stature, and the price was said to be 100 tackals, or about twelve or thirteen pounds sterling; but some diminutive images were sold as low as two or three tackals. The workmen were very civil and communicative. Their tools were a chissel and a mallet, and they smooth the images with freestone and water. Many were beautifully polished, which is said to be done by rubbing the marble with three different kinds of stone; the first rough, the second finer, and the third such as hones are made of. The workmen afterwards use the palms of their hands in polishing, which gives the images a transparent clearness far surpassing the brightest European marble.

On the subject of vitrification, which is but partially known here, Colonel Symes mentions the following curious and interesting fact: 'The Burmhan monarch,' says he, 'who is a great admirer of this manufacture, was particularly desirous to introduce it into his own dominions; and, supposing that every Englishman must be versed in the knowledge of making whatever comes from his own country, he sent a message to request that I would furnish his artificers with such instructions as might enable them to fabricate glass of a quality equal to what was made in England. Unluckily none of us happened to be skilled in the mystery of a glass-house; all, therefore, that we could do, was to explain the principles of the art, which Dr. Buchanan obligingly undertook; and, in order to facilitate them in the acquirement, and guide them in the practice, I lent them the *Encyclopædia Britannica*, and pointed out the article where the process is fully explained. Baba Sheen, the second in authority at the port of Rangoon, and the Armenian interpreter, translated it into the Burmhan tongue.'

The form of government is despotic; but the emperor is accustomed to consult a council of nobles. No country of the east has a more splendid or well managed royal establishment; it is said to be magnificent without being wasteful, and extensive without confusion. On the death of the possessor of any honor or employ-

ment, it reverts to the crown. The orders of nobility are distinguished by the number of strings which compose the chain which is their badge. No subject is ever honored with a higher degree than twelve, and the king alone wears twenty-four. He is further honored by being the only proprietor of elephants throughout the empire; and none but an officer of the first rank is permitted to ride on one. He is addressed by the most sounding epithets, and approached with a degree of awe which is uncommon even in the east. No part of his person is mentioned but with some allusion to the splendid metals, particularly gold. If it is meant to be said that the king has heard any thing, the expression is, 'It has reached the golden ears;' the otto of roses is described as being grateful to the 'golden nose;' and he who has been admitted to the royal presence is said to have bowed at the 'golden feet.'

The Burmese may be said to be a nation of soldiers, every man in the kingdom being liable to be called upon for military service. Until a recent period, a few undisciplined native Christians and renegades acting as artillery, a small body of cavalry, natives of the mountains, and perhaps 2000 or 3000 ill disciplined infantry, were the entire standing force of the country. The usual armies were composed of levies raised on the occasion of a war breaking out, by the princes and great lords who hold all their lands by military tenure: 60,000 men of all arms was thought a very large force. The infantry are armed with muskets and sabres, the cavalry with a lance: their horses are small, but very active.

One of the most respectable parts of the Burmhan military force, is their war boats, carrying from fifty to sixty rowers, and used with short oars that work on a spindle. The prow is solid, and is a flat surface, on which, when they go to war, a piece of ordnance is mounted; a six, a nine, or even a twelve pounder, and several are frequently fixed on the stern. Each rower is provided with a sword and lance, which are placed by his side while he plies the oar. Besides the boatmen, there are usually thirty soldiers on board, who are armed with muskets. Their attack is extremely impetuous; they advance with great rapidity, singing a war song, and beating time with the strokes of their oars. They generally endeavour to grapple, and when that is effected, the action becomes very severe. The largest of these war boats is from eighty to 100 feet long, and they draw about three feet of water.

The population of the Burmese empire it is very difficult to estimate. All the necessities of life being easily acquired, and the facilities for emigration being also great, sudden fluctuations take place. Immense numbers of emigrants from these districts have passed the Bengal frontier within a few years; and to the circumstance of an humane endeavour to provide for one body of them, which appeared in Chittagong under lord Teignmouth's government, we are indebted for Mr. Cox's account of this empire. Colonel Symes estimated the population of the whole empire, in 1795, at 17,000,000 of souls; Cap-

tain Cox, a few years later, at less than half that number (8,000,000). A late resident at the court of Amarapura, captain Canning, considers even 3,000,000 as nearer the truth. The principal provinces have been named; the chief towns are, beside, Ava, the ancient, and Amarapura, or Ummerapour, the capital; Monchaboo, Pegu, Rangoon, Syriam, Prome, Negrais, Persaim, and Chagaing.

The religion of the Burmese is Budd'hism, one of the most widely extended, and most refined modifications of the Hindoo creed. See HINDOO. Like other versions of that creed, it teaches the belief of a supreme deity, in whom the universe is comprehended, and its polytheism is a deification of the planets and elements; but the creating, preserving, and destroying powers of nature, are transformed to so many subordinate agents, who are real objects of worship, so that the most degrading idolatry is the practical result of the system. Budd'ha himself, that incarnation of the deity with which the Burmhan faith is more directly connected, is represented in their temples by the figure of a young man of placid countenance, in the dress of a rahaan, or priest. His most common posture is sitting cross-legged on a throne; his left hand resting on his legs and holding a book, while his right stretches over his knee. Dr. Buchanan mentions an immense block of pure alabaster thus modelled. He had no opportunity of measuring its size, but its fingers were about the length and thickness of a man's leg and thigh, and the other parts of the body in proportion. These images are of all sizes, and made of all kinds of materials.

The temples of Godama are generally of a pyramidal form, and supposed to contain some relics of the god, as a tooth, a bone, a hair, or a garment. The pyramids are often of immense size, constructed of solid brick-work, and surrounded by a group of smaller pyramids, plastered, and sometimes gilt, over the whole outside. At top the whole is crowned with a gilt umbrella of iron filagree, hung round with bells. Stones, bearing the impression of the foot of the god, are peculiarly objects of devotion; particularly the Samanalé Sri-pade (or Amala Sari-padi, as it is named by the Burmese) on Adam's Peak, in the centre of Ceylon. The friends and attendants of Godama are also worshipped as deified beings; and their images are placed in the temples for adoration. The Bráhmancial deities are considered as heroes, but receive no adoration. The offerings at these temples are of every kind of valuable produce of nature and art; fruits of all kinds, rice, the cocoa-nut, betel, flowers, natural and artificial, gold and silver, generally wrought, and canes, pillows, umbrellas, and slippers, gilded profusely. One common way for a worshipper to express his devotion, is to gild a patch of the temple wall, in consequence of which many of them present a very motley appearance. The offerings of the king, according to Dr. Buchanan, are worth annually 86,805 lbs. of silver. 'Private prayers, chaunted with the aid of rosaries, offerings in the temples, particularly on the changes of the moon, fasts continued from sun-rise to sun-set at a certain season of the

year, mirth and jollity at festivals, especially at the commencement and close of their Lent, are among the many of their religious observances,' says a late writer, 'which bear a singular resemblance to those of the Roman church.'

The most remarkable superstition of this empire, however, is that which teaches them to regard the white elephant as almost divine. One of these animals is lodged in a splendid palace at Ummerapoore. His apartment is shrouded from vulgar eyes by a black velvet curtain, richly embossed with gold, and his whole residence is as dazzling and sumptuous as gold and silver can make it. He is furnished with a rich crimson silk bed, adorned with gold tapestry hangings, and jewellery, and has his gold betel boxes, spitting pots, &c. This animal is actually considered the second person in the state. Foreign ministers are introduced to his sacred presence, and he ranks before every member of the royal family, except the king. Captain Canning, however, who saw him in 1810, represents him as a diminutive, sandy-colored beast, confined by gold and silver chains to the pillars of his apartments, disfigured by leprosy, and little gratified, apparently, by the services of his prostrate attendants.

The priests, and the morals professed to be taught, are alike creditable to the system, speaking of its comparison with many others. There are no secular priests who officiate in the worship; all are what the Romish church would call regular clergy. They live together in convents, which are by far the best habitations in the empire, and are dressed in a long yellow cloak, like the Carmelites; they go barefooted, and have their heads close shaven, on which they never wear a covering: they profess celibacy, and to abstain from every indulgence of the senses. If a rahaan, or priest, is detected in an act of incontinence, he is expelled from the society, and subjected to public disgrace. They never dress their own victuals, holding it an abuse to perform any of those common functions of life, which may divert them from contemplation. They receive the contributions of the laity ready dressed, and prefer cold food to hot. At the dawn of day they begin to perambulate the town, to collect their supplies, each convent sending forth a certain number of its members, who walk at a quick pace through the streets, and support with the right arm a blue lackered box for the donations. These consist generally of boiled rice, mixed with oil, dried and pickled fish, sweetmeats, fruit, &c. During their walk they never cast their eyes to the right or left, but keep them fixed on the ground; never stopping to solicit, and seldom even looking at their donors. They eat only once a day, at noon.

Dr. Buchanan says, as far as he could observe, they are of very decent moral deportment, remarkably hospitable to strangers, the most intelligent men in the country, and very highly respected by all classes. The road, on all occasions, is yielded up to them; they are generally addressed by some honorable title, and in their convents are allowed the use of painting and gilding, which are prohibited to all other subjects. In some cases they are even permitted to

plaster the outside roofs of their habitations white, which is the royal color, the most distinguishing of all royal insignia, and common only to Godama and the king. Though so highly honored, he adds, they retain the greatest simplicity in their manners. In the various commotions of the empire, they have never taken any active part, or publicly interfered, in politics, or engaged in war; and the Burmians and Peguers, professing the same religion, whoever were conquerors, equally respected the ministers of their faith.

There were formerly nunneries of virgin priestesses, who, like the rahaans, wore yellow garments, cut off their hair, and devoted themselves to chastity and religion; but these societies were long ago abolished, as being considered injurious to population. At present there are a few respected old women, who shave their heads, wear a white dress, follow funerals, and carry water to convents. Some years ago a Catholic bishop, residing at Ava, asked the chief rahaan, called Zaradobera, to give him some short treatise which would explain the doctrines of Godama. The priest, willing to satisfy the bishop, wrote for his use, it is said, a small treatise, the most important particulars of which are as follow: 'The gods who have appeared in the present world, and who have obtained the perfect state, Niebau (deliverance from all the evils of life), are four; Chauehasam, Gonagom, Caspa, and Godama. Of these the law of Godama ought at present to be followed. Q. Where is the god Godama? A. Godama, at the age of thirty-five years, having attained divinity, preached his law for forty-five years, and brought salvation to all living beings. At eighty years of age, he attained Niebau; and this happened 2362 years ago. Then Godama said, 'After I shall have departed from this earth, I will preserve my law and disciples for 5000 years; and he commanded, that his images and relics should be worshipped, which has accordingly been ever since done.' Q. What is the doctrine and law which Godama delivered to be observed by all men? A. It consists chiefly in observing the five commandments, and in abstaining from the ten sins. Q. What are the five commandments? A. 1. From the meanest insect, up to man, thou shalt kill no animal whatsoever. 2. Thou shalt not steal. 3. Thou shalt not violate the wife or concubine of another. 4. Thou shalt tell nothing false. 5. Thou shalt drink neither wine, nor any thing that will intoxicate: Thou shalt not eat opium, nor other inebriating drug. Whoever keeps these five commandments, during all successive transmigrations, shall either be born a nobleman or not, and shall not be liable to poverty, nor to other misfortunes and calamities.

Q. What are the ten sins. A. 1. The killing of animals. 2. Theft. 3. Adultery. 4. Falsehood. 5. Discord. 6. Harsh and indignant language. 7. Idle and superfluous talk. 8. The coveting of your neighbour's goods. 9. Envy, and the desire of your neighbour's death. 10. Embracing the doctrine of false gods.

One good work is called Dana, which consists in giving alms, particularly to the rahaans. A

second is called Bavana, which consists in thoughtfully pronouncing these three words, Aneizza, Docha, and Anatta. By the word Aneiza, is understood, that he who pronounces it recollects, that, by his particular situation, he is liable to vicissitudes; by the word Docha is understood, that by the same situation he is liable to misfortune; and by the word Anatta, that it is not in his power to exempt himself from being liable to changes and to misfortune. Whoever dies without having observed the Sila, Dana, and Bavana, will certainly pass into one of the infernal states, and will become a Nirea, a Prietta, or some animal.

‘Revolving these things in your mind’, continues this curious document, ‘O ye English, Dutch, Armenians, and others, adore Godama the true god; adore also his law and his priests. Be solicitous in giving alms, in the observance of Sila, and in performing Bavana. But a true and legitimate priest of Godama is not to be found, except in this empire, or in the island of Ceylon; and you, O Bishop, have obtained a great lot, who have been thought worthy, although born in one of the small islands depending on Zabudiha, to come hither and to hear the truth of the divine law. This book, which I now give you, is more estimable than gold or silver, than diamonds and precious stones; and I exhort all English, Dutch, Armenians, and others, faithfully to transcribe its contents, and diligently to act according to the precepts therein contained.’

The Burmese are exceedingly tolerant of all other religions, we should add, and teachers of all of them are considered privileged persons.

Colonel Symes passes a warm encomium on the general principles of Burmhan law. It provides, he assures us, with great perspicuity against every kind of crime that can be committed, and adds an ample chapter of precedents and decisions, to guard the inexperienced in cases of doubt. The trial by ordeal, however, disgraces it in common with the legal system of all countries where the Hindoo religion is professed. An instance of this mode of trial is related by the colonel. ‘Two women having litigated a small property in a court of justice, and the judges finding it difficult to decide the question of right, it was agreed to refer the matter to the issue of an ordeal. The parties, attended by the officers of the court, the rabaans, and a multitude of people, repaired to a pond. After certain prayers and ceremonies, the two women entered the pond, accompanied by two or three men, one of whom placed them close to each other, and put a board on their heads, which he pressed down till they were both immersed at the same instant. After continuing out of sight for about a minute and a-half, one of them being nearly suffocated, raised her head, whilst the other continued to sit on her hams at the bottom, but was immediately lifted up by the man; after which, an officer of the court pronounced judgment in her favor; and of the equity of the decision, none present seemed to entertain the smallest doubt.’ This practice, however, and that of imprecation, are now losing ground, and have of late years been discontinued by the judicial courts. In particular cases the criminal jurisprudence is lenient, but

rigorous in others. The first commission of theft does not incur the penalty of death unless the amount stolen is above 800 tackals, or about £100 sterling, or is attended with some circumstances of atrocity, as murder, or mutilation. In the former case, the culprit has a round mark imprinted on each cheek by gunpowder and puncturation, and on his breast the word *thief*, with the article stolen. For the second offence he is deprived of an arm; for the third he inevitably suffers death, by decapitation, a mode of punishment in the performance of which the Burmhan executioners are skilful. The administration of public affairs, was said at this time to be conducted with singular openness and publicity. The punishments which those who drink spirits, &c. meet with, are very frequent and severe. In 1808 the son of the viceroy of Rangoon was put to death for chewing opium; for the same offence another was crucified and nailed up with red hot nails; a third, for incorrigible drunkenness had boiling lead poured down his throat in small quantities. Various other cruel punishments disgrace their penal law.

Their common books, like those of the Hindoos, are composed of the palmyra leaf, on which the letters are engraved with a style; but they are much superior to those of the Western continent, in the neatness of the execution, and in the ornaments which decorate them. Books are also composed of thin stripes of bamboo, delicately plaited and varnished over in such a manner as to form a smooth and hard surface.

Their written language is the Pali or Bali, a dialect of the Sanscrit; but the common dialect of the people is a mixture of monosyllabic and polysyllabic words, abounding in terms of honor and dignity. A grammar of this language was lately composed by a British officer, and presented to the Asiatic Society of Calcutta. In their literature, while nothing profound in science or philosophy appears, great general intelligence pervades the body of the people; and respectable compositions in ethics, law, history, and poetry, are read and recited by all ranks. They are also decidedly contrasted with their Hindoo neighbours in their liberality of sentiment towards other nations, and their toleration. The Royal Library of the capital, when visited by Colonel Symes, contained a surprising number of books, methodically arranged; the contents of each chest being written on it in letters of gold. The theological department was very copious. The king, who sat on the throne when the British embassy was sent to this country, had caused the Institutes of Menu to be translated from the English of Sir W. Jones. But their astronomical and geographical opinions are similar to those of the Hindoos. The figures of the constellations, given by Dr. Hamilton in the Asiatic Researches, vi. 296, are evidently derived from the Hindoo systems of astronomy. Their year has twelve months, of twenty-nine and thirty days alternately, and is rectified by an intercalation every third year. Their calculation from the new to the full moon is progressive; for the remainder of the month, retrogressive. Their week, like that of the Hindoos, is divided into seven days, and the commencement of their era corresponds pretty nearly

with A.D. 638; it is consequently considerably more modern than those generally used in India. The eighth of the decreasing moon, and the last day of the moon, are set apart by the Burmese as sacred festivals. On these hebdominal holidays no public business is transacted, and mercantile engagements are suspended; and the strict observers of them take no sustenance between the rising and the setting of the sun: but the latter instance of self denial is not very common, except in the metropolis. The passage of time is ascertained by a curious machine, resembling the hour-glass, and sometimes by a perforated pan placed in a tub of water. The day commences at noon, and is divided into eight portions, of about three hours each. They are announced by a stroke on an oblong drum, which is always placed near the dwelling of the chief magistrate of the town or village. It is commonly raised on a high bamboo stage, with a roof of mats to protect it from the weather. The edifice at the royal palace in the capital is of masonry, and is very lofty; so that the sound is said to be distinctly conveyed to the remotest parts of the city.

The Burmese have little of the indolence of their neighbours; they are, on the contrary, inquisitive, energetic, and passionate, in a high degree. Their women are not secluded as in other parts of the east, but are nevertheless in the same state of general degradation and wretched slavery to the mere gratifications of man. They are frequently sold for prostitution, and are taken as a kind of chattel by a creditor. In the midst of all this they are industrious, and in that constantly useful employment which attaches to their husbands and produces a remarkable degree of fidelity. Colonel Symes mentions, that, on occasion of a formal visit to the mother of the present queen, they observed, in one of the galleries of his palace, three or four looms working by the damsels of his household. Weaving, indeed, is chiefly a female occupation, and most females make all the cotton and silk cloth that is necessary for domestic consumption. For these, amongst other reasons, we suppose, no women, nor even the female children of a casual intercourse with foreigners, are allowed to leave the country. So particular is the Burmhan law in this respect, that, before a ship receives her clearance at any port, she is searched with great care for this valuable commodity, by the custom-house officers, and should a vessel which has by fraud taken out a woman ever return to a Burmhan port, the master would be subject to fine and imprisonment, and the property confiscated.

In features, complexion, and general make, the Burmese approach to their Chinese neighbours; like them they pluck out their beards, and blacken their teeth and eyelids like the Hindoos. They also tattoo themselves on the arms and thighs. Coarse and uncleanly in their diet, notwithstanding the prohibitions of their law, they are very fond of animal food.

Houses here are generally raised three or four feet from the ground, and built of bamboos and mats: few are allowed by their laws to indulge in the luxury of lacker or gilding the pillars of their abode. They do not contract marriages

till the parties have attained the age of puberty; and are restricted to one wife; but concubinage is allowed. They burn their dead; and their widows are decently provided for.

The practice of their physicians is almost entirely empirical; and, accordingly, they are not held in high estimation. Dr. Buchanan mentions a curious custom respecting them. If a young woman appears to be dangerously ill, the physician and her parents frequently enter into an agreement, by which he undertakes to cure her. If the doctor is successful, he takes her as his property; but if she dies, he pays a certain sum for her to the parents. In surgery, the skill of the Burmese extends only to the dressing of wounds and setting of bones. But of late they have introduced from Arracan the art of inoculation. The practice, however, makes but slow progress, although a very great proportion of the people are marked with small pox. The Baptist missionary, Mr. Felix Carey, introduced in 1808 the vaccine inoculation into the city of Rangoon, and performed the operation on a considerable number of people; among others, on the family of the governor.

The nobles dress in a superb robe of flowered satin or velvet, reaching to the ancles, with an open collar, and loose sleeves. Over this is a scarf, or flowing mantle, which hangs from their shoulders; and on their heads they wear high caps of velvet, either plain, or of silk embroidered with flowers of gold. Some persons of condition wear for ear-rings tubes of gold, about three inches long, and as thick as a large quill, which expand at one end like the mouth of a trumpet; others wear a heavy mass of gold, beaten into a plate, and rolled up. This lump of metal drags down the lobe of the ear by its weight to the extent of two inches, and makes a considerable orifice in it. In their common dress, men of rank wear a tight coat, with long sleeves, made of muslin, or of very fine nankeen, and a silk wrapper that encircles the waist. The working classes are usually naked to the middle; but, in cold weather, they make use of a mantle or vest of European cloth. When women of quality go abroad, they wear a silk sash like a long shawl, which crosses their bosom, and is cast over the shoulder so as to flow down very gracefully. The poorer females often wear only a single garment, in the form of a sheet, wrapped round the body, and tucked under the arm; it crosses their breasts, which it scarcely conceals, and descends to their ancles in such a manner that the legs protrude from under it when they attempt to walk. Rank is regarded with particular attention. No one dare assume in his house a mode of structure to which he is not legally entitled, under the penalty of a most severe punishment; and even in the domestic instruments, in the shape of the betel box, which is carried by an attendant before one of noble birth, as well as in his ear-rings, his cup of ceremony, the accoutrements of his horse, and even in the metal of which his spitting-box is made, the due subordination and station of a Burmhan appears. The sitting posture is, among the Burmese, the most respectful, so that strangers are very apt to attribute to pride, what, in their view, is a mark of deference.

Among their amusements are boxing-matches, processions, fire-works, public dances, and puppet-shows. They are particularly fond of dramatic entertainments. At Pegue is a theatre, in an open court, often splendidly illuminated by lamps and torches. Indeed, at all festivals they have entertainments, consisting of music, dancing, and action, with a dialogue in recitation. The higher ranks are particularly fond of chess. The board which they use is exactly similar to ours, containing sixty-four squares, and the number of troops the same, sixteen on each side; but the names, the power, and the disposal of them, differ. On the last day of the year a curious custom prevails. Women are accustomed on this day to throw water on every man they meet, and the men have the privilege of retaliating, a licence which gives rise to a great deal of harmless merriment, particularly among the young women, who, armed with large syringes and flaggons, endeavour to wet every man that passes the streets; and, in their turn, receive the same compliment. Dirty water is never employed; nor is a man allowed to lay hold of a woman, but he may cast as much water over her as he pleases, provided she has been the aggressor. If a woman warns a man that she does not mean to join in the diversion, it is considered as an avowal of pregnancy, and she is exempt from attack.

This empire was founded by an obscure, but able and enterprising, village chieftain, in the middle of the last century. In the sixteenth century, Ava, with its dependent territory, was subject to the king of Pegue; but revolts frequently took place, until the Burmese, in 1752, were completely defeated; and Ava, the capital of the empire, after a short siege, surrendered at discretion. At this time Dweepdee, the last of a long line of kings of Ava, and all his family, except two sons, were taken prisoners: the latter fled for protection to the court of Siam; and the unhappy king was soon after cruelly murdered. In these contests the French frequently assisted the Peguese, while British gold, and British influence, favored our present enemies the Burmese.

But a champion now arose in the person of Alompra, the first sovereign of the present dynasty, possessed of a spirit of enterprise equal to the most arduous undertakings, and of the greatest wisdom and coolness to adapt his measures to the difficult circumstances of his country. He had been appointed by the Peguese conqueror to the command of a small district round Monchaboo, and had only in the first instance about 100 picked men devoted to his cause. With these, however, he overpowered the enemy in his immediate neighbourhood, and, advancing unexpectedly on Ava, compelled them to abandon it. In 1754 an expedition was fitted out from Pegue to retake this important possession. About the same time the eldest son of the late king endeavoured to assert his right to the throne: but Alompra soon compelled the latter to retire finally to the Siamese territory, and defeated Beinga, the king of Pegue, in a pitched battle near Promé, with immense slaughter. Successive armies of the Peguese, assisted by French officers, were subdued by the Burmhan chieftain,

who in 1756 obtained possession of Syriam by surprise, and thus cut off all communication between the enemy and the western countries of Dalla and Bassien, deprived them of the navigation of the Rangoon river and the Erawady, and shut them out from all foreign aid. In January, 1757, he undertook the siege of the city of Pegue by circumvallation, a favorite practice among the Burmese, and a negotiation was opened, which terminated in an agreement, that the king of Pegue should become tributary to the Burmhan monarch. His daughter was surrendered to the victor as a pledge of his allegiance. Notwithstanding these arrangements, however, Alompra still pressed the siege, and at last obtained possession of the town by famine, and abandoned it to indiscriminate slaughter. At this time an envoy being sent to him from the British factory at the Negrais, he was very lofty in his carriage, and displayed with great complacency the numerous captives of the royal forces of Pegue in his train. Alompra now proceeded to bring into subjection the countries to the eastward, including the fertile districts between Pegue and the three Pagodas: he also reduced Tavoy, and proceeded to chastise the Siamese for the support and encouragement which they had afforded his different enemies. After various achievements, the victor advanced towards the capital of that kingdom; but two days after the commencement of the siege, was taken ill of a disease which he foresaw would prove mortal, and therefore gave orders for an immediate retreat. Before, however, he reached the seat of his empire he died, May 15th, 1760, in the fiftieth year of his age, much regretted by his people; and, whether viewed in the light of a soldier or a politician, is undoubtedly entitled to considerable respect. He decidedly improved all the territory he subjugated, and studied the prosperity of his subjects. He severely restrained the use of spirituous liquors; issued an edict against all gambling; and reformed the courts of justice, prohibiting magistrates to decide at their private houses on criminal causes, or with regard to property, when the amount exceeded a certain sum: every process of importance was to be decided in public, and every decree registered. He was succeeded by his eldest son Namdojee, who followed his plans for promoting the improvement of the country, and died, after suppressing some unimportant revolts, in 1764. He left an infant son named Momien, whom his uncle Shembuan deprived of the crown. The new monarch, on ascending the throne, declared war against the Siamese, and after various encounters, proceeded to invest Siam, the imperial. The king of Siam, finding resistance hopeless, secretly withdrew from the town, in order to avoid falling into the hands of the enemy: and eluding the Burmhan outposts, sought refuge among the hills, where he perished, but in what manner is not known. His generals, now deserted, agreed to capitulate; the fortifications of the city were destroyed, and a governor was appointed, who took an oath of allegiance to the Burmhan monarchy, and engaged to pay an annual tribute. However, the conqueror had no sooner withdrawn, than one of the king's relations returned at the head of a numerous army, displaced the

new government, and abolished all the regulations that had been imposed on the Siamese. Shembuan now therefore despatched a new army to suppress the insurrection; but, in the mean time, the Chinese had sent an army of 50,000 into one of his northern provinces. The troops of Shembuan advanced to meet them, and surrounding the enemy on all sides, attacked them with such impetuosity, that after a conflict of three days, the latter entirely sunk under the pressure of superior numbers, and the carnage was dreadful. Not an individual of the Chinese army, it is said, returned home to relate the melancholy tale; about 2500 prisoners were however preserved, and conducted in fetters to Ava, where they were encouraged to marry and settle. This second founder of the empire, after various other military exploits, died in 1776, and was succeeded by his son Chenuza. He proved wholly unlike his father, and, being an abandoned debauchee, was deposed and put to death by his uncle Mindrajee Praw, in 1782.

This person was the fourth son of the great Alompra, the founder of the dynasty. One of his first acts was to drown his nephew Momien (the son of Namdojee Praw, the second sovereign), by fixing him betwixt two jars, which were sunk in the stream, the usual Burmhan mode, we are told, of executing members of the royal family. He, however, was himself soon deprived both of his life and diadem, by a desperado, named Magoung, who, with about 100 confederates, attacked him and his guards in his own palace, where they all fell. Mindrajee transferred the seat of empire from Ava to Ummerapoora. Of Ava, as he saw it, colonel Symes, says, 'The walls are moulderling into ruin, ivy clings to the sides, and bushes, suffered to grow at the bottom, undermine the foundation, and have already caused large chasms in the different faces of the forts. The materials of the houses, consisting chiefly of wood, had, on the first order for removing, been transported to the new city of Ummerapoora; but the ground, unless when it is covered with bushes or rank grass, still retains traces of former buildings and streets. The lines of the royal palace, of the grand council hall, the apartments of the women, and the spot on which the peasath or imperial spire had stood, were pointed out to us by our guide. Clumps of bamboos, a few plantain trees, and tall thorns, occupy the greater part of the area of the lately flourishing capital. We observed two dwelling houses of mortar and brick, the roofs of which had fallen in. These, our guides said, had belonged to foreigners. On entering one, we found it inhabited only by bats, which flew in our faces, whilst our sense of smelling was affected by their filth, and by the noisome mildew that hung upon the walls. Numerous temples, on which the Burmese never lay sacrilegious hands, were dilapidating by time. It is impossible to draw a more striking picture of desolation and ruin.'

In the year 1783 the Burmese sent a fleet of boats against Arracan, which, after a slight resistance, was completely conquered, and Mahasumda, the rajah, and his family, made prisoners.

The surrender of Cheduba, Ranree, and the Broken Isles, followed. In 1785 they attacked the Siamese island of Junkseydon, with a fleet of boats and an army; but were ultimately compelled to retreat. The Burmhan monarch, whose pride was thus deeply mortified, resolved to repair the disgrace; and, in 1786, invaded Siam with an army of 30,000 men, but was again defeated, near the frontiers, by Pietiek Sing, the king of Siam; his useless cannon taken, and himself escaping with great difficulty.

The Siamese, in the year 1790, obtained possession of Tavoy by treachery, which the Burmese, in 1791 regained by the same means; and that year compelled the Siamese to raise the siege of Mergui. In 1793 peace was concluded with the latter, who ceded to the Burmese the western maritime towns as far south as Mergui, or the entire possession of the coast of Tenasserim, and the important sea ports of Mergui and Tavoy.

In 1795 commenced our first dispute with this formidable native power. The Burmhan monarch learning that three noted banditti of Arracan, had taken refuge in the British district of Chittagong, ordered a body of 5000 men to enter the Company's territories, with positive instructions not to return unless he brought with him the delinquents dead or alive; he afterwards supported this detachment with an army of 20,000 men, held in readiness in Arracan.

General Erskine was now therefore ordered to advance with a strong detachment of the Company's troops from Calcutta, who were met by a battalion of Europeans by water, and the native sepoys. In the interim, the Chittagong magistrates had apprehended the fugitives. On the approach of the British, Serce Nanda Kiazio, the Burmhan commander, sent a flag of truce, proposing terms, and stipulating for the surrender of the fugitives as the basis of them. The British general replied, that no terms could be listened to while the Burmese continued on the Company's territories; but that as soon as they should withdraw within their own frontier, he would enter on the subject of their complaints; notifying also, that unless they evacuated their camp, which they had fortified, in a limited time, force would be used to compel them. The Burmese chief now personally waited on General Erskine, and disclosed his instructions, the enormity of the offenders, the outrages they had committed, &c. The British commander, on the other hand, repeated that it was impossible for him to retract: but assured his visitant that the Company's agents had no desire to protect offenders, and would quickly prove this on the retreat of the hostile force. This was at last agreed to, and conducted in the most orderly manner: not one act of violence having been committed during its continuance in Chittagong. The guilt of the refugees being established, they were immediately delivered over to the Burmhan authorities, and a good understanding was re-established. The origin of the late dispute, its fluctuating character, and we trust, its final termination, will meet our attention in the article *INDIA, BRITISH*

BURN', v. & n. } Goth. *brenna*, *brina*, per-
 BURN'ER, } haps from *arin*, fire, Per.
 BURN'ING, } *burjan*, Teut. *brennan*, Sax.
 BURNING-GLASS. } *birnan*, *bernan*, Lat. *uro*,
 Heb. *buur*, from Chald. and Heb. *ur*, Hyp. Lat.
pruina. To consume by fire, to be hot, to be on
 fire; to be kindled; to shine, to sparkle, Met
 Passion inflamed to a heating or burning excess,
 whether love, anger, jealousy, hate, or desire.

Wher that the fire was gret and *brent* fast.

Chaucer

He [Nero] Rome *breme* for his delicacy;
 The senators he slow upon a day,
 To heren how that men wolde wepe and crye;
 And slew his brother and by his sister lay.

Id. *Canterbury Tales*.

He causeth the' one to rage with golden *burning*
 dart,
 And doth alay with leaden colde again the others
 hart,
 Whote glemes of *burning* fire, and easy sparkes of
 flame,

In balance of unegal weight he pondereth by ayme.

Surrey. *Description of the Fickle Affections*, &c.

For with a beck you shall me call;

And if of one, that *burns* away,

Ye haue pitie, or ruth at all,

Aunswe're him faire with yea or nay.

Wyat. *The Lady to answer directly with Yea or Nay*.

His garment neither was of silke nor say,

But paynted plumes in goodly order dight,

Like as the sun-burnt Indians do array

Their tawny bodies in the proudest plight.

Spenser.

Tranio, I *burn*, I pine, I perish, Tranio,

If I achieve not this young modest girl!

Shakspeare.

The appetite of her eye did seem to scorch me up
 like a *burning-glass*.

Id.

Altar of Syrian mode, whereen to *burn*

His odious offerings.

Milton.

In liquid *burnings*, or on dry, to dwell,

Is all the sad variety of hell.

Dryden.

O, diadem, thou centre of ambition,

Where all its different lines are reconciled,

As if thou wert the *burning-glass* of glory!

Id.

While the vital fire

Burns feebly, heap not the green fuel on,

But prudently foment the wandering spark,

With what the soonest feels its kindred touch;

Be frugal even of that.

Armstrong.

We see the phlegm of vitriol is a very effectual
 remedy against *burns*.

Boyle.

Oh prince! oh wherefore *burn* your eyes? and why
 Is your sweet temper turned to fury?

Rowe.

She *burns*, she raves, she dies 'tis true,

But *burns*, and raves, and dies, for you.

Addison.

Say, by what name I shall presume to call

Him I see *burning* in these countless suns,

As Moses in the bush? *Young's Night Thoughts*.

The mighty stream, which volumes high

From their proud nostrils, *burns* the very air,

And sparks of flame, like dancing fire-flies, wheel

Around their manes, as common insects, swarm

Round common steeds towards sunset.

Byron's *Deformed Transformed*.

BURN',

BURN'ISH, v. & n. Goth. *bruna*, Swed. *brun*;
 Bel. *bruinis*, Fr. *brunir*, to
 polish, to make bright; also to make brown, that
 is to impart a burning color. Metal may be

polished to a dazzling brightness, so that it shall
 seem to burn. Chaucer and Gower write to
 burn, in the sense of burnish.

And downward from an hill under a bent,
 Ther stood the temple of Mars armipotent
 Wrought all of *burned* steele, of which the' entree
 Was longe and streite, and gastly for to see.

Chaucer. *The Knights Tale*, v. 1985.

And Phebus died hath hire tresses grete,

Like to the stremes of his *burned* hete.

Id. *The Doctoures Tale*, v. 11972.

And euermore, as it is tolde,

An harnois as for a lustie knight,

Whiche *burned* was as siluer brigh

Of swerde, of plate, and eke of maille.

Gower. *Conf. Am.* bk. v.

And them amongst, some were of *burnisht* gold,

So made by art to beautify the rest,

Which did themselves amongst the leaves enfold,

As larking from the view of covetous guest. *Spenser*.

Make a plate of them, and *burnish* it as they do

iron.

Bacon.

Mislike me not for my complexion,

The shadowed livery of the *burnished* sun,

To whom I am a neighbour and near bred.

Shakspeare.

Like a glad lover the fierce flames he meets,

And tries his first embraces in their sheets,

His shape exact which the bright flames enfold,

Like the sun's statue stands of *burnished* gold.

Marvell.

He Trulla loved; Trulla more bright,

Than *burnished* armour of her knight;

A bold virago, stout and tall,

As Joan of France, or English Moll.

Butler's *Hudibras*.

The frame of *burnished* steel, that cast a glare

From far, and seemed to thaw the freezing air.

Dryden.

To shoot, and spread, and *burnish* into man. *Id.*

I've seen a snake in human form,

All stained with infamy and vice,

Leap from a dunghill in a trice,

Burnish, and make a gaudy show,

Become a general, peer, and beau. *Swift*.

Bristling with spears, and bright with *burnished*
 shields,

The embattled legions stretch their long array.

Beattie.

BURN'. Goth. *brun*; Swed. *brun*; Teut.
brun, burn, from Goth. *rinna*; Islan. *bryuna*, to
 run; a small stream of water or rivulet.

BURN, in medicine and surgery, a lesion of
 the animal body, occasioned by the application
 of heat. The life of the part may be at once
 destroyed by these accidents, or mortification
 speedily follow the violent inflammation excited;
 but when slight, it usually produces an effusion
 of serum under the cuticle, like a blister. When
 the injury is extensive, considerable fever is apt
 to supervene, sometimes a comatose state; and a
 remarkable difficulty of breathing often precedes
 death. In the treatment of these accidents, two
 very different methods have been pursued. The
 more ancient plan consists in antiphlogistic
 means, giving cooling purgatives, &c. and even
 taking blood, where the irritation is great; em-
 ploying at the same time cold applications, and
 where the skin is destroyed, emollient dressings;
 opium was also recommended to relieve the pain,
 notwithstanding stupor might attend. More re-

cently, a surgeon at Newcastle, of the name of Kentish, has deviated from the ancient practice; applying first oil of turpentine, alcohol, &c. heated as much as the sound parts could bear, and gradually lessening the stimulus; in the mean time supporting the patient by a cordial diet, æther, &c. and giving opium largely to lessen the irritation. A considerable connexion with smelting furnaces, where accidents of this description are of very frequent occurrence, enables us confidently to state, that turpentine is one of the best possible applications. Where, however, the skin is torn, let lint, dipped in sweet oil, be laid next the part, and turpentine on lint likewise be laid over it, and occasionally renewed, till the fire is entirely drawn out.

BURNET (Gilbert), bishop of Salisbury, in the latter end of the seventeenth century, was born at Edinburgh, in 1643, of an ancient Aberdeenshire family. His father being bred to the law, was, at the Restoration, appointed one of the lords of session, with the title of lord Cramond. Our author, his youngest son, he himself instructed in the Latin tongue; and, at ten years of age, sent him to the university of Aberdeen, where he was admitted M.A. before he was fourteen. His own inclination led him to the study of the law; and from this he stated himself to derive more just notions concerning civil society and government, than those which many divines maintain. About a year after, to the great satisfaction of his father, he relinquished his legal pursuits, and began to apply to divinity. He was admitted preacher before he was eighteen; and Sir Alexander Burnet, his cousin-german, offered him a benefice, which he refused. In 1663, about two years after the death of his father, he went into England; and left his native land in 1664, to make the tour of Holland and France. At Amsterdam, by the help of a Jewish rabbi, he perfected himself in the Hebrew language; and became acquainted with the leading men of the different persuasions tolerated in that country; among all of whom, he says, he met with men of such unfeigned piety and virtue, that he became fixed in principles of universal charity, and an invincible abhorrence of all severities on account of religious opinion. Upon his return from his travels, he was admitted minister of Salton; and performed the duties of his station five years in the most exemplary manner. At this period he memorialised the Scots bishops, on the errors of their administration. In 1669 he published his *Modest and Free Conference between a Conformist and Non-Conformist*; and became acquainted with the duchess of Hamilton, who communicated to him all the papers belonging to her father and her uncle; upon which he drew up the *Memoirs of the Dukes of Hamilton*. The duke of Lauderdale now invited him to London, and introduced him to king Charles II. Returning to Scotland, he married the lady Margaret Kennedy, daughter of the earl of Cassillis; a lady of great piety and knowledge, and highly esteemed by the presbyterians. The day before their marriage, our author voluntarily settled her whole fortune on this lady. The same year he published his *Vindication of the Authority, Constitution, and Laws of the Church*

and State of Scotland; which at that juncture was regarded as so great a public service, that he was offered a bishopric; but did not accept of it, because he could not approve of the measures of the court. His intimacy with the dukes of Hamilton and Lauderdale occasioned him to be sent for frequently by the king and the duke of York, who had conversations with him in private. But Lauderdale conceiving a jealousy of him, represented at last to the king, that Dr. Burnet was engaged in an opposition to his measures. The duke of York, however, treated him with greater civility than ever, and dissuaded him from going to Scotland. Upon this, he resigned his professorship at Glasgow, and staid in London. About this time the living of Cripplegate was offered him by the dean and chapter of St. Paul's; but, as he had been informed of their first intention of conferring it on Dr. Fowler, he declined it. In 1675, at the recommendation of lord Hollis, whom he had known in France, he was, by Sir Harbottle Grimstone, appointed preacher of the Rolls chapel, notwithstanding the opposition of the court. He was soon after chosen a lecturer of St. Clement's, and became very popular. In 1679 he published his *History of the Reformation*, for which he had the thanks of both houses of parliament. The first part of it was published in 1679, and the second in 1681. Next year he published an abridgment of these two parts. Dr. Burnet about this time happening to visit a woman in sickness, who had been engaged in an amour with the earl of Rochester, he became acquainted with that nobleman, and for a whole winter, he spent one evening in a week with him. The happy effect of these conferences occasioned the publication of his well-known account of the life and death of his lordship. In 1682, when the administration was changed in favor of the duke of York, being much resorted to by persons of all ranks and parties, in order to avoid returning visits, he built a laboratory, and went for a year through a course of chemical experiments. Not long after, he refused a living of £300 a year, offered him by the earl of Essex, on the terms of his not residing there, but in London. The king now offered him the bishopric of Chichester, if he would engage in his interests; but he refused to accept it on these terms. He preached at the Rolls till 1684, when he was dismissed by order of the court. About this time he published several pieces. On king James's accession, having obtained leave to go out of the kingdom, he first went to Paris, and lived in great retirement, till contracting an acquaintance with brigadier Stoupe, a Protestant gentleman in the French service, he made a tour with him into Italy, and met with an agreeable reception at Rome. Pope Innocent XI. hearing of his arrival, sent the captain of the Swiss guards to acquaint him he would give him a private audience in bed, to avoid the ceremony of kissing his holiness's slipper. But Dr. Burnet excused himself. Some disputes which he had concerning religion were shortly after noticed, and, on an intimation from prince Borghese, he was obliged hastily to leave the city. He pursued his travels through Switzerland and Ger-

many, and, in 1688, came to Utrecht, where he received an invitation from the prince and princess of Orange (to whom their party in England had recommended him) to come to the Hague. Here he was at once made acquainted with the counsels of the prince, and advised the fitting out of a fleet in Holland to support his designs. This, and the Account of his Travels, which, with some papers, in single sheets, reflecting on the proceedings of England, were industriously dispersed throughout the country, alarmed king James, and occasioned him twice to insist, by his ambassador, on his being dismissed. This, after much importunity, was done, though he continued to be trusted and employed as before. To put an end to his frequent conferences with the Dutch ministers, a prosecution for high treason was set on foot against him both in England and Scotland. But Burnet receiving the news before it arrived at the States, he avoided the storm, by petitioning for, and obtaining, a bill of naturalisation, in order to an intended marriage with Mary Scot, a Dutch lady of considerable fortune. After his marriage, being legally under the protection of Holland, when he found king James plainly subverting the constitution, he omitted no method to promote the design the prince of Orange had formed of delivering Great Britain, and came over with him in quality of chaplain. He was soon advanced to the see of Salisbury, and declared for moderate measures with regard to the clergy, who scrupled to take the oaths, as well as for the toleration of non-conformists. His Pastoral Letter, concerning the oaths of allegiance and supremacy to king William and queen Mary, 1689, happening to touch upon the right of conquest, gave such offence to both houses of parliament, that it was ordered to be burnt by the hands of the common executioner. In 1698 he lost his wife by the small-pox; and, as he was almost immediately after appointed preceptor to the duke of Gloucester, of whose education he took great care, this employment, and the tender age of his children, induced him the same year to supply her loss by a marriage with Mrs. Berkley, eldest daughter of Sir Richard Blake, knight. In 1699 he published his Exposition of the thirty-nine articles; which occasioned a representation against him in the lower house of convocation, 1701; but he was vindicated in the upper house. His speech in the house of lords in 1704, against the bill to prevent occasional conformity, was severely attacked. He died in 1715, and was interred in the church of St. James, Clerkenwell, where he has a monument. He formed a scheme for augmenting the poor livings; which he pressed forward with such success, that it ended in an act of parliament passed in the second year of queen Anne, 'for the augmentation of the livings of the poor clergy.'

BURNET (Thomas), a learned writer in the end of the seventeenth century, was born at Croft, in Yorkshire, in 1635, and educated at Cambridge under the tuition of Mr. Tillotson, afterwards archbishop of Canterbury. In the beginning of 1685 he was made master of the Charter-House, after which he entered into holy orders. The year following he distinguished himself greatly,

by refusing to admit Andrew Popham, a Roman Catholic, as a pensioner of the Charter-House, though the man came with a letter from king James himself to the governors. In 1680 he published his *Telluris Theoria Sacra*, so universally admired for the purity of the style and beauty of the sentiments, that king Charles gave encouragement to a translation of it into English; and though, in point of philosophy, it is completely exploded, the book will ever continue to charm the reader by the eloquence of its style, and the grandeur of its imagery. It was answered by Warren, Keill, and Whiston; to all of whom Dr. Burnet replied. After the Revolution he was made clerk of the closet to the king, of which place he was deprived in 1692, for publishing some dangerous positions in his *Archæologia Philosophicæ*. He died in 1715. Since his death have been published, his books, *De Statu Mortuorum et Resurgentium*, and *De Fide et Officiis Christianorum*.

BURNETT (James), lord Monboddo, a learned lawyer and polite writer, was born at the family-seat of Monboddo, in North Britain, in 1714. He was educated at Laurencekirk, Aberdeen, and Groningen, where he studied the civil law. In 1738, on his return to Scotland, he was admitted an advocate, and obtained considerable practice. On the death of his relation, lord Milton, in 1767, he was promoted, by the title of lord Monboddo, to the bench; and died at Edinburgh of a paralytic stroke, in 1799. His lordship was deeply read in Greek literature, his love of which induced him to despise more modern learning. He indulged in some curious speculations; seriously advocating the existence of satyrs and mermaids, together with a supposed affinity between the human and the monkey tribes. His *Origin and Progress of Language* appeared in 1773; and the *First Part of his Ancient Metaphysics* in 1778. This last extended to six volumes.

BURNEY (Charles, Mus. D.), was a native of Shrewsbury, and born in 1726. Having received the rudiments of education, first at the grammar-school of his native town, and at Chester, he returned home in 1741, and continued the study of music, for which he had early shown a strong taste. He was finally placed under Dr. Arne for three years, and in 1749 was elected organist to a church in Fenchurch-street. His stay in London, however, was short; after composing, in the winter of 1749, *Robin Hood*, *Alfred*, and *Queen Mab*, for Drury-lane, he retired to Lynn Regis, where he commenced his great undertaking, the *General History of Music*, the first volume of which appeared in 1776, and the remaining three at intervals, till the whole was completed, in 1789. He returned, after nine years' absence, to the metropolis, and produced at Drury-lane an English version of the *Devin du Village of Rousseau*. In 1769 he took an honorary degree of doctor of music at Oxford, where his probationary exercise was much admired, and frequently performed. The year following he went abroad, and on his return published his *Musical Tour* through France and Italy. In 1772 he again left England and made a tour through Germany and the Netherlands, an

account of which appeared in two volumes, octavo. On his second return he became a fellow of the Royal Society, and drew up for the Philosophical Transactions, An Account of Little Crotch the Infant Musician, the present Oxford musical professor. His other works are—An Account of the Commemoration of Handel in 1785, with a Memoir of that celebrated man; a Life of Metastasio, in 3 vols. 8vo. 1796; an Essay on the History of Comets; a Plan of a Public Music School; and The Cunning Man; besides numerous sonatas, duets, and concertos. Dr. Burney was for some time an inhabitant of a house in St. Martin's-street, near Leicester-square, which was once the habitation of Sir Isaac Newton; but the last twenty-five years of his life were spent in his apartments in Chelsea College, to which he was organist. Several of his children, of whom he had eight, by two marriages, have also distinguished themselves in the literary world, especially his second son, and madame d'Arblay, authoress of *Evelina*, &c. His eldest son James was a companion of captain Cook round the world. Dr. Burney died in 1814, aged eighty-eight.

BURNEY (Charles, D. D.), was the second son of the preceding, and born at Lynn, in Norfolk, in 1757. He was educated at the Charter-house, and Caius College, Cambridge, whence he removed to King's College, Aberdeen, where he took his master's degree, in 1781. Soon after we find him an assistant in an academy at Highgate; and then, at Chiswick, in that of Dr. Rose. While here he wrote some criticisms in the *Monthly Review*, conducted in this neighbourhood, particularly on the *Monstrosities* of Mr. Huntingford. About this time he married the daughter of Dr. Rose, and opened a school at Hammersmith, in 1786; from whence, in 1793, he removed to Greenwich. In 1792 he had obtained the degree of doctor of laws from Aberdeen and Glasgow. Late in life he took orders, on which occasion he was presented to the living of St. Paul, Deptford, the rectory of Cliffe, a prebend in Lincoln cathedral, the honorary degree of D. D. and made chaplain in ordinary to the king. He died, December the 28th, 1817. His library was purchased by parliament, and presented to the British Museum. His works are—1. *Appendix ad Lexicon Græco-Latinum* a Joan. Scapulam, 1789. 2. *Remarks on the Greek Verses of Milton*, 1791. 3. *Richardi Bentleii et Doctorum Virorum Epistolæ*, 4to. 1807. 4. *Tentamen de Metris ab Æschylo in Opericis Cantibus Adhibitis*, 8vo. 1809. 5. *Bishop Pearson's Exposition of the Creed*, abridged, 12mo. 6. *Philemonis Lexicon Græcæ*, 4to. 7. *A Sermon on the Anniversary of the Sons of the Clergy at St. Paul's*, 4to. 1813.

BURNING, considered philosophically, is the action of fire on some pabulum or fuel, by which the minute parts thereof are put into a violent motion, and some of them, assuming the nature of fire themselves, fly off in orbem, while the rest are dissipated in form of vapor, or reduced to ashes.

BURNING, in antiquity, was a method of disposing of the dead, much practised by the ancient Greeks and Romans, and still retained by several

nations in the East and West Indies. The antiquity of this custom rises as high as the Theban war, where we are told of the solemnity accompanying this ceremony at the pyre of Menæceus and Archemorus, who were contemporary with Jair, the eighth judge of Israel. Homer abounds with descriptions of such funeral obsequies. In the inland regions of Asia, the practice was of very ancient date, and the continuance long: for we are told, that, in the reign of Julian, the king of Chionia burnt his son's body, and deposited the ashes in a silver urn. Coeval almost with the first instances of this kind in the East, was the practice in the western parts of the world. The Herulians, the Gotes, and the Thracians, had all along observed it; and its antiquity was as great with the Celtæ, Sarmatians, and other neighbouring nations. The origin of this custom seems to have been friendship to the deceased: their ashes were preserved, as we preserve a lock of hair, a ring, or a seal, which had belonged to a deceased friend. Kings were burnt in cloth made of the asbestos, that their ashes might be preserved pure from any mixture with the fuel and other matters thrown on the funeral pile. The same method is still observed with the princes of Tartary. Among the Greeks, the body was placed on the top of a pile, on which were thrown divers animals, and even slaves and captives, besides unguents and perfumes. In Homer's account of the funeral of Patroclus we find a number of sheep and oxen thrown in; then horses followed by two dogs, and lastly by twelve Trojan prisoners. The same customs are mentioned by Virgil in the funeral of his Trojans; where, besides oxen, swine, and all manner of cattle, we find eight youths condemned to the flames. The body was covered with the fat of the beasts, that it might consume the sooner; it being reckoned great felicity to be quickly reduced to ashes. We are assured by Plutarch and Macrobius, that with every ten men it was customary to put in one woman. Soldiers usually had their arms burnt with them. The garments worn by the living were also thrown on the pile, with other ornaments and presents; a piece of extravagance which the Athenians carried to so great a height, that some of the law-givers restrained them, by severe penalties, from defrauding the living by their liberality to the dead. In some cases, burning was expressly forbidden among the Romans, and even looked upon as the highest impiety. Thus infants, who died before the breeding of teeth, were intombed unburnt in the ground, in a particular place set apart for this purpose, called *suggrundarium*. The same was practised with regard to those struck dead by lightning. Some say that burning was denied to suicides. The manner of burning among the Romans was not unlike that of the Greeks; the corpse, being taken without the city, was carried directly to the place appointed; which, if it joined to the sepulchre, was called *bustum*; if separate from it, *ustrina*; and there laid on the *rogus* or *pyra*, a pile of wood prepared on which to burn it, built in shape of an altar, but of different height according to the quality of the deceased. Round the pile they set cypress trees, probably to hinder the noisome smell of the corpse. The body was

not placed on the bare pile, but on the couch or bed whereon it lay. This done, the next of blood performed the ceremony of lighting the pile; which they did with a torch, turning their faces all the while the other way, as if it were done with reluctance. During the ceremony, decursions and games were celebrated; after which came the ossilegium, or gathering of the bones and ashes; also washing and anointing them, and repositing them in urns.

BURNING, in medicine and surgery, denotes the application of an actual cautery See **CAUTERY**.

BURNING, or **BRENNING**, in our old writings, denotes an infectious disease, got in the stews by conversing with lewd women, and supposed to be the same with what we now call the venereal disease.

BURNING ALIVE, among the Romans, was a punishment inflicted on deserters, betrayers of the public councils, incendiaries, and even Christians: It was called crematio. The Jews had two ways of burning; the one called burning of the body, performed with wood and faggots; the other burning of the soul, combustio animæ, performed by pouring scalding hot lead down their throats. Incest in the ascending and descending degrees was thus punished by them. But philanthropy is shocked to reflect, for what trifling crimes this horrid punishment has been inflicted among other nations. Even in our own country, till within these few years, burning alive was the punishment of women, convicted of coining or counterfeiting shillings! Thus was the weaker sex punished in the most barbarous manner, for a trifling felony, which could hardly wrong any individual above the value of a few pence.

BURNING INTERNAL. See **COMBUSTION**.

BURNING GLASSES are commonly made convex and spherical. The small space upon which the collected rays fall, is called the focus; where wood, or any other combustible matter being put, will be set on fire. The term burning glass is also applied to those concave mirrors, whether composed of glass quick-silvered, or of metalline matters, which burn by reflection, condensing the sun's rays into a focus similar to the former. The use of burning glasses appears to have been very ancient. Diodorus Siculus, Lucian, Dion, Zonaras, Galen, Anthemius, Eustathius, Tzetzes, and others, attest, that by means of them Archimedes set fire to the Roman fleet at the siege of Syracuse. Tzetzes is so particular in his account of this matter, that his description suggested to Kircher the method by which it was probably accomplished. According to that author, Archimedes set fire to Marcellus's navy, by means of a burning glass composed of small square mirrors, moving every way upon hinges; which, when placed in the sun's rays, directed them upon the Roman fleet, so as to reduce it to ashes at the distance of a bow-shot. That the ancients were also acquainted with the use of catoptric or refracting burning glasses, appears from a passage in Aristophanes's comedy of the Clouds, which clearly treats of their effects. The author introduces Socrates as examining Strepsiades about the method he had discovered of getting clear of his debts. He replies, that 'he thought of mak-

ing use of a burning glass which he had hitherto used in kindling his fire; for, says he, 'should, they bring a writ against me, I shall immediately place my glass in the sun at some little distance from it, and set it on fire.' Pliny and Lactantius have also spoken of glasses that burn by refraction. The former calls them balls or globes of glass or crystal, which exposed to the sun, transmit a heat sufficient to set fire to cloth, or corrode the dead flesh of those patients who stand in need of caustics; and the latter, after Clemens Alexandrinus, takes notice that fire may be kindled by interposing glasses filled with water between the sun and the object, so as to transmit the rays to it. It seems difficult to conceive how they should know such glasses would burn without knowing they would magnify, which it is granted they did not, till towards the close of the thirteenth century. M. de la Hire accounts for this, by observing, that their burning glasses being spheres, either solid or full of water, their foci would be one-fourth of their diameter distant from them. If then their diameter were supposed half a foot, which is the most we can allow, an object must be only at an inch and a half distance to perceive it magnified; those at greater distances do not appear greater, but only more confused through the glass than out of it. Among the ancients, the burning mirrors of Archimedes and Proclus are famous. By the latter the navy of Vitellius besieging Byzantium, according to Zonaras, was burnt to ashes. Among the moderns, the most remarkable burning mirrors are those of Settala, Vilette, Tschirnhausen, Buffon, Trudaine, and Parker. Settala, canon of Padua, made a parabolic mirror, which, according to Schottus, burnt pieces of wood at the distance of fifteen or sixteen paces. The following experiments are noted in the *Acta Eruditorum*. 1. Green wood takes fire instantaneously, so as a strong wind cannot extinguish it. 2. Water boils immediately; and eggs in it are presently edible. 3. A mixture of tin and lead, three inches thick, drops presently; and iron and steel plate becomes red-hot presently, and a little after burns into holes. 4. Things not capable of melting, as stones, bricks, &c. become soon red-hot, like iron. 5. Slate becomes first white, then a black glass. 6. Tiles are converted into a yellow glass: and shells into a blackish yellow one. 7. A pumice stone, emitted from a volcano, melts into white glass. 8. A piece of crucible also vitrifies in eight minutes. 9. Bones are soon turned into an opaque glass, and earth into a black one. The breadth of this mirror is near three Leipsic ells, its focus two ells from it; it is made of copper, and its substance is not above double the thickness of the back of a knife. Vilette, a French artist of Lyons, made a large mirror, which was bought by Tavernier, and presented to the king of Persia; a second, bought by the king of Denmark; a third, presented by the French king to the Royal Academy; a fourth, has been in England, where it was publicly exposed. The effects hereof, as found by Dr. Harris, and Dr. Desaguliers, are, that a silver sixpence is melted in seven seconds and a half, a halfpenny in sixteen, and runs with a hole in thirty-four. Tin melts in three seconds, cast iron in sixteen, slate in three; a fossil shell

calceines in seven seconds; a piece of Pompey's pillar at Alexandria vitrifies, the black part in fifty seconds, the white in fifty-four; copper ore in eight seconds; bone calceines in four seconds, vitrifies in thirty-three. An emerald melts into a substance like a turquoise stone; a diamond weighing four grains loses seven-eighths of its weight; the asbestos vitrifies; as all other bodies will do, if kept long enough in the focus; but when once vitrified, the mirror can go no farther with them. This mirror is forty-seven inches wide, and is ground to a sphere of seventy-six inches radius; so that its focus is about thirty-eight inches from the vertex. Its substance is a composition of tin, copper, and tin glass. Every lens, whether convex, plano-convex, or convexo-convex, collects the sun's rays, dispersed over its convexity, into a point by refraction: and is therefore a burning glass. The most considerable of this kind is that made by M. de Tschirnhausen: the diameters of his lenses are three and four feet, the focus at the distance of twelve feet, and its diameter an inch and a half. To make the focus the more vivid, it is collected a second time by a second lens parallel to the first, and placed in that point where the diameter of the cone of rays formed by the first lens is equal to the diameter of the second; so that it receives them all; and the focus, from an inch and a half, is contracted into the space of eight lines, and its force increased proportionably. This glass vitrifies tiles, slates, pumice-stones, &c. in a moment. It melts sulphur, pitch, and all resins, under water; the ashes of vegetables, woods, and other matters, are transmuted into glass; and every thing applied to its focus is either melted, turned into a calx, or into smoke. Tschirnhausen observes, that it succeeds best when the substance applied is laid on a hard charcoal well burnt. Sir Isaac Newton presented a burning glass to the Royal Society, consisting of seven concave glasses, so placed, as that all their foci join in one physical point. Each glass is about eleven inches and a half in diameter; six of them are placed round the seventh, to which they are all contiguous; and they form a kind of segment of a sphere, whose subtense is about thirty-four inches and a half, and the central glass lies about an inch farther in than the rest. The common focus is about twenty-two inches and a half distant, and about an inch in diameter. This glass vitrifies brick or tile in one second, and melts gold in thirty. It appears that glass quicksilver is a more proper material for burning glasses than metals; for the effects of that speculum where-with Mr. Macquer melted the platina, seem to have been superior to those above mentioned, though the mirror itself was much smaller. The diameter of this glass was only twenty-two inches, and its focal distance twenty-eight. Black flint, when exposed to the focus, being powdered to prevent its crackling and flying about, and secured in a large piece of charcoal, bubbled up and ran into transparent glass in less than half a minute. Hessian crucibles, and glass-house pots, vitrified completely in three or four seconds. Forged iron smoked, boiled, and changed into a vitrescent scoria as soon as it was exposed to the focus. The gypsum of Montmartre, when the

flat sides of the plates or leaves, of which it is composed, were presented to the glass, did not show the least disposition to melt; but, on presenting a transverse section of it, or the edges of the plates, it melted in an instant, with a hissing noise, into a brownish yellow matter. Calcareous stones did not completely melt; but there was detached from them a circle more compact than the rest of the mass, and of the size of the focus; the separation of which seemed to be occasioned by the shrinking of the matter which had begun to enter into fusion. The white calx of antimony, commonly called diaphoretic antimony, melted better than the calcareous stones, and changed into an opaque pretty glossy substance, like white enamel. It was observed, that the whiteness of the calcareous stones and the antimonial calx was of great disadvantage to their fusion, by reason of their reflecting great part of the sun's rays; so that the subject could not undergo the full activity of the heat thrown upon it by the burning glass. The case was the same with metallic bodies, which melted so much the more difficultly as they were more white and polished; and this difference was so remarkable, that in the focus of this mirror, so fusible a metal as silver, when its surface was polished, did not melt at all. M. Trudaine, a French gentleman, constructed a burning lens on a new principle. It was composed of two circular segments of glass spheres, each four feet in diameter, applied with their concave sides towards each other. The cavity was filled with spirit of wine, of which it contained forty pints. It was presented by the maker to the Royal Academy of Sciences, but was, not long after, broken by accident. The expense of constructing it amounted to about £1000 sterling, and after all, it does not appear that the effects of this lens were very great. Mr. Macellan informs us, that it could only coagulate the particles of platina in twenty minutes, while Mr. Parker's lens entirely melted them in less than two.

M. Buffon's burning mirror, which he supposes to be of the same nature with that of Archimedes, consists of a number of small mirrors of glass quicksilvered, all of which are held together by an iron frame. Each of these small mirrors is also movable by a contrivance on the back part of the frame, that so their reflections may all coincide in one point. By this means they are capable of being accommodated to various heights of the sun, and to different distances. The adjusting them in this manner takes up a considerable time; but after they are so adjusted, the focus will continue unaltered for an hour or more. In 1747 he constructed a machine of this kind, with 140 plane mirrors; each about four inches long, and three broad; these were fixed about a quarter of an inch distant from each other, upon a large wooden frame, of about six feet square. The experiment was first tried with twenty-four mirrors, which readily set on fire a combustible matter, prepared of pitch and tow, and laid on a deal board, at the distance of sixty-six French feet. He then put together a kind of polyhedron, consisting of 168 pieces of plane looking glass, each being six inches square; and by means of this some boards of beech were set

on fire, at the distance of 150 feet, in the month of March, and a silver plate was melted at the distance of sixty feet. This machine, besides other advantages, may be easily moved, so as to burn downwards or horizontally; and it burns either in its distant focus, or in any nearer interval, which our common burning glasses cannot do, because their focus is wholly fixed. This machine, in the next stage of its improvement, contained 360 plane mirrors, each eight inches long, and six broad, mounted on a frame eight feet high, and seven broad. With twelve of these mirrors, light combustible matters were kindled at the distance of twenty feet; at the same distance a large tin vessel was melted with forty-five of them, and a thin piece of silver with 117. When the whole machine was employed, all the metals and metallic minerals were melted at the distance of twenty-five, and even of forty feet. Wood was kindled in a clear sky, at the distance of 210 feet. The focus, at the distance of fifty feet, is about seven inches broad; and at the distance of 240 feet, it becomes two feet in diameter. Buffon afterwards constructed a machine which contained 400 mirrors, each half a foot square, with which he could melt lead and tin at the distance of 140 feet. He observes, that in large refracting lenses, which are most convenient for many purposes, the thickness of the glass in the middle is so great, as very much to diminish their force. For this reason he proposes to form a burning glass of concentric or circular pieces of glass, each resting upon the other. His method is to divide the convex arch of the lens into three equal parts. Thus, suppose the diameter to be twenty-six inches, and the thickness in the middle to be three inches: by dividing the lens into three concentric circles, and laying the one over the other, the thickness of the middle piece needs be only one inch; at the same time that the lens will have the same convexity, and almost the same focal distance, as in the other cases; while the effects of it must be much greater, on account of the greater thinness of the glass.

Mr. Parker's lens is three feet in diameter, made of flint-glass, and which, when fixed in its frame, exposes a surface 2 feet 8 inches in the clear. The elevation is represented on plate XLV. fig. 1. *A*, is the lens of the diameter mentioned: thickness in the centre, $3\frac{1}{4}$ inches: weight 212 pounds: length of the focus, 6 feet 8 inches; diameter of ditto, 1 inch. *B*, a second lens, whose diameter in the frame is 16 inches, and shows in the clear 13 inches: thickness in the centre $1\frac{1}{2}$ inches: weight 21 pounds: length of focus 29 inches: diameter of ditto, $\frac{3}{4}$ of an inch. When the two above lenses are compounded together the length of the focus is 5 feet 3 inches: diameter of ditto, half an inch. *C*, a truncated cone, composed of 21 ribs of wood: at the larger end is fixed the great lens *A*, at the smaller extremity the lesser lens *B*: near the smaller end is also fixed a rack *D*, passing through the pillar *L*, movable by a pinion turning in the said pillar, by means of the handle *E*, and thus giving a vertical motion to the machine. *F*, a bar of wood, fixed between the two lower ribs of the cone at *G*; having,

within a chased mortice in which it moves, an apparatus *H*, with the iron plate, *I*, fixed thereto; and this part turning on a ball and socket, *K*; a method is thereby obtained of placing the matter under experiment, so as to be acted upon by the focal rays in the most direct and powerful manner. *L.L.*, a strong mahogany frame, moving on castors, *M.M.* Immediately under the table *N*, are three friction wheels, by which the machine moves horizontally. *O*, a strong iron bow, in which the lens and the cone hang. Section, fig. 2. *a*, the great lens marked *A*, in the elevation. *b*, The frame which contains the lens. *c*, The small lens marked *B*. *d*, The frame which contains the small lens. *e*, The truncated cone, marked *C*. *f*, the bar on which the apparatus marked *F* moves. *g*, The iron plate marked *I*. *h*, The cone of rays formed by the refraction of the great lens *a*, and falling on the lens *c*. *i*, The cone of rays formed by the refraction of the lens *c*. Front view, fig. 3, *k*, The great lens. *l*, The frame containing it. *m*, The strong iron bow in which it hangs. From a great number of experiments made with this lens, in the presence of many scientific persons, the following are selected as specimens of its powers:—

Substances fused, with their weight and time of fusion.	Weight in Grains.	Time in Seconds.
Gold, pure	20	4
Silver, ditto	20	3
Copper, ditto	33	20
Platina, ditto	10	3
Nickel	16	3
Bar iron, a cube	10	12
Cast iron, a cube	10	3
Steel, a cube	10	12
Scoria of wrought iron	12	2
Kearsh	10	3
Cauk, or terra ponderosa	10	7
A topaz, or chrysolite	3	45
An oriental emerald	2	25
Crystal pebble	7	6
White agate	10	30
Flint, oriental	10	30
Rough cornelian	10	75
Jasper	10	25
Onyx	10	20
Garnet	10	17
White Rhomboidal spar	10	60
Zeolites	10	23
Rotten-stone	10	80
Common slate	10	2
Asbestos	10	10
Common lime-stone	10	55
Pumice-stone	10	24
Lava	10	7
Volcanic clay	10	60
Cornish moor-stone	10	60

A subscription was attempted for the purpose of defraying the expense of this fine instrument, but it failed; and the instrument itself was purchased by captain Mackintosh, who accompanied lord Macartney in his embassy to China; and is now probably deposited among many ingenious and valuable presents, the use of which is unknown to the Chinese.

BURNING SPRINGS. Of these there are many in different parts of the world; particularly one in France, in the department of the Isère, near Grenoble; another near Hermanstadt in Transylvania; a third at Chermay, a village near Switzerland; a fourth in the canton of Friburg; and a fifth not far from the city of Cracow, in Poland. There also is, or was, a famous spring of this kind at Wigan in Lancashire, which, upon the approach of a lighted candle, would take fire and burn like spirit of wine for a whole day. But the most remarkable one, or at least that of which we have the minutest description, was discovered in 1711, at Brosely, in Shropshire. 'The well, for four or five feet deep, is six or seven feet wide; within that is another less hole of like depth dug in the clay, in the bottom whereof is placed a cylindric earthen vessel, of about four or five inches diameter at the mouth, having the bottom taken off, and the sides well fixed in the clay rammed close about it. Within the pot is a brown water, thick as puddle, continually forced up with a violent motion beyond that of boiling water, and a rumbling hollow noise, rising and falling, by fits, five or six inches; but there was no appearance of any vapor rising, which, perhaps, might have been visible had not the sun shone so bright. Upon putting a candle down at the end of a stick, at about a quarter of a yard distance, it took fire, darting and flashing after a very violent manner for about half a yard high, much in the manner of spirits in a lump, but with great agitation. It was said, that a teakettle had been made to boil in about nine minutes, and that it had been left burning for forty-eight hours without any sensible diminution. It was extinguished by putting a wet mop upon it; which must be kept there for a little time, otherwise it would not go out. Upon the removal of the mop there arises a sulphureous smoke, lasting about a minute, and yet the water is very cold to the touch.' In 1755 this well totally disappeared by the sinking of a coal-pit in its neighbourhood. The cause of the inflammable property of such waters is, with great probability, supposed to be their mixture with petroleum, which is one of the most inflammable substances in nature, and has the property of burning on the surface of water.

BURNISHERS, for gold and silver, were formerly made of the teeth of dogs or wolves, set in the end of iron or wooden handles; but for a long time past agates have been introduced and are found preferable. In most cases polished steel answers equally well, as it gives a very good lustre. These are of different forms; straight, crooked, &c. The steel burnishers used by engravers in copper are formed to serve with one end to burnish, and with the other to scrape out errors or scratches.

BURNISHING, the art of smoothing or polishing a metalline body, by a brisk rubbing of it with a burnisher. Book-binders burnish the edges of their books by rubbing them with a dog's tooth.

BURNS (Robert), one of the most eminent of modern Scots poets, was born 25th of January, 1759, on a small farm near the town of Ayr. Of this extraordinary genius, Dr. Currie's account is substantially as follows:—He was the

son of William Burnes, or Burns, a garden-r and small farmer, and was brought up to rustic labor; but his education was not neglected, as he was at an early age instructed in the grammar of the English language by Mr. Murdoch (who died not long since in London), to which he added an acquaintance with the French language and practical mathematics. A passion for reading urging him to devote every moment he could spare to the perusal of books, and meeting among them with the works of some of the best English poets, he was enabled to cultivate and improve a taste for poetry and fiction, which was perhaps first inspired by the chimney-corner tales of an old woman in his father's family. His first poetical effusions were prompted by love: having begun, he continued to make verses, which attracted the notice of his neighbours, and he was early esteemed a gay companion. He engaged in business as a flax-dresser in the town of Irvine, but his premises were destroyed by fire, and he was unable to sustain his credit. His father dying, he took a small farm in conjunction with his younger brother, and failed also in this scheme. In the mean time he had formed a connexion with a young woman, whom, on her becoming pregnant, he would have married, but his circumstances induced her friends to object to it; and he engaged himself to embark as overseer to a plantation in Jamaica. He first, however, was induced to publish, by subscription, a volume of poems, which was printed at Kilmarnock, in 1786; and shortly after was shown a letter from Dr. Blacklock, recommending that he should visit Edinburgh, in order to take advantage of the admiration his poems had excited. This advice he eagerly adopted, and remaining more than a year in the metropolis of his country, admired, flattered, and caressed by various persons of eminence, he retired to the country with the sum of £500, which he had realised by the second edition of his poems. With this sum he took a considerable farm near Dumfries. To his great credit, also, he now completed his matrimonial engagement with the female before alluded to: but his convivial habits soon prevented him from paying a proper attention to his farm; and, after a trial of three years and a half, he was obliged to resign his lease, and remove to the town of Dumfries, to follow the employment of an exciseman. Here he occasionally exercised his pen, particularly in the composition of a number of beautiful songs, and as a contributor to periodical works. Intemperance, however, had become his tyrant; and how the honorable friends, who obtained for him the appointment of an exciseman, could imagine that such an office would really benefit his fortunes, we cannot divine. It was just the situation calculated to hurry him into the moral ruin that ensued, and which, finally bringing on inveterate habits of intoxication, hurried him to a premature grave, July 21st, 1796. Mr. Coleridge, alluding with indignation to the circumstance of making this ill-fated son of genius 'a gauger of ale firkins,' calls upon his friend Lamb to gather a wreath of 'henbane, nettles, and nightshade.'

————— To tame
The illustrious brow of Scotland's chief.

We have little occasion to attempt a character of him as a poet: it has been often and fairly drawn. It was entirely in contrast with his character as a man. He attempted hardly any thing in civil life in which he succeeded—and scarcely any thing, as a poet, in which he did not succeed. Of the solemn and sublime, his poems entitled the Vision, Dependancy, the Lament, Winter, a Dirge, and the Invocation to Ruin, afford striking examples. Of the tender and the moral, many beautiful specimens are found in the elegaic verses, entitled Man was made to Mourn, in the Cotter's Saturday Night, the Stanzas to a Mouse, and those to a Mountain Daisy. There is scarcely an image more truly pastoral than that of the Lark, in the second stanza of the last named poem; and nothing can exceed the beauty and simplicity of the simile—

As bees flee hame wi' lades of treasure
The minutes winged their way wi' pleasure.

While some few of his poems are immoral, and more of them equivocal in their tendency, it is but just to add that he was never known deliberately to descend to an act of meanness; and the entire picture of his so-named indulgencies and agonies, pleasures and remorse, is by no means a tempting one. His picture is honestly drawn by his own pen, in a proposed epitaph for himself:—

Is there a whim-inspired fool,
Owre fast for thought, owre hot for rule,
Owre blate to seek, owr proud to snoul?
Let him draw near;
And owre this grassy heap sing dool,
And drap a tear.

Is there a bard of rustic song,
Who, noteless, steals the crowds among,
That weekly to this area throng?
O pass not by!
But with a frater-feeling strong,

Here, heave a sigh.
Is there a man whose judgment clear
Can others teach the course to steer,
Yet runs himself life's mad career,
Wild as the wave?
Here pause—and, through the starting tear,
Survey this grave.

The poor inhabitant below
Was quick to learn and wise to know,
And keenly felt the friendly glow,
And softer flame;
But thoughtless follies laid him low,
And stain'd his name.

Reader, attend.—Whether thy soul
Soars fancy's flight beyond the pole,
Or darkling grubs this earthly hole,
In low pursuit;
Know, prudent, cautious, self-control,
Is wisdom's root.

We should not omit to state that Burns was a prose writer of pieces as extraordinary, for his situation, as any of his poetical performances. His letters exhibit a purity and facility of expression which would be admired in any condition; and they abound with those marks of elegance, variety, and vigor, which distinguish genius. With one of these, which may serve as a prose sketch of his own character, we conclude:—"Take a being of our kind, give him a

stronger imagination and more delicate sensibility, which between them will ever engender a more ungovernable set of passions than are the usual lot of man; implant in him an irresistible impulse to some idle vagary, such as arranging wild flowers in fantastic nosegays, tracing the grasshopper to his haunt by his chirping song, watching the frisks of the little minnows in the sunny pool, or hunting after the intrigues of butterflies; in short, send him adrift after some pursuit which shall eternally mislead him from the paths of lucre, and yet curse him with a keener relish than any man living for the pleasures that lucre can bestow; lastly, fill up the measure of his woes by bestowing on him a spurning sense of his own dignity;—and you have created a wight nearly as miserable as the poet."

BURNTISLAND, a royal burgh and sea-port town, of a parish of the same name. The town is finely situated on a peninsula of the Frith of Forth, surrounded by hills on the north, in the form of an amphitheatre, which afford an excellent shelter for ships. It consists of two streets, running parallel to each other. The principal street is broad and spacious, containing a number of respectable buildings. It was formerly fortified, and part of the wall and east port still remain. It has the best harbour on the coast, formed by a rocky isle, with piers; a large dock has also been constructed here, with seventeen feet and a half of water at spring tides. The church is square, with a steeple rising in the centre, and was built by the inhabitants, in 1592, at their own expense. This place held out against Cromwell, till he was obliged to enter into conditions with the inhabitants; part of which were, that he should repair the streets and harbour; in consequence of which the quays, as they now stand, were built by him. In 1715 this town was surprised and possessed by the rebels, who formed the bold design of passing over a body of troops to the opposite shore; which was in part executed under the command of brigadier Macintosh, notwithstanding all the efforts of the men of war. It joins with Kircaldy, Kinghorn, and Dysart, in sending a member to parliament. The government is vested in twenty-one persons, viz. fourteen guild counsellors, out of whom are chosen three bailies; and seven trades counsellors. A provost is also elected annually. There is here a sugar-house, belonging to a Glasgow company, and vitriol-works. Ship-building is also carried on by a few hands; and about twelve or fifteen tons of kelp are annually made.

BURR, *n. s.* The lobe or lap of the ear.
BURR, among huntsmen, the round knob of a horn next a deer's head.

BURR PUMP, in a ship, a pump by the side of a ship, into which a staff seven or eight feet long is put, having a burr or knob of wood at the end, which is drawn up by a rope fastened to the middle of it; called also a bilge pump.

BURRA, an island of Scotland, in the county of Shetland.

BURRAMAHAL. See **BARRAMAHAL**.
BURRAMPOOTER, or **BEHMAPOOTRA**, a river of India, of considerable magnitude, of which the first account is given by J. Rennel,

Esq.; in the seventy-first volume of the Philosophical Transactions: the Burrampooter, says he, which has its source from the opposite side of the mountains that give rise to the Ganges, first takes its course eastward through the country of Thibet, where it is named Sanpoo or Zancu, which bears the same interpretation as the Ganga of Hindostan, namely the river. After winding with a rapid current through Thibet, it washes the border of the territory of Lassa, and then deviating from an east to a south-west course, it approaches within 220 miles of Yunan, the most westerly province of China. Here it appears as if undetermined whether to attempt a passage to the sea by the Gulf of Siam, or by that of Bengal; but it turns suddenly to the north-west, through Assam, and enters Bengal on the north-east. It now makes a circuit round the western point of the Garrow Mountains, and then altering its course to the south, in the Dacca province, is joined by the Megna, which, although not the tenth part of its size, receives and absorbs its name; henceforward communicating its own to the great mass of waters, until they intermix with those of the Ganges, near the Bay of Bengal. The whole known course of this river, including its windings, may be estimated at 1650 miles; but it is the fate of the Brahmapootra to penetrate a rude climate and stubborn soil, seldom approaching the habitation of civilised men; while the Ganges, on the contrary, waters a fertile territory, through rich and polished nations. The Brahmapootra, unknown in Europe as a capital river of India, until 1765, bears, during a course of 400 miles through Bengal, so intimate a resemblance to the Ganges, that one description answers both, except that, during the last sixty miles before their junction, under the name of Megna, it forms a stream, which is regularly from four to five miles wide, and, but for its freshness, might pass for an arm of the sea. The union of these two mighty rivers below Luckipoor now forms a gulf interspersed with large islands. The Bore, which is a sudden and abrupt influx of the tide into a river or narrow strait, prevails in the principal branches of the Ganges, and in the Megna; but the Hooghly river, and the passages between the islands and sands, situated in the gulf, formed by the confluence of the Brahmapootra and Ganges, are more subject to it than the rest of the rivers.

BURRAS PIPE, with surgeons, an instrument or vessel used to keep corroding powders in, as vitriol, precipitate &c.

BURREL, *n. s.* A sort of spear, otherwise called the red butter pear, from its smooth, delicious, and soft pulp.

BURREL FLY, *n. s.* Fr. *bourreler*, to execute, to torture. An insect, called also oxfly, gadbee, or breeze.

BURREL SHOT. From *bourreler*, to execute, and shot, in gunnery, small bullets, nails, stones, pieces of old iron, &c. put into cases, to be discharged out of the ordnance; a sort of case shot.

BURROCK, *n. s.* A small wear or dam, where wheels are laid in a river for catching of fish.

BUR'ROW, *v. & n.* } Sax. beorgan, byrgan
Bur'rowy. } to defend, to protect.
Properly borough, a corporation town. A hole in the ground; a den; a concealment. To make holes in the ground for concealment; from the noun.

When they shall see his crest up again, and the man in blood, they will out of their burrows, like conies after rain, and revel all with him. *Shakespeare.*

King of England shalt thou be proclaimed
In every burrow, as we pass along. *Id.*

And through the palaces' foundations bore,
Burrowing themselves, to hoard their guilty store. *Marvell.*

Possession of land was the original right of election among the commons; and *burrows* were entitled to sit, as they were possessed of certain tracts. *Temple.*

Sir, this vermin of court reporters, when they are forced into day upon one point, are sure to *burrow* in another; but they shall have no refuge; I will make them bolt out of all their holes.

Burke's Speech on American Taxation.

Some strew sand among their corn, which, they say, prevents mice and rats *burrowing* in it; because of its falling into their ears. *Mortimer.*

Little sinuses would form, and *burrow* underneath. *Sharp.*

BURROW (Sir James), master of the crown office, was elected F. R. S. and F. A. S. 1751. On the death of Mr. West, in 1772, he was prevailed on to fill the president's chair at the Royal Society till the anniversary election, when he resigned it to Sir John Pringle: and August 10th, 1773, when the society presented an address to the king, he was knighted. He published two volumes of Reports in 1766; two others in 1771 and 1776; and a volume of Decisions of the Court of King's Bench, upon settlement cases from 1732 to 1772 (to which was subjoined An Essay on Punctuation), in 3 parts, 4to. 1763, 1772, 1776. The Essay was also printed separately in 4to. 1773. He published, without his name, A few Anecdotes and Observations relating to Oliver Cromwell and his family, serving to rectify several errors concerning him; published by Nicol. Comm. Papadopolis, in his Historia Gymnasii Patavina, 1763, 4to. He died in 1782.

BURR-PUMP, or **BILGE-PUMP**, differs from the common pump, in having a staff six, seven, or eight feet long, with a bar of wood, whereto the leather is nailed, and this serves instead of a box. Two men, standing over the pump, thrust down this staff, to the middle whereof is fastened a rope, for six, eight, or ten men to hale by, thus pulling it up and down.

BURR REED. See SPARGANUM.

BURSA, **BURSE**, originally signifies a purse. In writers of the middle age it is more particularly used for a little college, or hall in a university, for the residence of students, called bursales or bursarii. In some universities it still denotes a foundation for the maintenance of poor scholars in their studies. The nomination to burses is in the hands of the patrons and founders thereof. The burses of colleges are not benefices, but mere places assigned to certain countries and persons. A burse becomes vacant by the bursar's being promoted to a cure.

BURSA, or **PRUSA**, the capital of Bithynia, in Asia Minor, situated in a fine fruitful plain, at the foot of mount Olympus, about seventy-five miles S. S. W. of Constantinople. It is one of the largest and finest cities of Asiatic Turkey, and contains 40,000 Turks, besides 300 families of Greeks, 400 of Jews, and 500 of Armenians. It was the capital of the Turkish empire, before the taking of Constantinople. Part of it stands on several small hills, at the foot of Olympus. The plain is covered with mulberry and various other fruit trees. The mosques and caravanseras are elegant; and so many springs proceed from Olympus that every house has its fountain. The bazaar contains all the commodities of the east. It also abounds in their own manufactures; the best workmen in Turkey residing in this town, and being excellent imitators of the French and Italian artists; particularly in tapestry.

BURSA, in zoology, a species of alcyonium, inhabiting the coasts of Europe, and commonly called the sea purse.

BURSA MUCOSA. A mucous bag, composed of membranes, containing a kind of mucous fat. The bursæ are of different sizes and firmness, and are connected by the cellular membrane with articular cavities, tendons, ligaments, or the periosteum. Their use is to secrete and contain a substance, to lubricate tendons, muscles, and bones, in order to render their motion easy. See **MUSCLES**, and Dr. Monro has published a detailed account of the bursæ, to which the reader is also referred.

BURSARIA, the bursary, or exchequer of collegiate and conventual bodies; or the place of receiving, paying, and accounting by the bursars.

BURSARIA, in botany. Class pentandria, order monogynia. Its generic characters are: **CAL.** deeply divided into five segments: **COR.** petals five, linear: **PIST.** short style; stigma simple: **CAPS.** heart-shaped, one-celled, opening into two parts, each with two valves, and two horns: **SEEDS** two. There is but one species, viz. *B. spinosa* a shrub of New Holland.

BURSARIA, in entomology, a species of aphid, found in the hollow excrescences which it forms in the leaves of the black poplar.

BURSARIA, in zoology, a species of sertularia, an inhabitant of the British coasts. The denticles are opposite, branched, and dichotomous; called in English the shepherd's purse coralline.

BURSE', } Barb. Lat. *bursarius*; Fr.
BUR'SAR, } *bourse*, a purse; *boursier*,
BUR'SARSHIP. } a scholar pensioned at a college; Goth. *biorghus*, an exchange house; a place for money or mercantile transactions. The term bursar specifically means the treasurer of a college; and a scholar who has a pension from it.

It has been considered as of so much importance, that a proper number of young people should be educated for certain professions, that sometimes the public, and sometimes the piety of private founders, have established many pensions, scholarships, exhibitions, *bursaries*, &c. for this purpose.

Smith's Wealth of Nations, b. 1. c. x.

BURSE, Guicciardini assures us, was first applied to a commercial edifice at Bruges, and took its rise from an hotel, built by a lord of the family de la Bourse, whose arms, which are three purses, are still found on the crowning over the portal of the house. The most considerable burse is that of Amsterdam, which is a large building, 230 feet long and 130 broad, round which runs a peristyle twenty feet wide. The columns of the peristyle, which are forty-six, are numbered, for the convenience of finding people. It will hold 4500 persons. The ancient Romans had public places for the meetings of merchants in most of their trading cities; that built at Rome, A. U. C. 259, under the consulate of Appius Claudius and Publius Servilius, was denominated the college of merchants; some remains of it are still to be seen, and are known by the modern Romans under the name *loggia*. The Hans towns, after the example of the Romans, gave the name of colleges to their burses.

BURSERIA, in botany, a genus of the diœcia order, belonging to the hexandria class of plants. The **CAL.** is triphyllous; the **COR.** tripetalous; the **CAPS.** carnos, trivalved, and monospermous. There is but one species; viz. *B. gummifera*, or gum elemi. It is frequent in woods in most of the Bahama Islands, and grows speedily to a great height and thickness. The leaves are pinnate; the middle rib three or six inches long, with the pinnæ set opposite, on foot-stalks half an inch long. It has yellow flowers, male and female on different trees. These are succeeded by purple-colored berries, bigger than large peas, hanging in clusters on a stalk of about five inches long, to which each berry is joined by a foot-stalk half an inch long. The seed is hard, white, and of a triangular figure, enclosed within a thin capsule, which divides in three parts, and discharges the seed. The fruit when cut discharges a clear balsam, esteemed a good vulnerary, particularly for horses. On wounding the bark, a thick milky liquor is obtained, which soon concretes into a resin no way different from the gum elemi of the shops.

BURSERY, 1. A Privilege to attend a college in Scotland, without paying fees: 2. A salary bestowed for that purpose at the disposal of some patron: 3. The treasury of a college or monastery.

BURST', *v. & n.* or **BRUST'**. Goth. *brusta*, *borsta*; Swed. *brista*; Belg. *borsten*; Sax. *burstan*; Teut. *bursten*; to break; fly open; rupture; to rush; to gush forth. It is applied to the violent inflammation produced by the passions, when we say of an individual he is ready to burst with rage; to suffer a violent disruption; to break suddenly. *Burst* and *brusta* are terms employed to designate hernia of the uncompendious kind.

Sire! I wol be your humble trewe wif,

Have here my trouth, till that myn herte *burste*.

Chaucer's Canterbury Tales.

With that she wept and wailed, as if her heart
 Would quite have *burst* through great abundance of
 her smart.

Spenser.

My breast I'll *burst* with straining of my courage,
 And from my shoulders crack my arms asunder,
 But I will chastise this high-minded strumpet.

Shakspeare.

He fastened on my neck, and bellowed out,
As if he would *burst* heaven.

Yet I am thankful; if my heart were great,
'Twould *burst* at this.

Down they came, and drew
The whole roof after them, with *burst* of thunder
Upon the heads of all.

Id.

Milton.

The egg, that soon
Bursting with kindly rupture, forth disclosed
The callow young.

Id.

She *burst* into tears, and wrung her hands.

Arbutnot.

We lye examining ourselves, and are ready to
burst,

Yet still are no wiser than we were at first.

Swift.

Imprisoned fires, in the close dungeons pent;
Roar to get loose, and struggle for a vent;
Eating their way, and undermining all,
Till with a mighty *burst* whole mountains fall.

Addison.

You *burst*, ah, cruel! from my arms,
And swiftly shoot along the Mall,
Or softly glide by the canal.

Pope.

But lust of power's a dropsy on the mind,
Whose thirst increases, while we drink to quench it,
Till swollen and stretched by the repeated draught,
We *burst* and perish.

Higgon's Generous Conqueror.

What then is unbelief? 'tis an exploit:
A strenuous enterprise: to gain it, man
Must *burst* through every bar of common sense.

Young's Night Thoughts.

Then *bursting* broad the boundless shout to heaven
From many a thousand hearts ecstasie sprung.

Thomson's Liberty.

If the worlds

In worlds inclosed, should on his senses *burst*,
He would abhorrent turn.

Thomson.

Once more through all he *bursts* his thundering way.

Byron.

BURSLEM, a market town of Staffordshire, famous for its pottery, which stands on a rising ground near the Trent and Mersey canal, which, about a mile hence, passes by a tunnel under ground, the length of 1888 yards. The church has a square tower, and was formerly a chapel of ease to Stoke. It has a neat market-house, and markets on Monday and Saturday. Fairs 22d March, 28th June, and 17th October. Distant three miles from Newcastle-under-Lyme, and 151 from London.

BURTON (Henry), a puritan divine, was born at Birsall, in Yorkshire, in 1579; educated at Cambridge, and took his degrees of M.A. and B.D. there and at Oxford. He first was tutor to lord Carey's sons; afterwards clerk of the closet to the princes Henry and Charles; and next appointed to attend the latter into Spain, in 1623; but, from speaking too freely of the bishops, was set aside, after his goods were partly shipped. In 1625 he presented a letter to king Charles, remonstrating against Drs. Laud and Neil, as being popishly affected; for which he was prohibited the court. About this time, however, he obtained the rectory of St. Matthews, London, where he preached with such freedom, that in 1636 he was summoned to answer for two sermons on the 5th of November preceding. He appealed to the king, but was suspended by the high commission court; whereupon he absconded, but published his sermons, with reasons for his appeal. He was soon after apprehended by

warrant from that state inquisition, the star-chamber; incarcerated in Fleet prison along with the celebrated Prynne and Bastwick; and all his papers seized. They were charged with writing seditious, schismatical, and libellous books, against the church and government. They gave in answers, but the court expunged the greater part of them, and, to its eternal disgrace, sentenced them to pay a fine of £5000 each; and Burton besides to be degraded from his office and degrees, deprived of his benefice, set in the pillory, there to have his ears cut off, and to be afterwards imprisoned for life, denied the use of paper, pens, and ink, and debarred the access of all persons except the keeper,—not even his wife being permitted to see him. After twelve weeks close confinement in Lancaster jail, he was removed in 1637 to Cornet castle, in Guernsey, where he was shut up for three years, till 1640, when the House of Commons reversed the sentence as illegal, annulled the fine, restored him to his degrees and benefice, and voted him £6000 as a compensation for his imprisonment and the loss of his ears. From the confusion of the times, however, he never received this sum, though he was restored to his living. He died in January, 1648.

BURTON (John), D.D. a learned divine, born in 1696, at Wembworth, in Devonshire, and educated at Oxford. In 1725, being then proctor, he spoke a Latin oration, entitled *Heb; or An Instance of a Magistrate's Erring through Unseasonable Lenity*; written and published with a view to encourage the salutary exertions of academical discipline; and afterwards treated the same subject still more fully in four Latin sermons before the university, and published them with appendixes. He also introduced into the schools, Locke, and other eminent modern philosophers, as suitable companions to Aristotle; and printed a double series of philosophical questions, for the use of the younger students; from which Mr. Johnson, of Magdalene College, Cambridge, took the hint of his larger work of the same kind. When the settling of Georgia was in agitation, in 1732, Dr. Burton preached before the Society, and published his sermon, with an appendix on the state of that colony; and he afterwards published an account of the designs of the associates of the late Dr. Bray, with an account of their proceedings in that business. About the same time, on the death of Dr. Edward Littleton, he was presented by Eton College to the vicarage of Maple-Derham, in Oxfordshire, where he married the widow of his predecessor, who was without a home, and without a fortune. In 1760 he exchanged his vicarage of Maple-Derham for the rectory of Worplesdon in Surrey. In his advanced age, finding his eyes begin to fail, he collected and published, in one volume, all his scattered pieces, under the title of *Opuscula Miscellanea*; and soon after died, February the 11th, 1771.

BURTON (Robert), known to the learned by the name of Democritus junior, was the son of Ralph Burton Esq. of Lindley, in Leicestershire, and born February 8th, 1576. He was educated at Sutton Colefield in Warwickshire; in 1597 was sent to Oxford; and in 1599 was elected

student of Christ-Church. In 1616 the vicarage of St. Thomas in Oxford was conferred upon him by the dean and canons of Christ-Church; and this, with the rectory of Segrave in Leicestershire, given him some time after by George lord Berkely, he held to his death, in January 1639. He was a man of general learning, and an exact mathematician; extremely studious, and of a melancholy turn; yet an agreeable companion, it is said, and very humorous. The *Anatomy of Melancholy* was printed first in 4to, afterwards in folio, in 1624, 1632, 1638, and 1652, to the great emolument of the bookseller. He was buried in the cathedral of Christ-Church, and had a monument erected to his memory with the following epitaph, said to have been his own composition:—

Paucis notus, paucioribus ignotus,
Hic jacet Democritus Junior;
Cui Vitam pariter et mortem
Dedit Melancholia.

He left behind him a very choice collection of books: bequeathed many to the Bodleian library; and £100 to Christ-Church, the interest of which was to be laid out yearly in books for their library.

BURTON UPON TRENT, a borough and market town of Staffordshire. It had formerly a large abbey, and over the Trent it has a famous bridge of free stone, about a quarter of a mile in length, supported by thirty-seven arches. It consists chiefly of one long street, reaching from the place where the abbey stood to the bridge; and has a good market for corn and provisions. Near the abbey stood the ancient parish church of St. Modwena, which was connected with the abbey by a cloister; but it was taken down, and the present church erected, in 1722, on a smaller scale. It is neat and convenient, with spacious galleries; it has also an organ. The church is a perpetual curacy, exempt from episcopal jurisdiction; in the patronage of the marquis of Anglesea, who is also inpropriator of the tithes to a considerable amount. The marquis is also lord of the manor of Burton and its hamlets; and the remains of the abbey are now his manor-house. He holds annually two court-leets, under the management of the perpetual bailiff and coroner; and also two probate-courts, for proving wills, &c. Here is also a court of request for the recovery of small debts; and the inhabitants are exempt from serving any county juries. This place is famous for the excellence of its ale and malt, which is sent down the river to Hull, and forwarded thence through the whole kingdom, and to the different ports on the continent. It has manufactures of hats, cotton, tanneries, and one for the purpose of converting bloom and scrap iron into bars. In the market-place is a neat town-hall. In this the public business of the town is transacted, and it also serves as a concert and assembly-room. Here are a free-school, several Sunday-schools, and two almshouses for poor women. The market on Thursday is well supplied with all kinds of meat, corn, poultry, &c. Fairs, Candlemas-day for cattle, &c. April 5th. Ascension-day, October 29th, and five following days, for cheese, horses, &c.

BURY', } Goth. *burja*, *byrgia*;
BURY'ER, } Sax. *burgian*; Teut. *ber-*
BURY'ING, } *gan*, to conceal; to inter;
BU'RIAL, } to put into the grave;
BU'RIAL PLACE. } into a place of secrecy
and safety.

Saint Urban with his dekenes, prively,

The body fette, and buried it by night,

Among his other sciutes, honestly.

Chaucer's Canterbury Tales.

Troy, that art now nought but an idle name,
And in thine ashes buried low dost lie. *Spenser.*

This is the way to make the city flat,
And bury all, which yet distinctly ranges,
In heaps and piles of ruin. *Shakspeare.*

Nor would we deign him burial of his men. *Id.*

Slave! thou hast slain me!
If ever thou wilt thrive, bury my body. *Id.*

See my wealthy Andrew docked in sand,
Vailing her high top lower than her ribs,
To kiss her burial. *Id. Merchant of Venice.*

The rude scene may end,
And darkness be the burier of the dead.

Id. Henry IV.

We have great lakes, both salt and fresh; we use them for burials of some natural bodies; for we find a difference of things buried in earth, and things buried in water. *Bacon.*

Ah! would those treasures which both Indies
have,

Were buried in as large and deep a grave!
War's chief support with them would buried be,
And the land owe their peace unto the sea. *Marvell.*

The office of the church is performed by the parish priest, at the time of interment, if not prohibited unto persons excommunicated, and laying violent hands on themselves, by a rubrick of the burial service. *Ayliffe's Purgon.*

The place was formerly a churchyard, and has still several marks in it of graves and burying-places.

Spectator.

And vice that digs her own voluptuous tomb,
Had buried long his hopes no more to rise. *Byron.*

BURY, ST. EDMUND'S, a borough, market, and county town of Suffolk, lies in a pleasant situation, ten miles east of Newmarket, and seventy-one N. N. E. of London. It was so named from St. Edmund, king of the East-Angles, who was crowned in it, and afterwards murdered by the Danes; and being buried in it, an abbey was erected to his honor by Sigbert, king of the East-Angles. It was situated between the two churches, which are both large, handsome buildings, with elegant windows and fine roofs, and in one church-yard. The town was burnt by Sueno the Dane; and Stow says it had the privilege of a mint, in the reign of king John. In 1636 it was infested with a dreadful plague. In 1772 some laborers, in digging among the ruins of the abbey, discovered a leaden coffin, which contained the body of Thomas Beaufort, son of John of Gaunt, duke of Lancaster; he was duke of Exeter, admiral and captain of Calais, and lord high chancellor of England. It sends two members to parliament, who are elected by the corporation; which consists of a recorder and twelve burgesses, a coroner, and twenty-four common council. This place, from the healthiness of its situation, is sometimes called the Montpelier of England. It is divided into five

wards, and has thirty-five streets, which are well paved and kept clean, most of them intersecting each other at right angles. Including the suburbs, it is a mile from east to west, and nearly two miles from south to north. It has a spacious guildhall, and a beautiful cross, surrounded with iron railings. It has likewise a handsome market place for fish and provisions; built at the expense of the earl of Bristol. Here is also a free grammar-school, founded by Edward VI. and various other charitable institutions. Large quantities of wool are annually brought hither, and exposed for sale in the wool-halls. The county assises are held in this town. The county gaol is a convenient and spacious building near the town, and the bridewell was formerly a Jews' synagogue. Market-day, Saturday.

BUSBY (Dr. Richard), son of Richard Busby, Esq. of Westminster, was born at Lutton, in Lincolnshire, in 1606. He passed through the classes in Westminster, and completed his studies at Oxford, where he took a Master's degree in 1631. In 1640 he was appointed master of Westminster school; and by his skill and diligence in the discharge of this important and laborious office for the space of fifty-five years, educated the greatest number of eminent men in church and state, that ever at one time adorned any age or nation. He is said to have been extremely severe with his pupils; though rather from a love of discipline than from disposition, as he permitted, at times, the free exercise of their juvenile witticisms against himself. This great man, after a long and healthy life, the effect of temperance, died in 1695, aged eighty-nine; and was buried in Westminster Abbey, where there is a fine monument erected to him. He composed several books for the use of the school.

BUSCH (John George), a native of Lunenburg, and director of the Academy of Commerce at Hamburg, was born in 1728, and wrote several works in German, on commerce and political economy, as 1. *The Theory of Commerce*, 3 vols. 8vo. 2. *On Banks*, 8vo. 3. *On the Circulation of Money*, 3 vols. 8vo. 4. *Essays on Commerce*, 2 vols. 8vo. 5. *On Mathematical Studies*, as applicable to Civil Life, 8vo. 6. *Encyclopedia of Mathematics*, 8vo. 7. *Experience and Observations*, 5 vols. 8vo. 8. *An Account of the Commercial Academy of Hamburg*, 12mo. 9. *The Merchant's Library*, a periodical work. He died after 1800.

BUSCHING (Anthony Frederic), an able writer on history and geography, was a native of Westphalia, and educated at the university of Halle. He accompanied the family of count Lynar, as tutor, on an embassy from the Danish court to Westphalia, in 1749. In 1754 he was appointed professor of philosophy, and subsequently of divinity at Gottingen, in which offices he was the advocate of very liberal opinions; and he removed to Petersburg, to become the minister of a Lutheran church in 1761, and founded there a very extensive seminary of education. Other disputes afterwards compelled him to remove to Altona; and in 1766 he accepted the post of director of a gymnasium at Berlin, where he died in May 1793, in the sixty-ninth year of his age. He was a useful, rather than

a polished or very accurate writer; but the science of modern geography is much indebted to his labors. The most celebrated of his works are, *General Geography*, 6 vols. 4to. An Introduction to the *Descriptive Geography of the States of Europe*. A *Magazine of Modern History and Geography*, 22 vols. 4to. A *Weekly Account of New Maps*, published periodically from 1767 to 1783. *Biography of Celebrated Men*, 6 vols. 8vo. *Character of Frederic II. king of Prussia*. *Elements of Natural History*. *Sketch of the History of Philosophy*, 2 vols. 8vo. *History and Theory of the Belles Lettres*, 2 vols. 8vo. Busching also wrote tracts on theology, and on general education.

BUSHP, } Swed. *buske*; Bel. *bosch*;
BUSHMENT, } Dan. *buske*, Teut. *busch*; Ital.
BUSHINESS, } *bosco*; Fr. *bois*; a thick shrub;
BUSHY, } a thicket; a wood; a whole
wood: now applied to a low tree or shrub with thick small boughs or roots, and to any thing similar, as bushy eyebrows; a bushy wig; many things that thicken by growth and combination.

For out of tounne we list to gone,
The sound of birdes for to here,
That on the bushes singen cleere.

Chaucer's Romaunt of the Rose.

She darst the wilde bestes donnes seke,
And rennen in the mountaignes all the night,
And slepe under the bush.

Id. Canterbury Tales.

These blazing starres the Greeks call cometas, our
Romanes crinitas: dreadfull to be seene, with bloudie
haire, and all over rough and shagged in the top,
like the bush of hair upon the head.

Hollav's Punic, vol. i. fol. 15.

Moreover a goodly broad bushy tail they (the squirrels) have, wherewith they cover their whole body.

Id. vol. i. fol. 218.

The gentle shepherd sat beside a spring.

All in the shadow of a bushy briar. *Spenser.*

Princes thought how they might discharge the
earth of woods, briars, bushments, and waters, to
make it more habitable and fertile. *Raleigh.*

If it be true that good wine needs no bush, 'tis true
that a good play needs no epilogue. *Shakespeare.*

The roses bushing round

About her glow'd, half stooping to support
Each flower of tender stalk. *Milton.*

Generally the cutting away of boughs and suckers,
at the root and body, doth make trees grow high; and,
contrariwise, the polling and cutting of the top, make
them spread and grow bushy. *Bacon.*

The poller and exacter of f-ees, justifies the resemblance
of the courts of justice to the bush, whereunto
while the sheep flies for defence from the weather, he
is sure to lose part of the fleece. *Id. Essays.*

Her heart was that strange bush, whose sacred fire
Religion did not consume, but inspire. *Donne.*

A gushing fountain broke

Around it, and above, for ever green,
The bushing alders formed a shady scene.

Pope's Ode.

Statues of this god, with a thick bushy beard, are
still many of them extant in Rome. *Adrian.*

Bush, among huntsmen, a fox's tail.

Bush, BURNING, the bush wherein the Lord
appeared to Moses at the foot of mount Horeb,
as he was feeding his father-in-law's flock. As
to the person that appeared in the bush, the text

says, 'That the angel of the Lord appeared unto him in a flame of fire, out of the middle of the bush;' but whether it was a created angel, speaking in the person of God, or God himself, or (as the most received opinion is), Christ the son of God, has been a matter of some controversy among the learned. See **ANGEL**. The emblem of the burning bush is used as the seal of the church of Scotland, with this motto: 'Though burning, never consumed.'

BUSHEL, a measure of capacity for things dry; as grain, pulse, dry fruits, &c. containing eight gallons, or one-eighth of a quarter. Du Cange derives the word from *busellus*, *bustellus*, or *bissellus*, a diminutive of *buz*, or *buza*, used in the corrupt Latin for the same thing; others derive it from *bussulus*, an urn wherein lots were cast; which seems to be a corruption from *buxulus*. *Bussellus* appears to have been first used for a liquid measure of wine, equal to eight gallons. *Octo libræ faciunt galonem vini, et octo galones vini faciunt bussellum London, quæ est octava pars quarterii*. It was soon after transferred to the dry measure of corn of the same quantity. See **ARITHMETIC**, where the contents of the new bushel are particularly specified. At Paris the bushel is divided into two half bushels; the half bushel into two quarts; the quart into two half quarts; the half quart into two litrons; and the litron into two half litrons. See **MEASURE** and **WEIGHT**.

BUSHEL. Fr. *boisseau*; barb. Lat. *bischefila*, *schefila*, from *σάφη*, a modulus, a measure of eight gallons.

And then, they found
Of Floreins fine, of gold yeoined round,
Wel nigh an eighte *bushels* as him thought.

Chaucer's Canterbury Tales.

His reasons are as two grains of wheat hid in two *bushels* of chaff; you shall seek all day ere you find them; and when you have them, they are not worth the search. *Shakspeare.*

The worthies of antiquity bought the rarest pictures with *bushels* of gold, without counting the weight or the number of pieces. *Dryden.*

BUSHIRE, or **BUSHAVIR**, a sea-port town of Persia, situated on the Persian Gulf, in the province of Fars. It occupies the southern extremity of a peninsula; but in high tides and storms it has sometimes been completely insulated. The town is of a triangular form, and fortified on the land side by a mud wall, mounting twelve pieces of cannon, and the streets are very narrow, and it is but a mean place. Provisions and fruits are cheap and excellent in Bushire, but the water must be brought from a distance of two miles, nor is it good nearer than sixteen miles. A considerable trade is carried on here in carpets, Shiraz wine, rose water, drugs; and the imports are Indian goods of different kinds, and English broad cloth. The English East India Company have a factory at this place. Population 5000. Distant ten miles W. S. W. of Shiraz, and twenty south of Bender Rigkh.

BUSIRIS, in entomology, a species of papilio, with black oblong wings; on the anterior pair are two yellow spots, and on the posterior ones a yellow disk. This is a native of Hindostan.

BUSIRIS, in ancient geography, a city of the Lower Egypt, south of Leontopolis, on the Busriticus, built by Busiris. In this city there stood a great temple of Isis, which gave it the appellation of the city of Isis. It was destroyed on a revolt, by Dioclesian.

BUSIRIS, in fabulous history, a tyrant of Egypt, noted for his cruelty, and slain by Hercules. Strabo denies such a tyrant ever existed; Isocrates has written his panegyric.

BUSIRTICIUS FLUVIUS, in ancient geography, that branch of the Nile which empties itself at the mouth called Ostium Pathmeticum, or Phatniticum; also a part, according to an ancient map, at the Ostium Mindesium; this branch dividing at Diospolis into two branches, called Busriticus, from the city of Busiris, which stood on its left, or west branch. It is the second branch of the Nile, reckoning from the east.

BUSITIS, in ancient geography, a district of Arabia Deserta; the country of Elihu; so called from Buz, Nahor's second son. It is called Buzites by the Septuagint.

BUSK, ³ Now written bush. See **BOSKE**.

BUSKET, ⁵ Basket, the diminutive of busk.

For there is neither *buske* nor hay

In Mey, that it nil shrouded bene

And with the new leues wrene.

Chaucer's Romaunt of the Rose, fol. 116.

Youngthes folke now flocken in every where,

To gather May-bushets and smelling breere.

Spenser's Shepheard's Calender.

BUSK, *v. & n.* } Fr. *buis*, *buisque*; thus the
BUSKET, } noun is applied to a slip
BUSKY, } of boxwood, or of any thing

else that is a strengthener for women's stays.—The verb is derived differently and applied differently. Dr. Jamieson thinks it is from the German, *butzen*, *bussen*, to decorate and ornament. A well-dressed woman is *butz frauw*. *Busk* is so termed, perhaps, because it adds to the grace of the person; and the verb may be applied to the general preparation and making ready, in which ladies are so very nice and particular, before they appear in company. Thus, in the song, as quoted below, 'busk ye,' is make ready, prepare 'my bonny, bonny bride.' It is sometimes used in the sense of repair to; to go; to direct one's steps. It is, however, as a verb nearly obsolete, and modern fashion is getting rid of the noun. *Busks* were only known to our grandmothers: the substitutes are lighter and more elegant.

Busk ye, then busk, my bonny, bonny bride;

Busk ye, busk ye, my winsome marrow;

Busk ye, and luvie me on the banks of Tweed,

And think nae mair on the braes of Yarrow.

W. Hamilton.

Her long slit sleeves, stiffe *buske*, puffie verdingall,
Is all that makes her thus angelical.

Marston. Scourge II.

Ye might haue *busked* you to huntly banks,

Your pryde was pevysh to play such pranks.

Shelton's Ware the Hawke.

The commons renyed their tax's to pay

Of then demaunded and asked by the kyng

With one voice importune they plainly sayd nay,

They *buskt* them on a *bushment* themselfe in baile
to bring, *Id. p. 306.*

No fowler that had wylie witte
But will forcee such hap,
That birds will alway *buske* and bate
And 'scape the fowlers trap.
Turberville. Of the diuers Passions, &c.

BUSK, a town in Austrian Galicia, situated on the Bug, which here first becomes navigable. It contains three Greek churches, and one Roman Catholic, and there is here a large tannery. In the neighbourhood are iron works, and the lakes afford good fishing. Twenty-five miles E. N. E. of Lemberg, and fifty north of Halicz.

BUSKIN, *Ital. borzachino; Fr. brodequin*, **BUSKINED**, *from Lat. pero*. Some derive it from the Greek *βυσσα*, a hide or skin; a kind of half boot; a shoe which comes to the mid leg. It is now confined to the stage, and is chiefly characteristic of tragedy.

She, having hong upon a bough on high
Her bow and pointed quiver, had unlaste
Her silver *buskins* from her nimble thigh. *Spenser.*

The foot was dressed in a short pair of velvet *buskins*; in some places open, to shew the fairness of the skin. *Sidney.*

Or what, though rare, of later age,
Ennobled hath the *buskined* stage? *Milton.*

There is a kind of rusticity in all those pompous verses; somewhat of a holiday shepherd strutting in his country *buskins*. *Dryden.*

Here, armed with silver bows, in early dawn,
Her *buskined* virgins traced the dewy lawn. *Pope.*

But, O! how altered was its sprightlier tone,
When Cheerfulness, a nymph of healthiest hue,
(Her bow across her shoulder flung,
Her *buskins* gemmed with morning dew),
Blew an inspiring air, that dale and thicket rung.
Collins' Ode. The Passions.

BUSKINS anciently were adapted to either foot, and worn by either sex. This part of dress, covering both the foot and mid leg, was tied below the knee; it was very rich, and principally used on the stage by actors in tragedy. It was of a quadrangular form; and the sole was so thick, that by means thereof, men of ordinary stature might be raised to the elevation of the heroes they personated. The color was generally purple on the stage; herein it was distinguished from the sock worn in comedy, that being only a low common shoe. The buskin seems to have been worn not only by actors but by girls, to raise their height; travellers and hunters also made use of it to defend themselves from the mire. In classic authors, we frequently find the buskin used for tragedy itself, as it was a mark of tragedy on the stage. It was also to be understood for a lofty strain or high style.

BUSS, *v. & n. Per. bosu, from boos, poos, the lips; Lat. basium; Fr. baiser; Ital. bacio, Span. buza*, which approaches nearest to the English, but all these may have the same root with kiss, by the frequent intermutation of *k* and *p*. A kiss; to kiss; to salute with the lips.

Yonder walls, that partly front your town,
Yond towers, whose wanton tops do *buss* the clouds,
Must kiss their feet. *Shakspeare.*

Go to them with this bonnet in thy hand,
Thy knee *bussing* the stones; for in such business,
Action is eloquence. *Id.*

Thou dost give me flattering *busses*.—By my troth,
I kiss thee with a most constant heart. *Id.*

Sweete *busses* not sharpe battels, then,
Did alter man and minde:
Till he, as others, sorrowe in
Securitie did finde. *Waller.*
And we by signs sent many a secret *buss*,
Drayton's Barons' Wier.

Kissing and *bussing* differ both in this,
We *buss* our wantons, but our wives we kiss.
Harriek.

BUSS. Goth. *busa*; Swed. *buz*; Bel. *buis*;
Teut. *busse*; a fishing boat, made like a box,
with wide hull and broad prow.

Herfor kyng Richard wrathes him & sais,
'Dight vs þider ward our *busses* & galais,
Mi sister I wille out wyn or I ferre go.'

R. Branne, p. 149.

BUSS. Used only in composition, as in *blunderbuss*, but common in all Gothic dialects, as *bos, bus, busche*, a barrel, a tube, supposed to be from Lat. *buxus*.

BUSS, is a small vessel, used by the English and Dutch in the herring fishery, commonly from forty-eight to sixty tons burden, and sometimes more: a buss has two small sheds or cabins, one at the prow and the other at the stern; that at the prow serves for a kitchen. Every buss has a master, an assistant, a mate, and seamen in proportion to the size of the vessel; the master commands in chief, and without his express orders the nets cannot be cast nor taken up; the assistant has the command after him; and the mate next, whose business is to see the seamen manage their rigging in a proper manner, to mind those who draw in their nets, and those who kill, gut, and cure the herrings, as they are taken out of the sea: the seamen generally engage for a whole voyage in the lump. The provision which they take on board the busses, consists commonly in biscuit, oat meal, and dried or salt fish; the crew being content for the rest with what fresh fish they catch. See **FISHERIES**.

BUSSA, a large sort of vessel of war, in use in the middle age, spoken of by antiquaries and historians under the denomination of *bussa, buscia, bureia, buza, bucea, and bucia*.

BUSSARA, or **BASSORA**. See **BASSORA**.

BUSSELLUS. See **BUSHEL**.

BUSSORES, from *Bassora*, whence they were originally brought, a name given by some to that species of pigeon called the carrier.

BUSSELLUS. See **BUSHEL**.

BUSSY (Roger Rabutin), count of. See **RABUTIN**.

BUST. *Ital. busto; Fr. buste; Lat. bustum, ustum, from uro, burn, to burn*. It signifies a half statue usually placed over the ashes of the dead. It retains the name, though the custom in which it originated, in Christian nations, has been long obsolete.

Agrippa, or Caligula, is a common coin, but a very extraordinary *bust*; and a Tiberius a rare coin, but a common *bust*. *Addison on Italy.*

Ambition sighed: she found it vain to trust
The faithless column, and the crumbling *bust*. *Pope*

This night, no *bust* or picture claims your praise,
Our claim's superior—he his spirit raises.
Garrick's Prologue.

What though no marble-piled *bust*
 Adorn his desolated dust,
 With speaking sculpture wrought!
 Pity shall woo the weeping Nine
 To build a visionary shrine,
 Hung with unfading flowers, from fairy regions
 brought. *Warton.*

Stop!—for thy tread is on an empire's dust!

An earthquake's spoil is sepulchred below!

Is the spot marked with no colossal *bust*?

Nor column trophied for triumphal show?

None: but the moral's truth tells simpler so;

As the ground was before, thus let it be;—

How that red rain hath made the harvest grow.

Byron's Child Harold.

BUST, or **BUSTO**, in sculpture, denotes the figure or portrait of a person in relieve, showing only the head, shoulders, and stomach, the arms being lopped off; ordinarily placed on a pedestal or console. In speaking of an antique, we say the head is marble, and the bust porphyry, or bronze, that is, the stomach and shoulders. Felibien observes, that though, in painting, one may say a figure appears in busto, yet it is not properly called a bust, that word being confined to things in relieve. The bust is the same with what the Latins called *Herma*, from the Greek *Hermes*, Mercury, the image of that god being frequently represented in this manner among the Athenians. Bust is also used, especially by the Italians, for the trunk of a human body, from the neck to the hips.

BUSTA GALLICA, was a place in ancient Rome wherein the bones of the Gauls, who first took the city, and were slain by Camillus, were deposited. It differed from

BUSTA GALLORUM, a place on the Appennines, so called from many thousands of Gauls being killed there by Fabius.

BUSTARD, a bird resembling a turkey. Barb. Lat. and Ital. *tarda*, *avis*, *tarda*; Ital. *avattarda*; Fr. *outarde*; the Lat. *tarda* does not apply to this bird, unless in the sense of late in taking wing.

His sacrifices were phenicopters, peacocks, *bustards*, turkeys, pheasants; and all these were daily offered.

Hakevill.

BUSTARD, in ornithology. See **OTIS**.

BUSTARD BAY, a bay on the east coast of New Holland, where ships may lie in safety, and obtain fresh water. Lat. 24° 4' S., long. 208° 18'.

BUSTARIE MŒCHÆ, in antiquity, according to some, women that were hired to accompany the funeral and lament the loss of the deceased: but others are of opinion, that they were rather common prostitutes, who stood among the tombs, graves, and other such lonely places.

BUSTLE, *v.* & *n.* } Frequentative of busy;
BUSTLER, } to hurry; to stir; to have
BUSTLINGS. } much to do; to be active;
 to be in tumult or confusion.

At length within the yvie totde,
 (There shrouded was the little god),
 I heard a busie *bustling*.

Spenser's Shepheard's Calendar.

Come, *bustle*, *bustle*—caparison my horse.

Shakespeare.

God take king Edward to his mercy,
 And leave the world for me to *bustle* in.

Id.

Wisdom's self,
 Oft seeks to sweet retired solitude:
 She plumes her feathers, and lets grow her wings,
 That in the various *bustle* of resort
 Were all too ruffled. *Milton.*

Engaged his legions in fierce *bustles*
 With perriwinkles, prawns, and muscles;
 And led his troops with furious gallops,
 To charge whole regiments of scallops.

Butler's Hudibras.

Sir Henry Vane was a busy and *bustling* man, who had credit enough to do his business in all places.

Clarendon.

A poor abject worm,
 That crawled awhile upon a *bustling* world,
 And now am trampled to my dust again.

Southerne.

BUSTUARI, in Roman antiquity, gladiators who fought about the bustum or funeral pile of a person of distinction, that the blood which was spilt, might serve as a sacrifice to the infernal gods, and render them more propitious to the manes of the deceased. This custom was introduced in the room of the more inhuman one of sacrificing captives at the bustum, or on the tombs of warriors.

BUSTUM, in antiquity, denotes a pyramid or pile of wood, whereon were anciently placed the bodies of the deceased, in order to be burnt. The Romans borrowed from the Greeks the custom of burning their dead. The deceased, crowned with flowers, and dressed in his richest habits, was laid on the bustum. Some authors say, it was only called bustum, after the burning, quasi bene ustum: before the burning it was more properly called *pyra*; during it *rogus*; and afterwards bustum. When the body was only burnt there, and buried elsewhere, the place was not properly called bustum, but *ustrina*, or *ustrinum*. Bustum was also figuratively applied to denote any tomb. Whence those phrases, *facere bustum*, *violare bustum*, &c.

BUSTUM, in the Campus Martius, was a structure whereon the emperor Augustus first, and after him the bodies of his successors, were burnt. It was built of white stone, surrounded with an iron palisade, and planted withinside with alder trees.

BUSY, *v.* & *adj.* } Sax. *bysig*; Bel. *bizig*;
BUSINESS, } from Goth. *buā*, to arrange;
BUSILY, } to prepare; employed;
BUSINESS, } active; officious; med-
BUSY BODY. } dling; industrious; trouble-
 some; vexatiously intrusive and importunate;
 a busy-body is a vain, meddling, fantastical person.

Full *busy* was Grisilde in every thing,
 That to the feste was appertinent;
 Right naught was she abaist of hire clothing,
 Though it were rude, and sondele, eke to-rent;
 But with glad chere to the yate is went,
 With other folk to grete the markisesse;
 And after that doeth forth hire *businessse*.

Chaucer's Canterbury Tales.

He in great passion all this while did dwell,
 More *busy*ing his quick eyes her face to view,
 Than his dull ears to hear what she did tell.

Færie Queene.

Must *business* thee from hence remove?

Oh! that's the worst disease of love. *Donne.*

Bestow

Your needful counsel to our *businesses*,
Which crave the instant use. *Shakespeare.*

The sweet thoughts do even refresh my labour,
Most *business* when I do it. *Id.*

After seventy years (as the Psalmist says), all is trouble and sorrow; and common experience confirms the truth of it in weak and old persons, especially in such as have lived in action all their lives, had great employments, much *business*, much command, and many servants to oversee and leave off ex abrupto; as Charles the Fifth did, to king Philip, resign up all on a sudden.

Burton's Anatomy of Melancholy.

Busybodies and intermeddlers are a dangerous sort of people to have to do withal. *L'Estrange.*

Affected despatch is one of the most dangerous things to *business* that can be. *Bacon.*

The coming spring would first appear,
And all this place with roses strow,
If *busy* feet would let them grow. *Waller.*

The grand *business* of our Saviour, and his apostles after him, was to teach, and that chiefly in order to persuade. *South's Sermons.*

At two afternoon for our Psyche inquire,
Her tea-kettle's on, and her smock at the fire;
So loitering, so active, so *busy*, so idle,
Which hath she most need of, a spur or a bridle? *Swift.*

She is well acquainted with all the favourite servants, *busybodies*, dependants, and poor relations, of all persons of condition in the whole town. *Spectator.*

Rumours strange,
And of unholy nature, are abroad,
And *busy* with thy name. *Byron's Manfred.*

BUT. Per. *budur*; Sax. *bute*; Swed. *but*, *utan*, *butan*; Bel. *buitan*, from Goth. *ut*, *be ut*, or *be out*. We shall insert all the various shades of application in which it is used, in the order preserved by Dr. Johnson. Each definition, and its appropriate illustration, will thus stand separate.

Except.

An emission of immateriate virtues we are little doubtful to propound, it is so prodigious: *but* that it is so constantly avouched by many. *Bacon.*

Who can it be, ye gods! *but* perjured Lycon?
Who can inspire such storms of rage, *but* Lycon?
Where has my sword left one so black, *but* Lycon? *Smith.*

Except that; unless; had it not been that: in this sense we now write *but that*. See sense 11.

And *but* infirmity,
Which waits upon worn times, hath something seized
His wished ability, he had himself
The lands and waters measured. *Shakespeare.*

Yet; nevertheless. It sometimes only enforces *yet*.

Then let him speak, and any that shall stand without shall hear his voice plainly; *but yet* made extreme sharp and exile, like the voice of puppets: and yet the articulate sounds of the words will not be confounded. *Bacon.*

Our wants are many, and grievous to be borne, *but* quite of another kind. *Swift.*

The particle which introduces the minor of a syllogism; now.

God will one time or another make a difference between the good and the evil. *But* there is little or

no difference made in this world; therefore that must be another world, wherein this difference shall be made. *Watts's Logick.*

Only; nothing more than.

If my offence be of such mortal kind,
That not my service past, or present sorrows,
Can ransom me into his love again;
But to know so, must be my benefit. *Shakespeare.*

Prepared I stand: he was *but* born to try
The lot of man, to suffer and to die. *Pope.*

'Trough on his brow were graven lines a stern
And tranquil sternness, which had taken place
Of feelings fiercer far *but* less severe;
Joy was not always absent from his face,
But o'er it in such scenes would steal with transient trace. *Byron's Childe Harold.*

Than.

The full moon was no sooner up and shining in all its brightness, *but* he opened the gate of Paradise. *Guardian.*

But that; without this consequence that.

Frosts that constrain the ground
Do seldom their usurping power withdraw,
But raging floods pursue their hasty hand. *Dryden.*

Otherwise than that.

It cannot be *but* nature hath some director, of infinite power, to guide her in all her ways. *Hooker.*

Who shall believe,

But you misuse the reverence of your place? *Shakespeare.*

Not more than; even.

A genius so elevated and unconfined as Mr. Cowley's, was *but* necessary to make Pindar speak English. *Dryden.*

It is evident, in the instance I gave *but* now, the consciousness went along. *Locke.*

By any other means than.

Out of that will I cause those of Cyprus to mutiny: whose qualifications shall come into no true taste again, *but* by transplanting of Cassio. *Shakespeare.*

If it were not for this; that; if it were not that. Obsolete.

I here do give thee that with all my heart,
Which, *but* thou hast already, with all my heart
I would keep from thee. *Shakespeare.*

However; howbeit; a word of indeterminate connexion.

I do not doubt *but* I have been to blame;
But, to pursue the end for which I came,
Unite your subjects first, then let us go
And pour their common rage upon the foe. *Dryden.*

It is used after *no doubt*, *no question*, and such words, and signifies the same with *that*. It sometimes is joined with *that*.

They made no account, *but that* the navy should be absolutely master of the seas. *Bacon.*

That. This seems no proper sense in this place.

It is not therefore impossible *but* I may alter the complexion of my play, to restore myself into the good graces of my fair critics. *Dryden.*

Otherwise than. Obsolete.

I should sin

To think *but* nobly of my grandmother. *Shakespeare.*

A particle by which the meaning of the foregoing sentence is bounded or restrained; only.

Thus fights Ulysses, thus his fame extends.
A formidable man, *but* to his friends. *Dryden.*

A particle of objection; yet it may be objected: it has sometimes *yet* with it.

But yet, Madam —

I do not like *but yet*; it does allay

The good precedence; lie upon *but yet*!

But yet is as a jaylour, to bring forth

Some monstrous malefactor. *Shakspeare.*

But for; without; had not this been.

Rash man, forbear! *but for* some unbelief,

My joy had been as fatal as my grief. *Waller.*

When the fair boy received the gift of right,

And, *but for* mischief, you had died for spite.

Dryden.

BUT', n. s. Fr. *bout*, a boundary.

But, if I ask you what I mean by that word, you will answer, I mean this or that thing, you cannot tell which; but if I join it with the words in construction and sense, as, *but* I will not, a *but* of wine, *but* and boundary, the ram will *but*, shoot at *but*, the meaning of it will be as ready to you as any other word. *Holder.*

BUT', n. s. In sea language, the end of any plank which joins to another on the outside of a ship, under water.

BUT' Thick, round, large. Goth. *bult*; Teut. *bult*; Swed. *bult*; Bel. *bot*. It seems to mean *be out*, extending; and was applied to denote several kinds of flat fish; Bel. *bot*, a flounder.

BUT-END, n. s. From *but* and *end*; the blunt end of any thing; the end upon which it rests.

The reserve of foot galled their foot with several volleys, and then fell on them with the *but-ends* of their muskets. *Clarendon.*

Some of the soldiers accordingly pushed them forwards, with the *but-ends* of their pikes, into my reach.

Swift.

BUTCHER, *v. & n.*

BUTCHERING,

BUTCHERLINESS,

BUTCHERLY,

BUTCHERY.

Barb. Lat. *bucador*, from Lat. *boves cadere*, was an ox killer; Fr. *boucher*; but Ital. *bec-caro* seems to be from

becco, a goat, the flesh of which was probably most common in ancient times. A butcher now is one who kills animals to sell; the verb, and sometimes the noun, is used in a far greater latitude of application. A butcher is one that is delighted with blood: to butcher is to kill, to murder; the adjective expresses bloody, gross, clumsily, barbarous, brutal, cruel, savage.

The lamb thinks not the *butcher's* knife

Should then bereave him of his life.

Earl of Surrey.

Teaching stern murder how to *butcher* thee.

Shakspeare.

Uncharitably with me have you dealt,

And shamefully by you my hopes are *butchered*. *Id.*

There is no place, this house is but a *butchery*;

Abhor it, fear it, do not enter it. *Id.*

There is a way which, brought into schools, would take away this *butcherly* fear in making of Latin.

Ascham.

The shepherd and the *butcher* both may look upon one sheep with pleasing conceits.

Sidney.

Brentford fair,

Where sturdy *butchers* broke your noodle,

And handled you like a pop-doodle. *Hudibras.*

Can he a son to soft remorse incite,

Whom gaols, and blood, and *butchery* delight.

Dryden.

The poison and the dagger are at hand to *butcher* a hero, when the poet wants brains to save him. *Id.*

Hence he learnt the *butcher's* guile.

How to cut your throat and smile;

Like a *butcher*, doomed for life

In his mouth to wear his knife.

Swift.

Yet this man, so ignorant in modern *butchery*, has cut up half an hundred heroes, and quartered five or six miserable lovers, in every tragedy he has written.

Pope.

His eyes

Were with his heart, and that was far away;

He recked not of the life he lost, nor prize,

But where his rude hat by the Danube lay,

There were his young barbarians all at play;

There was their Dacian mother—he, their sire,

Butchered to make a Roman holiday—

All this rushed with his blood.

Byron's Child Harold.

BUTCHERS, in antiquity. Among the ancient Romans there were three kinds of established butchers, whose office it was to furnish the city with the necessary cattle, and to take care of preparing and vending their flesh. The suarii provided hogs; the pecuarii, or boarii, other cattle, especially oxen; and under these was a subordinate class, whose office was to kill, called lanii and carnifices. Two classes of butchers are recognised in London; carcase butchers, who slaughter animals in great numbers, and dispose of them to the retail butchers, who are dispersed in different places for the supply of their customers.

To exercise the office of butcher among the Jews with dexterity is difficult. So particular are they in this, that the stricter Jews will buy meat of none of the London butchers, unless he have a licence from the rabbis, and keep a Jew slaughterer. This person performs his work in a peculiar manner: he never knocks down a bullock, as is the usual custom, but invariably cuts the throat of every animal, the sheep or ox being placed on its back, with the legs tied and the head held back. He never makes but one cut, and if by any accident this should fail to kill the animal, or he should break or notch his knife in the attempt, he would pronounce the animal unfit for the food of his people. He is also the first to examine the intestines and lungs, and should they be found in the least degree injured, or diseased, he would refuse the animal. Should he be sound, and the stroke succeed, as is generally the case, he proceeds to mark the bones of each separate joint with Hebrew characters, which are to the Jews the sign that the meat is clean and fit for food, and also convey the date when it was killed.

Butchers not selling meat at reasonable prices shall forfeit double the value, leviable by two justices of the peace. No butcher shall kill any flesh in his scalding-house, or within the walls of London, on pain to forfeit for every ox so killed 12*d.* and for every other beast 8*d.* to be divided between the king and the prosecutor.

The Butcher's Company, though very ancient, was not incorporated till the reign of James I. Their arms are, *azure*, two axes saltier-wise, *argent*, between three bulls' heads couped, attired, or; a boar's head, *gules*, betwix two garbs, *vert*.

BUTCHER-BIRD. See LANIUS.

BUTE, an island lying to the west of Scotland, being separated from Cowal, in Argyleshire, only by a narrow channel. It is about sixteen miles in length; the broadest part from east to west is about five miles. Part of it is rocky and barren; but, from the middle southwards, the ground is cultivated, and produces peas, oats, and barley. Here is a quarry of red stone, which the natives have used in building a fort and chapel in the neighbourhood of Rothsay, which is a very ancient royal borough, head town of the shire of Bute and Arran; but very thinly peopled, and maintained chiefly by the herring fishery. On the north side of Rothsay are the ruins of an ancient castle, formerly belonging to the kings of Scotland. It has likewise the remains of some Danish towers. The natives are healthy and industrious, speak the Erse and the dialect of the Lowlands indifferently, and profess the Protestant religion. The island is divided into two parishes, Rothsay and Kingcastle, accommodated with four churches. It was from very early times part of the patrimony of the Stuarts: large possessions in it were granted to Sir John Stuart son of Robert II. by his beloved mistress Elizabeth More; and it has continued in that line to the present time. Bute gives title of marquis to a branch of the family of Stuart, and Rothsay that of duke to the heir apparent of the British throne. Mount-Stuart, a seat of lord Bute, and from which he takes his second title, is an elegant house, having a fine view of the Frith of Clyde. Rothsay has of late become a fashionable watering-place.

BUTE, a shire of Scotland, comprehending the island, with those of Arran, the two Cambrays, and Inchmarnock. This county and that of Caithness send a member to parliament alternately. The earl of Bute is admiral of the county, by commission from his majesty; and no way dependent on the lord high admiral of Scotland; so that if any maritime case occurs within his jurisdiction (even crimes of as high a nature as murder, or piracy,) he is judge, by virtue of his powers as admiral, or he may delegate his authority to any deputies.

BUTE (John), earl of. See STEWART.

BUTEA, in botany, a genus of plants of the class diadelphia, order decandria: essential characters, CAL. sub-bilabiate: COR. standard conlanceolate; legume compressed, with one seed at the summit. There are two species, viz. *B. frondosa*, an evergreen tree, growing on the coast of Malabar to the height of fifteen feet. From this tree, according to Jussieu, the gum lac is procured. See GUM LAC. An infusion of the flowers dye cotton cloth, previously impregnated with alum, of a bright yellow. 2 *B. superba*, a native of the coast of Coromandel.

BUTEO, in ornithology, a species of falco, the common buzzard of Latham. The cere and legs of this bird are yellow; the body brown, and the belly pale, with brown spots. This species is rather larger than a kite in the body.

BUTEONIS, in zoology, a species of echinorhynchus, color clear white; the vesicles of the tail bluish and lentiform. Also a species of ascaris, and another of cucullanus. These three

are found in the intestines of the common buzzard.

BUTHYSIA, *βουθυσία*, in antiquity, a sacrifice of the greatest kind; such were the hecatombs. See SACRIFICE and HECATOMBS. The Greeks frequently prefixed the particle *βου* to words, to denote things of extraordinary magnitude, as alluding to the bigness of oxen.

BUTLER, *n.* } Teut. *buteler*, from *ben-*
BUTLERAGE, *n.* } *ten*; Swed. *byla*, to buy;
BUTTERSHIP, } *beutel*, a purse, signified a
BUTTERY, } pursuer. Its general appli-
BUTLERESS. } cation is a house steward,
but Fr. *boutiller*, is one who has the charge of the bottles or cellar.

These ordinary finances are casual or uncertain, as be the escheats, the customs, *butlerage*, and impost.

Bacon.
Butlers forget to bring up their beer time enough.

Scrip.
It seems my entertainer was all this while only the *butler*, who, in his master's absence, had a mind to cut a figure, and to be for a while the gentleman himself, and to say the truth, he talked politics as well as most country gentlemen do.

Goldsmith. *The Vicar of Wakefield*, ch. xix.
Prizage, by charter of Edward I. was exchanged into a duty of 2s. for every ton imported by merchant strangers, and called *butlerage*, because paid to the king's *butler*. *Blackstone. Commentaries*, b. i. c. viii.

BUTLER (Charles), was master of the grammar school at Basingstoke, and a native of Weycombe, in Bucks, and M. A. of Magdalen College, Oxford, presented in 1600 to the vicarage of Lawrence Wotton, in Hampshire, where he died in 1647. His works are—1. *The Feminine Monarchy*, or a Treatise on Bees, 1609, 8vo.; 1623, 8vo.; and 4to. 1634 (quoted by Dr. Johnson in his Dictionary). 2. *Rhetoricæ*, lib. duo, 1618. 3. *De Propinquitate Matrimonium impediens regula generalis*, 4to. 4. *Oratoria*, lib. duo, 4to. 5. *English Grammar*, 4to. 6. *The Principles of Music*, 4to. The last work is highly praised by Dr. Burney.

BUTLER (Joseph), bishop of Durham, a prelate distinguished by his piety and learning, was the youngest son of Mr. Thomas Butler, a reputable shopkeeper at Wantage, in Berkshire, where he was born in 1692. His father, who was a presbyterian, observing that he had a strong inclination to learning, sent him to an academy in Gloucestershire, to qualify him for a dissenting minister; and while there he wrote some remarks on Dr. Clarke's first sermon at Boyle's lecture. Afterwards, resolving to conform to the established church, he studied at Oriel College, where he contracted an intimate friendship with Mr. Edward Talbot, brother to the chancellor, which laid the foundation of his subsequent advancement. He was first appointed preacher at the Rolls, and rector of Haughton and Stanhope, two rich benefices in the bishopric of Durham. He quitted the Rolls in 1726; and published in 8vo. a volume of sermons, preached at that chapel. After this he constantly resided at Stanhope, in the regular discharge of the duties of his office, till 1733, when he was called to attend lord chancellor Talbot as his chaplain, who gave him a prebend in the church of Rochester. In 1736 he was appointed clerk of the

closet to queen Caroline, whom he attended every day, from seven to nine in the evening. In 1738 he was appointed bishop of Bristol; and not long afterwards dean of St. Paul's. He now resigned his living of Stanhope. In 1746 he was made clerk of the closet to the king; and in 1750 was translated to Durham. This rich preferment he enjoyed but a short time; for he died at Bath, June 16th, 1752, and was interred in the cathedral of Bristol, where there is a monument to his memory. He died a bachelor. His deep learning and comprehensive mind appear sufficiently in his writings; particularly in his noble work, *The Analogy of Religion, Natural and Revealed, to the Constitution and Course of Nature*, first published in 8vo, 1736.

BUTLER (Samuel), a celebrated poet of the seventeenth century, was the son of a reputable Worcestershire farmer, and born in 1612. He passed some time at Cambridge, but was never matriculated. Returning to his native country, he lived some years as a clerk to a justice of peace; devoting his leisure to the fine arts. Being recommended to Elizabeth countess of Kent, he enjoyed in her house, not only the use of all kinds of books, but the conversation of the great Mr. Selden, who often employed Butler to write letters, and translate for him. He also lived some time with Sir Samuel Luke, a gentleman of an ancient family in Bedfordshire, and a commander under Cromwell. Here he is supposed to have planned his celebrated *Hudibras*; and under that character to have ridiculed the old knight. Thus, *Hudibras* in the first canto says—

'Tis sung, there is a valiant mamaluke
In foreign land yeled — — —
To whom we oft have been compared
For person, parts, address, and beard.

After the Restoration, Mr. Butler was made secretary to the earl of Carbury, lord president of Wales, who appointed him steward of Ludlow castle, when the court was revived there. At this time he married a Mrs. Herbert, a lady of good family and some fortune, which he soon expended. The earl of Dorset brought his celebrated poem into notice at court, and he had promises of a place from Clarendon, but they were never accomplished. He died in 1680, disappointed and poor, but without debt. Charles II. is said often to have quoted *Hudibras* in his conversation: and, as Dr. Johnson says, it can perish only with the language. But of late years it has experienced a good deal of the fate of the author through life; it has been neglected: its topics are less familiar to the public, and its language more so. Grainger calls it as great an effort in its kind, as *Paradise Lost*.

BUTLER (James), duke of Ormond, a celebrated statesman in the reigns of Charles I. and II., was the son of Thomas Butler, of London, and born at Newcastle-house, in Clerkenwell, in 1610. He succeeded to the earldom of Ormond on the death of his grandfather, Walter Butler, in 1632. In 1641, at the breaking out of the Irish rebellion, he was appointed lieutenant-general of an army of 3,000 men, and succeeded in arresting the progress of the insurgents, a ser-

vice for which he was created a marquis. In 1643 he defeated the rebels under Preston; and was shortly after appointed lord-lieutenant of Ireland. When the royal cause was altogether ruined, he went to France; but after the death of Charles I. returned to Ireland. Here, however, his efforts to rouse the people were at this time unavailing; and when Cromwell landed, the marquis re-embarked for France. At the Restoration he was raised to an Irish dukedom, and appointed lord-lieutenant of Ireland; but, for his attachment to lord Clarendon, incurred the displeasure of the court, and was deprived of his office. In 1670 the infamous colonel Blood, whom he had imprisoned in Ireland, attempted to seize his person, and hang him at Tyburn. He was for this purpose actually taken out of his carriage, gagged, and placed behind a powerful horseman; but the duke, by his personal exertions, threw himself and the villain off the horse, and obtained assistance. At the desire of the king, he afterwards consented to forgive Blood, saying, 'that if his majesty could pardon him for attempting to steal the crown, he might easily do so for an attempt upon his life.' He was at length again appointed to the vice-royalty of Ireland, and in 1682 advanced to an English dukedom. He died at Kingston-hall, in Dorsetshire, in 1688, and was buried in Westminster-abbey.

BUTLER (Thomas), earl of Ossory, son of the above, was born in Kilkenny in 1634. He behaved nobly in the rebellion, and in 1666 was summoned to the house of peers by the title of lord Butler, of Moore Park. He bore a gallant part in the great engagement with the Dutch fleet, and in 1673 was made full admiral. In 1677 he commanded the English troops in the service of the prince of Orange, at the battle of Mons, and died in 1680, when his father said, that 'he would not exchange his dead son for any living son in Christendom.'

BUTLER was the name anciently given to an officer in the court of France, similar to that of the *ci-devant grand echanson*, or great cup-bearer; which was abolished with the other appendages of royalty.

BUTLERS, buticulari, among the Normans, denote wine-tasters, appointed to examine liquors, and see that they be right and legal.

BUTLERAGE is a duty of 2s. for every ton of wine imported by merchants strangers; being a composition in lieu of the liberties and freedoms granted to them by king John and Edward I., by a charter called *charta mercatoria*. Butlerage was originally the only custom that was payable upon the importation of wines, and was taken by virtue of the regal prerogative for the proper use of the crown. But for many years past, parliament having granted subsidies to the kings of England, and the duty of butlerage not repealed, but confirmed, they have granted it away to some nobleman, who, by virtue of such grant, is to enjoy the full benefit thereof, and may cause it to be collected in the same manner that the kings themselves were formerly wont to do.

BUTMENTS of arches are the same with buttresses. They answer to what the Romans called *sublicas*: the French *entrees* and *butees*

BUTMENTS, or abutments, of a bridge, denote the two masses at the end of a bridge, whereby the two extreme arches are sustained and joined with the shore on either side.

BUTOMUS, the flowering rush, or water gladiolus; a genus of the hexagynia order, and enneandria class of plants; natural order fifth, tripetaloidæ: CAL. none; petals six, and as many monospermous capsules. There is but one species, viz. *B. umbellatus*; of which there are two varieties, the one with a white, the other with a rose-colored, flower.

BUTRINTO, a port town of Epirus, in Turkey in Europe, situated opposite to the island of Corfu, at the entrance of the gulph of Venice. Thirty miles south of Chimera.

BUTT, *v. & n.* Teut. *butten*, to push out; but Swed. *bockta*, is from Goth. *bockta*, to strike like a buck goat; thus it signifies to push, to thrust, to strike with the head. Thus the noun is from *botta*; Ital. and Fr. *botte*; which means a stroke or thrust in fencing. Thus likewise the mark for archers is now called a butt; and a person on whom others break their jests, or thrust the darts of their wit, is called a butt; so is likewise any object against which an attack is directed.

Be not afraid though you do see me weaponed;
Here is my journey's end, here is my *butt*,
The very sea-mark of my journey's end. *Shakspeare.*

The papists were the most common-place, and the *butt* against whom all the arrows were directed.

Clarendon.

'Virtue, and social love,' he said,
And honour from the land were fled,
The patriots now, like other folks,
Were made the *butt* of vulgar jokes.'

E. Moore. The Trial of Selim.

Nor wars are seen,
Unless upon the green,

Two harmless lambs are *butting* one the other.

Wotton.

A snow-white steer, before thy altar led,
Butts with his threatening bows, and bellowing stands.

Dryden's Æneid.

A ram will *butt* with his head though he be brought up tame, and never saw that manner of fighting. *Ray.*
I played a sentence or two at my *butt*, which I thought very smart, when my ill genius suggested to him such a reply as got all the laughter on his side.

Spectator.

And idly *butting* feigns

His rival gored in every knotty trunk. *Thomson.*

BUTTER, *n. s.* Sax. *butter*. A vessel; a barrel containing one hundred and twenty-six gallons of wine; a butt contains one hundred and eight gallons of beer; and from fifteen to twenty-two hundred weight is a butt of currants.

I escaped upon a *butt* of sack, which the sailors heaved overboard.

Shakspeare.

BUTTER, *v. & n.* *Бутровъ*; Lat. *butyrum*; Sax. *buttere*; Bel. *butter*; Teut. *butter*. An oily substance procured from milk, properly of cows. To *butter* is to spread this substance over any thing, to make it palatable as food; or to lubricate and soften what is dry and hard. To *but-*

ter is metaphorically used to express flattery, on account of its softness and insinuating character. *Butterfly* is so called because of its buttery softness, says Junius; because of its comparative magnitude among the different species of winged insects, say I. *Butter* signifies large; thus *butterfly* is large fly. Johnson says it is so called because it first appears in the beginning of the season for butter.

And he took *butter* and milk, and the calf which he had dressed, and set before them. *Genesis* xviii. 8.

And so befell, that as he cast his eye

Among the wortes on a *butterfly*,

He was ware of this fox that lay full low.

Chaucer's Canterbury Tales.

Emongst these leaves she made a *butterfly*,

With excellent device and wondrous slight,

Fluttering among the olives wantonly,

That seemed to live, so like it was in sight;

The velvet nap which on his wings doth lie,

The silken downe with which his backe is dight,

His broad outstretched homes, his hayrie thies,

His glorious colours, and his glistering eies.

Spenser's Muirpotmos.

With an old *buttery* hatch, worn quite off the hooks,
And an old kitchen that maintained half a dozen old cooks.

Old Song.

Tongue, I must put you into a *butterwoman's* mouth,
and buy myself another of Bajazet's mule, if you prattle me into these perils.

Shakspeare.

'Twas her brother, that, in pure kindness to his horse, *battered* his hay.

Id.

Tell old tales and laugh

At gilded *butterflies*; and hear poor rogues

Talk of court news, *Id.*

Go, sirrah, take them to the *buttery*,

And give them friendly welcome every one. *Id.*

Words *butter* no parsnips. *L'Estrange.*

That which seems to be a powder upon the wings of a *butterfly*, is an innumerable company of extreme small feathers, not to be discerned without a microscope.

Greuv.

Milk, and all that comes of milk, as *butter* and cheese, curds, &c. increase melancholy (why only excepted, which is most wholesome).

Burton's Anatomy of Melancholy.

Nothing more convertible into hot cholerick humours than its *buttery* parts.

Harvey.

A young man, fallen into an ulcerous consumption, devoted himself to *buttermilk*, by which sole diet he recovered.

Id.

A *butterprint*, in which were engraven figures of all sorts and sizes, applied to the lump of butter, left on it the figure.

Locke.

Let weeds, instead of *butterflowers*, appear;

And meads, instead of daisies, hemlock bear; *Gay.*

And what's a *butterfly*? at best

He's but a caterpillar drest. *Id. Fables.*

On life's gay stage, one inch above the grave,

The proud run up and down in quest of eyes:

The sensual, in pursuit of something worse,

The grave of gold, the politic of power;

And all, of other *butterflies*, as vain.

Young's Night Thoughts.

BUTTER, in chemistry, is a name given to several preparations, on account of their consistence resembling that of butter; as butter of antimony, &c.

BUTTER.—Butter appears to have been long unknown to the ancient Greeks. Their poets make no mention of it, though they frequently speak of milk and cheese. The Romans used

butter no otherwise than as a medicine, never as food. The ancient Christians of Egypt burnt butter in their lamps instead of oil; and in the Roman churches, it was anciently allowed, during Christmas time, to burn butter instead of oil, on account of the great consumption of it otherwise.

Butter is the fat, oily, and inflammable part of the milk; a kind of oil is naturally distributed through all the substance of the milk in very small particles, which are interposed betwixt the caseous and serous parts, amongst which it is suspended by a slight adhesion, but without being dissolved. It is in the same state in which oil is in emulsions; hence the same whiteness of milk and emulsions; and hence, by rest, the oily parts separate from both these liquors to the surface, and form a cream. See EMULSION. When butter is in the state of cream, its proper oily parts are not yet sufficiently united together to form an homogeneous mass. They are still half separated by the interposition of a pretty large quantity of serous and caseous particles. The butter is completely formed by pressing out these heterogeneous parts by means of continued percussion. It then becomes a uniform mass.

Butter melts with a weak heat, and none of its principles are disengaged by the heat of boiling water, which proves that the oily part is of the nature of the fat, fixed, and mild oils obtained from many vegetable substances by expression. See OILS. The half fluid consistence of butter, as of most other concrete oily matters, is thought to be owing to a considerable quantity of acid united with the oily part; which acid is so well combined, that it is not perceptible while the butter is fresh and has undergone no change; but when it grows old, and undergoes some kind of fermentation, then the acid is disengaged more and more; and this is the cause that butter, like oils of the same kind, becomes rancid by age.

In making butter, when the cream has been churned, open the churn, and with both hands gather it well together, take it out of the butter-milk, and lay it into a very clean bowl, or earthen pan; and if the butter be designed to be used sweet, fill the pan with clear water, and work the butter in it to and fro, till it is brought to a firm consistence of itself, without any moisture. When this has been done, it must be scotched and sliced over with the point of a knife, every way, as thick as possible, in order to fetch out the smallest hair, mote, bit of rag, strainer, or any other thing that may have happened to fall into it. Then spread it thin in a bowl, and work it well together, with a proper quantity of salt, and make it up into dishes, pounds, half pounds, &c. The following directions concerning the making and management of butter, including the Epping method, are extracted from the third volume of the Bath Society Papers. In general it is to be observed, that the greater the quantity made from a few cows, the greater will be the farmer's profit; therefore he should never keep any but what are esteemed good milkers. A bad cow will be equally expensive in keeping. When good ones are obtained, a careful servant should be employed to milk them; as, through the neglect

and mismanagement of servants, it frequently happens that the best cows are spoiled. A farmer should himself often see that the cows are milked clean; for if any milk is suffered to remain in the udder, the cow will daily give less, till at length she will become dry before the proper time, and the next season will scarcely give milk sufficient to pay for keeping her. It sometimes happens that some of a cow's teats may be scratched or wounded so as to produce foul or corrupted milk; when this is the case, we should by no means mix it with the sweet milk, but give it to the pigs; and that which is conveyed to the dairy-house should remain in the pail till it is nearly cool, before it be strained, that is, if the weather be warm; but in frosty weather it should be immediately strained, and a small quantity of boiling water may be mixed with it, which will cause it to produce cream in abundance, and the more so if the pans or vats have a large surface. During the hot summer months, it is proper to rise with or before the sun, that the cream may be skimmed from the milk ere the dairy becomes warm; nor should the milk at that season stand longer in the vats, &c. than twenty-four hours, nor be skimmed in the evening till after sun-set. In winter, milk may remain unskimmed for thirty-six or forty-eight hours; the cream should be deposited in a deep pan, which should be kept during the summer in the coolest part of the dairy; or in a cool cellar where a free air is admitted, which is still better. Where people have not an opportunity of churning every other day, they should shift the cream daily into clean pans, which will keep it cool, but they should never fail to churn at least twice in the week in hot weather; and this work should be done in a morning before the sun appears, taking care to fix the churn where there is a great draught of air. If a pump churn be to be used, it may be plunged a foot deep into a tub of cold water, and should remain there during the whole time of churning, which will very much harden the butter. A strong rancid flavor will be given to butter, if we churn so near the fire as to heat the wood in winter. After the butter is churned, it should be immediately washed in many different waters till it is perfectly cleansed from the milk; but here it must be remarked, that a warm hand will soften it, and make it appear greasy, so that it will be impossible to obtain the best price for it. The cheesemongers use two pieces of wood for their butter; and if those who have a very hot hand were to have such, they might work the butter so as to make it more saleable. The Epping butter is made up into long rolls, weighing a pound each; in the county of Somerset they dish it in half pounds for sale; but if they forget to rub salt round the inside of the dish, it will be difficult to work it so as to make it appear handsome. Butter will require and endure more working in winter than in summer; but it is remarked, that no person whose hand is warm by nature makes good butter. Those who use a pump churn must endeavour to keep a regular stroke; nor should they admit any person to assist them, except they keep nearly the same stroke: for if they churn more slowly, the butter will in winter go back, as it is called; and if the stroke

be more quick and violent in the summer, it will cause a fermentation, by which means the butter will imbibe a very disagreeable flavor. Where people keep many cows, a barrel churn is to be preferred; but if this be not kept very clean, the bad effects will be discovered in the butter; nor must we forget to shift the situation of the churn when we use it, as the seasons alter, so as to fix it in a warm place in winter, and where there is a free air in summer. In many parts of this kingdom, they color their butter in winter, but this adds nothing to its goodness; and it rarely happens that the farmers in and near Epping use any color, but when they do it is very innocent. They procure some sound carrots, whose juice they express through a sieve, and mix with the cream when it enters the churn, which makes it appear like May butter; nor do they at any time use much salt, though a little is absolutely necessary.—As they make in that country very little cheese, so very little whey butter is made; nor indeed should any person make it, except for present use, as it will not keep more than two days; and the whey will turn to better account to fatten pigs with. The foregoing rules will suffice for making good butter in any country; but, as some people are partial to the west country method, it shall also be described as briefly as possible. 1. They deposit their milk in earthen pans in their dairy-house, and (after they have stood twelve hours in the summer, and double that space in the winter) they remove them to stoves made for that purpose, which stoves are filled with hot embers; on these they remain till bubbles rise, and the cream changes its color, it is then deemed heated enough, and this they call scalded cream; it is afterwards removed steadily to the dairy, where it remains twelve hours more, and it is then skimmed from the milk and put into a tub or churn; if it be put into a tub it is beat well with the hand, and thus they obtain butter; but a cleaner way is to make use of a churn. Some scald it over the fire, but then the smoke is apt to affect it; and in either case, if the pans touch the fire, they will crack or fly, and the milk and cream will be wasted.

The Cambridgeshire salt butter is held in high esteem, and is made nearly after the same method as the Epping; and by washing and working the salt from it the cheesemongers in London often sell it at a high price for fresh butter. They deposit it, when made, into wooden tubs or firkins, which they expose to the air for two or three weeks, and often wash them; but a readier way is to season them with unslacked lime, or a large quantity of salt and water well boiled: with this they must be scrubbed several times, and afterwards thrown into cold water, where they should remain three or four days, or till they are wanted; then they should be again scrubbed, and well rinsed with cold water; but, before they receive the butter, care must be taken to rub every part of the firkin with salt: then, if the butter be properly made, and perfectly sweet, it may be gently pressed into the firkin; but it must be well salted when it is made up, and the salt should be equally distributed through the whole mass, and a good handful of salt must be spread

on the top of the firkin before it is heated, after which the head should be immediately put on. They pursue nearly the same method in Suffolk and Yorkshire; and the butter of these counties is often sold in London for that of Cambridge. No people make more butter from their cows than the Yorkshire farmers do, which is certainly owing to the care they take of them in the winter: at that season they house them all, feed them with good hay, and never suffer them to go out, except to water, but when the weather is very serene; when the cows calve, they give them comfortable malt meshes for two or three days after. These cows never answer if they are removed to other counties, except the same care and attendance be given them, and then none answer better. Land, whereon cows feed, very often affects the butter. If wild garlic, charlock, or may-weed, be found in a pasture ground, cows should not feed therein till after they have been mown, when such pernicious plants will appear no more till the following spring; but those cows that give milk must not partake of the hay, as that, also, will diffuse its bad qualities. Great part of the Epping butter is made from cows that feed during the summer months in Epping forest, where the leaves and shrubby plants contribute greatly to the flavor of the butter. The mountains of Wales, the highlands of Scotland, and the moors, commons, and heaths in England, produce excellent butter where it is properly managed; and though not equal in quantity, yet far superior in quality to that which is produced from the richest meadows: and the land is often blamed when the butter is bad through mismanagement, sluttishness, or inattention. Turnips and rape affect milk and butter, but brewer's grains are sweet and wholesome food, and will make cows give abundance of milk; yet the cream thereon will be thin, except good hay be given at the same time, after every meal of grains. Coleworts and cabbages are also excellent food; and if these and savoy were cultivated for this purpose, the farmers, in general, would find their account in it.

Butter forming an important article of commerce as well as food, the legislature has passed various statutes respecting its package, weight, and sale. The principal of these are the 36th and 38th of Geo. III.

Naturalists speak of showers and dews of a butyraceous substance. In 1675, there fell in Ireland, during the winter and following spring, a thick yellow dew, which had the medicinal properties of butter.

BETTER OF CACAO; an oily white matter, of a firmer consistence than suet, obtained from the cacao nut, of which chocolate is made. The method of separating it consists in bruising the cacao and boiling it in water. The oil contained in the nut is by this means liquefied, and rises to the surface, where it is left to congeal, that it may be the more easily taken off. It is generally mixed with small pieces of the nut, from which it may be purified, by keeping it in fusion without water in a pretty deep vessel, until the several matters have arranged themselves according to their specific gravities. By this treatment it becomes very pure and white. It has no smell,

but a very mild taste, when fresh: and in all its general properties it resembles fat oils, among which, it must, therefore, be classed. It is used as an ingredient in pomatums.

BUTTER-FLOWER, or **BUTTER-CUP**, is a species of crow-foot. See **RANUNCULUS**.

BUTTERFLY. See **PAPILIO**.

BUTTERFLY-FISH, a name given by some to the blennus, or blennius; from a spot in the fin, which resembles those in the wings of some butterflies.

BUTTERFLY-SHELL, in natural history. See **VOLUTA**.

BUTTER-MILK is the milk which remains after the butter is obtained by churning. Butter-milk is esteemed an excellent food, in the spring especially, and is particularly recommended in hectic fevers. Some make curds of butter milk, by pouring into it a quantity of new milk hot.

BUTTER OF ANTIMONY, &c. See **ANTIMONY**, &c.

BUTTER OF STONE, a kind of mineral drug found on the highest mountains, and hardest rocks, of Siberia, being drawn by the heat of the sun, in transudation, from the dry substance of the stones themselves, and adhering to the surface thereof like a sort of calx, which, having received its full coction, is scraped off by the inhabitants under the name of kamine nasta. The Russians ascribe many virtues to it. It is much used for the dysentery and venereal diseases; but its operation is so violent, however corrected by other ingredients, that none but the Russians dare use it.

BUTNERIA, or **BYTNERA**, in botany, a genus of plants; class pentandria; order monogynia; essential character, *cal.* five cleft; *cor.* petals fine, three lobed: at the summit, the middle lobe prolonged into a filiform kind of awn: *cap.* five grained, covered with prickles. There are eight species, all perennial shrubs; and, except *B. herbacea*, which is found in the East Indies, all natives of South America.

BUTTOCK, *n.* The thick of the hip, the rump; from *but*, thick, round; and *hock*, a joint.

This wenche thicke and wel ygrowen was,

With canuse nose, and eyen grey as glas,

With *buttocks* brode. *Chaucer's Canterbury Tales.*

It is like a barber's chair, that fits all *buttocks*.

Shakspeare.

Such as were not able to stay themselves, should be holden up by others of more strength, riding behind them upon the *buttocks* of the horse. *Knolles.*

The tail of a fox was never made for the *buttocks* of an ape. *L'Estrange's Fables.*

BUTTON, *v. & n.* } *Ital.* *bottone*; *Fr.* *bouton*. See **BOSS** and

BUTTONHOLE. } *But.* A knob; a bud;

BUTTONMAKER. } A stud used in dress. It is applied to a handle placed upon anything, and projecting or protruding from it, as a coat-button, a door-button. To button is to fasten by buttoning, or to put buttons upon a garment, &c.

A fayre russet coat the tanner had on,

Fast *buttoned* under his chin,

And under him a good cow-hide,

And a mare of four shilling. *Old Ballad.*

Pray you, undo this *button*.

Shakspeare

The canker galls the infants of the spring,

Too oft before their *buttons* be disclosed. *Id.*

One whose hard heart is *buttoned* up with steel. *Id.*

Let me take you a *buttonhole* lower. *Id.*

I'll please the maids of honour, if I can:

Without black velvet breeches, what is man?

I will my skill in *buttonholes* display,

And brag, how oft I shift me every day. *Bramston.*

We fastened to the marble certain wires, and a *button*. *Boyle.*

I mention those ornaments, because of the simplicity of the shape, want of ornaments, *buttons*, loops, gold and silver lace, they must have been cheaper than ours. *Arbutnot.*

An honest man, close *buttoned* to the chin,

Broad cloth without and a warm heart within. *Cowper.*

In prologues, prefaces, be flat!

A silver *button* spoils your hat.

Garrick's Prologues.

BUTTON, in chemistry, signifies the metal which is collected in a roundish mass at the bottom of a crucible after fusion, or which remains in the cupels after cupellation; more generally called a bead.

BUTTONS, as an article of dress, are not only important to an honest man in cold weather (in the extract from Cowper), but give employment, as a manufacture, to many thousands of the population of Sheffield, Birmingham, and other large towns. Attention has, of course, been directed to the improvement of this manufacture by machinery, &c. in modern times.

Buttons are made of bone, horn, or wood, used plain, or covered with hair, cloth, thread, silk, &c.; but, of late, more commonly of metal polished, gilt, or plated. Bone or horn buttons sometimes are made with fixed shanks, and sometimes with holes, for the purpose of being sewed to the garment. The latter are called sailors' buttons, and the surface is concave in front, to preserve the thread by which they are sewed from wearing. They are made from cow-hoofs, by a process of pressing them into heated iron moulds. The hoofs, having been boiled in water till they are soft, are cut into parallel slips by a cutting knife, which is a blade, with a long handle at one end, and jointed to the bench by a hook and eye at the other. It then acts like a lever in cutting the horn placed beneath its edge. The slips being the width of the diameter of the intended button, are cross cut into small squares; and the angles of these being cut off, octagonal pieces are left nearly the size of the intended buttons. They are dyed black, by dipping them into a cauldron of water of logwood and copperas mixed. Being dried they are pressed between moulds, or pincers, represented in our plate, **BUTTON-MAKING**, fig. 3. Each plate, *a, a*, has six, eight, or ten, small steel dies fastened to it, each containing the impression of the intended buttons embossed in it. When shut, these impressions correspond. The two claws, *c, c*, enter corresponding cavities in the opposite plate, and insure them coming accurately together. The presser, being provided with a great number of different moulds, arranges them in an oven or furnace, till they become heated somewhat above boiling water. A piece of horn is then placed

BUTTON MAKING.

Fig. 1.

Fig. 2.

Fig. 3.

Fig. 4.

upon each impression in the mould, which is shut close, and the mould is placed in a small screw press fixed to the work bench, which holds the moulds shut together for a few minutes, till the horn is warmed and softened by being between them; and the business is finally completed by means of a pressing vice: the fashes, or edges, being clipped off by shears, are then filed smooth and round in a lathe.

Sailor's buttons have the holes (generally four) drilled in them by means of a lathe, the upper part of which is represented in fig. 2. *a, a, a, a*, are four spindles, all turning together by a common foot-wheel, like a grind-stone, by means of two straps, *e, f*, each of which turns two spindles. At the end of the spindles, is a hook, uniting them with four other spindles, *b, b*, which are supported by passing through holes in a metal standard, *A*; and their points projecting beyond this, are formed into small drills. The spindles, *A*, are placed at some distance asunder, to admit the pulleys for the straps; but the hooks acting as universal joints, allow the ends of the drills, *b*, to come very near. The button is placed in a concave rest, *B*, and thrust against the drills by a piece of wood. The standard *A* can be changed for another with more distant holes, to suit larger buttons; and the rest, *B*, can be elevated or depressed for the same purpose. Ornaments are often formed on the surface of plain horn buttons by means of a thin brass plate, out of which the pattern is cut. The plate is applied to the surface of the button, and the uncovered parts of the surface, being rubbed with emery powder, present a rough appearance, while those which are protected by the brass have a fine black polish.

Large buttons are first made from pieces of bone, and the smaller ones cut, afterwards, from the spaces left between the first; so that the materials are made to yield the utmost; and the remains are sold to farmers for manure, to the makers of hartshorn, cutlers, &c. Various hard woods are cut into large buttons in the same manner, and afterwards dyed black in an infusion of sulphate of iron and gall nuts. Oak, beech, or elder, are chiefly used in this country.

Buttons intended to be covered with cloth, silk, &c. are called also moulds. They are made from the refuse chips of bone, sawn into thin flakes, and perforated in the centre by two operations, illustrated in fig. 1. One end of the spindle *D*, has a tool *b*, screwed into, and moving along with it. The other end of the spindle is connected by a peculiar kind of joint, with a lever *e, f*, whose fulcrum is *c*; the other end *f*, being connected with a second lever and handle *g*, which the operator holds in his left hand. The right hand is employed in holding the flake of bone *d* opposite the tool *b*, against a piece of wood firmly fixed into the iron standard *E* by two screws; then, by drawing the handle *g* forwards, the tool *b* being at the same time in rapid motion by the foot wheel, with which *c* is connected; its centre *p*, is pressed against the bone, and drills a hole through in the centre of the intended button; while its two other points describe a deep circle in the bone, about half through its thickness. The flat surface is cut smooth by the intermediate parts of the tool.

The piece is now moved a small distance, to cut out another button from a fresh part; and when as many as the flake of bone will contain are thus cut half through, the other side is presented to the tool. The point *k* is inserted into the hole made from the other side by the former operation. The other two teeth of the tool now cut another deep circle, exactly opposite the former, at the same time cutting the flat surface smooth. By this means the bone is cut through, and a button mould left sticking on the point of the tool. By drawing back the handle *g*, the tool recedes, and the button meeting a fixed piece of iron plate, is forced off the tool, and falls into a small box *F*, completely finished. So rapid are these operations, that a girl of ten or twelve years of age will cut out in one minute, twenty-five or thirty buttons. Moulds are chiefly used at present sewn up in a piece of the same cloth with the garment for which they are designed. They were formerly covered by women, &c. with the most costly materials. Each had a large needle fixed in the table opposite the part where she was seated, and a bobbin, containing the thread to cover the button. The mould was stuck by the hole in its centre upon the needle, and the end of a thread of silk, mohair, and sometimes gold thread, put through the centre at the same time, to fasten one end; the thread was then wound about the button mould to cover it, and give such an ornamental surface as fashion dictated. Some manufactured silk buttons are still used. These are not finished until the superfluous hairs and hubs of silk are taken off, which is done in the following manner: a quantity are put into a kind of iron sieve, called by workmen a singeing box. Then a little spirit of wine being poured into a shallow iron dish, and set on fire, the workman moves and shakes the singeing box, containing the buttons, over the flame of the spirit, by which the superfluous hairs, hubs of silk, &c. are burnt off, without damaging them. Great care, however, must be taken that the buttons in the singeing box be kept continually in motion; for if they are suffered to rest over the flame, they will immediately burn. When all these loose hairs, &c. are burnt off by the flame of the spirit, the buttons are taken out of the singeing box, and put, with a proper quantity of the crumbs of bread, into a leather bag, about three feet long, and of a conical shape: the mouth or smaller end of which being tied up, the workman takes one of the ends in one hand and the other in the other, and shakes the hand briskly with a particular jerk. This operation finally cleanses the buttons, and renders them very glossy.

The basis of metal buttons is generally an inferior kind of brass, pewter, or other composition: the shanks made of brass or iron wire are a distinct manufacture; but the buttons are cast round the shank in the following manner. The workmen have a metal pattern consisting of a great number, say from four to twelve dozen of buttons, connected in one plane by very small bars. An impression from this pattern being taken in sand, the shanks are pressed into it, each in the centre of one impression; the part which is to enter the button top being made to

project a little above the surface of the sand. The whole surface of it is now covered with the fused metal, to which sometimes a portion of zinc is added, for the purpose of making it flow freely, and producing a sharp impression. The metal being cooled, the buttons are taken from the moulds, cleaned from the sand by brushing, and are ready for the lathe, where the edges are filed round and smoothed. A person is then employed in smoothing the back of the button and turning the projecting part of the shank. This operation is also performed in the lathe, as well as that of smoothing the face of the button.

The next operation, polishing, is generally performed by women. The shank of the button being secured, the face is rubbed on a board covered with leather, and spread with powder of rotten-stone; in a second polishing a finer powder is employed; and the last polish is given by holding the button lightly to a circular board, which is covered with soft leather spread over with still finer powder of the same materials. The board is moved by the lathe.

The last operation is boiling or washing, for the purpose of communicating a purer white to the surface. This is performed by boiling a quantity of granulated tin in a solution of cream of tartar. A portion of the tin being dissolved, and the buttons arranged on a grating of wire, being immersed in the solution, their surface is covered with a thin layer or wash of the metal, which improves their whiteness without affecting the polish.

Plated buttons are cut by a fly-press, at the flattening-mill, out of copper plate, covered on one side with silver. The copper side is placed upwards in stamping it out, and the die or hole through which they are stamped, is rather chamfered at its edge, to make the silver turn over the edge. These pieces are called blanks, and they are now introduced into a furnace to undergo the annealing process, which fits them for that of stamping. This is done by a machine very similar to the common pile-driver. The striking part, which is from one to two hundred weight, carries the die on its lower surface, and the plate or button is fixed beneath it. It is raised by means of a pulley and rope, which the workman moves partly with his hands and partly with one foot, placed in a stirrup. In this manner it is drawn up with a sudden dexterous jerk; and, when it is sufficiently elevated, let go as suddenly. When any impression is to be given to a plated button, after the shank has been attached, the latter is introduced into a cavity, formed by two pieces of steel, which, when united together, form a cone, and the top is convex, to correspond with the concave back of the button.

The soldering on of the shank is performed on each button separately by means of the flame of a lamp and a blow-pipe. Silver solder is generally employed. For plain plated buttons, the next operation is to smooth the edges with a file in the lathe. To clean the backs, the buttons are dipped in acid; and to whiten them they are boiled in cream-of-tartar and silver. The backs are then brushed clean as they revolve in the lathe, when they are ready for burnishing. This

is also performed in the lathe: the blood-stone or burnishing substance being an ore of iron, fixed in the handle; and frequently dipped in water. To render the polish still more perfect, a stone of finer quality is afterwards employed, and this finishes the button.

Gilt buttons are stamped from copper, with sometimes an alloy of zinc, and laminated in the flattening mill and stamped, after the manner of the plated button. The stamping rendering the face slightly convex prevents the buttons from sticking together in gilding. But the soldering of the shanks is managed in a different manner from that of the plated buttons. Each blank is furnished with a small spring, like a pair of tweezers, which holds the shank down upon it in the proper place. A small portion of spelter and borax, mixed with water, is now placed round each shank, and ten or twelve dozen of buttons being thus prepared, are placed on a flat iron plate, which is placed in an oven of temperature sufficient to fuse the solder; when this is accomplished they are withdrawn, and while yet warm, are thrown into a liquor which is called the pickle, and is composed of water with the addition of aqua-fortis, or weak nitric acid. The action of the acid makes the surface black, and the edges of the buttons are then filed and smoothed in a lathe. They are then dipped in a second pickle more diluted with water, by which the surface is cleaned, and, after being burnished in the lathe, are ready for the process of gilding.

Five grains of gold are fixed by act of parliament as the legal quantity for gilding twelve dozen of buttons of one inch diameter. It is put into an iron ladle with a small quantity of quicksilver, and exposed to heat till the metals are united. The buttons are then placed with the amalgam of gold and mercury in an earthen pan, together with as much aqua-fortis as will moisten the whole, and the mixture is stirred with a brush until they are completely whitened: this is called the quickening of them. An operation now succeeds called drying off, or separating the mercury from the gold, and fixing the latter on the buttons. This is accomplished by shaking them over a fire in a flat iron pan until the mercury appears to melt. The buttons are now thrown into a felt cap, and stirred about with a brush, that the amalgam may be equally spread over their surface, and, while it is at that temperature which renders the mercury nearly volatile, the buttons are returned to the pan, the increased heat drives off the mercury in a state of vapor, and the gold begins to appear distinctly. This process is repeated, and, if any white spots should remain, the buttons are put into a cylindrical copper box with a lid, and turned round on a charcoal fire to heat all the parts equally, until the remaining mercury is separated. The buttons now have only to be burnished by the same operation as has been described in respect to finishing plated buttons. In some cases they are double and treble gilt.

Sometimes gilt buttons are milled on the edge like coin, and the machine employed is similar to that which is used for milling coin. The milling tool is a small steel roller, on the circumference

of which the pattern required is cut: the operation is performed in the lathe, and the instrument is held in a side rest, that circles of the same diameter may be formed on all the buttons.

The process of gilding buttons, or the drying off, being, from the vapor of the mercury, exceedingly dangerous to the operator, an apparatus, fig. 4, has been employed with success, by Mr. Mark Sanders, an eminent button manufacturer at Birmingham, for drying off buttons, and at the same time preserving the mercury evaporated in the process. It is thus described in the *Philosophical Magazine*, vol. ix. A hearth, or fire-place, of the usual height, is to be erected; in the middle of which, a place for the fire is to be made; but instead of admitting the smoke to ascend into the top A, made of sheet or cast iron, through which the mercury is volatilised, a flue for that purpose should be conducted backwards to the chimney B. An iron plate, thick enough to contain heat sufficient to volatilise the mercury, is to cover the fire-place at the top of the hearth C. There must be an ash-hole D under the fire-place. The dark square space E, seen in the fire-place, is the flue which serves to carry the smoke back under the hearth into the chimney B. The door of the fire-place and the ash-pit, may either be in front or at the end of the hearth at F, which will perhaps less incommode the work people. The space between A and the iron plate C, is covered up with a glass window, coming down so low as only to leave sufficient room for moving the pan backwards and forwards with facility. If the sides were also glass instead of brick-work it would be still better, as the work people would be able to have a full view of their work without being exposed to the fumes of the mercury, which when volatilised, by heat communicated to the pan by the heated iron plate over the fire-place, ascends into the top A, appropriated for its reception, and descends into the tub G, covered at top, and filled pretty high with water. By this means the hearth would in fact become a distilling apparatus for condensing and recovering the volatilised mercury. In the tub G the principal part would be recovered; for, of what may still pass on, a part would be condensed in ascending the tube H, and fall back, while the remainder would be effectually caught in the tube or cask I, open at the top and partly filled with water. The latter tub should be on the outside of the building, and the descending branch of the tube H should go down into it at least eighteen inches, but not into the water. The chimney or ash-pit should be furnished with a damper to regulate the heat of the fire. The water may be occasionally drawn out of the tube by a siphon; and the mercury, clogged with heterogeneous matter, may be triturated in a piece of flannel till it passes through, or placed in a pan of sheet iron, like a dripping-pan, in a sufficient degree of heat, and having such an inclination that the mercury, as it gets warm, may run down and unite in the lower part of the pan. But the mercury will be most effectually recovered by exposing the residuum left in the flannel bag to distillation, in a retort made of iron or earthenware.

BUTTON-SHANKS are generally made from

brass or iron wire bent, and are cut by these means: The wire being wound spirally round a piece of steel bar, A in the diagram. The coil B

thus formed is slipped off, and a wire-fork C put into it. It is now laid upon an anvil, and by a punch the coil is beat down between the two branches of the fork C, so as to be in the state D. The punch has an edge which marks the middle d, and the coil being cut open by a pair of shears along this mark, each turn of the coil is divided into two perfect button-shanks.

An ingenious improvement on this, however, is said to have been lately introduced at Birmingham. A machine is contrived that, merely by turning a winch, supplies itself with wire from a reel, and, after performing the different operations of cutting and bending to the proper form, delivers the shank completely finished. One shank is formed at each turn of the winch, and the power required to set it in motion is so small, that the strength of a boy is sufficient. The inventor, however, employs a small steam-engine as his moving power, and in this way can produce these articles at a very trifling advance upon the cost of the wire.

BUTTON, in fencing, signifies the tip of a foil, made roundish, and usually covered with leather, to prevent contusions or wounds.

BUTTON, in the menage, the button of the reins of a bridle, is a ring of leather, with the reins passed through it, which runs all along the length of the reins. To put a horse under the button, is when a horse is stopped without a rider upon his back, the reins being laid on his neck, and the button lowered so far down that the reins bring in the horse's head, and fix it to the true posture or carriage. Not only the horses managed in the hand must be put under the button; but the same method must be taken with such horses as are bred between two pillars, before they are backed.

BUTTON-STONE, in natural history, a kind of figured stone, so denominated from its resembling the button of a garment. Dr. Hook gives the figure of three sorts of button-stones, which seem to have been nothing else but the filling up of three sorts of shells. They are all very hard flints; and have this in common, that they consist of two bodies, which seem to have been the filling up of two holes or vents in the shell. Dr. Plot describes a species finely striated from the top, after the manner of some lark-buttons. This name is also given to a peculiar species of slate found in the marquisate of Bareuth, in a mountain called Fichtelberg; which is extremely different from the common sorts of slate, in that it runs with great ease into glass in five or six hours, without the addition of any salt or other foreign substance, to promote its vitrification. It contains in itself all the principles of glass, and really has mixed in its substance the things

necessary to be added to promote the fusion of other stony bodies. The Swedes and Germans make buttons of the glass produced from it, which is very black and shining, and it has hence its name button-stone. They make several other things, also, of this glass, as the handles of knives and the like, and send a large quantity of it unwrought in round cakes, as it cools from the fusion, into Holland.

BUTTRESS, *v.* } Sax. *butereis*, from *but*,
 BUTTRESS, *n.* } external, and Goth. *reisa*,
 to raise; prop, or support; to *buttress* is,
 therefore, to prop up a building, or any object,
 that requires support, by external means.

No jutting frize

Buttress, nor coigne of vantage, but this bird

Hath made his pendant bed, and procreant cradle.
Shakspeare.

But we inhabit a weak city here,

Which *buttresses* and props but scarcely bear.

Dryden.

It will concern us to examine the force of this plea, which our adversaries are still setting up against us, as the ground pillar and *buttress* of the good old cause of nonconformity.

South.

If ancient fabries nod, and threat to fall,

To patch their flaws, and *buttress* up the wall,

Thus far 'tis duty: but here fix the mark,

For all beyond it is to touch the ark. *Roscommon.*

Then another question arises, whether this house stands firm upon its ancient foundations, and is not, by time and accidents, so declined from its perpendicular as to want the hand of the wise and experienced architects of the day to set it upright again, and to prop and *buttress* it up for duration. *Burke.*
Reform of Representation in the House of Commons.

BUTTRESS is a kind of butment built archways, or a mass of stone or brick, serving to prop or support the sides of a building, wall, &c. on the outside, where it is either very high, or has any considerable load to sustain on the other side, as a bank of earth, &c. Buttresses are used against the angles of steeples, and other buildings of stone, &c. on the outside, and along the walls of such buildings as have great and heavy roofs, which would be subject to thrust the walls out, unless very thick, if no buttresses were placed against them. They are also placed for a buttment against the feet of some arches, that are turned across great halls in old palaces, abbeys, &c.

BUTUS, or BUTO, in ancient geography, a town of Lower Egypt, on the west side of the branch of the Nile, called Thermuthiacus: towards the mouth called Ostium Sebennyticum. In this town stood an oracle of Latona. Ptolemy places Butus in the Nomos Phthenotes. It had temples of Apollo and Diana, but the largest was that of Latona, where the oracle stood.

BUTYRIC ACID. Chevreul states, that butter is composed of two fat bodies, analogous to those of hog's lard, of a coloring principle, and an odorous one, which gives it that distinguishing principle by which it differs from mere fats. To this principle he has given the name of butyric acid, which, like other acids, unites with earths and metals, and thus forms salts; 100 parts, we are told by Chevreul, neutralise a quantity of base, which contains about ten of oxygen; but he does not mention the process by

which this acid is best separated from the other principles of butter.

BUTZBACH, a town of Germany, in the grand duchy of Hesse. It contains 3100 inhabitants, a great number of whom are employed in the manufactory of linen and woollen stuffs, worsted stockings, and shoes. Seven miles S. S. W. of Giessen.

BUXAR, a town and fortress of Hindostan, province of Bahar; situated on the south bank of the Ganges, and celebrated for the victory gained in its vicinity in 1764, by the British, over the united armies of the nabob Shuja ad Dowleh, and Cossim Aly Khan. Long. 83° 58' E., lat. 25° 35' N.

BUXBAUMIA, in botany, a genus of the order musci, and cryptogamia class of plants; ovate capsule, gibbous on one side at the base; fringe double; outer of sixteen short truncate teeth; inner a plated membrane. Species, two only; one, *B. foliosa*, a native of our own country.

BUXENTUM, or PYXUS, a town of Lucania, first built by the people of Messina, but afterwards deserted. A Roman colony was sent thither, and when found still thin of inhabitants, a new colony was sent by a decree of the senate. Its name is from *buxus*, the box tree, growing plentifully there. Strabo says, the name Pyxus includes a promontory, port, and river, under one. It is now called Policastro.

BUX'OM, } Goth. *bugsam*; Sax. *bug-*
 BUX'OMLY, } sum; easily bended or bowed
 BUX'OMNESS. } to the will of another; obe-
 dient, jolly, good humored, wanton.

----- my dear wif! I thee b-seke
 As be to every wight *buxom* and neke;
 And for to kepe our good be curious;
 And honestly governe wel our hous

Chaucer's Canterbury Tales.

For many han unto mischiefe fall,
 And ben of ravenous wolves yrent,
 And for they would be *buxome* and bent.

Spenser.

It was from a cellar this archer did play,
 Where a *buxom* young damsel continually lay;
 Her eyes shone so bright when she rose every day,
 That she shot the poor cobbler quite over the way.

Old Song.

I'm born

Again a fresh child of the *buxom* morn,
 Heir of the sun's first beams.

Crashaw.

Zephyr, with Aurora playing,
 As he met her once a maying,
 Fill'd her with thee, a daughter fair,
 So *buxom*, blithe, and debonnaire.

Milton.

He, with broad sails,

Winnow'd the *buxom* air.

Id.

Almighty Jove descends, and pours

Into his *buxom* bride his fruitful showers.

Dryden.

She feign'd the rights of Bacchus! cried aloud,
 And to the *buxom* god the virgin vowed.

Id.

Lord! cries a *buxom* widow, loud and strong,
 He's quite a boy! to play that part is wrong.

Garrick's Prologues.

BUXTON, a town in the Peak of Derby, celebrated for its medicinal waters; from the resort to which, this place has grown into a considerable town. The houses are chiefly, or rather solely, built for the reception of invalids;

and many of them are not only commodious, but elegant. The duke of Devonshire has erected a most magnificent building in the form of a crescent, with piazzas, under which the company walk in wet or cold weather. It is divided into different hotels, shops, &c. with a public coffee-room, and a very elegant room for assemblies and concerts; and has twenty-nine windows in length on each floor, besides five at each end. There are stables on the back of this building, of an octagonal form on the outside, and circular within the yard, where there is a riding-house. The principal trade is the cotton manufacture. It lies in an open healthy country, twenty-three miles from Manchester, thirty-two north-west of Derby, and 160 N.N.W. of London.

It is asserted by antiquaries, that the Romans were well acquainted with the wells of Buxton, as there is a military way still visible, called the Bath-gate, seven miles long, from Burgh to this place. When, about a century ago, Sir Thomas Delves, of Cheshire, caused a monument to be erected in memory of a cure he received here, the workmen in digging for the foundations, came to the remains of a solid and magnificent Roman structure; in other places of the neighbourhood very capacious leaden vessels, and other utensils, of Roman workmanship, have also been discovered. These waters are mentioned by Leland as well known above 200 years ago. They were brought into great credit, by a Dr. Jones, in 1572, and by George Earl of Shrewsbury, who erected a building over the bath, then composed of nine springs. The warm waters are the bath, consisting of nine springs, St. Ann's well, and St. Peter's or Bingham well. St. Ann's well rises at the distance of somewhat more than thirty-two yards north-east from the bath. It is chiefly supplied from a spring on the north side, 'out of a rock of black limestone, or bastard marble. It formerly rose into a stone basin, shut up within an ancient Roman brick wall, a yard square within, a yard high on three sides, and open on the fourth. But in 1709 Sir Thomas Delves erected an arch over it, twelve feet long and as many broad, set round with stone steps on the inside. In the midst of this dome the water springs up into a stone basin two feet square. St. Peter's or Bingham well rises about twenty yards south-east of St. Ann's. It is also called Leigh's well, from a memorable cure received from it by a gentleman of that name. It rises out of a black limestone, in a very dry ground; and is not so warm as St. Ann's well. The hot water resembles that of Bristol. It has a sweet and pleasant taste. The principal peculiarity in the appearance is a large quantity of elastic vapor, that rises and forms bubbles, which pass through the water, and break as soon as they reach the surface. The air of these bubbles was ascertained by Dr. Pearson to consist of azotic gas, mixed with a small proportion of atmospheric air. Buxton water is frequently employed both internally and externally: one of which methods often proves beneficial, when the other would be injurious; but, as a bath alone, its virtues may not be superior to those of tepid common water. It contains the calcareous earth, together with a small quantity of sea salt, and an

inconsiderable portion of a purging salt, but no iron can be discovered in it. This water taken inwardly is esteemed good in the diabetes, bloody urine, bilious cholice, loss of appetite, coldness of the stomach, inward bleedings, atrophy, contractions of the vessels and limbs, especially from age, cramps and convulsions; dry asthma without fever, and in barrenness. Inwardly and outwardly, it is said to be good in rheumatic and scorbutic complaints, the gout, inflammation of the liver and kidneys, consumptions of the lungs, old strains, hard callous tumors, withered and contracted limbs, the itch, scabs, nodes, chalky swellings, ring worms, and similar complaints. Besides the hot water, there is also a cold chalybeate water, with a rough irony taste: it resembles the Tunbridge water in virtues. For composing artificial Buxton water, or impregnating the original water with a greater quantity of its own or other gases, see **WATERS, MEDICINAL**.

BUXTON (Jedidiah), a prodigy of the last century, with respect to skill in numbers. His father, William Buxton, was schoolmaster of the parish where he was born, in 1704, yet Jedidiah's education was so much neglected that he was never taught to write; and, with respect to any other knowledge but that of numbers, seemed always as ignorant as a boy of ten years of age. How he came first to know the relative proportions of numbers, and their progressive denominations, he did not remember; but he applied the whole force of his mind to them from an early age, and upon them his attention was constantly fixed: so that he frequently took no cognisance of external objects, and when he did, it was only with respect to their numbers. If any space of time was mentioned, he would soon after say it was so many minutes; and if any distance of way, he would assign the number of hairs' breadths, without any question being asked, or any calculation expected by the company. When he once understood a question, he began to work with amazing facility, after his own method, without the use of a pen, pencil, or chalk, or even understanding the common rules of arithmetic as taught in the schools. He would stride over a piece of land or a field, and tell the contents of it almost as exact as if it had been measured by the chain. In this manner he measured the whole lordship of Elinton, of some thousand acres, belonging to Sir John Rhodes, and brought him the contents, not only in acres, roods, and perches, but even in square inches. After this, for his own amusement, he reduced them into square hair breadths, computing forty-eight to each side of the inch. His memory was so great, that while resolving a question, he could leave off, and resume the operation again, where he left off, the next morning, or at a week, a month, or at several months, and proceed regularly till it was completed. His memory would doubtless have been equally retentive with respect to other objects, if he had attended to other objects with equal diligence; but his perpetual application to figures prevented the smallest acquisition of any other knowledge. He was sometimes asked, on his return from church, whether he remembered the text, or any part of the ser-

mon, but it never appeared that he brought away one sentence; his mind, upon a closer examination, being found to have been busied, even during divine service, in his favorite operation, either dividing some time, or some space, into the smallest known parts, or resolving some question that had been given him as a test of his abilities. As this extraordinary person lived in laborious poverty, his life was uniform and obscure. Time, with respect to him, changed nothing but his age; nor did the seasons vary his employment, except that in winter he used a flail, and in summer a ling-hook. In 1754 he came to London, where he was introduced to the Royal Society, who, in order to prove his abilities, asked him several questions in arithmetic, and he gave them such satisfaction, that they dismissed him with a handsome gratuity. In this visit to the metropolis, the only object of his curiosity, except figures, was to see the king and royal family; but they being at Kensington, Jedidiah was disappointed. During his residence in London, he was taken to see King Richard III. performed at Drury-lane theatre; and it was expected, either that the novelty and splendor of the show would have fixed him in astonishment, or kept his imagination in a continual hurry, or that his passions would, in some degree, have been touched by the power of action, if he had not perfectly understood the dialogue. But Jedidiah's mind was employed in the theatre just as it was employed in every other place. During the dance he fixed his attention upon the number of steps; he declared, after a fine piece of music, that the innumerable sounds produced by the instruments had perplexed him beyond measure; and he attended even to Mr. Garrick, only to count the words that he uttered, in which he said he perfectly succeeded. Jedidiah returned to the place of his birth, where, if his enjoyments were few, his wishes did not seem to be greater. He applied to his labor with cheerfulness; he regretted nothing that he left behind him in London; and it continued to be his opinion, that a slice of rusty bacon afforded the most delicious repast.

BUXUS, the box-tree, a genus of the tetrandria order, and monœcia class of plants; natural order, thirty-eighth, tricocœæ. Male CAL. tryphyllous; cor. two-petalled; the germ an embryo, or imperfect rudiment. Female CAL. is tetraphyllous; cor. three-petalled; the capsule is three-beaked and trilobular, with three seeds. There are three species; viz. 1. *B. angustifolia*, the narrow-leaved box; 2. *B. arborescens*, with oval leaves. These two species grow in great plenty upon Box-hill, near Dorking, in Surrey. Here were formerly large trees of that kind; but now they are few in number. The *arborescens*, or large box-tree, is proper to intermix in clumps of evergreens, &c. where it adds to the variety of such plantations; they are a very great ornament to cold and barren soils, where few other things will grow. The leaves possess a very strong nauseous bitter taste, and aperient virtues. They are occasionally exhibited, in form of decoction, amongst the lower orders of people, in cases of dropsy, asthma, and worms. As much as will lie upon a shilling, of the common dwarf box,

dried and powdered, may be given at bed-time, every night, to an infant. Boxwood is extremely hard and smooth, and therefore well adapted to the use of the turner. Combs, mathematical instruments, knife-handles, and button moulds, are made of it. It is also used for wood engravings. It may properly enough be substituted in default of ebony, the yellow alburnum of which it perfectly resembles. Decoction of boxwood has been recommended by some as a powerful sudorific, preferable even to guaiacum; but the taste readily discovers that it wants the qualities of that wood. Neither the wood nor the leaves of the box-tree at present are used for any other medicinal purpose than the distillation of an empyreumatic oil; and an oil of nearly the same quality is obtained from almost every other wood. 3. *B. suffruticosa*, dwarf or Dutch box, commonly used for bordering flower-beds. It is increased by parting the roots, or planting the slips but as it makes a great increase of itself, and easily parts, it is hardly worth while to plant the slips that have no roots. For borders to flower plots, it far excels any other plant; being subject to no injuries from cold or heat. It is of long duration; is easily kept handsome; and, by the firmness of its rooting, keeps the mould in the borders from washing into the gravel walks more effectually than any plant.

BUXTORF (John), a learned philologist, and Hebrew scholar, born in 1564 at Camen, in Westphalia. He became Chaldee and Hebrew professor at Basil, where he died in 1629. His principal works, are 1. *Lexicon Chaldaicum, Talmudicum, et Rabbinicum*, fol. 2. A small Hebrew and Chaldaic Lexicon, 12mo. 3. *The-saurus Linguae Hebraicæ*, 2 vols. 8vo. 4. A Hebrew Bible, with a Rabbinical Commentary, 4 vols. fol. 5. *Synagoga Judaica*. 6. *Institutio Epistolæ Hebraicæ*; 7. *Concordantiæ Hebraicæ*, &c.

BUXTORF (John), son of the former, born at Basil in 1599. He succeeded to his father's professorship; and published a book against Cappelus, entitled *Tractatus de Punctorum Vocalium et Accentuum in Libris Veteris Testamenti Hebraicæ Origine, Antiquitate, et Auctoritate*, 1648. He also compiled a Chaldaic and Syriac Lexicon, and other works. He died in 1664.

BUY, *v.* } Mod. Goth. *buggan*; Sax. byg-
BUY'ING, } gan; Swed. *bygga*; *byta*; Teut.
BUY'ER, } *beuten*; Per. *biutan*; Old Fr. *bi-*
guer; Sans., and Ara. *bicu*; Sax. *bige*, traffic.
To purchase; to procure by giving a price, either money, or an equivalent; opposed to gift, or theft.

The shepherds there robben one another,
And layen baytes to beguile hir brother;
Or they will *buye* his sheepe out of the cote,
Or they will carven the shepheardes throte.

Spenser's Shepheard's Calender.

We loath the very light (some of us, as Seneca notes,) because it comes free; and we are offended with the sun's heat, and those cool blasts, because we *buy* them not.

Burton Anat. Mcl.

I have bought

Golden opinions from all sorts of people. *Shakespeare.*

Pent to linger

But with a grain a day, I would not *buy*
Their mercy at the price of one fair word.

I will *buy* with you, sell with you, talk with you, walk with you, and so following. *Id.*

What pitiful things are power, rhetorick, or riches, when they would terrify, dissuade, or *buy off* conscience! *South.*

In little trades, more cheats and lying

Are used in selling than in *buying*;

But in the great, unjust dealing

Is used in *buying*, than in selling. *Butler.*

Pleasure with praise and danger they would *buy*,
And wish a foe that would not only fly. *Denham.*

Husbands, more covetous than sage,

Condemn this China-*buying* rage. *Gay.*

He has ordered my master to *buy* no more books for me, but says he will *buy* them himself.

Steele. Spectator.

BUZZ, *v. & n.* } Lat. *musso*, from *musca*;

BUZZING, } and Fr. *bourdon* a drone bee.

BUZZER. } A humming noise, like that of bees; a whisper; a murmur; a continued uninterrupted monotonous sound.

And all the chamber filled was with flies
Which *buzzed* all about, and made such sound,
That they encumbered all men's ears and eyes,
Like many swarms of bees assembled round. *Spenser.*

Herewith arose a *buzzing* noise among them, as if it had been the rustling sound of the sea afar off.

Hayward.

There is such confusion in my powers,

As, after some oration fairly spoke

By a beloved prince, there doth appear

Among the *buzzing* multitude. *Shakespeare.*

Where doth the world thrust forth a vanity,

That is not quickly *buzz'd* into his ears? *Id.*

I will *buzz* abroad such prophecies,

That Edward shall be fearful of his life. *Id.*

Did you not hear

A *buzzing* of a separation

Between the king and Catharine? *Id.*

Her brother is in secret come from France,

And wants not *buzzers* to infest his ear

With petulant speeches of his father's death. *Id.*

The hive of a city or kingdom is in best condition when there is least noise or *buzz* in it. *Bacon.*

When every knight and citizen

Kept legislative journeyman,

To bring them in intelligence

From all points of the rabble's sense,

And fill the lobbies of both Houses

With politic important *buzzes*.

Butler's Hudibras.

We join, like flies and wasps, in *buzzing* about wit.

Swift.

Where I found the whole outward room in a *buzz* of politicks. *Addison.*

And here the *buzz* of eager nations ran,

In murmured pity, or loud-roared applause,

As man was slaughtered by his fellow man.

Byron's Child Harold.

BUZZARD; *Per. buz, buz*; *Fr. buzard*; *Lat. bateo*. A species of hawk, Johnson says, mean and degenerate. Hence it is metaphorically applied to a blockhead, or a dunce.

This have I heard oft in saying,—

That man ne maie for no daunting

Make a sperhawk of a *bosarde*.

Chaucer. Romaunt of the Rose.

BUZZARD, in ornithology, the name of several species of the hawk kind. See *FALCO*.

BY. The preposition. *Mæso Goth. bi*; *Swed. and Sax. bi*; *Belg. by*; *Teut. bei*; *Arab. and Per. bi, ba*. Tooke makes it the imperative of

Ang-Sax. beon. This word can only be classified according to the distinctions so judiciously marked out by Dr. Johnson. Change here would not be improvement, but injury.

It notes the agent.

The Moor is with child *by* you, Launcelot.

Shakespeare.

The grammar of a language is sometimes to be carefully studied *by* a grown man.

Locke.

Death 's what the guilty fear, the pious crave,

Sought *by* the wretch, and vanquished *by* the brave.

Garth.

It notes the instrument, and is commonly used after a verb neuter, where *with* would be put after an active; as he killed her *with* a sword; she died *by* a sword.

But *by* Pelides' arms when Hector fell,

He chose Æneas, and he chose as well.

Dryden.

It notes the cause of any effect.

I view, *by* no presumption led,

Your revels of the night.

Parnell.

By woe the soul to daring action steals,

By woe in pliantless patience it excels.

Savage.

It notes the means by which any thing is performed, or obtained.

You must think, if we give you any thing, we hope to gain *by* you.

Shakespeare.

Happier! had it sufficed him to have known

Good *by* itself, and evil not at all.

Milton.

It shows the manner of an action.

I have not patience: she consumes the time

In idle talk, and owns her false belief:

Seize her *by* force, and bear her hence unheard.

Dryden.

By chance, within a neighbouring brook,

He saw his branching horns, and altered look.

Addison.

It has a signification, noting the method in which any successive action is performed with regard to time or quantity.

The best for you, is to re-examine the cause, and try it even point *by* point, argument *by* argument, with all the exactness you can.

Hooker.

We are not to stay altogether, but to come *by* him, where he stands, *by* ones, *by* twos, and *by* threes.

Shakespeare.

Others will soon take pattern and encouragement *by* your building; and so house *by* house, street *by* street, there will at last be finished a magnificent city.

Spratt.

It notes the quantity had at one time.

Bullion will sell *by* the ounce for six shillings and five pence unclipped money.

Locke.

What we take daily *by* pounds, is at least as much importance as what we take seldom, and only *by* grains and spoonfuls.

Arbutnot.

The north *by* myriads pours her mighty sons;

Great nurse of Goths, of Alans, and of Huns.

Pope.

At, or in; noting place: it is now perhaps only used before the words *sea*, or *water*, and *land*. This seems a remnant of a meaning now little known. *By* once expressed situation; as *by west*, westward

We see the great effects of battles *by* sea; the battle of Actium decided the empire of the world.

Bacon.

I would have fought *by* land, where I was stronger; You hindered it; yet, when I fought at *sea*,

Forsook me fighting.

Dryden.

By land, *by* water, they renew their charge.

Pope.

According to; noting permission.

It is lawful, both *by* the laws of nature and nations, and *by* the law divine, which is the perfection of the other two. *Bacon's Holy War.*

According to; noting proof.

The present, or like, system of the world cannot possibly have been eternal, *by* the first proposition; and without God it could not naturally, nor fortuitously, emerge out of chaos, *by* the third proposition.

Bentley.

The faculty, or desire, being infinite, *by* the preceding proposition, may contain or receive both these.

Cheyne.

After; according to; noting imitation or conformity.

The gospel gives us such laws, as every man, that understands himself, would chuse to live *by*.

Tillots.in.

This ship, by good luck, fell into their hands at last, and served as a model to build others *by*.

Arbuthnot.

From; noting ground of judgment, or comparison.

Thes, *by* the musick, we may know, When noble wits a hunting go Through groves that on Parnassus grow. *Waller.*

By what he has done, before the war in which he was engaged, we may expect what he will do after a peace. *Dryden.*

It notes the sum of the difference between two things compared.

Meantime she stands provided of a Laius, More young and vigorous too *by* twenty springs. *Dryden.*

Her brother Rivers,

Ere this, lies shorter *by* the head at Pomfret. *Rowe.*

It notes co-operation.

By her he had two children at one birth. *Shakspeare.*

For: noting continuance of time. This sense is not in use.

Ferdinand and Isabella recovered the kingdom of Grenada from the Moors; having been in possession thereof *by* the space of seven hundred years. *Bacon.*

As soon as; not later than: noting time.

By this, the sons of Constantine which fled, Ambrise and Uther, did ripe years attain. *Faerie Queene.*

Hector, *by* the fifth hour of the sun, Will with a trumpet, 'twixt our tents and Troy, To-morrow morning call some knight to arms.

Shakspeare.

By this time the very foundation was removed. *Swift.*

By the beginning of the fourth century from the building of Rome, the tribunes proceeded so far as to accuse and fine the consuls. *Id.*

Beside: noting passage.

Many beautiful places, standing along the sea shore, make the town appear longer than it is to those that sail *by* it. *Addison.*

Beside; near to; in presence: noting proximity of place.

So thou may'st say, the king lies *by* a beggar, if a beggar dwell near him; or the church stands *by* thy labour, if thy labour stand *by* the church. *Shakspeare.*

Before *himself*, *herself*, or *themselves*, it notes the absence of all others.

He will imagine, that the king and his ministers sat down and made them *by themselves*, and then sent them to their allies to sign. *Swift.*

More pleased to keep it till their friends could come, Than eat the sweetest *by themselves* at home, *Pope.*

At hand.

He kept then some of the spirit *by him*, to verify what he believes. *Boyle.*

The merchant is not forced to keep so much money *by him*, as in other places, where they have not such a supply. *Locke.*

It is the solemn form of swearing.

His godhead I invoke, *by him* I swear. *Dryden*

It is used in forms of adjuring, or obtesting.

Which, O! avert *by* yon ethereal light,

Which I have lost for this eternal night;

Or, if *by* dearer ties you may be won,

By your dead sire, or *by* your living son. *Dryden.*

Now *by* your joys on earth, your hopes in heaven, O spare this great, this good, this aged king! *Id.*

It signifies specification and particularity.

Upbraiding heaven, from whence his lineage came, And cruel calls the gods, and cruel thee, *by name.* *Id.*

By proxy of: noting substitution.

The gods were said to feast with Ethiopians; that is, they were present with them *by* their statues. *Broome.*

In the same direction with

They are also striated, or furrowed, *by* the length, and the sides curiously punched, or pricked. *Grew.*

By, adv.

Near; at a small distance.

And in it lies the god of sleep;

And, snorting *by*

We may descry

The monsters of the deep. *Dryden.*

Beside; passing.

I did hear

The galloping of horse. Who was 't came *by*? *Shakspeare.*

In presence.

The same words in my lady Philoclea's mouth, as from one woman to another, so, as there was no other body *by*, might have had a better grace. *Sidney.*

I'll not be *by* the while; my liege, farewell: What will become hereof, there's none can tell. *Shakspeare.*

BY AND BY. In a short time.

He overtook Amphialus, who had been staid here, and *by and by* called him to fight with him. *Sidney.*

The noble knight alighted *by and by* From lofty steed, and bad the lady stay, To see what end of fight should him befall that day. *Spenser.*

In the temple; *by and by* with us,

These couples shall eternally be knit. *Shakspeare.*

By, n. s. From the preposition. Something not the direct and immediate object of regard.

In this instance, there is, upon the *by*, to be noted, the percolation of the verjuice through the wood. *Bacon.*

So, while my loved revenge is full and high, I'll give you back your kingdom *by the by.* *Dryden.*

By. In composition, implies something out of the direct way, and consequently some obscurity, as a by-road; something irregular, as a by-end; or something collateral, as a by-concernment; or private, as a by-law. This composition is used at pleasure, and will be understood by the examples following.

BY-COFFEEHOUSE, n. s. A conce-house in an obscure place.

I afterwards entered a *by-coffeehouse*, that stood at the upper end of a narrow lane, where I met with a nonjuror. *Addison.*

BY-CONCERNMENT, n. s. An affair which is not the main business.

Our plays, besides the main design, have underplots, or *by-concernments*, or less considerable persons and intrigues, which are carried on with the motion of the main plot. *Dryden.*

BY-DEPENDENCE, n. s. An appendage; something accidentally depending on another.

These,
And your three motives to the battle, with
I know not how much more, should be demanded;
And all the other *by-dependencies*,
From chance to chance. *Shakspeare.*

BY-DESIGN, n. s. An incidental purpose.

And if she miss the mouse-trap lines,
They'll serve for other *by-designs*,
And make an artist understand
To copy out her seal or hand;
Or find void places in the paper,
To steal in something to entrap her. *Hudibras.*

BY-END, n. s. Private interest; secret advantage.

All people that worship for fear, profit, or some other *by-end*, fall within the intendment of this fable. *L'Estrange.*

BY-GONE, adj. A Scotch word. Past.

Tell him, you're sure
All in Bohemia's well: this satisfaction
The *by-gone* day proclaimed. *Shakspeare.*
As we have a conceit of motion coming, as well as
by-gone; so have we of time, which dependeth thereupon. *Grew.*

BY-INTEREST, n. s. Interest distinct from that of the public.

Various factions and parties, all aiming at *by-interest*, without any sincere regard to the public good. *Atterbury.*

BY-LAW, n. s.

By-laws are orders made in court-leets, or court-baron, by common assent, for the good of those that make them, farther than the public law binds. *Cowell.*
There was also a law, to restrain the *by-laws*, and ordinances of corporations. *Bacon.*

In the beginning of this record is inserted the law or institution; to which are added two *by-laws*, as a comment upon the general law. *Addison.*

BY-MATTER, n. s. Something incidental.

I knew one that, when he wrote a letter, would put that which was most material into the postscript, as if it had been a *by-matter*. *Bacon.*

BY-NAME, n. s. A nick-name; name of reproach, or accidental appellation.

Robert, eldest son to the Conqueror, used short hose, and thereupon was *by-named* court-hose, and shewed first the use of them to the English. *Cumden.*

BY-PAST, adj. Past; a term of the Scotch dialect.

Wars, pestilences, and diseases, have not been fewer for these three hundred years *by-past*, than ever they had been since we have had records. *Cheyne.*

BY-PATH, n. s. A private or obscure path.

Heaven knows, my son,
By what *by-paths*, and indirect crooked ways,
I got this crown. *Shakspeare.*

BY-RESPECT, n. s. Private end or view.

It may be that some, upon *by-respects*, find somewhat friendly usage in usance, at some of their hands. *Carew.*

Augustus, who was not altogether so good as he was wise, had some *by-respects* in the enacting of this law; for to do any thing for nothing was not his maxim. *Dryden.*

BY-ROAD, n. s. An obscure unfrequented path.

Through slippery *by-roads*, dark and deep,
They often climb, and often creep. *Swift.*

BY-ROOM, n. s. A private room within another.

I prythee, do thou stand in some *by-room*, while I question my jany drawer to what end he gave the sugar. *Shakspeare.*

BY-SPEECH, n. s. An accidental or casual speech, not directly relating to the point.

When they come to allege what word and what law they meant, their common ordinary practice is to quote *by-speeches*, in some historical narration or other, and to use them as if they were written in most exact form of law. *Hooker.*

BY-STANDER, n. s. A looker on; one unconcerned.

She broke her feathers, and, falling to the ground, was taken up by the *by-standers*. *L'Estrange.*

The *by-standers* asked him, why he ran away, his bread being weight. *Locke.*

BY-STREET, n. s. An obscure street.

The broker here his spacious heaver wears,
Upon his brow sit jealousies and cares;
Bent on some mortgage, to avoid reproach,
He seeks *by-streets*, and saves the expensive coach. *Gay.*

BY-VIEW, n. s. Private self-interested purpose.

No *by-views* of his own shall mislead him. *Atterbury.*

BY-WALK, n. s. A private walk; not the main road.

He moves afterwards in *by-walks*, or under-plots, as diversions to the main design, lest it should grow tedious; though they are still naturally joined. *Dryden.*

BY-WAY, n. s. A private and obscure way.

Night stealths are commonly driven in *by-ways*, and by blind fords, unused of any but such like. *Spenser on Ireland.*

Other *by-ways* he himself betook,
Where never foot of living wight did tread. *Spenser.*

This is wonderfully diverting; the understanding, thus to perceive a precept, as it were, through a *by-way*, and to apprehend an idea that draws a whole train after it. *Addison.*

BY-WEST, adv. Westward; to the west of.

Whereupon grew that *by-word*, used by the Irish, that they dwelt *by-west* the law, which dwelt beyond the river of the Barrow. *Davies on Ireland.*

BY-WORD, n. s. A saying; a proverb.

Bashful Henry be deposed; whose cowardice Hath made us *by-words* to our enemies. *Shakspeare.*

BYBLIS, in fabulous history, the daughter of Miletus, who, falling in love with her brother Caurus, killed herself, and was metamorphosed into a fountain.

BYBLUS, in ancient geography, a town of Phœnicia, situated between Berytus and Botrys; it was the royal residence of Cinyras, and sacred to Adonis. Pompey delivered it from a tyrant, whom he caused to be behaved. It stood near the sea, on an eminence, and near it ran the

Adonis into the Mediterranean. It is now in ruins.

BYNG (George), lord viscount Torrington, the son of John Byng, Esq., was born in 1663. At the age of fifteen he went a volunteer to sea with the king's warrant. His early engagement in this course of life gave him little opportunity of acquiring learning, but by his abilities and activity as a naval commander he furnished abundant matter for the pens of others. After being several times advanced, he was, in 1702, raised to the command of the Nassau, a third rate, and was at the taking and burning of the French fleet at Vigo; and in 1703 he was made rear-admiral of the red. In 1704 he served in the grand fleet sent to the Mediterranean under Sir Cloudesly Shovel; and commanded the squadron that attacked, cannonaded, and reduced Gibraltar. He was in the battle of Malaga, and was knighted by queen Anne for his gallant behaviour in that action. In 1705, within two months, he took twelve of the enemy's largest privateers, with the *Thetis*, a French man of war of forty-four guns; and also several merchant ships, most of them richly laden. The prisoners taken on board were 2070, and 334 guns. In 1718 he was made admiral and commander in chief of the fleet; and was sent with a squadron into the Mediterranean for the protection of Italy, against the Spaniards; who had surprised Sardinia, and landed an army in Sicily. In this expedition he despatched captain Walton in the *Canterbury*, with five more ships, in pursuit of six Spanish men of war, with galleys, fire-ships, bomb-vessels, and store-ships, who separated from the main fleet, and stood in for the Sicilian shore. The captain's laconic epistle on this occasion, showed that fighting was his talent as well as his admiral's, and not writing. 'Sir, We have taken and destroyed all the Spanish ships and vessels which were upon the coast, as per margin. *Canterbury*, off Syracuse, I am, &c. G. Walton.' From the account referred to, it appeared that he had taken four Spanish men of war, with a bomb-vessel and a ship laden with arms; and burned four with a fire-ship and bomb-vessel. By his advice and assistance, the Germans retook the city of Messina in 1719, and destroyed the ships that lay in the basin; which completed the ruin of the naval power of Spain. The Spaniards, being much distressed, offered to quit Sicily; but the admiral declared, that the troops should never be suffered to quit the island till the king of Spain had acceded to the quadruple alliance. After performing many signal services, in token of which he received from the emperor his own picture set round with very valuable diamonds, he was made rear-admiral of England and treasurer of the navy, one of the most honorable privy council, baron Byng of Southill in the county of Bedford, viscount Torrington, in Devonshire, and one of the knights companions of the Bath. George II. on his accession to the crown, placed him at the head of the navy, as first lord of the Admiralty; in which high station he died January the 15th, 1733, in the seventieth year of his age, and was buried at Southill in Bedfordshire.

BYNG (John, Esq.), the unfortunate son of the former, was bred to the sea, and rose to the rank of admiral of the blue. He gave many proofs of courage; but was at last shot, upon a dubious sentence for neglect of duty, and to shield an incompetent ministry from popular indignation, in 1757. Shortly after his death, the following inscription was boldly placed by his family on his tomb, in the parish church of Southill:—

To the perpetual disgrace of
Public Justice,
The Honorable John Byng,
Vice Admiral of the Blue,
fell a Martyr to
Political Persecution,
on March the 14th, in the year 1757:
when bravery and loyalty
were insufficient securities
for the Life and Honor
of a Naval Officer.

See GREAT BRITAIN.

BYNNI, in ichthyology, a species of cyprinus, having thirteen rays in the dorsal fin, the third of which is thick and horny; tail linear, and bifid; cirri, four. It is a fish of a silvery color, and oblong oval form, very common in the Nile.

BYROM (John), an ingenious poet of Manchester, born in 1791. His first poetical essay appeared in the *Spectator*. He was admitted a member of the Royal Society in 1724. On taking his degree of master of arts, he went to Montpellier, where he became doctor in physic, and imbibed an extravagant love for the mystic theology of Mallebranche and Bourignon, to which he afterwards added that of Behmen. But reducing himself to narrow circumstances, by a precipitate marriage, he supported his family by teaching a new method of writing shorthand, of his own invention; until an estate devolved to him by the death of an elder brother. He was a man of lively wit, of which he gave many humorous specimens. He died in 1763; and a collection of his Miscellaneous Poems was printed at Manchester, in 2 vols. 8vo. 1773.

BYRON (John), commodore, and grandfather of the late lord Byron, was the second son of William, the fourth lord Byron. He was born at Newstead Abbey, in 1723, and, entering the navy early, held the rank of a midshipman in 1740, when Anson commanded an expedition against the Spaniards, in the South Seas. The vessel to which Byron belonged was wrecked on a desert island, from which, after enduring the greatest hardships, he reached Chiloe, and having been made prisoner by the Spaniards, did not return to England for five years. His narrative of his disasters has always been a popular book. In June, 1764, he again left England in command of an expedition fitted out to make discoveries in the South Sea; and, having circumnavigated the globe, returned home in May, 1766. Many ports and islands were explored in this voyage, which were afterwards visited by Bougainville and Cooke; and experiments were made to determine the accuracy of Harrison's time-keeper. Mr. Byron was subsequently made an admiral, and commanded in the West Indies during the American war. He died in 1768.

B Y R O N.

BYRON (George Gordon), afterwards George Gordon Noel, lord Byron, a late British peer and distinguished poet, was born in Holles Street, London, January 22d, 1788. His father was captain John Byron, of the guards, eldest son of admiral Byron, of whose history we have given a slight sketch; and his mother, a Miss Gordon of Gight, in Scotland, descended according to Mr. Dallas, from the princess Jane Stuart, a daughter of James II., of Scotland, who married the marquis of Huntley. The peerage was given to the family by Charles I.

Lord Byron's immediate predecessor in the title was his father's uncle, William, lord Byron, who after a fatal duel with a relation and neighbour, Mr. Chaworth, felt the public opinion to be so much against his conduct, that he secluded himself at Newstead Abbey from all society, for many years previous to his death. The late lord Byron, who was somewhat prone to similar partialities, told captain Medwin that his uncle devoted himself at this period to the feeding of crickets. 'He had made them so tame as to crawl over him, and used to whip them with a whip of straw if too familiar. When he died, tradition says that they left the house in a body. I suppose I derive my superstition (added his lordship), from this branch of the family.' Lord Byron's father was also too remarkable for his eccentricities and dissipation for us to be chargeable with any indelicacy in alluding to them, or for a fair estimate of his lordship's character to be given without taking them into the account. He was notorious in the circles of fashion as the 'mad Jack Byron', of handsome person, but of so abandoned a character, that to be known as his companion, was an exclusion from decent society. At the age of twenty-six he seduced lady Carmarthen, whom, after her divorce from the marquis, he married, having issue one daughter, Mrs. Leigh: he afterwards eloped with Miss Gordon, and, having nearly dissipated her fortune, separated from her, and died at Valenciennes in 1791. Mrs. Byron had, a short time before this event, retired to Mar Lodge, near Aberdeen, with her infant, the subject of our memoir.

Here she personally conducted his education until he was seven years of age; and the wild scenery of Morven, of Loch-na-Garr, and of the banks of the Dee, became, as he afterwards opined, 'the parents of his poetical vein.' He is said to have remembered the later broils of his father and mother; and to have imbibed an early horror of matrimony from that circumstance. Be this as it may, he became certainly worse than fatherless, at an early age; his passions and affections were not only, as a poetical divine phrases it, his 'first governors,' and 'clearly possessed themselves of his soul before his reason was heard to speak,'—but an indulgent mother was their only director: and with a constitution not robust, and a malformation of one of his feet, he had peculiar claims on her solicitude. So that if generally (as the good bishop says), 'reason

speaks at first so little and so low, that the common noises of fancy and company drown her voice,'—we cannot suppose this voice to have been much heard in lord Byron's youth and childhood. If the honors of his birth afterwards increased his attractions as a poet, he clearly owed but little to it as a man.

In his eighth year he was placed at the grammar school of Aberdeen; and, though little distinguished for constant application, was found capable of considerable efforts of mind. He was still more famous for the love of hardy exercises, than for either; and was indulged with frequent vacations, which he spent in the Highlands, on account of his health. On the whole, he says, he imbibed, at this time, an affection for Scotland, which Scottish Reviewers might afterwards shake, but did not destroy.

In 1798 he succeeded, on the death of his great-uncle, to the title and estates of the family, and was immediately removed, under the guardianship of lord Carlisle, brother-in-law of the late lord Byron, to Harrow. Here he confesses that he ill-brooked the discipline, he could not but approve; and while he imbibed a lasting sense of the head master, Dr. Drury's, kindness (which he commemorates in his *Hours of Idleness*), he submitted with great reluctance to the ordinary discipline of the school. His vacations were at this time spent at Newstead, where, in his thirteenth year he became enamoured of Miss Chaworth, the only daughter and heiress of the gentleman who fell by the hand of his predecessor. The future properties of the youthful pair adjoined; and their meetings, though stolen ones, were frequent. The lady being his senior by some years, the affair soon terminated by her hand being bestowed on a more mature lover; but the disappointment was always described by lord Byron as serious to himself. At Harrow, the duke of Dorset was his fag, and 'I was not,' says he, 'a very hard task master. There were times in which if I had not considered it as a school, I should not have been unhappy at Harrow. There is one spot I should like to see again: I was particularly delighted with the view from the church yard, and used to sit for hours on the stile leading into the fields; even then I formed a wish to be buried there. Of all my schooffellows, I know no one for whom I have retained so much friendship as for lord Clare; I have been constantly corresponding with him ever since. I knew he was in Italy, and look forward to seeing him, and talking over with him our old Harrow stories, with infinite delight.'

Such was one of his communications to captain Medwin respecting his early life: and we may here observe, that while that gentleman's *Journal of Conversations with lord Byron* has not our absolute credence in all particulars; whatever we find elsewhere confirmed or rendered probable by other accounts, we adopt—and many of the observations he records could not be otherwise than lord Byron's. He related

in after life, two other striking recollections of Harrow,—that he fought lord Calthorpe there for writing ‘atheist’ under his name; and, in the best spirit of a young aristocrat, prevented the school-room from being burnt, during a rebellion of the boys, by pointing out to them the names of their fathers and grandfathers on the walls. ‘Had I married Miss C —,’ continued lord Byron to captain Medwin, ‘perhaps the whole tenor of my life would have been different. She tilted me, however; but her marriage proved any thing but a happy one. She was at length separated from Mr. M —, and proposed an interview with me, but by the advice of my sister I declined it. I remember meeting her after my return from Greece, but pride had conquered my love; and yet it was not with perfect indifference I saw her.’ He has beautifully alluded to these circumstances in his well-known *Dream*.

At the age of seventeen he was entered at Trinity College, Cambridge, and, as at Harrow, subjected himself to frequent rebukes for his vagaries: he ever entertained, he says, great contempt for academical honors, and, among other proofs of it, trained a bear at college, designing it, as he stated, to take a degree. In 1807 he was himself complimented with the honorary degree of M. A.

He quitted college the same year to take up his residence at Newstead, and printed, at Newark, in December, his first volume of poems. These were given to the world under the title of *Hours of Idleness*, and were criticised with memorable severity in the *Edinburgh Review*. They certainly contain but few traces of the towering genius he afterwards exhibited; but his critics have since made the amende honorable in all but direct terms: they inflicted on him the misery, the ‘rage,’ in which he was first stimulated, to an effect worthy his muse; and their bullying, as he says, far from deterring him from writing, made him but the more ‘bent on falsifying their raven predictions, and determined’ him ‘to show them, croak as they would, it was not the last time they should hear from him.’ He now, therefore, set to work in good earnest, and in the course of the following year produced the *English Bards and Scotch Reviewers*. Lord Byron, in our humble judgment, never composed lines to exceed, in strength and beauty, several that are found in this poem. We cannot multiply specimens, but select the best criticism of the day on *Little*, alias *Moore’s* amorous poems, as expressing all a friendly moralist must often have felt inclined to say to his lordship afterwards.

Grieved to condemn, the muse must still be just,
Nor spare melodious advocates of lust.
Pure is the flame which o’er her altar burns;
From grosser incense with disgust she turns:
Yet kind to youth, this expiation o’er,
She bids thee ‘mend thy line and sin no more.’

And the apostrophe to *Kirke White*, alluding to his death being hastened by his devotion to study:—

So the struck eagle stretch’d upon the plain,
No more through rolling clouds to soar again,

Viewed his own feather on the fatal dart,
And winged the shaft that quivered in his heart.
Keen were his pangs, but keener far to feel—
He nursed the pinion that impelled the steel;
While the same plumage that had warmed his nest
Drank the last life drop from his bleeding breast.

Mr. Dallas gives us an anecdote or two of the passage of this poem through the press, which are worth preserving. The day on which he came of age lord Byron put it into the hands of that gentleman, in London, wishing him to get it published anonymously. It was then entitled the *British Bards*, and the author added 110 lines during the printing of it. Among other alterations he inserted the entire panegyric on *Crabbe*, whose name was at first altogether omitted; and the couplet respecting *Congreve* and *Otway*; changed a censure of Mr. *Smythe* to the highest praise, and a strong commendation originally bestowed on lord *Carlisle’s* poetry into the elaborate condemnation of it which now stands in the poem. It was at first said, that among the peers,

On one alone Apollo deigns to smile,
And crowns a new Roscommon in *Carlisle*.

Now his poetry is ‘paralytic feeling;’ and ‘no muse will smile upon it.’ The fact is, a violent family quarrel had taken place between the noble bards in the interim. This satire, according to Mr. Dallas, was offered to the most extensive publishing house of the day, Messrs. Longman’s, and refused, on the ground of its asperity: rather, we should apprehend, on account of their well-known connexion with the reviewers, so severely chastised. It is remarkable that the first number of that *Review* itself is also stated to have been thrown aside by another sapient publisher, then living in the Poultry, for a similar reason with that Mr. Dallas assigns.

This satire made a deep impression on the public in favor of its author, who was soon known. Just previous to its publication he resolved upon taking his seat in the House of Peers, pro forma; and the two circumstances transpiring together, increased the general eclat which now attended his name. He had written, it seems, to his near relative, lord *Carlisle*, with the desire to procure his introduction to the House: but that nobleman, in a cold reply, merely informed him, technically, of the mode of proceeding: so that he was received in their lordship’s anti-chamber by some of the official persons only; and advanced to the table of the House, as Mr. Dallas informs us, with evident mortification and subdued anger. Here, however, having taken the oaths, he was kindly greeted by the chancellor, who descended from his seat and offered him his hand. ‘Lord Byron made a stiff bow, and gave his lordship the tips of his fingers,’ says Mr. Dallas, ‘in return.’ ‘If I had shaken hands heartily,’ he afterwards said, ‘he would have set me down for one of his party—but I will have nothing to do with any of them on either side: I have taken my seat, and now I will go abroad.’

Unhappily, even at this period, lord Byron had indulged himself in a career of dissipation which seriously injured his fortune. He made, Don Juan describe, but too truly, his own case:—

I wish they knew the life of a young noble,
* * * * *

They are young, but know not youth : it is anticipated ;
Handsome, but wasted ; rich without a sou ;
Their vigour in a thousand arms is dissipated ;
Their cash comes from, their wealth goes to, a Jew.

And without a single friend in his own rank of life, an impaired constitution, and a joyless indifference to the world, he commenced his travels in June, 1809, in company with his fellow collegian J. C. Hobhouse, Esq. He, however, at this time resolved, and pledged himself to his mother, never to part with Newstead.

The travellers passed by Lisbon and the southern provinces of Spain up the Mediterranean ; Mr. Hobhouse keeping a journal, but Lord Byron reserving himself for his poetical 'pilgrimage.' This has celebrated his residence in Greece and Turkey too fully to render any further details necessary : but one of the principal incidents of the Giaour occurred at this time to himself. A meer accident enabled him to rescue one of the unhappy objects of his amours from the wretched death of being drowned in a sack—for his sake. 'I was taking one of my usual evening rides by the sea-side,' says his lordship, 'when I observed a crowd of people moving down to the shore, and the arms of the soldiers glittering among them. They were not so far off but that I thought I could now and then distinguish a faint and stifled shriek. My curiosity was forcibly excited, and I despatched one of my followers to enquire the cause of the procession. What was my horror to learn that they were carrying an unfortunate girl, sewn up in a sack, to be thrown into the sea ! I did not hesitate as to what was to be done. I knew I could depend upon my faithful Albanians, and rode up to the officer commanding the party, threatening, in case of his refusal to give up his prisoner, that I would adopt means to compel him. He did not like the business he was on, or perhaps the determined look of my body-guard, and consented to accompany me back to the city with the girl, whom I soon discovered to be my Turkish favorite. Suffice it to say that my interference with the chief magistrate, backed by a heavy bribe, saved her ; but it was only on condition that I should break off all intercourse with her, and that she should immediately quit Athens, and be sent to her friends at Thebes. There she died a few days after her arrival of a fever : perhaps of love.'

Lord Byron always exhibited this kind of noble disinterestedness and courage : strange that the certain miseries he was preparing for himself and his companions for the future, should be the only enemies he was too cowardly to deal with now.

Through the same channel, captain Medwin, we receive his lordship's account of one of the severest illnesses he ever had. It curiously illustrates the character of the Albanians. 'They,' he says, 'were devotedly attached to me, and watched me day and night. I am more indebted to a good constitution for having got over this attack than to the drugs of an ignorant Turk, who called himself a physician. He would have been glad to have disowned the name, and re-

Vol. IV.

signed his profession too, if he could have escaped from the responsibility of attending me, for my Albanians came the grand seignior over him, and threatened that if I were not entirely recovered at a certain hour, on a certain day, they would take his life ! They are not people to make idle threats, and would have carried them into execution, had any thing happened to me. You may imagine the fright the poor devil of a doctor was in, and I could not help smiling at the ludicrous way in which his fears showed themselves. I believe he was more pleased at my recovery, than either my faithful nurses or myself. I had no intention of dying at that time, but if I had died the same story would have been told of me that was related of colonel Shelbrooke, in America. On the very day my fever was at the highest, a friend of mine declared that he saw me in St. James's Street, and somebody put down my name in the book at the palace, as having enquired after the king's health.'

Lord Byron wrote home occasionally to his mother, during the whole of his absence from England, and gave these letters afterwards to Mr. Dallas, saying 'Some day or other they will be curiosities.' They formed a principal part of the letters which, at the instance of Lord Byron's executors, the court of chancery restrained Mr. Dallas from publishing. This circumstance we cannot but regret, while the mercenary views of Mr. Dallas are but too obvious.

His lordship was in Albania at the height of the late Ali Pacha's prosperity, and was lodged at his palace. When introduced to that chief, the latter remarked that he had heard lord Byron's family was a great one, and should have known him to be a man of rank from the smallness of his ears, his curling hair, and his small white hands : that he begged to be considered as his father during his stay in Albania, and wished to be respectfully remembered to his mother. In going into a ship of war, provided for them by Ali, intending to sail for Patras, the travellers were very near being lost in a gale of wind. They were driven on the coast of Suli ; and there experienced the most disinterested hospitality. After having been lodged and refreshed with his suite, consisting of his servant Fletcher, a Greek, two Athenians, a Greek priest, and Mr. Hobhouse, lord Byron offered the chief of the Suliote village money ; but he refused any remuneration, and only asked for a written acknowledgment that he had treated the strangers well. 'I wish you to love me,' he said, 'not to pay me.' It was while his frigate was at anchor in the Dardanelles, that lord Byron swam from Sestos to Abydos : an exploit on which he much prided himself.

He returned to England in July, 1811, having never heard but once from his man of business during his travels, and this was, it seems, to propose the sale of Newstead Abbey. Lord Byron, however, sent home Fletcher, with his determination not to do this ; but rather to sacrifice his Rochdale or Yorkshire property. If Newstead remained, he said, he should come back to England, if not he never should.

On his return he had so far cooled in his re-

sentiment toward the objects of his attack in the English Bards and Scotch Reviewers as to be fully prepared to withdraw that poem from circulation. It is singular that the principal part of them became afterwards his personal friends. Even from 'hoarse Fitzgerald,' he accepted complimentary verses. The piece passed rapidly through four editions, and was then suppressed, 'as far as in him lay.' He brought home with him a second satire, however, which he called *Hints from Horace*, and from which Mr. Dallas, in his *Recollections*, gives a considerable extract. One remarkable couplet, like many parts of his poems, reflects singularly on himself.

Satiric rhymes first sprang from selfish spleen,
You doubt—see Dryden, Pope, St. Patrick's dean.

In this piece also he renews the expressions of his marked contempt for the poet-laureat's productions:

Whose Epic mountains never fail in mice.

But Mr. Dallas exercised a sound judgment in persuading him to publish, in preference to this poem, the first and second cantos of his *Childe Harold*, which he also had in great part prepared; and to that gentleman must certainly be awarded the merit of having considerably assisted their final touching.

His lordship had imbibed at Cambridge a strong tendency to infidel, if not to atheistical sentiments. This was checked, however, at that period, by the premature death of one of the boldest advocates for infidelity, his particular friend; all intellect and energy, it would appear, like himself. It staggered him, he confessed, that such powers should be for ever lost; that such a mind should be gathered into the corruption, that so speedily awaited the body. And thus the good,

The lingering light unwilling to depart,

struggled with the bad and cheerless system of too many of his associates for years. Throughout his life, indeed, he seems to wish himself to be considered a desponding rather than a contemptuous sceptic. Mr. Dallas induced him at this time to modify what he would not suppress of his sceptical opinions, and procured the substitution of the beautiful stanza, beginning,

Yet if, as holiest men have deemed, there be
A land of souls beyond that sable shore,

For this

Frown not upon me churlish priest! that I
Look not for life, where life may never be;
I am no sneerer at thy phantasy;
Thou pitiest me,—alas! I envy thee,
Thou bold discoverer in an unknown sea,
Of happy isles and happier tenants there;
I ask thee not to prove a Sadducee,
Still dream of Paradise, thou knowest not where,
But lovest too well to bid thine erring brother share.

And, as an apology for these sentiments generally, he had proposed to insert the following remarkable note: 'In this age of bigotry, when the puritan and priest have changed places, and the wretched Catholic is visited with the 'sins of his fathers,' even unto generations far beyond the pale of the commandment, the cast of

opinion in these stanzas will doubtless meet with many a contemptuous anathema. But let it be remembered, that the spirit they breathe is desponding, not sneering, scepticism; that he who has seen the Greek and Moslem superstitions contending for mastery over the former shrines of polytheism; who has left in his own country Pharisees, thanking God that they are not like publicans and sinners, and Spaniards in theirs, abhorring the heretics, who have helped them in their need; will be not a little bewildered, and begin to think, that as only one of them can be right, they may most of them be wrong. With regard to morals, and the effect of religion on mankind, it appears, from all historical testimony, to have had less effect in making them love their neighbours, than inducing that cordial Christian abhorrence between sectaries and schismatics. The Turks and Quakers are the most tolerant; if an infidel pays his heretich to the former, he may pray how, when, and where he pleases; and the mild tenets and devout demeanor of the latter, make their lives the truest commentary on the sermon of the mount.'

Mr. Dallas also induced him to suppress three additional stanzas of censure on the memorable convention of Cintra. One part of the description of the arrival of the news of that treaty being signed we cannot omit. It is not in his printed works, and we know no equal description of the principal personage.

Pens, tongues, feet, hands, combined in wild uproar;
Mayor, aldermen, laid down the 'uplifted fork;
The bench of bishops half forgot to snore;
Stern COBBETT, who for one whole week forbore
To question aught, once more with transport leap't,
And bit his devilish quill agen, and swore
With foe such treaty never should be kept,
Then burst the blatant beast, and roared, and raged,
and—slept!!!

However Lord Byron might shrink from his own image when drawn with such truth and force, the world has ever since considered him, in point of fact, the hero of the *Childe Harold*. It supplies all the main points of his character, and that large portion of the actual events of his life which his own genius alone could have grouped in this way. On its publication he was at once highly popular, his relations became friends, his enemies friendly; while the critics trembled and adored. None were more lavish of their commendations than those northern sages, who in the first instance had so unsparingly chastised the young poet. In the winter of 1812, he was the object of universal curiosity and attraction. Various eminent persons courted an introduction to him, some are said even to have volunteered their cards. He happened to go early into one fashionable party, into which the Prince Regent came shortly afterwards, and sent a gentleman to him to desire he would be presented. The presentation of course followed; Lord Byron ever after spoke of it with pleasure: the prince did him the honor to say, that he hoped soon to see the author of *Childe Harold* at Carlton house. In consequence of this, Mr. Dallas tells us, he found his lordship on the next appointed levee day, in a full dress-suit, and just ready to start

for the court, when the levee was suddenly put off. 'It was the first and last time he was ever so dressed for a British court.' But his poem travelled all over the kingdom with the greatest rapidity; its first impression being taken off in three days. Among the abundant testimonies of applause and respect, he valued none more than a letter he now received from Dr. E. D. Clarke, the traveller, who declares, with all his characteristic ardor, and passionately fond as he had been of poetry from his youth, 'I was never so much affected by any poem before.' The intended new Satire was now entirely suppressed; together with a similar production, the *Curse of Minerva*, written on some modern spoiliations of Greece.

Newstead Abbey, after all, was brought to the hammer at Garraway's, in the autumn of 1812. It was at first bought in, then sold to a Mr. Cloughton, for the sum of £140,000, but the purchaser could not complete his bargain: it finally was disposed of some time in 1815.

After this, becoming satiated with the hollow praises and pleasures of a fashionable life, he applied himself once more to composition. Mr. Gifford had sent to him, we are told (*Dallas's Recollections*, p. 286), calling upon him not to give up his time to light compositions, 'as he had genius to send him to the latest posterity with Milton and Spenser.' Meanwhile he had written the *Giaour*, and the *Bride of Abydos*, which sold prodigiously. In December, Mr. D. found him composing the *Corsair*, which he presented to that gentleman on new year's day, 1814: giving him the copy-right of this, as of all his previous poems. At the end was inserted the 'Stanzas to a Lady Weeping,' which his lordship's more intimate friends assert to have been composed long before his interview with the prince. However this may be, it is supposed to have given great personal offence in a certain high quarter.

In May he commenced his *Lara*, and finished it 24th June. The *Siege of Corinth* made its appearance almost immediately after.

We should have noticed, perhaps earlier, his maiden speech in the House of Lords. This was delivered, February, 1812, against the Nottingham frame-work bill. He took great pains in its composition, and is said to have delivered it with considerable energy: he once more addressed the House in favor of Catholic emancipation, as it is termed, and a third and last time, when he presented a petition of Major Cartwright's, on reform. But if he had nerve, he had not steadiness enough for a political life in England. He seems always to have felt it was not his *forté*, and says he could never have adhered to any party. The late Lord Londonderry, he told Captain Medwin, however, was the only public character which he ever 'detested.'

In January, 1815, he obtained the hand of Miss Anna Isabella Milbanke, daughter of Sir Ralph Milbanke Noel, Bart. having proposed himself as a suitor a year before, and been rejected. The marriage was an unhappy one. Lord Byron with all his scepticism was superstitious; he remarked to Mr. Moore, on his first

introduction to the lady, that he stumbled going up stairs, and the omen was bad. The fortune he received with this lady was not, as it has been stated, very large, and his own having been at this time much reduced, his lavish expenditure could be sustained but for a few months. He was soon beset by importunate creditors; the bailiffs entered his house within the first year of their marriage, and lady Byron, after giving birth to a daughter, December 10th, returned to her father's. The baronet wrote at first to announce her determination not to return: lord Byron refused, very properly, to credit this; the resolution, however, was shortly after avowed by her ladyship; and a final separation took place. Its merits and demerits seem to have been a considerable topic in the suppressed 'Memoirs' of his lordship; at least so he is reported to have told captain Medwin, and that he forwarded the narrative for lady Byron's sanction. This she refused to give; and the public has been supplied with nothing further respecting this event. Lord Byron said 'I have prejudices about women. I do not like to see them eat. Rousseau makes *Julie un peu gourmande*; but that is not at all according to my taste. I do not like to be interrupted when I am writing. Lady Byron did not attend to these whims of mine. The only harsh thing I ever remember saying to her, was one evening, shortly before our parting. I was standing before the fire, ruminating upon the embarrassment of my affairs, and other annoyances, when lady Byron came up to me, and said 'Byron, am I in your way?' to which I replied 'damnable!' I was afterwards sorry, and reproached myself for the expression; but it escaped me unconsciously, involuntarily; I hardly knew what I said.'

He now left England, expressing his resolution not to return, and crossed over to France, through which he passed to Brussels, taking the field of Waterloo on his way. Hence he proceeded to the banks of the Rhine, Switzerland, and the north of Italy; and resided for some time at Venice, where Mr. Hobhouse joined him, and they together started for Rome, where he completed the third canto of *Childe Harold*. In 1816 appeared the *Prisoner of Chillon*, a *Dream*, and other poems; and in 1817 *Manfred*, a tragedy, and the *Lament of Tasso*. In his excursions at this time from Italy, we find him taking up his abode for some time at *Abydos*; whence he proceeded to *Tenedos* and the island of *Scio*, where he staid three months, during which time he explored every classical scene, and all the celebrated islands. At length he reached Athens, where, in 1818, he sketched the fourth and last canto of *Childe Harold*. In this year was also published the *jeu d'esprit* of *Beppo*, and in 1819 the romantic tale *Mazeppa*.

This year also he forwarded to England the commencement of his *Don Juan*, to which Mr. Murray his bookseller, refused to put his name. The performance as a whole is generally considered as a degradation to lord Byron's genius; while unquestionable traces of it appear in various parts. Some of his friends attempt to defend it as an improvement on the looser Italian models which he professes to follow. He him-

self dignified it when about half written with the name of an epic, and complained loudly of the conduct of his publisher. It assuredly is in this country the dead weight of his poetical fame. In 1820 he sent home Marino Faliero, Doge of Venice, a tragedy, having only as designed for the stage, the equivocal recommendation of a close attention to the dramatic unities. It was a failure: lord Byron afterwards affirmed that it never was offered to the theatre with his approbation; but was evidently mortified at its being considered that he could not succeed in this species of composition. Shortly after he addressed a letter to the Rev. W. L. Bowles, on the poetical character of Pope, which he considers to have been unfairly depreciated in that writer's *Life of the Poet*. In the same year, 1820, appeared the *Drama of Sardanapalus*, the best of his tragic productions; *The Two Foscari*, a tragedy; and *Cain*, a Mystery. Lord Byron, on being much censured for the speeches given to Lucifer and Cain, in this piece, defended himself by the example of Milton, and asked how the first rebel and the first murderer ought to be made to speak? It is a poem displaying great occasional energy; but Mr. Hobhouse called it bombastical, and considered the publication of it disgraceful, we are told. (*Medwin's Conversations*, p. 187) Lord Byron characterised it as the finest thing he ever wrote. His gravest and best defence is addressed to his bookseller. 'If Cain be blasphemous, *Paradise Lost* is blasphemous; and the words of that Oxford gentleman, 'evil be thou my good,' are from that very poem, from the mouth of Satan,—and is there any thing more in that of Lucifer, in the *Mystery*? Cain is nothing more than a drama, not a piece of argument. If Lucifer and Cain speak as the first rebel and the first murderer may be supposed to speak, nearly all the rest of the personages talk also according to their characters; and the stronger passions have been permitted to the drama. I have avoided introducing the Deity as in Scripture, though Milton does, and not very wisely either; but have adopted his angel as sent to Cain instead, on purpose to avoid shocking the feelings on the subject, by falling short of what all uninspired men must fall short in, viz. giving an adequate notion of the effect of the presence of Jehovah. The old Mysteries introduced Him liberally enough, and all this I avoided in the new one.'

Lord Byron clearly forgets in all this that Milton's Satan is never suffered to make the worse appear at last the better cause: and that the whole weight of his own personal character and habits were well known to be (speaking charitably) not on the same side of the balance with those of the great poet of the commonwealth. Our poet quitted Venice for Pisa in 1821. What will our fair readers say to the following sentiments imputed to him by Captain Medwin. 'I wrote little at Venice, and was forced into the search of pleasure,—an employment I was soon jaded with the pursuit of. Women were there, as they have ever been fated to be, my bane; like Napoleon, I have always had a great contempt for women; and formed this opinion of them not hastily, but from my own fatal experience.

My writings, indeed, tend to exalt the sex; and my imagination has always delighted in giving them a *beau idéal* likeness, but I only drew them as a painter or statuary would do, as they should be; perhaps my prejudices, and keeping them at a distance, contributed to prevent the illusion from altogether being worn out and destroyed as to their celestial qualities. They are in an unnatural state of society. The Turks and eastern people manage these matters better than we do. They lock them up, and they are much happier. Give a woman a looking-glass and a few sugar-plumbs, and she will be satisfied. I have suffered from the other sex ever since I remember anything. I began by being jilted, and ended by being unwived. Those are the wisest who make no connexions of wife or mistress.'

At this his last place of residence in Italy, he became acquainted with the Gamba family; and formed at the house of her father no equivocal acquaintance with the countess Guiccioli, a lady who at twenty years of age had married a husband of sixty; who tolerated the connexion with his lordship. The lady was of course all attraction, and lord Byron longer devoted to her, we believe than to any other of his connexions of this kind: but from such fathers—matches—husbands—and lovers, may our native land at least be long preserved! Mr. Leigh Hunt, who had been invited out to Italy with his family, joined him at Pisa in 1822, and with this writer, in conjunction with Mr. Percy Bysshe Shelley, the publication called *The Liberal*, was commenced, which owing to the unhappy fate of Mr. Shelley (who perished by the upsetting of a boat in the Mediterranean), extended only to four numbers. In this periodical work appeared the celebrated *Vision of Judgment*, caused by a performance of the same foolish title, written by Mr. Southey. Our opinion of these performances approaches that of an orator, (the Rev. Mr. Irving), who has on some occasions no small share of the true poetic feeling. He says, 'with the one blasphemy is virtue when it makes for loyalty; with the other blasphemy is the food and spice of jest-making.—I know not whether the self confident tone of the one, or the ill-placed merriment of the other, displeaseth me the more. It is ignoble and impious to rob the sublimest of subjects of all its grandeur and effect, in order to serve wretched interests and vulgar passions.' Heaven and Earth, a mystery, first appeared also in the *Liberal*. It is founded on the alleged intercourse between angels and the daughters of men before the flood. *Werner*, a tragedy; the *Deformed Transformed*, a drama; and the last cantos of *Don Juan*, complete the list of lord Byron's works, all of which he finished prior to the autumn of 1822. *Don Juan* we exclude from all consideration as a work of lord Byron: it is unworthy of him. But the *March on Rome* of the *Deformed Transformed* is worthy of his best days. We can only find space for the first two stanzas, and the concluding one.—

I.

'Tis the morn, but dim and dark.
Whither flies the silent lark?
Whither shrinks the clouded sun?
Is the day indeed begun?

Nature's eye is melancholy
O'er the city high and holy :
But without there is a din
Should arouse the Saints within,
And revive the heroic ashes
Round which yellow Tiber dashes.
Oh ye seven hills ! awaken,
Ere your very base be shaken !

2.

Hearken to the steady stamp !
Mars is in their very tramp !
Not a step is out of tune !
As the tides obey the moon,
On they march, though to self-slaughter,
Regular as rolling water,
Whose high waves o'ersweep the border
Of huge moles, but keep their order,
Breaking only rank by rank.
Hearken to the armour's clank !
Look down o'er each frowning warrior,
How he glares upon the barrier :
Look on each step of each ladder,
As the stripes that streak an adder.

8.

Yet once more, ye old Penates !
Let not your quenched hearths be Ate's !
Yet again ye shadowy heroes,
Yield not to these stranger Neros !
Though the son who slew his mother,
Shed Rome's blood, he was your brother :
'Twas the Roman curbed the Roman ;—
Brennus was the baffled foe-man.
Yet again ye Saints and Martyrs,
Rise ! for yours are holier charters.
Mighty gods of temples falling,
Yet in ruin still appalling !
Mightier founders of those altars,
True, and Christian,—strike the assaulters !
Tyber ! Tyber ! let thy torrent
Show even nature's self abhorrent.
Let each breathing heart dilated
Turn, as doth the lion baited !
Rome be crushed to one wide tomb,
But be still the Roman's Rome !

Lord Byron quitted Pisa in the autumn of 1822, and wintered at Genoa. The motives which induced him to leave Italy and join the Greeks, struggling for emancipation from the yoke of their ignorant and cruel oppressors, are the most creditable, upon the whole, of any which ever swayed his wayward mind. It was in Greece that his high poetical faculties had been first most powerfully developed ; and they who know the delight attendant, even in a very inferior degree, upon this process, will know how to appreciate the tender associations which cling to the scenes and the persons that have first stimulated their genius. 'Greece, a land of the most venerable and illustrious history, of a peculiarly grand and beautiful scenery, inhabited by various races, of the most wild and picturesque manners, was to him the land of excitement, never cloying—never wearying, ever changing excitement.' 'Such,' continues an able contemporary writer, 'must necessarily have been the chosen and favorite spot of a man of powerful and original intellect, of quick and sensible feelings, of a restless and untameable spirit, of warm affections, of various information, and,

above all, of one satiated and disgusted with the formality, hypocrisy, and sameness of daily life Dwelling upon that country, as it is clear from all lord Byron's writings he did, with the fondest solicitude, and being, as he was well known to be, an ardent though perhaps not a very systematic lover of freedom, we may be certain that he was no unconcerned spectator of its recent revolution : and as soon as it appeared to him that his presence might be useful, he prepared to visit once more the shores of Greece.'

On his thirty-sixth birth-day, he thus apostrophises himself :

If thou regret thy youth, why live ?
The land of honourable death
Is here—Up to the field and give
Away thy breath—
Awake not Greece—She is awake,
Awake my spirit !—

Lord Byron embarked at Leghorn and arrived in Cephalonia in the early part of August 1822, attended by a suite of six or seven friends in an English vessel (the *Hercules*, captain Scott, which he had hired for the purpose of taking him to Greece. His lordship had never seen any of the volcanic mountains, and for this purpose the vessel deviated from its regular course in order to pass the island of Stromboli. The vessel lay off this place a whole night in the hopes of witnessing the usual phenomena, when, for the first time within the memory of man, the volcano emitted no fire, and the disappointed poet was obliged to proceed, in no good humor with the forge of Vulcan. We abridge the Narrative of a Friend of Greece for the sequel.

'It was a point of importance to determine on the particular part of Greece to which his lordship should direct his course—the country was afflicted by intestine divisions, and lord Byron thought that if he wished to serve it, he must keep aloof from faction. The different parties had their respective seats of influence, and to choose a residence, if not in fact, was in appearance, to choose a party. In a country where communication is impeded by natural obstacles and unassisted by civilised regulations, which had scarcely succeeded in expelling a barbarian master, and where the clashing interests of contending factions often make it advantageous to conceal the truth, the extreme difficulty of procuring accurate information may be easily supposed. It, therefore, became necessary to make some stay in a place which might serve as a convenient post of observation, and from which assistance could be rendered where it appeared to be most needed. Cephalonia was fixed upon ; where lord Byron was extremely well received by the English civil and military authorities, who, generally speaking, seemed well inclined to further the objects of his visit to Greece. Anxious, however, to avoid involving the government of the island in any difficulty respecting himself, or for some other cause, he remained on board the vessel until further intelligence could be procured.

'When lord Byron arrived in the Ionian Islands, Greece, though even then an intelligent observer could scarcely entertain a doubt of her ultimate

success, was in a most unsettled state. The third campaign had commenced, and had already been marked by several instances of distinguished success. Odysseus and Niketas had effectually harassed and dispersed the two armies of Yusuf Pasha, and Mustapha Pasha, who had entered Eastern Greece, by the passes of Thermopylæ. Corinth, still held by the Turks, was reduced to the greatest extremities—and, indeed, surrendered in the course of the autumn. The Morea might also be said to be thoroughly emancipated. Patras, Modon, and Coron, and the castle of the Morea, did then and still hold out against the combined assaults of famine and the troops of the besiegers. But the ancient Peloponnesus had, at this moment, more to fear from the dissensions of its chiefs, than the efforts of the enemy—they had absolutely assumed something like the character of a civil war. The generals had been ordered on different services, when it appeared, that the funds destined for the maintenance of their armies were already consumed in satisfying old demands for arrears. Much confusion arose, and a bloody conflict actually took place in the streets of Tripolitza, between a troop of Spartiates and another of Arcadians, the followers of rival leaders. The military chiefs, at the head of whom was the able but avaricious Colocotronis, at that time vice-president of the executive government, were jealous of the party which may be termed the civil faction. Over this party presided Mavrocordatos, who, as a Constantinopolitan, was considered as a foreigner, and who, on account of his being a dexterous diplomatist, a good letter-writer, and a lover of intrigue, was regarded with feelings of jealousy and hatred by the rude and iron-handed generals of the Morea. Mavrocordatos was secretary to foreign affairs, and was accused of holding correspondence with foreign courts without the knowledge of the government, and of aiming at getting himself elected the president of the legislative body. It turned out that the actual president fled from the seat of government, and that Mavrocordatos was elected into the office. He too was soon obliged to retreat, and had just resigned the office and retired to the island of Hydra, where the civil and commercial party was strong, and where he was held in considerable estimation, when lord Byron arrived at Cephalonia.

Western Greece too was in a very critical situation—Mustapha, Pasha of Scutari, was advancing on Acarnania in large force, and was on the point of being resisted by the chivalrous devotion of the brave Marco Botzaris. This chief, worthy of the best days of Greece, succeeded on the 9th of August (O. S.) by his famous night attack, in cutting off a considerable part of the Turkish army, and fell a sacrifice to his generous efforts. In spite of this check, however, the Pasha advanced and proceeded towards Anatolicon and Messolonghi; the latter place was invested by Mustapha, and the Albanian chief, Omer-Vrionès, by the early part of October. The Turkish fleet had arrived in the waters of Patras about the middle of June, and continued to blockade (at least nominally) Messolonghi, and all the other ports of Western Greece up to

the arrival of lord Byron. Previous to Marco Botzaris's arrival at Carpenissi, the little village where he discomfited the Turks, he had heard of lord Byron's arrival in Greece, and it is not a little remarkable that the last act he did before proceeding to the attack, was to write a warm invitation to his lordship to come to Messolonghi, offering to leave the army, and to give him a public reception in a manner suitable to the occasion and serviceable to the cause.

‘Almost the first act of lord Byron in Greece, was the arming and provisioning of forty Suliotes, whom he sent to join in the defence of Messolonghi. After the battle he transmitted bandages and medicines, of which he had brought a large store from Italy, and pecuniary succour to those who had been wounded in the battle. He had already made an offer to the government, to which he himself alludes, as well as to the dissensions in Greece, in a letter of which this is an extract. ‘I offered to advance a thousand dollars a month for the succour of Messolonghi, and the Suliotes under Botzaris (since killed), but the government have answered me through ——— of this Island, that they wish to confer with me previously, which is in fact, saying they wish me to expend my money in some other direction. I will take care that it is for the public cause, otherwise I will not advance a para—the opposition say they want to cajole me, and the party in power say the others wish to seduce me, so between the two I have a difficult part to play; however, I will have nothing to do with the factions unless to reconcile them if possible——’ Though solicited in the most flattering manner by count Metaxa, the Exarch of Messolonghi, and others, to repair to that place, lord Byron had too reasonable a fear of falling into the hands of a party to take a decided step in his present state of information. He determined to communicate alone with the established government; for this purpose he despatched two of his friends, Mr. Trelawny and Mr. Hamilton Browne, in order to deliver a letter from him to the government, and to collect intelligence respecting the real state of things. The extreme want of money which was at that time felt in Greece, and the knowledge that lord Byron had brought large funds with the intention of devoting them to the cause, made all parties extremely eager for his presence. He, however, yielded to none of the pressing entreaties that were made to him, but after waiting undecided six weeks in his vessel, he took up his residence on shore, at the village of Metaxata within five or six miles of Argostoli.

Here he resumed his usual occupations, while he kept a watchful eye on all the transactions of Greece, and carried on a very active intercourse with every part of it. Those who know lord Byron's character, know that he rarely resisted the impulse of his feeling, and that these impulses were often of the most benevolent kind. As usual, the neighbourhood of his residence never ceased to experience some kind and munificent exertion of his unfeeling, but by no means indiscriminate or ill-applied, generosity. His physician says, that the day seemed sad and

gloomy to him, when he had not employed himself in some generous exertion. He provided even in Greece for many Italian families in distress, and indulged the people of the country even in paying for the religious ceremonies which they deemed essential to their success. Our informant mentions one circumstance in particular, which affords some idea of the way in which he loved to be of service. While at Metaxata the fall of a large mass of earth had buried some persons alive. He heard of the accident while at dinner, and starting up from the table, ran to the spot, accompanied by the physician, who took with him a supply of medicines. The laborers who were engaged in digging out their companions, soon became alarmed for themselves, and refused to go on, saying, they believed they had dug out all the bodies which had been covered by the ruins. Lord Byron endeavoured to induce them to continue their exertions, but finding menaces in vain, he seized a spade and began to dig most zealously: at length the peasantry joined him, and they succeeded in saving two more persons from certain death.

The friends whom lord Byron had despatched to the government proceeded to the Morea, and crossed the country to Tripolitza, from which place it appeared, that the two assemblies had removed to Salamis. At Tripolitza, however, they had an opportunity of seeing Colocotronis, some of the other distinguished chiefs, as well as the confidential officers of Mavrocordatos' suite, whom he had left behind him in his precipitate retreat from the chair of the legislative assembly, and, consequently, they were able to collect a considerable quantity of information, and procure answers to the questions with which lord Byron had charged them. After doing this, they proceeded to the place where the assembly was collecting. His queries were of a very searching and judicious nature, and the answers obtained were complete enough to afford a very accurate idea of the state, resources, and intentions of the country.

The congress met at Salamis to deliberate on the most important questions, the form of the government, and the measures of the future campaign. The legislative assembly consisted of fifty, and the executive of five. They received the agents of lord Byron in the most friendly manner, and opened every thing to them without reserve; and enabled them to convey to him a very instructive account of the real state of affairs. Ulysses Odysseus, a brave and dexterous mountain chief, of great power and consummate military skill at that time, and still in command of Athens, was about to lead 5000 Albanians into Negropont, whither Mr. Trelawny agreed to accompany him as his aide-de-camp, being promised any number of men he chose under his command. Colocotronis and his son, a fine, spirited young man, with all their forces were to undertake the siege of Patras. Tombasi, the admiral of Hydra, was in command at Candia, where active warfare was expected. Staicos was to remain at Corinth, which surrendered in October, very soon after the congress. Marco Botzari's brother, with his Suliotes, and Mavrocordatos, were to take charge of Messolonghi,

which at that time, October 1823, was in a very critical state, being blockaded both by land and sea.' Mavrocordatos at this time was endeavouring to collect a fleet for the relief of Messolonghi.

Lord Byron's intentions at the same period appear from the following extracts:—'It is my intention to proceed by sea to Nauplia di Romania, as soon as I have managed this business. I mean the advance of the 400 000 piastres for the fleet. My time here has not been entirely lost; indeed, you will perceive by some former documents, that any advantage from my then proceeding to the Morea was doubtful. We have at last named the deputies, and I have written a strong remonstrance on their divisions to Mavrocordatos, which I understand was forwarded to the legislative body by the prince.' He did not, however, depart for the seat of government at the time he had expected, and conceived it necessary to address the authorities again on the subject of their dissensions. The following is a translation of the concluding part of this very admirable letter:—

'Allow me to add once for all, I desire the well-being of Greece and nothing else; I will do all I can to secure it; but I cannot consent, I never will consent, to the English public, or English individuals, being deceived as to the real state of Greek affairs. The rest, gentlemen, depends on you; you have fought gloriously; act honorably towards your fellow-citizens and towards the world, and then it will no more be said, as has been repeated for 2000 years with the Roman historian, that Philopomen was the last of the Grecians. Let not calumny itself (and it is difficult to guard against it in so difficult a struggle) compare the Turkish pasha with the patriot Greek in peace, after you have exterminated him in war.

'30th November, 1823.

N. B.'

In another letter, written a few days after this, we find a circumstance mentioned which turned his views from the Morea to Western Greece. It must be remembered that the Suliotes were his old favorites, and that their late bravery had raised them still higher in his estimation. 'The Suliotes, now in Acarnania, are very anxious that I should take them under my direction, and go over and put things to rights in the Morea, which, without a force seems impracticable, and really though very reluctant, as my letters will have shown you, to take such a measure, there seems hardly any milder remedy. However, I will not do any thing rashly, and have only continued here so long in the hope of seeing things reconciled, and have done all in my power therefore. Had I gone sooner they would have forced me into one party or the other, and I doubt as much now. But we will do our best. December 7th, 1823.' 'I am convinced if they (the Greeks) succeed in getting the loan, the liberty of Greece will be definitively founded on a firm basis. True, there is much difference of opinion existing amongst the people in authority here, as well as in every other country, and some little squabbling for place and power, but they all unite against the common enemy. Love of liberty and exera-

tion of their barbarous oppressors actuate them. What they want, to ensure success and consolidate the government, is money—money—money.'

Lord Byron continues to allude to these unfortunate differences, and is pleasant upon the gasconading which distinguishes the Greek of this day as it did the Greek of the age of Cleon. 'C—— will tell you the recent special interposition of the gods in behalf of the Greeks, who seem to have no enemies in heaven or earth to be dreaded but their own tendency to discord among themselves. But these too, it is to be hoped, will be mitigated, and then we can take the field on the offensive; instead of being reduced to the 'petite guerre' of defending the same fortresses year after year, and taking a few ships, and starving out a castle, and making more fuss about them than Alexander in his cups or Buonaparte in a bulletin. Our friends have done something in the way of the Spartans, but they have not inherited their style. December 10th, 1823.' Soon after the date of this letter the long desired squadron arrived in the waters of Messolonghi, and in a letter written three days after the date of the last, December 13th, his lordship says that 'he momentarily expects advices from prince Mavrocordatos, who is on board, and has, I understand, despatches from the legislative to me; in consequence of which, after paying the squadron, I shall probably join him at sea or on shore.'

He speaks afterwards of the supplies, with some pleasantry, and concludes a letter to his banker, in Cephalonia, thus: 'I hope things here will go well, some time or other; I will stick by the cause as long as a cause exists, first or second.' His lordship had by this time yielded to the solicitations of Mavrocordatos, who repeatedly urged him in the most pressing manner to cross over to Messolonghi, and who offered to send, and did send, ship after ship to Cephalonia, to bring him over. He seems to have been chiefly delayed by the difficulty in procuring money for his Italian bills. When the supplies were procured, and his other preparations made for departure, two Ionian vessels were hired, and embarking his horses and effects, his lordship sailed from Argostoli on the 29th of December. Anchoring at Zante the same evening, the whole of the following day was occupied in making his pecuniary arrangements with Mr. —; and, after receiving a quantity of specie on board, he proceeded towards Messolonghi. But count Gamba had been charged with the vessel in which the horses and part of the money were embarked; and when off Chiarenza, a point which lies between Zante and the place of their destination, they were surprised at day-light on finding themselves under the bows of a Turkish frigate. Owing, however, to the activity displayed on board lord Byron's vessel, and her superior sailing, she escaped, while the second was fired at, brought to, and carried into Patras; but Yusuff Pasha released the vessel.

The wind becoming contrary, Lord Byron's vessel took shelter at Dagoinestre, where Prince Mavrocordatos despatched a gun-boat to accompany him, while a portion of the Greek squadron stationed at Messolonghi, were ordered to cruise in the offing. The vessel afterwards grounded

on a shoal near the Serofes, and was with difficulty got off.

Lord Byron was received at Messolonghi with the most enthusiastic demonstrations of joy. The ships anchored off the fortress fired a salute as he passed. Prince Mavrocordatos and all the authorities, with all the troops and the population collected together, met him on his landing and accompanied him to the house which had been prepared for him, amidst the shouts of the multitude and the discharge of cannon. Nothing could exceed the eagerness with which he had been expected, except the satisfaction which was displayed on his arrival.

One of the first objects to which Lord Byron naturally turned his attention was, to mitigate the ferocity with which the war had been carried on. He had not been long at Messolonghi, before an opportunity presented itself for showing his sense of Yusuff Pasha's moderation in releasing Count Gamba. Hearing that there were four Turkish prisoners in the town, he requested that Prince Mavrocordatos would place them in his hands; this being immediately granted, they were sent to the castle of the Morea, near Patras, with the following letter addressed to the Turkish chief.

'Highness, — A vessel in which a friend and some domestics of mine were embarked, was detained a few days ago and released by order of your highness. I have now to thank you, not for liberating the vessel, which as carrying a neutral flag, and being under British protection, no one had a right to detain, but for having treated my friends with so much kindness while they were in your hands.

'In the hope, therefore, that it may not be altogether displeasing to your highness, I have requested the governor of this place to release four Turkish prisoners, and he has humanely consented to do so. I lose no time, therefore, in sending them back, in order to make as early a return as I could for your courtesy on a late occasion. These prisoners are liberated without any conditions; but, should the circumstance find a place in your recollection, I venture to beg, that your highness will treat such Greeks as may henceforth fall into your hands with humanity, more especially since the horrors of war are sufficiently great in themselves, without being aggravated by wanton cruelties on either side.

'NOEL BYRON.

'Messolonghi, 23rd Janury, 1824.'

Another grand object with Lord Byron, and one which he never ceased to forward with the most anxious solicitude, was to reconcile the quarrels of the native chiefs, to make them friendly and confiding to one another, and submissive to the orders of the government. He had neither time nor much opportunity before his decease to carry this point to any great extent.

Mavrocordatos had dwelt on the importance of his lordship's presence at Messolonghi. Accordingly Lord Byron landed at Messolonghi, animated with military ardor. Five hundred Suliotcs, the bravest and most resolute of the soldiers of Greece, were taken into his pay on the 1st of January, 1824; an object worthy of them and their leader was not difficult to be

found, in the castle of Lepanto, which commands the gulf of that name, the only fortress occupied by the Turks in Western Greece. Its position at the mouth of the gulf, is one of great importance, and enables it to keep up a constant communication with Patras, and while this was the case, it was impossible to reduce it in the ordinary mode of starvation. The garrison consisted of 500 Turks, and a considerable number of Albanians; the soldiers were clamorous for their pay, and much confusion was said to reign in the place. It was understood that the Albanians would surrender on the approach of Lord Byron, and on being paid their arrears, which amounted to 23,000 dollars. Lord Byron was raised to the highest pitch of enthusiasm, and spent his whole time in preparing for the expedition. At the latter end of January, Lord Byron was appointed by the Greek government to the sole command of all the 3000 troops destined to act against Lepanto. But the Suliotes, who conceived that they had found a patron whose wealth was inexhaustible, determined to make the most of the occasion, and proceeded to make the most extravagant demands on their leader for arrears, and under other pretences. Untameable in the field, they were equally unmanageable in a town, and were at this moment peculiarly disposed to be obstinate, riotous, and mercenary. They had been chiefly instrumental in preserving Messolonghi, when besieged the previous autumn by the Turks, had been driven from their abodes, and the whole of their families were at this time in the town destitute of either home or sufficient supplies. Of turbulent and reckless character, they kept the place in awe, and Mavrocordatos having, unlike the other captains, no soldiers of his own, was glad to find a body of valiant mercenaries. Within a fortnight after Lord Byron's arrival, a burgher refusing to quarter some Suliotes who rudely demanded entrance in his house, was killed, and a riot ensued in which some lives were lost. Lord Byron's impatient spirit could ill brook the delay of a favorite scheme, and he saw, with the utmost chagrin, that the state of his favorite troops was such as to render any attempt to lead them out at present impracticable.

The project of proceeding against Lepanto being thus suspended, at a moment when lord Byron's enthusiasm was at its height, it produced a degree of irritability which, if it was not the sole cause, contributed greatly to a severe fit of epilepsy, with which he was attacked on the 15th of February. His lordship was sitting in the apartment of colonel Stanhope, the active and enlightened representative of the Greek committee in Greece, who had gone out to co-operate with lord Byron, and was talking in a jocular manner with Mr. Parry the engineer, when it was observed, from occasional and rapid changes in his countenance, that he was suffering under some strong emotion. On a sudden he complained of a weakness in one of his legs, and rose, but finding himself unable to walk, he cried out for assistance. He then fell into a state of nervous and convulsive agitation, and was placed on a bed. For some minutes his countenance was much distorted. He however,

quickly recovered his senses, his speech returned and he soon appeared perfectly well, although enfeebled and exhausted by the violence of the struggle. During the fit he behaved with his usual remarkable firmness, and his efforts in contending with, and attempting to master the disease, are described as gigantic. In the course of the month the attack was repeated four times; the violence of the disorder at length yielded to the remedies which his physicians advised, such as bleeding, cold bathing, perfect relaxation of mind, &c., and he gradually recovered. An accident happened during this illness, which was ill calculated to aid the efforts of his medical advisers. A Suliote walked into the Seraglio, which had formerly been used as a sort of fortress and barrack for the Suliotes. The sentinel on guard ordered him to retire; and the sergeant of the guard pushed him back. The Suliote struck again: the sergeant and he closed and struggled, when the Suliote drew a pistol from his belt, and shot captain Sass, a Swede, who came up, and ordered him to the guard room. This was a serious affair, and great apprehensions were entertained that it would not end here. The Suliotes refused to surrender the man to justice, alleging that he had been struck, which, in Suliote law, justifies all the consequences which may follow.

Notwithstanding lord Byron's improvement in health, his friends felt from the first that he ought to try a change of air. A gentleman of Zante wrote to him early in March, to induce him to return to that island for a time; in reply to his letter, he said, *I cannot quit Greece* while there is a chance of my being of (even supposed) utility,—there is a stake worth millions such as I am,—and while I can stand at all, I must stand by the cause.

After so severe a fit of illness, it may well be supposed that he was in no humor to pursue his scheme against Lepanto—supposing that his state of health had been such as to bear the fatigue of a campaign in Greece. The Suliotes, however, showed some signs of repentance, and offered to place themselves at his lordship's disposal. They had however another objection to the nature of the service. In a letter which colonel Stanhope wrote to lord Byron on the 6th of March, from Athens, he tells his lordship that he had bivouacked on the 21st of February in the hut of the prefect of the Lepanto district, who had just had a conference with the garrison of that place. This man said that if lord Byron would march there with a considerable force and the arrears due to the troops, that the fortress would be surrendered; and colonel Stanhope adds a pressing entreaty that lord Byron would proceed there immediately, and take advantage of this disposition on the part of the garrison. To this his lordship has appended this note: 'the Suliotes have declined marching against Lepanto, saying that they would not fight against stone walls. Colonel Stanhope also knows their conduct here, in other respects lately.' We may conclude that the expedition to Lepanto was not thought of after this time.

This letter, which communicated the faculty with which Lepanto might be taken, also announced to lord Byron the intention of Ulysses

Odysseus, to summon a congress of chiefs at Salona, to consider of a mode of uniting more closely the interests of Eastern and Western Greece, and arranging between them some method of strict co-operation. The whole of these two districts are all subordinate to their respective governments, and, as the Turkish army was expected to come down, it was supposed by Odysseus that some plan of acting in concert might be hit upon, which would not only enable them to resist the enemy with greater effect, but likewise rapidly advance the progress of civilisation and the authority of the government and constitution; Odysseus, who had the most influence in Eastern Greece, and was able to collect all the chiefs of his own district, was most desirous of prevailing upon Mavrocordatos and lord Byron, who were all-powerful in the opposite territory, to be present at this congress, which he proposed to hold at Salona, a town nearly on the confines of the two departments. Two agents were sent to persuade them to join in the design and repair to Salona. Odysseus himself, first despatched Mr. Finlay, and after him captain Humphries went over to Messolonghi with all haste, by desire of colonel Stanhope. The latter succeeded: lord Byron, as may be supposed, was well disposed to the measure, but his consent was for some time held back by the prince, who had reasons for not approving the congress. Mavrocordatos was always averse to meeting Odysseus, a man of a very different character from himself, nor did he relish the idea of lord Byron's quitting the seat of his government. It was however apparently settled that both should attend at Salona.

But they did not set out in a few days as it seems to have been intended. In the government, which since lord Byron's arrival at Messolonghi had been changed, the civil and island interest now greatly preponderated, and consequently by it a congress of military chiefs was looked upon with some jealousy, and most unjustly stiled an unconstitutional measure. Mavrocordatos's views were now those of the government, so that, in addition to his private motives, he had also a public interest in withholding lord Byron from Salona. Various pretexts were urged for delay—among others, whether a true or a pretended one is not exactly ascertained, a design of delivering up Messolonghi to the Turks was alleged against the Suliotes. But at last came lord Byron's fatal illness, and all schemes of congresses and campaigns were for a time forgotten in the apprehensions entertained for his life, and in the subsequent lamentations over his death: the meeting took place at Salona, on the 16th of April; Mavrocordatos was not there, and lord Byron was on his death-bed.

'My master' says Mr. Fletcher, 'continued his usual custom of riding daily when the weather would permit, until the 9th of April. But on that ill-fated day, he got very wet, and on his return home, his lordship changed the whole of his dress, but he had been too long in his wet clothes, and the cold, of which he had complained more or less ever since we left Cephalonia, made this attack be more severely

felt. Though rather feverish during the night his lordship slept pretty well, but complained in the morning of a pain in his bones and a headache: this did not, however, prevent him from taking a ride in the afternoon, which I grieve to say was his last. On his return, my master said that the saddle was not perfectly dry, from being so wet the day before, and observed that he thought it made him worse. His lordship was again visited by the same slow fever, and I was sorry to perceive on the next morning, that his illness appeared to be increasing. He was very low, and complained of not having had any sleep during the night. His lordship's appetite was also quite gone. I prepared a little arrow-root, of which he took three or four spoonfuls, saying it was very good, but could take no more. It was not till the third day, the 12th, that I began to be alarmed for my master. In all his former colds, he always slept well, and was never affected by this slow fever. I therefore went to Dr. Bruno and Mr. Millingen, the two medical attendants, and enquired minutely into every circumstance connected with my master's present illness: both replied that there was no danger, and I might make myself perfectly easy on the subject, for all would be well in a few days. This was on the 13th; on the following day I found my master in such a state, that I could not feel happy without supplicating that he would send to Zante for Dr. Thomas: after expressing my fears lest his lordship should get worse, he desired me to consult the doctors, which I did, and was told there was no occasion for calling in any person, as they hoped all would be well in a few days. Here I should remark, that his lordship repeatedly said in the course of the day, he was sure the doctors did not understand his disease; to which I answered, then, my lord, have other advice by all means. 'They tell me,' said his lordship, 'that it is only a common cold, which you know I have had a thousand times.' I am sure, my lord, said I, that you never had one of so serious a nature. 'I think I never had,' was his lordship's answer. I repeated my supplications that Dr. Thomas should be sent for on the 15th, and was again assured that my master would be better in two or three days. After these confident assurances, I did not renew my entreaties until it was too late. With respect to the medicines that were given to my master, I could not persuade myself that those of a strong purgative nature were the best adapted for his complaint, concluding that, as he had nothing on his stomach, the only effect would be to create pain: indeed this must have been the case with a person in perfect health. The whole nourishment taken by my master for the last eight days, consisted of a small quantity of broth at two or three different times, and two spoonfuls of arrow-root on the 18th, the day before his death. The first time I heard of there being any intention of bleeding his lordship, was on the 15th, when it was proposed by Dr. Bruno, but objected to at first by my master, who asked Mr. Millingen if there was any very great reason for taking blood: the latter replied that it might be of service, but added that it could be deferred till the next day. And accordingly my master

was bled in the right arm, on the evening of the 16th, and a pound of blood was taken. I observed at the time, that it had a most inflamed appearance. Dr. Bruno now began to say he had frequently urged my master to be bled, but that he always refused; a long dispute now arose about the time that had been lost, and the necessity of sending for medical assistance to Zante, upon which I was informed for the first time, that it would be of no use, as my master would be better, or no more, before the arrival of Dr. Thomas. His lordship continued to get worse, but Dr. Bruno said, he thought letting blood again would save his life, and I lost no time in telling my master how necessary it was to comply with the doctor's wishes; to this he replied by saying, he feared they knew nothing about his disorder, and then stretching out his arm, said, 'here, take my arm and do whatever you like.' His lordship continued to get weaker, and on the 17th he was bled twice in the morning, and at two o'clock in the afternoon; the bleeding at both times was followed by fainting fits, and he would have fallen down more than once, had I not caught him in my arms. In order to prevent such an accident, I took care not to let his lordship stir without supporting him. On this day, my master said to me twice,—'I cannot sleep, and you well know I have not been able to sleep for more than a week: I know,' added his lordship, 'that a man can only be a certain time without sleep, and then he must go mad, without any one being able to save him; and I would ten times sooner shoot myself than be mad, for I am not afraid of dying, I am more fit to die than people think.' I do not, however, believe that his lordship had any apprehension of his fate till the day after, the 18th, when he said, 'I fear you and Tita will be ill by sitting up constantly night and day.' I answered, 'we shall never leave your lordship till you are better.' As my master had a slight fit of delirium on the 16th, I took care to remove the pistols and stiletto which had hitherto been kept at his bed side in the night. On the 18th his lordship addressed me frequently, and seemed to be very much dissatisfied with his medical treatment. I then said, 'Do allow me to send for Dr. Thomas,' to which he answered, 'do so, but be quick. I am only sorry I did not let you do so before, as I am sure they have mistaken my disease; write yourself, for I know they would not like to see other doctors here.' I did not lose a moment in obeying my master's orders, and on informing Dr. Bruno and Mr. Millengen of it, they said it was very right, as they now began to be afraid themselves. On returning to my master's room, his first words were, 'Have you sent?' 'I have, my lord,' was my answer; upon which he said, 'You have done right, for I should like to know what is the matter with me.' Although his lordship did not appear to think his dissolution was so near, I could perceive he was getting weaker every hour, and he even began to have occasional fits of delirium. He afterwards said, 'I now begin to think I am seriously ill, and, in case I should be taken off suddenly, I wish to give you several directions, which I hope you will be particular in seeing

executed.' I answered I would, in case such an event came to pass, but expressed a hope that he would live many years, to execute them much better himself, than I could. To this my master replied, 'No, it is now nearly over,—and then added, 'I must tell you all without losing a moment.' I then said, 'Shall I go my lord, and fetch pen, ink, and paper?' 'Oh! my God, no—you will lose too much time, and I have it not to spare, for my time is now short,' said his lordship, and immediately after, 'Now, pay attention;' his lordship commenced by saying, 'You will be provided for. I begged him, however, to proceed with things of more consequence; he then continued, 'Oh, my poor dear child! my dear Ada; my God, could I but have seen her! give her my blessing—and my dear sister Augusta and her children;—and you will go to lady Byron, and say ——— tell her everything,—you are friends with her.' His lordship appeared to be greatly affected at this moment. Here my master's voice failed him, so that I could only catch a word at intervals, but he kept muttering something very seriously for some time, and would often raise his voice and say, 'I fetcher, now if you do not execute every order which I have given you, I will torment you hereafter if possible.' Here I told his lordship in a state of the greatest perplexity, that I had not understood a word of what he said, to which he replied, 'Oh, my God! then all is lost! for it is now too late—can it be possible you have not understood me?' 'No, my lord,' said I, 'but I pray you to try and inform me once more.' 'How can I?' rejoined my master, 'it is now too late, and I am over.' I said, 'Not our will, but God's be done;' and he answered, 'Yes, not mine be done—but I will try —' His lordship did indeed make several efforts to speak, but could only repeat two or three words at a time, such as,—'my wife! my child! my sister! you know all,—you must say all,—you know my wishes;' the rest was quite unintelligible. A consultation was now held (about noon), when it was determined to administer some Peruvian bark and wine. My master had now been nine days without any sustenance whatever, except what I have already mentioned. With the exception of a few words, which can only interest those to whom they were addressed, and which, if required, I shall communicate to themselves, it was impossible to understand anything his lordship said, after taking the bark. He expressed a wish to sleep. I at one time asked whether I should call Mr. Parry, to which he replied, 'Yes, you may call him.' Mr. Parry desired him to compose himself. He shed tears, and, apparently, sunk into a slumber. Mr. Parry went away, expecting to find him refreshed on his return,—but it was the commencement of the lethargy preceding his death. The last words I heard my master utter were at six o'clock on the evening of the 18th, when he said, 'I must sleep now; upon which he laid down, never to rise again! for he did not move hand or foot during the following twenty-four hours. His lordship appeared, however, to be in a state of suffocation at intervals, and had a frequent rattling in the throat: on these occasions, I called Tita to assist me in

raising his head, and I thought he seemed to get quite stiff. The rattling and choking in the throat took place every half hour; and we continued to raise his head whenever the fit came on, till six o'clock in the evening of the 19th, when I saw my master open his eyes, and then shut them, but without showing any symptom of pain, or moving hand or foot. 'Oh! my God,' I exclaimed, 'I fear his lordship is gone.' The doctors then felt his pulse, and said, 'You are right—he is gone.'

From the account of the examination of the body it is plain that lord Byron died in consequence of inflammation of the brain: at least if the appearances really were as described: and the cause of the attack was clearly his exposure to wet and cold on the 9th of April.

His lordship's death was a severe blow to the people of Messolonghi, and they testified their sincere and deep sorrow by paying his remains all the honors their state could by any possibility invent and carry into execution. The rude and military mode in which the inhabitants of Messolonghi, and other places, vented their lamentations over the body of their deceased patron and benefactor, touches the heart more deeply than the vain and empty pageantry of much more civilised states. Immediately after the death of lord Byron, and it was instantly known, for the whole town were watching the event, the prince Mavrocordatos published the following proclamation:—

Art. 1185.

'Provisional Government of Western Greece.'

'The present day of festivity and rejoicing, is turned into one of sorrow and mourning.

'The lord Noel Byron departed this life at six o'clock last night, after an illness of ten days: his death being caused by an inflammatory fever. Such was the effect of his lordship's illness on the public mind, that all classes had forgotten their usual recreations of Easter, even before the afflicting end was apprehended.

'The loss of this illustrious individual is undoubtedly to be deplored by all Greece; but it must be more especially a subject of lamentation at Messolonghi, where his generosity has been so conspicuously displayed, and of which he had even become a citizen, with the ulterior determination of participating in all the dangers of the war.

'Every body is acquainted with the beneficent acts of his lordship, and none can cease to hail his name as that of a real benefactor.

'Until, therefore, the final determination of the national government be known, and by virtue of the powers with which it has been pleased to invest me, I hereby decree,

'1st. Tomorrow morning, at daylight, thirty-seven minute guns will be fired from the grand battery, being the number which corresponds with the age of the illustrious deceased.

'2nd. All the public offices, even to the tribunals, are to remain closed for three successive days.

'3rd. All the shops, except those in which provisions or medicines are sold, will also be shut: and it is strictly enjoined, that every spe-

cies of public amusement, and other demonstrations of festivity, at Easter, may be suspended.

'4th. A general mourning will be observed for twenty-one days.

'5th. Prayers and a funeral service are to be offered up in all the churches.

(Signed)

A. MAVROCORDATOS.

GIORGIS PRAIDIS,

Secretary.

Given at Messolonghi,

this 19th day of April, 1824.

There was considerable difficulty in fixing upon the place of interment. No directions had been left by lord Byron—and no one could speak as to the wishes he might have entertained on the point. After the embalming, the first step was to send the body to Zante, where the authorities were to decide as to its ultimate destination. Lord Sidney Osborne, a relation of lord Byron by marriage, the secretary of the senate at Corfu, repaired to Zante to meet it. It was his wish, and that of some others, that his lordship should be interred in that island—a proposition which was received with indignation and most decidedly opposed by the majority of the English. By one it was proposed that his remains should have been deposited in the temple of Theseus, or in the Parthenon at Athens, and as some importance might have been attached to the circumstance by the Greeks, and as there is something consolatory in the idea of lord Byron reposing at last in so venerable a spot, thus re-consecrating, as it were, the sacred land of the arts and the muses, we cannot but lament that the measure was not listened to. Ulysses sent an express to Messolonghi, to solicit that his ashes might be laid in Athens; the body had then, however, reached Zante, and it appearing to be the almost unanimous wish of the English that it should be sent to England, for public burial in Westminster Abbey or St. Paul's, the resident of the island yielded. The Florida was therefore taken up for that purpose.

On its arrival in England, the body lay in state in London for two days, and was escorted out of town by a train of carriages belonging to distinguished personages of various parties. At Nottingham it was received by the corporation, and attended to the place of interment at Hucknall, near his former seat of Newstead Abbey, where a plain marble slab records his name and title, date of death, and age. Lord Byron, besides his legitimate child and heirress, left another daughter in Italy, to whom he bequeathed £5000 on the condition of her not marrying an Englishman. His successor to the title was his cousin, Captain George Anson Byron, of the navy.

We have alluded to certain suppressed 'Memoirs' which lord Byron is said to have written. These he presented to his friend Mr. Thomas Moore, who sold or pledged the copy-right to Mr. Murray for 2000 guineas. On the demise of his lordship an arrangement took place with the family, by which the manuscript was destroyed, and the money returned.

Into the personal character of lord Byron we are not disposed to enter deeply: the grave has scarcely closed upon him; and various exculpatory, as well as honorable facts, in his history,

may yet be brought to light. Certainly his efforts for the Greek cause (in which we have followed him therefore at considerable length) present the redeeming points of his character. Here he found an unoccupied field for high designs and noble daring. The poet, and the scholar, and the British peer, could here receive and impart unquestionable honor. Here, therefore, his purse was as freely opened as his person and character were boldly embarked, and his former dissipated habits forsaken. And although he was scarcely permitted to see the morning star of the liberties of Greece, he accomplished something for her future benefit, in the union he counselled and for a time effected amongst her rulers; in mitigating the ferocities that

had hitherto marked the Greek as well as the Turkish mode of warfare; and in the splendid disinterestedness of his example. As a poet claiming the first rank, and perhaps the first name of his age, he was only too independent of every acknowledged school: his thoughts, his feelings, his modes of expression, were altogether self-emanative; he bends every thing to the purpose of his genius; he owes little to any rules of his art, and nothing to imitation or his predecessors. But his works have already formed the reader's judgment respecting him. They are published in both the common 8vo. and small 8vo. sizes; the former in 7 vols. the small 8vo. in 8 vols.

BYRON'S ISLAND, an island in the Pacific Ocean, about twelve miles in length, low and flat, full of woods, in which the cocoa tree is predominant. The inhabitants are tall and well proportioned, and of good features. All go naked, wearing strings of shells as ornaments round the neck and wrists. One individual was seen with a string of human teeth about his waist, which he refused to part with. These people use various weapons; the most remarkable is a spear, which, for three feet of its length, is set full of shark's teeth. This island was discovered by commodore Byron, in 1765. Long. 173° 16' E., lat. 1° 18' S.

BYRRHUS, in entomology, a genus of insects belonging to the order of coleoptera. The feelers are clavated, pretty solid, and a little compressed. The species of this genus are *gigas*, *pilula*, *ater*, *dorsalis*, *varius*, *æneus*, *nitidus*, *fasciatus*, and *virescens*.

BYRSEUS, in fabulous history, a king of Thrace, who having entertained Jupiter, Mercury, and Neptune, with great hospitality, was offered, as a reward for his virtue, whatever he should ask. Having no children, he asked a son, whom these deities accordingly co-operated to produce, in a manner equally miraculous and ridiculous, by jointly making their water in a bull's hide; which, being buried in the earth, in due time produced the boy Orion.

BYSSAS, a Thracian monarch, who, according to Diodorus Siculus, founded Byzantium. Eustathius makes him a native of Megara, who arrived in Thrace, and settled there with a colony of Megarenses, a short time before the expedition of the Argonauts.

BYSSOLETE, a massy mineral, of an olive-green color, in short stiff filaments, implanted perpendicularly on stones, like moss. It has been found near Mont Blanc, on gneiss.

BYSSUM, or BYSSCS, a fine thready matter produced in India, Egypt, and about Elis in Achaia, of which the richest apparel was anciently made, especially that worn by the priests both Jewish and Egyptian. Some interpreters render the Greek *βυσσος*, which occurs both in the Old and New Testament, by *fine linen*. But other versions, as Calvin's and the Spanish printed at Venice in 1556, explain the word by *silk*; and yet byssus must have been different

from our silk, as appears from many ancient writers, particularly Julius Pollux. M. Simon agrees with Hesychius and Bochart, that the byssus was a finer kind of linen, which was frequently dyed purple. Some authors will have the byssus to be the same with our cotton, others take it for the *linum asbestinum*; and others for the lock or bunch of silky hair found adhering to the pinna marina, by which it fastens itself to other bodies. That of Judea was the finest.

BYSSUS, in botany, a genus of mosses, belonging to the order algae, in the cryptogamia class of plants; and ranked by some under algae, the fifty-seventh order in the natural method; though others rank them under the fifty-eighth, fungi. The characters are, that the mosses of it are composed of simple and uniform parts, and always appear in the form of excrescences, either of a woolly or of a dusty matter. It seems properly a genus of a middle kind, between the mushrooms and the mosses, but most approaching to the latter, as the several species of it are of longer duration, and want that fleshy texture which distinguishes the fungus class, and as they never produce heads, nor have any thing of the figure or texture of fungi. They have not yet been discovered to have either flower or seed, but appear always in form of threads, or of a light down, on the surface of many different bodies, but principally such as are liable to putrefaction. Michaeli, in his *Nov. Gen. Plantarum*, p. 210, mentions the seeds of some of the byssi: but later botanists, and particularly the indefatigable Dillenius, were never able to observe them. This last author has described twenty species of these small plants. There are fifteen natives of Britain. They are found in many parts of Europe, covering the ground like a carpet.

BYSSUS asbestinus, a species of asbestos or combustible flax, composed of fine flexible parallel fibres. It is found plentifully in Sweden, either white or of different shades of green. At a copper mine, in Westmannland, it forms the greatest part of the vein out of which the ore is dug; and, by the heat of the furnace which melts the metal, is changed into a pure semi-transparent glass.

BYSTROPOGON, in botany, a genus of plants of the class didynamia, order gymnospermia, natural order *verticillata*; essential charac-

ters, CAL. bearded; cor. a bifid upper lip, the lower one being three lobed; stam. distant. There are seven species, viz. 1. *B. pectinatum*, a perennial plant, growing from six to seven feet high, and bearing a fine yellow flower; 2. *B. plumosum*, a native of the Canary Isles; 3. *B. originifolium*, also from the Canaries; 4. *B. Canariensis*, found at Madeira; 5. *B. punctatum*, brought from Madeira by Sir Joseph Banks; 6. *B. snavolens*, an annual shrub, growing in South America, and the West Indies. It is very much made use of as a cephalic and alexipharmic.

BYZANTIUM, an ancient city of Thrace, situated on the Bosphorus. It was founded, according to Eusebius, about the thirtieth olympiad, while Tullius Hostilius reigned in Rome. But according to Diodorus Siculus, the foundations were laid in the time of the Argonauts, by one Bysas, from whom the city was called Byzantium. See *BYZAS*. Velleius Paterculus ascribes the founding of it to the Milesians, and Ammianus Marcellinus to the inhabitants of Attica. Some ancient Byzantine medals bear the name and head of Bysas, with the prow of a ship on the reverse. The year after the destruction of Jerusalem by Titus, Byzantium was reduced to a Roman province. In A. D. 193 it took part with Niger against Severus. It was strongly garrisoned by Niger, as being a place of the utmost importance. It was soon after invested by Severus; and, as he was universally hated for his cruelty, the inhabitants defended themselves with the greatest resolution. They had been supplied with a great number of warlike machines, most of them invented and built by Periscus, a native of Nicaea, and the greatest engineer of his age. For a long time they baffled all the attempts of the assailants, killed great numbers of them, and crushed with large stones such as approached the walls; and when stones began to fail, they used the statues of their gods and heroes. At last they were obliged to submit, through famine, after having been reduced to the necessity of devouring one another. Severus put all the magistrates and soldiers to the sword; but spared the engineer Periscus. Before this siege Byzantium was the greatest, most populous, and wealthiest city in Thrace. It was surrounded by walls of an extraordinary height and breadth; and defended by a great number of towers, seven of which were built with such art, that the least noise heard in one of them was immediately conveyed to all the rest. But Severus was no sooner master of it, than he laid it in ashes. The inhabitants were stripped of all their effects, and sold for slaves, and the walls levelled with the ground. By the chronicle of Alexandria we are informed, that, soon after this terrible catastrophe, Severus himself caused a great part of the city to be rebuilt, calling it Antonina from his son Antoninus Ca-

racalla. In 262 the tyrant Gallienus wreaked his fury on the inhabitants of Byzantium. He intended to besiege it; but on his arrival, despaired of being able to make himself master of such a strong place. He was admitted the next day, however, into the city; and, without regarding the terms he had agreed to, caused the soldiers and all the inhabitants to be put to the sword. Trebellius Pollio says, that not a single person was left alive. What the reason was for such an extraordinary massacre, we are nowhere informed. In the wars between the emperors Licinius and Maximin, Byzantium was obliged to submit to the latter, but was soon after recovered by Licinius. In 323 it was taken from Licinius by Constantine the Great, who in 330 greatly enlarged and beautified it. He began with extending its walls from sea to sea; and, while some of the workmen were busied in rearing them, others were employed in raising within them a great number of stately buildings, and among others a palace no way inferior in magnificence and extent to that of Rome. He built a capitol and amphitheatre, and made a circus maximus, several forums, porticoes, and public baths; and divided the whole city into fourteen regions. Thus Byzantium became one of the most flourishing and populous cities of the empire. Vast numbers of people flocked to it from Pontus, Thrace, and Asia, Constantine having decreed, that such as had lands in those countries should not be at liberty to dispose of them, nor even leave them to their heirs at their death, unless they had a house in his new city. But however desirous the emperor was that his city should be filled with people, he did not wish it to be inhabited by any but Christians. He therefore caused all the idols to be pulled down, and all their temples consecrated to the true God. He built besides an incredible number of churches, and caused crosses to be erected in all the squares and public places. Most of the buildings being finished, it was solemnly dedicated to the Virgin Mary, according to Cedrenus, but, according to Eusebius, to the God of Martyrs. At the same time Byzantium was equalled to Rome in point of privileges. The same rights and immunities were granted to its inhabitants as to those of the metropolis. He established a senate and other magistrates, with a power and authority equal to those of Old Rome. He took up his residence in the new city, and changed its name to *CONSTANTINOPLE*, which see.

BZOVIUS (Abraham), a celebrated writer of the seventeenth century. His chief work is the continuation of Baronius's Annals. He was a native of Poland, and a Dominican friar. Upon his coming to Rome he was received with open arms by the pope, and had an apartment assigned him in the Vatican. He died in 1637, aged seventy.

C.

C, the third letter of the alphabet, has two sounds; but neither of them properly its own. Ben Jonson says, 'our forefathers might very well have spared it in our tongue.' It sounds like *k*, before *a*, *o*, *u*, or a consonant; and like *s*, before *e*, *i*, and *y*. In Saxon and Irish it is invariably pronounced like *k*.

C, in music, the name of that note in the natural major mode, to which Guido applied the monosyllable, for which the Italians now substitute D².—C above G gamut, that note which is a fourth higher than G gamut.—C above the bass cliff, that note which is a fifth higher than the bass cliff.—C above the treble cliff, a note which is a fourth higher than the treble cliff.

CAA APHA, in botany, the Brazilian name of the *dorstema Brasilensis*, the root of which so much resembles the *ipeacuanha* in its virtues, that some have erroneously called it by the same name. It is astringent and emetic, but possesses both qualities in a weaker degree, and is therefore given in a larger dose, a dram being commonly given at once. The Brasilians bruise the whole plant, and express the juice, which they take internally, and apply externally to wounds by poisoned arrows, and by the bites of serpents.

CAABA, or CAABAN, properly signifies a square stone building; but is particularly applied by the Mahomedans to the temple of Mecca. This edifice is indisputably so ancient, that its original use and the name of its builder are lost in a cloud of idle traditions. The Mahomedans affirm that it is almost coeval with the world, and they pretend that Adam, after his expulsion from paradise, supplicated divine permission to erect a building like what he had seen there, called 'Beit al Mamâr,' or the frequented house, and 'Al Dorâh,' towards which he might direct his prayers, and which he might compass, as the angels do the celestial one. Upon which God let down a representation of that house in curtains of light, and set it in Mecca, perpendicularly under its original, ordering the patriarch to turn towards it when he prayed, and to compass it by way of devotion. After Adam's death, they say, his son Seth built a house in the same form, of stones and clay, which, being destroyed by the deluge, was rebuilt by Abraham and Ishmael, at the command of God, in the place where the former had stood, and after the same model; directions for this purpose having been given them by revelation. Independently of these fabulous traditions, it is not improbable that it was erected by some of the patriarchs descended from Ishmael; but whether it was built as a place of divine worship, as a fortress, as a sepulchre, or as a monument of the treaty between the old possessors of Arabia and the sons of Kedar, it is impossible to ascertain. Reland supposes that it was the mansion of some ancient patriarch, and on that account revered by his posterity. At length it came to be appropriated to the service of pagan Arab divinities; but that it was not

originally a temple seems to appear from these circumstances,—that the door was not placed in the middle of the structure, and that, for many ages, there was no divine worship performed in it, though the pagan Arabs frequently went in procession round it. It is most probable, however, that the caaba was primarily designed for religious purposes; and it is certain that it was held in the highest veneration long before the birth of Mahomet. Having undergone several reparations, it was, a few years after his birth, rebuilt by the tribe of Koreish, who had acquired the custody of it either by fraud or force, on the same foundation; afterwards repaired by Abdallah Ebn Zobeir, the caliph of Mecca, and again rebuilt by Yusof, surnamed Al Hejâj, in the seventy-fourth year of the Hegira, with some alterations, in the form in which it now remains. The temple is in length, from north to south, about twenty-four cubits; in breadth, from east to west, twenty-three; and in height twenty-seven. The door, which is on the east side, stands about four cubits from the ground; the floor being level with the bottom of the door. In the corner next this door is the black stone, so much celebrated among the Mahomedans. On the north side of the caaba, within a semi-circular enclosure fifty cubits long, lies the white stone, said to be the sepulchre of Ishmael, which receives the rain water from the caaba by a spout, formerly of wood, but now of gold. The black stone, according to the Mahomedans, was brought down from heaven by Gabriel at the creation of the world; and originally of a white color; but contracted the blackness which now appears on it, from the guilt of the sins committed by the sons of men! It is set in silver, and fixed in the south-east corner of the caaba, looking towards Basra, about seven spans from the ground. This stone, upon which there is the figure of a human head, is held in the highest estimation among the Arabs; all the pilgrims kissing it with great devotion, and some even calling it the right hand of God. Its blackness, which is only superficial, is probably owing to the kisses and touches of so many people. After the Karmatians had taken Mecca, they carried away this precious stone, and could by no means be prevailed upon to restore it; but finding at last that they were unable to prevent the concourse of pilgrims to Mecca, they sent it back of their own accord, after having kept it twenty-two years. The double roof of the caaba is supported within by three octagonal pillars of aloes-wood; between which, on a bar of iron, hang some silver lamps. The outside is covered with rich black damask, adorned with an embroidered band of gold, which is changed every year, and was formerly sent by the caliphs, afterwards by the sultans of Egypt, and is now provided by the Turkish emperors. The caaba, at some distance, is almost surrounded by a circular enclosure of pillars, joined towards the bottom by a low balustrade, and towards the top by bars of silver. Just

without this inner enclosure, on the south, north, and west sides of the caaba, are three buildings, which are the oratories where three of the orthodox sects assemble to perform their devotions. Towards the south-east stands an edifice which covers the well zemzen, the treasury, and the cupola of Al Abbas. Formerly there was another cupola, that went under the name of the hemicycle, or cupola of Judæa: but whether any remains of that are now to be seen is unknown; nor is it easy to obtain information in this respect, all Christians being denied access to this holy place. At a small distance from the caaba, on the east side, is the station of Abraham; where is another stone much respected by the Mahomedans, and where they pretend to show the footsteps of the patriarch, where he stood when he built the caaba. Here the fourth sect of Arabs, viz. that of Al Shafei, assemble for religious purposes. The square colonnade, or great piazza, which at a considerable distance encloses these buildings, consists, according to Al Janabi, of 448 pillars, and has no less than thirty-eight gates. Mr. Sale compares this piazza to that of the Royal Exchange at London, but allows it to be much larger. It is covered with small domes or cupolas, from the four corners of which rise as many minarets or steeples with double galleries, and adorned with gilded spires and crescents, as are also the cupolas which cover the piazza and other buildings. Between the columns of both enclosures hang a great number of lamps, which are constantly lighted at night. The first foundation of this second enclosure was laid by Omar, who built no more than a low wall, to prevent the court of the caaba from being encroached upon by private buildings: but by the liberality of succeeding princes the whole has been raised to that state of magnificence in which it appears at present. This temple is an asylum for all criminals; but it is most remarkable for the pilgrimages made to it by the devout mussulmans, who pay so great a veneration to it, that they believe a single sight of its sacred walls, without any particular act of devotion, is as meritorious, in the sight of God, as the most careful discharge of duty, for a whole year, in any other temple!

CAAMINA, or CAAMINIA, in botany, a name given by the Spaniards and others to the finest sort of Paraguayan tea. It is the leaf of a shrub which grows on the mountains of Maracaya, and is used in Chili and Peru, as tea is with us. The mountains where this shrub grows naturally are far from the inhabited parts of Paraguay; but the people of the place know so well the value and use of it, that they constantly furnish themselves with great quantities of it from the spot. They used to go out on these expeditions many thousands together; leaving their country in the meantime exposed to the insults of their enemies, and many of themselves perishing by fatigue. To avoid these inconveniences, they have of late planted these trees about their habitations; but the leaves of these cultivated ones have not the fine flavor of those that grow wild. The king of Spain has permitted the Indians of Paraguay to bring to the town of Santa Fé 12,000 arobas of the leaves of this tree every year; but they are

not able to procure so much of the wild leaves annually; about half the quantity is the utmost they bring; the other half is made up of the leaves of the trees in their own plantations: and this sells at a lower price, and is called pabos. The aroba is about twenty-five pounds weight; the general price is four piastres; and the money is always divided among the people of the colony.

CAANA, KAANA, a town in Upper Egypt, on the east banks of the Nile, whence they carry corn and pulse to Mecca. It contains several monuments of antiquity, inscribed with hieroglyphics. It is 320 miles south of Cairo. Long. 30° 23' E., lat. 26° 30' N.

CAB. *n. s.* [קב] A Hebrew measure, containing about three pints English, or the eighteenth part of the ephah.

CABAL', <i>v. & n.</i>	} Heb. <i>cabala</i> ; from hence Ital. <i>cabala</i> ; Fr. <i>cabale</i> . The verb is in Fr. <i>cabaler</i> . Ital. <i>cabulare</i> . Jewish tradition concerning the Old Testament; mere inventions of the rabbies, which they, a crew of cunning deceivers, united for the purpose of vile intrigue, and securing to themselves the veneration of the people, pretended were divine mysteries. A cabal is a body of men united in some close design; to form close intrigues; to unite in small parties. A cabal differs from a party, as <i>few</i> from <i>many</i> .
CAB'ALA, <i>n.</i>	
CAB'ALIST,	
CAB'ALISM,	
CABALISTICAL,	
CABALISTICK,	
CABALISTICALLY,	
CABAL'LER.	

Faction and rich, bold at the council board;
But, cautious in the field, he shunned the sword;
A close *caballer*, and tongue-valiant lord. *Dryden*.
His mournful friends, summoned to take their leaves,

Are thronged about his couch, and sit in council:
What those *caballing* captains may design,
I must prevent, by being first in action. *Id.*

When each, by cursed *cabals* of women, strove
To draw the indulgent king to partial love. *Id.*
Then Jove thus spake: with care and pain
We formed this name, renowned in rhyme,
Not thine, immortal Neufgermain!
Cost studious *cabalists* more time. *Swift*.

She often interposed her royal authority, to break the *cabals* which were forming against her first ministers. *Addison*.

The letters are *caballistical*, and carry more in them than it is proper for the world to be acquainted with. *Id.*

He taught him to repeat two *caballistick* words, in pronouncing of which the whole secret consisted. *Spectator*.

CABAL is said to have been a kind of acrostical name given to the infamous ministry of Charles II., composed of Clifford, Ashley, Buckingham, Arlington, and Lauderdale; the first letters of whose names, in this order, formed the word which has since become an appellative for similar juntos. But it would appear to be of greater antiquity.

CABALA, or CABALA VEIN, in natural history, a kind of iron ore, commonly wrought in Sussex. It is stony, of a brownish color, with a blush of red, which is more or less conspicuous in different parts of the same masses. It is

usually found in thin strata, near the surface, and is not very rich in iron, but runs very readily in the fire.

CABALA. See **CAEBALA**.

CABALARIA, in botany; class polygamia, order diœcia: **CAL.** small, persisting, campanulate, with five oval divisions: **cor.** wheel-shaped; tube very short; border divided into five oval segments: **stam.** anthers five, inserted at the base of the segments of the corolla: **pist.** stigma sessile, five-sided; germ superior, nearly round: **per.** globular, drupe one-seeded, with five oblong points. Eight species are described in the *Flora Peruviansis*, all shrubs, natives of South America.

CABALLARIA, in middle age writers, lands held by the tenure of furnishing a horseman with suitable equipage, in time of war, or when the lord had occasion for him.

CABALLI, or **COBALES**, among mystic philosophers, denote the shades, or bodies of men who died any sudden or violent death before the expiration of their predestinated term of life. They were supposed to wander as ghosts over the face of the earth, till their destined term was accomplished; being doomed to live out the time as spirits, which they ought to have spent in the flesh.

CABALLINUM, in ancient geography, a town of the *Ædii*, in *Gallia Celtica*; now called *Chalons sur Saône*, which see.

CABALLINUS, in ancient geography, a clear fountain of mount *Hælicon*, in *Beotia*; called *Hippocrene* by the Greeks, fabled to have been opened by *Pegasus* on striking the rock with his hoof, and hence called *Pegasus*.

CABANIS (Peter John George), a French physician, born about 1756. He became connected with *Mirabeau*, and was one of the council of five hundred in the revolution. He died in 1808. His works are,—1. *Observations sur les Hopitaux*, 8vo. 2. *Journal de la Maladie et de la Mort de Mirabeau*, 8vo. 3. *Melanges de Litterature Allemande*. 4. *Du Degre de Certitude de la Medicine*, 8vo. 5. *Quelques Considerations sur l' Organization Sociale en generale*, 12mo. 6. *Des Rapports du Physique et du Morale de l'Homme*, 2 vols. 8vo. 7. *Coup d'œil sur les Revolutions et la Reforme de la Medicine*, 8vo. 8. *Observations sur les Affections Catarrhales*, 8vo.

CABBAGE, *v. & n.* } *Cole*, with a head;
 CABBAGE-TREE. } a species of plant. *Fr.* *chou cabus*; *Ital.* *volò cappuccio*; *capitati*, from *Lat.* *caput*. The name is supposed by some to have been given to particular kinds of cole, to distinguish them from others that do not cabbage or head. To cabbage, is to form a head as the plants begin to cabbage. To cabbage, a cant word among tailors, and refers to what is taken or purloined in cutting out clothes, is from the *Ital.* *capezzo*, *roba caputa*; from *Lat.* *capio*.

'Tis scarce an hundred years since we first had cabbages out of Holland, Sir *Arth. Ashley* of *Wiberg St. Giles*, in *Dorsetshire*, being, as I am told, the first who planted them in England.

Acetaria, or Discourse of Sallets.

Amongst herbs to be eaten, I find gourds, cucum-
VOL. IV.

bers, coleworts, melons, disallowed, but especially cabbage. *Burton's Anatomy of Melancholy.*

Your taylor, instead of shread, cabbages whole-yards of cloth. *Arbuthnot.*

The leaves are large, fleshy, and of a glaucous color; the flowers consist of four leaves, which are succeeded by long taper pods, containing several round acrid seeds. The species are, cabbage. Savoy cabbage. Broccoli. The cauliflower. The musk cabbage. Branching tree cabbage, from the sea coast. Colewort. Perennial Alpine colewort. Perfoliated wild cabbage, &c. *Miller.*

It is very common in the *Caribbee* islands, where it grows to a prodigious height. The leaves of this tree envelope each other, so that those which are enclosed, being deprived of the air, are blanched; which is the part the inhabitants eat for plants for hats, and the young shoots are pickled; but whenever this part is cut out, the trees are destroyed; nor do they rise again from the old roots; so that there are very few trees left remaining near plantations. *Id.*

Cole cabbage, and coleworts, are soft and demulcent, without any acidity; the jelly or juice of red cabbage, baked in an oven, and mixed with honey, is an excellent pectoral. *Arbuthnot, on Aliment.*

CABBAGE BARK TREE. See **GEORGEA**.

CABBAGE DOG'S. See **TRIFOLIUM**.

CABBAGE PALM, TREE. See **ARICA**.

CABBAGE, SEA. See **CRAMBI**.

CABBAGE, TREE. See **CALALIA**.

CABBALA, a mysterious kind of science, pretended to have been delivered by revelation to the ancient Jews, and transmitted by oral tradition to those of our times; serving for interpretation of the books both of nature and Scripture. The word is also written *Cabala*, *Kabbala*, *kabala*, *Cabalistica*, *Ars Cabala*, and *Gaballu*. It is originally Hebrew קַבְּלָה, *kabbalah*; and properly signifies reception; formed from the verb קָבַל, *kibel*, to receive by tradition. *Cabbala* then primarily denotes any sentiment, opinion, usage, or explication of Scripture transmitted from father to son. In this sense, the word is not only applied to the whole art; but also to each operation performed according to its rules. Thus *R. Jac. Ben-Ascher*, surnamed *Baal-Hatturim*, is said to have compiled most of the *cabbalas* invented on the books of *Moses* before his time. The *cabbala* is by some called the aromatic philosophy of *Moses*, by way of distinction from the exoteric or popular doctrine. The generality of the Jews prefer the *cabbala* to the Scripture; comparing the former to the sparkling lustre of a precious stone, and the latter to the faint glimmering of a candle. The first author who delivered any thing of the *cabbala* was *Joachides*, *Simon* son of *Joachai*, who published a famous cabbalistical work, entitled *Zohar*. Some say, he lived about the time of the destruction of *Jerusalem* by *Titus*; others only in the tenth century. There are no sure principles of this knowledge. It depends entirely upon the traditions of the ancients. The cabbalists have abundance of names which they call sacred; these they make use of in invoking of spirits, and imagine they receive great light from them. They told us that the secrets of the *cabbala* were discovered to *Moses* on mount *Sinai*; and that these have been delivered down to them from father

to son, without interruption, and without any use of letters; for to write them down, is what they are by no means permitted to do. This is likewise termed the oral law, because it passed from father to son, in order to distinguish it from the written laws. Another kind of cabbala, viz.

Artificial CABBALA, consists in searching for abstruse and mysterious significations of a word in Scripture, whence they borrow certain explanations, by combining the letters which compose it: this cabbala is divided into three kinds, the gematric, the notaricon, and the temura or themurah. The gematric consists in taking the letters of a Hebrew word for ciphers or arithmetical numbers, and explaining every word by the arithmetical value of the letters whereof it is composed. The notaricon consists in taking every particular letter of a word for an entire diction. The themurah (change) consists in making different transpositions or changes of letters, placing one for the other, or one before the other. Some visionaries among the Jews believe that Jesus Christ wrought his miracles by virtue of the mysteries of the cabbala.

CABBALA is also applied to the abuse which visionaries make of Scripture, for discovering futurity, by the study and consideration of the combination of certain words, letters, and numbers, in the sacred writings. All the words, terms, magical figures, numbers, letters, charms, &c. used in the Jewish magic, or in the hermetical science, are comprised under this species of cabbala. But it is only the Christians that call it by this name, on account of the resemblance this art bears to the explication of the Jewish cabbala: for the Jews never use the word in any such sense, but ever with the utmost respect and veneration. It is not, however, the magic of the Jews alone which we call cabbala, but the word is for any kind of magic.

CABECA, or *CABESSE*, a name given to the finest silks in the East Indies; those from fifteen to twenty per cent. inferior, being called *bariga* or *barina*.

CABELLO, or *CAVELLO*, *PORTO*, a sea-port of Venezuela, South America, with a most excellent and capacious harbour. It is situated a league to the west of the bay of Borburata, and has become the emporium of the commerce of the province. Men of war communicate with the land by means of a flying bridge of three or four toises long, the water being at all times smooth, and the bay defended on all sides from the wind. *Porto Cabello*, originally founded by some Dutch pirates, stood formerly on a peninsula, surrounded by the sea, except where a neck of land about 100 toises broad joined it with the continent. This has been now traversed by a canal, which divides the old town from the suburbs, and connects the northern and the southern coasts. The buildings on the continent are by far the most numerous. A bridge crosses the canal, which has a gate shut every evening, and a military guard. The new streets, which are chiefly outside the gate, have been laid out in a line, the public squares, places for markets, &c. being well regulated; so that this part of the town has become the residence of the principal merchants. But it is not considered a healthy

place for Europeans. The population has been estimated at 9000.

An aqueduct, five thousand varas long, conveys the waters of the Rio Estevan by a trench to the town. This work has cost more than 30,000 piastres; but its waters gush out in every street. *Porto Cabello* is the deposit of all the eastern part of the province of Venezuela. Its stores furnish to the jurisdictions of Valencia, San Carlos, Barquisimeto, St. Philip, and one part of the Valleys of Aragua, all the merchandise consumed; and it is at this port also that a great portion of the articles cultivated within those districts arrive. More than 10,000 mules are exported annually. They are thrown down with ropes, and then hoisted on board the vessels by means of a machine. Ranged in two files, they with difficulty keep their feet during the rolling and pitching of the ship; and, in order to frighten and render them docile, the drum is beaten during a great part of the day and night. 'We may guess,' says a late traveller, 'what quiet a passenger enjoys, who has the courage to embark for Jamaica in a schooner laden with mules.'

Next to Carthagena, it is the most important fortified place on this coast. Art has had scarcely any thing to add to the advantages which the nature of the spot presents. A neck of land stretches first towards the north, and then towards the west. Its western extremity is opposite to a range of islands, connected by bridges, and so close together that they might be taken for another neck of land. One vessel only can enter the harbour at a time; while the largest ships can anchor very near land, to take in water. There is no other danger in entering than the reefs of Punta Brava, opposite which a battery of eight guns has been erected. Toward the west and south-west is the fort, which is a regular pentagon with five bastions; in this direction also is the battery of the reef, and the fortifications that surround the ancient town, founded on an island of a trapezoidal form. The bottom of the basin or little lake which forms the harbour of *Porto Cabello*, turns behind the suburb to the south-west.

The real defence of the harbour consists in the low batteries of the neck of land at Punta Brava, and of the reef: but from ignorance of this principle, a new fort, the Belvedere (*Mirador*) of Solano, has been constructed at a great expense, on the mountains towards the south, that command the suburb. It is a quarter of a league distant from the harbour, and is raised 400 or 500 feet above the surface of the water. The works have cost annually, during a great number of years, from 20,000 to 30,000 piastres, but have been of late suspended. The vessels of La Guayra, which is less a port than a bad open roadstead, come to *Porto Cabello* to be caulked and repaired.

CABENDA a port of the western coast of Africa, situated a little to the north of the river Zaire, in the district called properly *Cacongo*. Its situation is so beautiful as to have obtained for it the name of the Paradise of the coast. The landing is easy and safe, and the town is known by a conical mountain, covered with wood, which appears behind it. On the opposite bank is *Togno*, and both places have driven

a large trade in slaves, which the Portuguese have long endeavoured to monopolise. The approach from Malemba is sometimes dangerous.

CABESTAN, or **CABESTEIGN** (William de), a gentleman of Provence, and a troubadour, who, gaining the good graces of Trichino, wife of Raymond de Seillans, was murdered by the husband out of jealousy. Raymond afterwards caused his heart to be served up for the table of his wife, who, on being informed of what she had unconsciously eaten, died of grief.

CABIDOS, or **CAVIDOS**, a long measure used at Goa, and other places of the East Indies, belonging to the Portuguese, to measure stuffs, and linens, and equal to four-sevenths of the Paris ell.

CABILLAU, in ichthyology, a name which some authors call the common cod-fish, the morbua and asellus major of other writers.

CABIN, *v. & n.* } Ara. *qoobbu*; Heb. *kaba*;
CABINED, *adj.* } Per. *klwab*; Chald. *khuba*;
CABIN'NATE. } Ital. *capanno*; Fr. *cabanc*;
 Welsh, *caban*; Teut. *koben*; all allied to Lat. *cavus*. A cottage; a room in a ship; any small place of dwelling, chamber, or apartment, whether fixed or temporary.

So long in secret *cabin* there he held
 Her captive to his sensual desire,
 Till that with timely fruit her belly swelled,
 And bore a boy unto a savage sire. *Spenser.*

Fleance is escaped; I had else been perfect,
 As broad and general as the easing air;
 But now I am *cabined*, cribbed, confined, bound in,
 To saucy doubts and fear. *Shakespeare.*

I will make you feed on berries and on roots,
 And feed on curds and whey, and suck the goat,
 And *cabin* in a cave. *Id.*

Come from marble bowers, many times the gay
 harbour of anguish,

Unto a silly *cabin*, though weak, yet stronger against
 woes. *Sidney.*

Men may not expect the use of many *cabins*, and
 safety at once, in the sea service. *Raleigh.*

The nice morn, on the Indian steep,
 From her *cabined* loophole peep. *Milton.*

Neither should that odious custom be allowed, of
 jaying off the green surface of the ground, to cover
 their *cabins*, or make up their ditches. *Swift.*

Whose wit at best was next to none,
 And now that little next is gone;
 Against the court is always blabbing,
 And calls the senate-house a *cabin*. *Id.*

The chessboard, we say, is in the same place it
 was, if it remain in the same part of the *cabin*, though
 the ship sails all the while. *Locke.*

CABINS, in ships, are the apartments where the officers usually reside. There are many of these in a large ship; the principal of which is designed for the commander. In ships of the line, this chamber is furnished with an open gallery in the ship's stern, and a little gallery on each quarter. The apartments where the inferior officers, or common sailors, sleep and mess are usually called births. The bed places for the sailors at the ship's side in merchantmen are also called cabins.

CABINET, *v. & n.* } Fr. *cabinet*; Ital. *gabinctto*; diminutive of
CABINET-COUNCIL, } *cabin*. A small cham-
CABINET-MAKER, } ber; a repository; a
CABINET-SECRETS, *n.* } chest of drawers. A cabinet-council is a select

choice number of persons, who hold their consultations in a place of seclusion from others.

Hearken awhile in the green *cabinet*,
 The laurel song of careful Cabinet. *Spenser.*

The doctrine of Italy, and practice of France, in
 some kings' times, hath introduced *cabinet-councils*. *Baron.*

At both corners of the farther side, let there be
 two delicate or rich *cabincts*, daintily paved, richly
 hang'd, glazed with crystalline glass, and a rich cupola
 in the midst, and all other elegance that may be
 thought on. *Id.*

Who sees a soul in such a body set,
 Might love the treasure for the *cabinet*. *Ben Jonson.*

We cannot discourse of the secret, but by describing
 our duty; but so much duty must needs open a *cabin-*
et of mysteries. *Taylor.*

You began in the *cabinet* what you afterwards
 practised in the camp. *Dryden.*

Thy breast hath ever been the *cabinet*
 Where I have locked my secrets. *Denham.*

From the highest to the lowest it is universally
 read; from the *cabinet-council* to the nursery. *Gay to Swift.*

The root of an old white thorn will make very fine
 boxes and combs; so that they would be of great use
 for the *cabinet-makers*, as well as the turners, and
 others. *Mortimer.*

CABINET is also used in speaking of the more select and secret councils of a prince or administration. Thus we say, the secrets, the intrigues of the cabinet. To avoid the inconveniences of a numerous council, some of the despotic princes of Europe first introduced cabinet councils. King Charles I. is charged with first establishing this usage in England. Besides his privy council, that prince erected a kind of cabinet council, or *junto*, under the denomination of a council of state; composed of archbishop Laud, the earl of Strafford, and lord Cottington, with the secretaries of State. Yet some pretend to find the substance of a cabinet council of much greater antiquity, and even allowed by parliament, who anciently settled a quorum of persons most confided in, without whose presence no arduous matter was to be determined; giving them power to act without consulting the rest of the council.

As long ago as the 28th of Henry III. a charter was passed in affirmance of the ancient rights of the kingdom; which provided that four great men, chosen by common consent, who were to be conservators of the kingdom, among other things, should see to the disposing of monies given by parliament, and appropriated to particular uses; and parliament were to be summoned as they should advise. Of these four any two made a quorum; and generally the chief justice of England, and chancellor, were of the number of conservators. In the first of Henry VI. the parliament provides, that the quorum for the privy council be six or four at least; and that, in all weighty considerations, the dukes of Bedford and Gloucester, the king's uncles, should be present; which seems to be erecting a cabinet by law.

CABIRI, a term in the theology of the ancient Pagans, signifying great and powerful gods; being a name given to the gods of Samothracia. They were also worshipped in other parts of Greece, as Lemnos and Thebes, where the cabi-

ria were celebrated in honor of them; these gods are said to be four in number; viz. Axieros, Axioersa, Axiocersus, and Casmilus. Their festivals were celebrated in Thebes and Lemnos, but especially in Samothracia, an island consecrated to the Cabiri. All who were initiated into the mysteries of these gods, were thought to be secured thereby from storms at sea, and all other dangers. The obscenities which prevailed at the celebration have obliged the authors of every country to pass over them in silence, and say that it was unlawful to reveal them. These deities are often confounded with the Corybantes, Anaces, Dioscouri, &c., and according to Herodotus, Vulcan was their father. This author mentions the sacrilege which Cambyzes committed in entering their temple, and turning to ridicule their sacred mysteries. They were supposed to preside over metals.

These deities are represented on medals, as in the annexed figure of a man with a hammer in his right hand, and in his left an anvil, or something resembling.

CABLE, *n.* } Ara. *kabl*; Heb. *khabel*;
CA'LED, *adj.* } *καμλος*; Goth. *kadel*; Swed.
and Belg. *kabel*; Fr. *cable*. A thick rope for an anchor.

What though the mast be now blown overboard,
The cable broke, the holding anchor lost,
And half our sailors swallowed in the flood,
Yet lives our pilot still. *Shakespeare.*

The length of the cable is the life of the ship in all extremities; and the reason is, because it makes so many bendings and waves, as the ship, riding at that length, is not able to stretch it; and nothing breaks that is not stretched. *Raleigh.*

The cables crack; the sailors' fearful cries
Ascend; and sable night involves the skies. *Dryden.*

Self-flattered, unexperienced, high in hope,
When young, with sanguine cheer, and streamers gay,
We cut our cable, launch into the world,
And fondly dream each wind and star our friend.

Young's Night Thoughts.

Should we at least be driven by dire decree
Too near the fatal margin of the sea,
The hull distasted there awhile may ride,
With lengthened cables, on the raging tide.

Falconer's Shipwreck.

Hoarse o'er her side the rustling cable rings;
The sails are furled, and, anchoring, round she swings;
And gazing loiterers on the land, discern
Her boat descending from the latticed stern.

Byron's Corsair.

CABLE, the long thick rope, serving to hold ships firm at anchor, and to tow vessels in large rivers. In Europe, the cables are commonly made of hemp; in Africa, of long straw or rushes called bass; and in Asia, of a peculiar kind of Indian grass. Every cable, of whatsoever thickness it be, is composed of three strands; every strand of three ropes; and every rope of three twists; the twist is made of more or less threads, according as the cable is to be thicker or thinner. There are some cables, however, manufactured of four strands; which are chiefly the production of Italy and Provence. In the manufacture of cables after the ropes are made, they use sticks,

which they pass first between the ropes of which they make the strands, and afterwards between the strands of which they make the cable, to the end that they may all twist the better, and be more regularly wound together; and also, to prevent them from entwining or entangling, they hang, at the end of each strand and of each rope, a weight of lead or of stone. There is no merchant-ship, however weak, but has at least three cables; viz., the chief cable, or cable of the sheet anchor, a common cable, and a smaller one. All cables ought to be 120 fathoms in length; for which purpose the threads or yarns must be 180 fathoms, as they are diminished one-third in length by twisting. Besides this length, it is necessary to splice at least two cables together, in order to double the length when a ship is obliged to anchor in deep water. For although it is not common to anchor in a greater depth than forty fathoms, yet if there is only one cable, and the ship rides in a stormy and tempestuous sea, the anchor will of necessity sustain the weight and violent jerking of the ship, in a direction too perpendicular. By this effort it will unavoidably be loosened from its hold; whereas it is evident, that if the cable, by its great length, were to draw more horizontally on the anchor, it would bear a much greater force. A long cable is not so apt to break as a short one; because it will bear a great deal more stretching before it comes to the greatest strain; it, therefore, resembles a sort of spring, which may be very easily extended, and afterwards recovers its first state, as soon as the force which extended it is removed; and by increasing the radius of motion, the arch grows nearer to a right line, and consequently the change of place is made less sensible.

The number of threads each cable is composed of, is always proportioned to its length and thickness; and it is by this number of threads that its weight and value are ascertained: thus, a cable of three inches circumference, or one inch diameter, ought to consist of forty-eight ordinary threads, and to weigh 192 pounds; and on this foundation is calculated the following table, very useful for all people engaged in marine commerce, who fit out merchantmen on their own account, or freight them on the account of others:

Circumf.	Threads.	Weight.
3 inches	48	192 pounds.
4	77	308
5	121	484
6	174	696
7	238	952
8	311	1244
9	393	1572
10	485	1940
11	598	2392
12	699	2796
13	821	3284
14	952	3808
15	1093	4372
16	1244	4976
17	1404	5616
18	1574	6296
19	1754	7016
20	1943	7772

CABLE, SHEET ANCHOR, is the greatest cable belonging to a ship.

CABLE, STREAM, a hauser or rope, sometimes smaller than the bowers, and used to moor the ship in a river or haven, sheltered from the wind and sea, &c.

To serve or plait the CABLE, is to bind it about with ropes, clouts, &c. to keep it from galling in the hawse. To splice the cable, is to make two pieces fast together by working the several threads of the rope the one into the other. Pay more Cable, is to let more out of the ship. Pay cheap the Cable, is to hand it out apace. Veer more Cable, is to let more out, &c.

CABLED, CABLEE, in heraldry, a term applied to a cross formed of the two ends of a ship's cable; sometimes also to a cross covered over with rounds of rope; more properly called a cross corded.

CABO, or CAPO D'ISTRIA. See **CAPO D'ISTRIA**.

CABOCHED, in heraldry, is when the heads of beasts are borne without any part of the neck, full faced.

CABOLETTO, in commerce, a coin of the republic of Genoa, worth about 3d. of our money.

CABOT (Sebastian), the first discoverer of the continent of America, (see **AMERICA**, sect. 4.), was the son of John Cabot, a Venetian. He was born at Bristol in 1477; and, before he was twenty years of age, made several voyages. The first of any consequence seems to have been with his father, who had a commission from Henry VII. for the discovery of a north-west passage to India. They sailed in the spring 1497: and proceeding to the north-west, they discovered land, which for that reason they called *Prima-vista*, or Newfoundland. Another smaller island they called *St. John*, from its being discovered on the feast of *St. John Baptist*; after which they sailed along the coast of the American continent, as far as Cape Florida, and then returned with a good cargo, and three Indians to England. Thus the honor of the discovery of America is due to Cabot, not to Columbus, who did not begin his voyage till a year after that of Cabot. Sebastian, in 1517, sailed for the East Indies, but, after touching on the coast of Brasil, he shaped his course to Hispaniola and Porto Rico, where he carried on some trade, and returned to England. He soon after entered into the service of Spain, where he was made pilot-major, and entrusted with reviewing all projects for discoveries, which were then very numerous. His great capacity and approved integrity induced many eminent merchants to treat with him about a voyage to the newly discovered Straits of Magellan to the Moluccas. He therefore sailed in 1525, first to the Canaries, then to the Cape Verd islands; thence to *St. Augustine* and the island of *Patos*; when some of his people beginning to be mutinous, and refusing to pass through the Straits, he laid aside the design of sailing for the Moluccas; left some of the principal mutineers upon a desert island; and, sailing up the rivers of *Plata* and *Paraguay*, discovered, and built forts in, a large tract of fine country, that produced gold, silver, and other rich commodities. He thence despatched messengers to Spain for a supply of pro-

visions, ammunition, goods for trade, and a recruit of men; but his request not being readily complied with, after staying five years in America, he then returned home; where he met with a cold reception, the merchants being displeased at his not having pursued his voyage to the Moluccas, while his treatment of the mutineers had given umbrage at court. Hence he returned to England; and being introduced to the duke of Somerset, then Lord Protector, a new office was erected for him; he was made governor of the mystery and company of the merchant adventurers for the discovery of regions, dominions, islands, and places unknown; a pension was granted him, by letters patent of £166. 13s. 4d. per annum; and he was consulted on all affairs relative to trade. In 1522, by his advice, the court fitted out some ships for the discovery of the northern parts of the world. This produced the first voyage the English made to Russia, and the beginning of that commerce which has ever since been carried on between the two nations. The Russia Company was now founded by a charter granted by Philip and Mary; and of this company Sebastian was appointed governor for life. He is said to be the first who took notice of the variation of the needle, and who published a map of the world. The exact time of his death is not known, but he lived to be above seventy years of age.

CABRAL (Pedro Alvares), a Portuguese navigator, who commanded the second fleet which was sent to the Indies in 1500. He received the royal standard from the hands of the king, in the church of Belem, and the bishop of Viseu placed on his head a hat which had been blessed by the pope. In this voyage he was driven on that part of the coast of America now called Brasil, where he landed, and called the spot *Santa Cruz*. Thence he sailed to *Sofala*, on the coast of Africa, and next to *Calicut*, where he entered into a treaty with the zamorin; and in 1501 returned to Portugal, richly laden. He wrote an account of his voyage, which was published at Venice.

CABRILLA, in ichthyology, a species of perca, found in the Mediterranean sea, the body of which is marked with four longitudinal sanguineous bands.

CABRUSI, in the writings of the ancients, a word frequently used to express Cyprian, or coming from the island of Cyprus. The ancient Greeks had almost all their vitriols and vitriolic minerals from this island; they therefore called these cabrusi, without any addition. It is probable that our word *cupperias*, the common name of green vitriol, is derived from this word.

CABUTA, a West Indian species of hemp, produced in Panama, from a plant resembling the chardon or iris; when ripe they lay it to steep in water, and after drying it, beat it with wooden mallets till nothing but the hemp remains, which they afterwards spin, and make thread and ropes of it; the former of which is so hard and tough, that with it they saw iron, by fitting it on a lathe, and laying a little sand over the metal as the work proceeds.

CABUL, or GAROUL, a city of Asia, and capital of the province of Cabulistan. It lies on the

frontiers of Great Bukharia, on the south side of the mountains which divide the former territories of the Mogul from that part of Great Tartary. It was one of the finest places in that part of the world; large, rich, and very populous. Being considered as the key of the great Mogul's dominions on that side, great care was taken to keep its fortifications in repair, and a numerous garrison was maintained for its security. It lies on the road between Samarcand and Lahore; and is much frequented by the Tartars, Persians, and Indians. The Usbec Tartars drive there a great trade in slaves and horses, of which it is said that no fewer than 60,000 are sold annually. The Persians bring black cattle and sheep, which renders provisions very cheap. The city stands on the river Attock, which falls into the Indus, and affords a speedy passage for all the rich commodities in the country behind it: which, when brought to Cabul, are exchanged for slaves and horses, and conveyed by merchants of different countries to all parts of the world. There has been a small Armenian colony here since the time of Nadir Shah, and among the most industrious of its inhabitants are the Hindoos. Cabul has several fine palaces and spacious caravanseras; and lies 680 miles north-west of Delhi. Long. $68^{\circ} 58' E.$, lat. $34^{\circ} 36' N.$

CABUL, or CAUBUL. See CAUBUL.

CABURE, in ornithology, a small Brazilian bird of the owl kind; very beautiful, and easily tamed. It is brown, variegated with white, and is feathered down to the toes. The Brazilians keep it tame for its diverting tricks; it will play with people like a monkey, and is perfectly harmless.

CABURNS, *n. s.* Small ropes used in ships.

CACAGOGA, in ancient medicinal writers, a word used for certain ointments intended for rubbing on the fundament to procure stools. The most common of these was made of alum mixed with honey, and boiled till the whole was of a tawney color.

CACALIA, in botany, alpine colt's foot; a genus of the order polygamia aequalis, and class syngenesia. The receptacle is naked; the papus hairy; the calyx cylindrical, oblong and calyculated, or having a small calyx of very short scales only at the base. There are forty species. The principal are *C. ficoides*, a native of the Cape of Good Hope. It rises with strong round stalks to the height of seven or eight feet, woody at bottom, but soft and succulent upwards, sending out many irregular branches, garnished more than half their length with thick, taper, succulent leaves, a little compressed on two sides, ending in points, covered with a whitish glaucous farina, which comes off when handled. These, when broken, emit a strong odor of turpentine, and are full of a viscous juice; at the extremity of the branches, the flowers are produced in small umbels; they are white, tubulous, and cut into five parts at the top. The leaves are pickled by the French, who esteem them much. They have a method of preserving the white farina upon them, which adds greatly to the beauty of the pickle when brought to table. *C. kleinia*, with a compound shrubby stalk. It grows naturally in the Canary Islands, but has long been cultivated in the English gardens. It rises with

a thick fleshy stem, divided at certain distances into so many joints. Each of these divisions swell much larger in the middle than at each end; and the stalks divide into many irregular branches of the same form, which, toward their extremities, are garnished with long, narrow, spear-shaped leaves of a glaucous color, standing all round the stalks without order. As they fall off, they leave a scar at the place, which always remains on the branches. The flowers are produced in large clusters at the extremity of the branches, which are tubulous, and of a faint carnation color. They appear in August and September, but continue great part of October, and are not succeeded by seeds in this country. This plant has been called the cabbage tree, from the resemblance which the stalk of it has to the cabbage: others have entitled it the carnation tree, from the shape of the leaves and the color of the flowers. *C. suaveolens*, with a herbaceous stalk, a native of North America. It has a perennial creeping root, which sends out many stalks, garnished with triangular spear-shaped leaves, sawed on their edges, of a pale green on their under side, but a deep shining green above, placed alternately. The stalks rise to seven or eight feet, and are terminated by umbels of white flowers, which are succeeded by oblong seeds covered with down. It flowers in August, and the seeds ripen in October. The stalks decay in autumn, and new ones rise in spring. This plant multiplies greatly by its spreading roots, as well as by the seeds, which are spread to a great distance by the wind, their down greatly assisting their conveyance. The roots cast out of Chelsea garden, being carried by the tide to a great distance, have fixed themselves to the banks of the river, and increased so much, that in a few years this species may probably appear as a native of England.

CACALIE, in entomology, a species of chrysomela; of a greenish color, with a longitudinal blue streak on the wing-cases and blue suture; wings red. Inhabiting Austria.

CACAO, in botany. See THEOBROMA.

CACERES, an ancient town of Spain, in Estremadura, noted for the exceeding fine wool of the neighbourhood. It has four churches and seven religious houses, with a population of about 7000. It is thirty miles south-east of Alacantara, and thirty-five south-west of Placentia. Between this town and Broças, there is a wood, where the allies defeated the rear-guard of the duke of Berwick, April 7th, 1706.

CACHAO, KACHO, KCHIO, or BACKHINK, a city of Tonquin, the capital of that kingdom, and formerly the residence of the sovereigns of that country. It is situated on the west side of the Songkoi, about eighty miles from the sea. The principal streets are wide, and paved with bricks and small stones; but intermediate spaces are left unpaved for the passage of elephants and other beasts of burden. The whole town, which is large and straggling, is surrounded by a bamboo hedge. The houses are a few of them constructed of brick, but the larger proportion of mud and timber, thatched with straw, leaves, or reeds. The royal palace is several miles in circuit, and surrounded by high walls. It contains

many extensive public and other buildings of handsome appearance, and the place is celebrated for its excellent police. Cachao is a place of great resort. The river is generally covered with the vessels of neighbouring nations, equaling in numbers, it is said, many of the most frequented European ports. It exports gold, beautiful silks of its own manufacture, and the finest lackered ware of the east. The imports are arms, chintz, long cloths, pepper, &c. Both the English and Dutch formerly had commercial establishments here, which have been withdrawn. On the opposite side of the river is Campez, a town of the Chinese. Cachao was set on fire by some incendiaries discharging arrows on the roofs in the middle of the eighteenth century, and immense damage ensued. Fires are now prohibited during the night, and permitted only during some hours of the day, under severe fines. It is supposed to contain 40,000 souls.

CACHAR, a province of the Burmhan empire, lying in 25° of N. lat., between Bengal and Ava. A communication exists by water to the centre of the province. Through Assam, and by land, the British intercourse with it is principally carried on from Silhet. The inhabitants are Hindoos, generally, of the Katri caste. The country is fertile, but overgrown in parts with jungle, and thinly peopled. In 1774 Oundaboo, the general of the Burmese, marched against the rajah of Cachar; who possessed the sovereignty of a productive though mountainous country, north-west of Manipoor, and advanced within three days march of Cospoor. Here he was opposed by Chawal, the rajah, leagued with the Gossain rajah; and his troops being attacked by the hill fever were all dispersed or cut off. A second expedition of the Burmese was more successful; and compelled the rajah to consent to pay, besides a sum of money, a maiden of the royal blood to the king of Ava, and a tree with the roots bound in the native clay, as an unequivocal token of homage.

CACHECTICAL, *adj.* } From *cachexy*;
 CACHECTICK. } having an ill habit
 of body; showing an ill habit.

Young and florid blood, rather than vapid and
cachectical. *Arbutnot on Air.*

The crude chyle swims in the blood, and appears as
 milk in the blood, of some persons who are *cachectic*.

Floyer.

CACHEF, or CACHEEF, in the Turkish affairs, the governor of a city, town, or province of Egypt. The title is also given to the commanders of little flying armies, intended to keep the Arabs in obedience.

CACHEFTECK, the government of a cachef. Egypt is divided by the Turks into thirty-nine of these governments.

CACHET, *LETTRES DE*, private letters or mandates, issued by the French monarchs under the royal signet, before the revolution, for the apprehension of individuals, who were obnoxious to the court, and who, in such cases, were generally lodged in the bastille without trial, and very often never more heard of. The late celebrated Mirabeau, who was himself many years a sufferer under this tyranny, wrote a learned and

spirited treatise, in four volumes, 8vo. on *Lettres de Cachet*.

CACHEXY, *n.s.* *Καχξία*; a general word to express a great variety of symptoms: most commonly it denotes such a distemperature of the humors, as hinders nutrition, and weakens the vital and animal functions; proceeding from weakness of the fibres, and an abuse of the non-naturals, and often from severe and acute distempers. In Cullen's Nosology, cachexiæ forms a class of diseases, which includes three orders, namely, marcores, intumescenciæ, and impetigines.

CACHINNATION, *n.s.* Lat. *cachinnatio*; a loud laughter.

CACHINNATIO, in medicine, an hysterical or maniacal tendency to immoderate laughter.

CACHLEX, in natural history, a name used by some authors for the small pebbles found on the sea and river shores, which being heated red hot, and quenched in whey, are said to have an astrigent virtue.

CACHOLONG; a variety of quartz. It is opaque, dull on the surface, internally, of a pearly lustre, brittle, with a flat conchoidal fracture, and harder than opal. Its color is milk-white, greyish, white, or yellowish. It is not fusible before the blow-pipe. Specific gravity 2.2. It is found in detached masses on the river Cach in Bukharia, in the trap rocks of Iceland, in Greenland, and the Feroe islands. Brogniart states that this mineral is also found in the vicinity of Paris, in the cavities of a calcareous breccia, sometimes hard, with a shining fracture, at other times resembling chalk.

CACHRYS, in botany, a genus of the dyginia order, and pentandria class of plants; natural order forty-fifth, umbellate. The fruit is subovate, angled, and cork or spongy ringed. Species seven; chiefly natives of Sicily, and the Barbary coast. The principal species are, 1. *C. Hungaria*, with a plain fungous channelled seed; 2. *C. libanotis*, with smooth furrowed seeds; 3. *C. linearis*, with plain channelled fruit; 4. *C. Cretica*, with double winged leaves; 5. *C. odontalgica*, with leaves doubly pinnate, and lance-linear, pubescent leaflets; seeds quite smooth. The root is aromatic, and employed for the toothache, instead of that of the pyretherum, whence its specific name. The last two are natives of Siberia.

CACHRYS, or CANCHRYS, in ancient botany, denoted a scaly tuft, growing like a katkin on the oak, beech, pine, &c. or, according to others, an unseasonable kind of bud, appearing either in spring, or autumn, and which, after the winter is over, spreads or shoots into branches. The word is sometimes also used for the seed of rosemary, or even the plant itself; sometimes for barley roasted in a furnace, to render it more easy to grind.

CACHRYS, in entomology, a species of papilio hesperia, with entire wings of a yellowish color, with a brown border spotted with white. Found at Cayenne.

CACHUNDE, a medicine, highly celebrated among the Chinese and Indians, made of several aromatic ingredients, perfumes, medicinal earth, and precious stones. They make the whole into

a stiff paste, and form out of it several figures, according to their fancy, which are dried for use; these are principally used in the East Indies, but are sometimes brought over to Portugal. In China the principal persons usually carry a small piece in their mouths, which is a continued cordial, and gives their breath a very sweet smell. It is a highly valuable medicine, also, in all nervous complaints; and is esteemed a prolonger of life, and a provocative to venery, the two great intentions of most of the medicines in use in the East.

CACHYMIA, in metallurgy, a term used by Paracelsus for an imperfect metalline ore.

CACIQUES, a denomination anciently given by the original Americans to governors of provinces and generals of armies. It was also applied to the sovereigns of the five great native kingdoms of the island of Hispaniola, and also to the sovereigns in the other islands. Their power over the subject, which was hereditary, was absolute, and they were regarded with almost idolatrous veneration; there were also subordinate chieftains, or princes, who were tributaries to the sovereign of each district.

CACK'EREL, *n. s.* A fish, said to make those who eat it laxative.

CACKLE, *v. & n.* } *Swed. kackla; Teut. kicheln; Belg. kackelen.*
CACK'LER, }
CACK'LING, *n.* } The noise of a hen after laying her egg; to cry like a cock or hen, or a goose; a cackler is one who noisily tells his own and others affairs; a tell-tale; a tattler.

And for these water-fouls tho began
 The gosse to speke; and in her *cackelynge*,
 She said: Pece now, take kepe every man,
 And herken whiche reson I shal forth bring;
 My witte is sharpe, I love no taryng;
 I say, I rede him, though he were my brother,
 But she wil love him, let him love another.

Chaucer's Asseble of Fowles.

The nightingale, if she should sing by day,
 When every goose is *cackling*, would be thought
 No better a musician than the wren. *Shakspeare.*

The silver goose before the shining gate
 There flew, and by her *cackle* saved the state. *Dryden.*

The trembling widow, and her daughters twain,
 This woeful *cackling* cry with horreur heard
 Of those distracted damsels in the yard. *Id.*

Nic grinned, *cackled*, and laughed, till he was like
 to kill himself, and fell a frisking and dancing about
 the room. *Arbutnot.*

Thus vaunting cross the mead she stalks,
 The *cackling* brood attend her walks. *Moore's Fables.*

CACOCYHMICAL, *adj.* } From *cacochy-*
CACOCYHMICK. } *my*; having the
 humors corrupted.

It will prove very advantageous, if only *cacochy-*
mick, to clarify his blood with a laxative.

Harvey on Consumptions.

If the body be *cacochymical*, the tumours are apt to
 degenerate into very venomous and malignant ab-
 cesses. *Wiseman.*

The ancient writers distinguished putrid fevers, by
 putrefaction of blood, cholera, melancholy, and phlegm;
 and this is to be explained by an effervescence hap-
 pening in a particular *cacochymical* blood.

Flayer on the Humours.

CACOCYHMY, *n. s.* *Κακοχμία*; a deprava-
 tion of the humors from a sound state, to what
 the physicians call by a general name of a ca-
 cocyhy. Spots and discolorations of the skin,
 are signs of weak fibres; for the lateral vessels,
 which lie out of the road of circulation, let gross
 humors pass, which could not, if the vessels had
 their due degree of stricture.

Strong beer, a liquor that attributes the half of its
 ill qualities to the hops, consisting of an acrimonious
 fiery nature, sets the blood, upon the least *cacochymy*,
 into an ergasmus. *Harvey.*

CACODEMON, } *Gr. κακος*, evil; and
CACODEMON'IAL, } *δαίμων*, a demon. An evil
 or mischievous demon or spirit.

Nor was the dog a *cacodeemon*,
 But a true dog, that would show tricks
 For the' emperor, and leap o'er sticks.

Butler's Hudibras, part ii. canto 3.

CACODES, in ancient medical writers, a
 name given to matter discharged from the hu-
 man body, with an ill smell.

CACONGO, a small state of western Africa,
 bounded on the south by the Zaire, which sepa-
 rates it from Congo, and on the north by Loango.
 The country is mountainous, but fertile, and the
 climate less humid and hurtful to Europeans
 than that of Loango. The government is a
 limited monarchy; and on the death of the sove-
 reign, the most powerful or popular chief ascends
 the throne. Justice is administered by him in
 person, beginning usually at six in the morning,
 and continuing till eleven in the forenoon. He
 is said to solace himself at every judgment he
 delivers, with a draught of palm wine, without
 which the sentence would not be legal. All the
 principal inhabitants show a fondness for Euro-
 pean goods and customs, and many of them have
 their apartments furnished in the European style,
 with beds, chairs, plate, &c. The mambouc of
 Malemba, when visited by Degrandpré, had a
 cook whom he had sent to be trained in France.
 The chief port is Malemba, which is situate fifty
 miles south of Loango.

CACOORS, in botany, a species of mimosa.
 Its seeds have been thrown by the sea on the
 Hebrides and Orkneys.

CACOPHONIA; from *κακος*, evil, and *φωνη*,
 voice, a bad sound of words; in grammar and
 rhetoric, the meeting of two letters, or syllables,
 which yield an uncouth and disagreeable sound.

These things shall lie by, till you come to carp at
 them, and alter rhimes, grammar, triplets, and *caco-*
phonies of all kinds. *Pope to Swift.*

CACTI, in entomology, a species of coccinella
 with black wing-sheaths, and two red spots.
 Found on the cactus grandiflorus of America.
 Also the name of a species of coccus.

CACTUS, in botany, a genus of the monog-
 gymia order, and icosandria class of plants;
 natural order thirteenth, succulentæ: *CAL.* is
 monophyllous, superior, imbricated; *cor.* poly-
 petalous; the fruit an unilocular, polyspermous
 berry. This genus has been well subdivided
 into 1. those of a roundish form, generally
 called melon-thistles; 2. creeping with lateral
 roots, commonly named cereuses; 3. erect,
 supporting themselves, and called torch-thistles;

4. compressed, with proliiferous joints. Prickly pears, or Indian figs. The melon-thistles are plants of a singular structure, but especially the larger kinds of them; which appear like a large, fleshy, green melon, with deep ribs, set all over with strong sharp thorns; and, when the plants are cut through the middle, their inside is a soft pale-green fleshy substance, very full of moisture; the taste of which is agreeably acid. There are twenty-eight species, all natives of the West Indies. The three following are the most remarkable: viz. 1. *C. tuna*, proliiferous jointed; the joints ovate-oblong; spines subulate, in clusters: flower large and yellow: a prickly pear; 2. *C. grandiflora*, one of the creeping cactuses. The flower of this species, though very short-lived, is said to be as grand and beautiful as any in the vegetable system: it begins to open in the evening about seven o'clock, and fades about four in the morning; so that the same flower only continues in perfection about six hours. The calyx when expanded is about a foot in diameter, of a splendid yellow within, and a dark brown without; the petals are many, and of a pure white; and the great number of recurved stamina, surrounding the style in the centre of the flower, make a grand appearance, to which may be added the beautiful scent which perfumes the air to a considerable distance. It flowers in July. 3. *C. opuntia*; the prickly leaves of this plant abound with a mucilaginous matter, which is esteemed in its native countries an emollient, in the form of poultice.

CACULE, in the materia medica, a name given by Avicenna, Serapion, and all the other Arabian writers, to the cardamom seeds. They distinguish two kinds of this fruit, a larger, and a smaller. The larger is the grain of paradise, and the smaller the common cardamom.

CACUMINATE, *v. a.* Lat. *cacumino*; to make sharp or pyramidal.

CACUS, in fabulous history, the son of Vulcan, an Italian shepherd upon mount Aventine. As Hercules was driving home the herd of king Geryon, whom he had slain, Cacus robbed him of some of his oxen, which he drew backward into his den lest they should be discovered, by their traces. Hercules at last finding them out by their lowing, killed Cacus with his club. The death of this monster is the subject of a fine episode in Virgil's *Æneid*. He was said to have been of prodigious bulk, half man, half satyr, and to have had three heads.

CACUS, in entomology, an Indian species of sphinx, having indented black wings, marked with three light streaks; posterior pair striated.

CAD' } A water insect, called the case
CAD'DIS, }
CAD'DEW, } worm.

He loves the mayfly, which is bred of the cod-worm, or *caddis*; and these make the trout bold and lusty. *Walton's Angler.*

CADARI, or **KADARI**, from كادر, *cadara*, Arab. i. e. power; a sect of Mahommedans, who assert free-will, and deny all absolute predestination. The author of this sect was Mabah ben Kaled Al Gihoni, who suffered martyrdom for it.

CADAV'ER, } Lat. *cadaver*, from *cado*;
CADAV'EROUS, *adj.* } to fall, or fallen; a dead

body; having the qualities and appearance of a corpse.

In vain do they scruple to approach the dead, who livingly are *cadaverous*, for fear of any outward pollution, whose temper pollutes themselves.

Brown's Vulgar Errors.

The urine, long detained in the bladder, as well as glass, will grow red, fetid, *cadaverous*, and alkaline. The case is the same with the stagnant waters of hydropical persons.

Arbuthnot on Aliments.

Since, whilst a man is truly and properly said to live, many affections belong to his corporeal part, or are performed in it, or by it, that make this automaton called his body, much, and very advantageously differing from a mere *cadaver*.

Boyle's Christian Virtuoso, vol. vi. p. 748.

But scarce away the vultures for an hour;

The scent *cadaverous* for, oh! how rank

The stench of profligates soon lures them back.

Young, On Public Affairs.

CAD'DIS, *n.* This word is used in Erse for the variegated cloths of the Highlanders. It is also a kind of ferret or worsted lace of which garters were formerly made. *Caddis carter* is one of the epithets bestowed by prince Henry on the landlord.—1 *Henry IV.* n. 4.

He bath ribbons of all the colours of the rainbow; inkles, *caddies*, cambricks, lawns; why he sings them over as if they were gods and goddesses. *Shakspeare.*

CAD'E *v. & n.* } Old. Fr. *cadre*, *cadeler*;
CAD'E, *adj.* } Ital. *caudare*, *codeare*, from

Lat. *cauda*, to go after; and like Lat. *sequor*, to cherish; Fr. *cadeler*, to make ornamental tails to capital letters, signified afterwards to ornament; and thus *cadeau* was a tail, a flourish, a treat, and a suite. *Cade*, the substantive, καδος; Lat. *cadus*; Ital. *cado*, a small cask or barrel; the adjective is from Fr. *cadeler*, which signifies tame, soft, delicate, as a *cade lamb*, a lamb bred at home. Thus the verb and adjective agree; for to *cade* is to follow, attend, cherish; to breed up tenderly.

We, John Cade, so termed of our supposed father. —Or rather of stealing a *cade* of herrings. *Shakspeare.*

Soon as thy liquor from the narrow cells

Of close pressed husks is freed, thou must refrain

Thy thirsty soul; let none persuade to broach

Thy thick, unwholesome, undigested *codes*. *Philips.*

CADE (Jack), a native of Ireland from which place he had been obliged to fly for his crimes), who, heading the Kentish men, who were then in commotion, drove the court from London, and took possession of the capital. Having seized and beheaded Lord Say and Sele, late high treasurer of England, and his son-in-law Sir James Cromer, sheriff of Kent, they proceeded to pillage the city; but they were soon driven out of it, and, failing in their attempts to repossess it, they agreed to a short truce. An amnesty being proclaimed to all who should return home, his followers fell off in great numbers. *Cade* first fled to Queenborough, but being refused admittance put on a disguise, and left his followers. A proclamation was immediately published, offering a reward of 1000 marks to any who brought him in, dead or alive. He was discovered lurking in a garden at Hothfield, in Sussex, by Alexander Eden, a gentleman of Kent, and, making some resistance, was killed, and his body was brought to London.

CADÉ-OIL, in the materia medica, a name given to an oil much in use in some parts of France and Germany. The physicians have called it *oleum cada*, or *oleum de cada*. This is supposed by some to be the *pissekum* of the ancients, but improperly: it is made of the fruit of the *oxycedrus*, which is called by the people of those places *cada*.

CAD'ENCE, *v. & n.* } Lat. *cado*, to fall;
CAD'ENCY, } Fr. *cadence*; Ital. *cadenza*;
CAD'ENT. } *Sp. cadencia*.
 To fall in sound; to any thing going down; declining; to the gradual gentle fall in a measure of poetry or music. It is sometimes used for the general modulation of the voice.

And nathless hath set thy wit,
 Although in thy hed ful lite is,
 To make bokes, songes and dities,
 In rime or elles in *cadence*,
 As thou best canst, in reverence
 Of love and of his servautes eke
 That have his service sought.

Chaucer's House of Fame.

Let it stamp wrinkles in her brow of youth,
 With *cadent* tears fret channels in her cheeks.

Shakspeare's King Lear.

The sliding, in the close or *cadence*, hath an agreement with the figure in rhetoric, which they call *præter expectatum*; for there is pleasure even in being deceived. *Bacon.*

There be words not made with lungs,
 Sententious showers! O let them fall!
 Their *cadence* is rhetorical. *Crashaw.*

Hollow rocks retain

The sound of blustering winds, which all night long
 Had roused the sea, now with hoarse *cadence* lull
 Sea-faring men, o'erwatched. *Milton.*

Now was the sun in western *cadence* low
 From noon; and gentle airs, due at their hours
 To fan the earth, now waked. *Id.*

The words, the versification, and all the other elegancies of sound, as *cadences*, and turns of words upon the thought, perform exactly the same office both in dramatick and epick poetry. *Dryden.*

He hath a confused remembrance of words since he left the university; he hath lost half their meaning, and puts them together with no regard, except to their *cadence*. *Swift.*

Accept this token, Carteret, of good-will,
 The voice of nature, undebased by skill,
 These parting numbers, *cadenced* by my grief,
 For thy loved sake, and for my own relief,
 If aught, alas! thy absence may relieve,
 Now I am left, perhaps, through life to grieve.

Philips. To Lord Carteret.

It is very observable, that though the measure is the same in which the musical efforts of Fear, Anger, and Despair, are described, yet, by the variations of the *cadence*, the character and operation of each is strongly expressed.

Commentary on Collins' Ode on the Passions.

If we would keep up the attention of the reader or hearer, if we would preserve vivacity and strength in our composition, we must be very attentive to vary our measures. This regards the distribution of the members, as well as the *cadence* of the period.

Blair's Lectures.

CADENCE, in reading, from *cadere*, Lat. to fall, is a falling of the voice below the key-note at the close of every period. In reading, whether prose, or *versé*, a certain tone is assumed which

is called the key-note; and in this tone the bulk of the words are sounded; but this note is generally lowered towards the close of every sentence.

CADENCE, or **REPOSE**, in music, the termination of an harmonical phrase on a repose, or on a perfect chord. See **MUSIC**.

CADENCE DU DIABLE, the devil's cadence, a shake of an extraordinary effect: it is made on the violin, by beating the little finger on a note held by the third finger, whilst the two first execute different notes upon the next string. Its invention is attributed to Tartini, who, as it is said, receiving a lesson from the devil in a dream, was taught to perform this cadence.

CAD'ET, } Fr. *cadet*; Ital. *caudata*, *co-*
CAD'ETSHIP. } *dato*, *cardeto*, from Lat. *cauda*,
 Fr. *quac*, retinue, suite, may have had the same origin with Lat. *sequor* and *secundus*. Its primary application is to a younger brother, or to the youngest. It is now used to designate a volunteer in the army without a commission; a follower. It is specially appropriated to young gentlemen sent out to India by the East India Company to seek their fortunes in the military profession.

Joseph was the youngest of the twelve, and David the eleventh son, and the *cadet* of Jesse.

Brown's Vulgar Errors.

CAD'ET is a word naturalised in our language from the French. At Paris the cadets had an equal patrimony with the rest, before the revolution. At Caux, in Normandy, the custom was to leave all to the eldest, except a small portion to the cadets. In Spain it is usual for one of the cadets in great families to take the mother's name.

CAD'ET, in military language, is a young gentleman who applies himself to the study of fortification, gunnery, &c. and who sometimes serves in the army, with or without pay, till a vacancy happens for his promotion. There is a company of gentlemen cadets maintained at Woolwich, at the king's expense, where they are taught all the sciences necessary to form a complete officer. Their number has lately been increased, and commissions are given to them when qualified. A cadet in the French service, did not receive any pay, but entered as a volunteer in a troop or company, for the specific purpose of becoming master of military tactics.

CADGE', *v. 2* } Teut. *kautser* and *kaupster*, a
CADGE'ER, *n.* } dealer are cognate with *chapman*; but Teut. *ketsler*, is a carrier. Thus a *cadger* is a higgler, a huckster, and seller of goods. Archdeacon Nares observes:

A round frame of wood, on which the *cadgers* or sellers of hawks carried their birds for sale. See *Bailey*: and *cadger* is also given, as meaning a huckster, from which the familiar term *cadger* is more likely to be formed, than from any foreign origin.

CADI, or **CADHI**, קדי, קאדי, Arab. i. e. a judge; in the Turkish empire, is generally taken for the judge of a town; judges of provinces being distinguished by the appellation of *moulas*. There are numerous complaints of the avarice, iniquity, and extortion of the Turkish *cadis*; all justice is venal; the people bribe the *cadis*, the *cadis* bribe the *moulas*, and the *moulas* the *cadi*:-

ieschers, and the cadileschers the mufti. Each *cadi* has his serjeants, who summon persons to answer complaints. If the party summoned fails to appear at the hour appointed, sentence is passed in favor of his adversary. It is usually vain to appeal from the sentences of the *cadi*, as the cause is never heard a-new, but judgment is passed on the case as stated by the *cadi*. But the *cadis* are often cashiered and punished for flagrant injustice, with the *bastinado* and mulets; the law, however, does not allow them to be put to death. Constantinople has had *cadis* ever since 1390, when Bajazet I. obliged John Paleologus, emperor of the Greeks, to admit *cadis* to judge all controversies that occurred between the Greeks and the Turks settled there. In some countries of Africa the *cadis* are also judges of religious matters. Among the Moors, *cadi* is the denomination of their higher order of priests or doctors, answering to the rabbies among the Jews.

CADIA, in botany, a genus of plants of the class *decandria*, and order *monogynia*: *CAL.* five-cleft; petals equal, inversely heart-shaped; legume polyspermous. Species one only; a native of Arabia Felix, with solitary, axillary, one or two-flowered peduncles, of a purple hue.

CADILESCHER, or **CADILE-KTR**, a capital officer of justice among the Turks, answering to a chief justice among us. It is said that this authority was originally confined to the soldiery; but that at present it extends to the determination of all kinds of law-suits; only it is subject to appeals. There are but three *cadileschers* in all the grand seignior's territories, viz. 1st of Europe; 2d of Natolia; and 3d at Grand Cairo. This last is the most considerable. They have their seats in the divan next to the grand vizier.

CADIZ, a city and sea-port of Spain, in Andalusia, supposed to have been founded by the Phœnicians; who settled a colony here, and gave it the name of *Gadis*, or *Gadira*. It was afterwards incorporated by the Roman empire, under the title of *Municipium*. It then fell into the hands of the Saracens, who held it till the middle of the thirteenth century, when it was recovered by the Spaniards. In 1596 it was taken and plundered by the English, under the earl of Essex; and the attempt was repeated by the duke of Ormond in 1702, but after landing his troops he found it impracticable to remain. During the dreadful earthquake which demolished Lisbon on the 1st of November, 1755, the sea rising in an extraordinary manner, overflowed the country about Cadiz to a great extent, and by its leaving behind it wrecks, which appeared to have belonged to a temple, a tradition that the ancient city of Cadiz was once swallowed by an earthquake, appeared to be confirmed. It is certain that the sea without the straits of Gibraltar has encroached upon the land. It is said, that in very calm weather, when the tide is low, the ruins of the old houses, and the remains of the temple of *Hercules*, may sometimes be discerned under the water. The view on entering the bay is exceedingly fine: on one extremity of the left point is the town of Rota, a little farther off appear the castle of *Catalina* and the neat city of *Santa Maria*; at a

greater distance, on the lap of a lofty hill, stands *Medina*; nearer the sea the town of *Puerto Real* and the arsenal of the *Caraccas*; and on the extremity of the right hand point the city of *Cadiz*. When this extensive bay is filled as it sometimes is with the vessels of different nations, displaying their respective colors amidst a forest of masts, the whiteness of the houses, their size and apparent cleanliness, the magnificence of the public edifices, and the neat and regular fortifications, form together a most striking assemblage of objects. Opposite *Cadiz* the land has little appearance of verdure; and, except the vineyards near *Santa Maria* and *Rota*, all is brown and barren.

The best houses have brick floors and stone or marble stairs; and, the windows generally looking into the patio or court, are private and retired; and under the house is a cistern, which, in the rainy season, is filled with water. But good water is very scarce here: they usually prefer drinking that which is brought in casks, by boats, from *St. Mary's*. To cool this water, and render it fit for drinking, they filter it through small jars of porous clay, which renders it very pleasant and refreshing. The richer inhabitants use water cooled with ice, which is brought daily in large quantities, from the mountains of *Ronda*, and in this climate is a great luxury. Every dwelling is a sort of separate fort, and capable of military defence. The streets of this city are remarkably well paved, which may in some measure arise from there being few or no wheel-carriages to destroy the pavement. Coaches are not in use, and most of the streets are too narrow to admit them. Carts for the conveyance of goods are also almost unknown. The *Gallegos*, or natives of *Gallicia*, a strong and industrious race of men, perform those laborious occupations for which, in other cities, horses and carts are employed. By the help of poles on their shoulders these men remove the heaviest articles with the utmost facility; and being frugal, as well as industrious, execute their tasks at a cheap rate. Every large town in Spain is filled with them: a man from any other part of Spain, following the occupation of a porter, is from custom called the *Gallego*, a name at present implying the occupation as well as the country. The entrances of the houses are the receptacles of every kind of filth; and, except in those belonging to the houses of the richer class, who keep a *Gallego* sitting at the door, you are almost suffocated by stench before you reach the apartments. This city, placed on a peninsula, at the termination of a long sandy isthmus, has no unoccupied ground, and can spare little for squares. The *Plaza de St. Antonio* is the only one and is very small; but being surrounded with magnificent houses, and contrasted with the streets, all of which with one exception are very narrow, it has a good effect, and is the principal resort of the inhabitants. To the ladies it is the mall; to the merchants the exchange; and to the officers, the parade. The *Alameyda*, or public walk, is very beautiful; always dry under foot, and furnished with good marble seats on both sides; being close to the sea, the trees do not thrive, and indeed afford very little shade: the cool sea

breeze is however enjoyed towards evening, and the walk is then crowded with good company. The whole of the ramparts that surround the city are also agreeable promenades, from which the sea breaking over the rocks, and the varied scenery of the bay, form a charming prospect.

Cádiz is defended by four forts, St. Sebastian, St. Catherine, Louis, and Matagorda; the two last form the defence of the grand arsenal called La Carracas, in which there are no less than three basins, and twelve docks, with ample supplies of naval stores. The bay is the grand rendezvous of the Spanish navy. An insulated tract at the mouth of the river Guadalete is called the island of Leon, and the city stands at the extremity of a long tongue of land, projecting in a north-west direction from this island, communicating with the rest of it by a road nearly five miles in length. It is surrounded, therefore, by the sea on the north-east and west, which, with the narrowness of the land communication, prevents its capture by a military force, so long as its possessors are masters of the sea. This was strikingly exemplified in the long blockade of 1810, 1811, and 1812.

Among the public buildings, the old cathedral is chiefly remarkable for its paintings, most of which are copies; and its treasures, which consist of gems, many large silver candlesticks and lamps, and three custodias, one of which is constructed of the finest silver, weighing fifty-one arrobas, and another of solid gold. The church of the capuchins, the church of the oratory, and some of the convents, also contain some fine pictures. The best collections, however, are to be found in the possession of private individuals.

In the garden of the convent of the capuchins, Mr. Jacob saw a tree, which he considered to be the only one of the kind in Europe; it yields the resinous gum called Dragon's blood. He was informed that it came originally from the East Indies. A new cathedral has been erecting ever since 1792, and, if ever finished, will be a most magnificent edifice. But the labor of many years is as yet required to complete it. The chief expense has been hitherto defrayed by the Consulado, or body of merchants, which have expended upwards of a million of dollars. It is of white marble, but towards the sea the saline particles have changed it to a brown color; the marble Corinthian pillars within are very handsome; the dome designed to occupy the centre is not begun, and the interior has been for many years a heap of rubbish. The asylum, or general work-house, maintains above 800 paupers of every nation, age, or sex, who are instructed and employed in useful arts. The boys are employed in manufacturing silk, linen, cotton, and printed calicoes; the girls in spinning, in needle-work, and in household business; and the aged and infirm work according to their abilities and strength. It was greatly improved by count O'Reilly in 1785, but it degenerated after his resignation. It is a handsome building, with Doric columns, and a front of 260 feet; has several courts; and round the principal one is a gallery with sixteen columns of the Doric order. The other charitable institutions are; the royal military hospital, which accommodates eighty

students, who are maintained and educated at the king's expense; two hospitals for the sick, one set apart for each sex; and an asylum for forty-seven widows, founded by a Turkish merchant.

The manufactures are few, being confined to ribbons and silk net-work; but its commercial industry is great. It is unquestionably the principal trading port in the south of Spain, and was long the seat of the public board for American affairs: there has been here also an East India Company since 1782. The American trade was a monopoly until 1778; what it afterwards became, it now avails little to state: in 1791, which may be considered an average year, the imports from America amounted in gold and silver to £5,500,000 sterling; the number of vessels arriving from that quarter were 176, and the total number of ships that entered the port was 1010. The imports from America, exclusive of gold and silver, were cocoa, tobacco, sugar, chocolate, vanilla, and all kinds of colonial produce. The exports to that quarter, hardware, linen, (Silesian and Irish), and woollens, along with wine, oil, almonds, raisins, wax, cinnamon, paper, books, and medicines. But the changes and revolutions at home, and the loss of the colonies, have annihilated large portions of this trade. There are still, however, few great sea-ports in Europe that are not occasionally connected with Cadiz; and English, Irish, Italian, French, and Dutch merchants are established here. The common period for bills of exchange with England, Holland, Germany, and other foreign countries, except France, is sixty days date. Smuggling is also a profitable, and by no means a decreasing pursuit. Linen is manufactured in the country adjoining in considerable quantity; and an important branch of industry is carried on in the neighbourhood, in the preparation of salt. The pits extend from the bay of Puntal to Santa Maria, and belong to the Spanish government. Fishermen from all the maritime countries of Europe; but especially from the neighbouring coasts of Normandy, are constantly coming in here for supplies of this article.

Cádiz has often been an object of attack by Great Britain. In 1596 the earl of Essex and the lord high admiral Howard pillaged this city: thirty years afterwards lord Wimbledon landed an army of 10,000 men here: but though it was supported by a fleet of eighty ships it re-embarked after storming a fort. In 1702 the duke of Ormond and Sir George Rooke attempted to seize the city for the archduke Charles of Austria, but failed in the object. We bombarded Cadiz in 1800; and from this port sailed the combined fleets of France and Spain in 1805, to be the final trophies of lord Nelson's fame in the battle of Trafalgar. Here, in 1808, the French fleet surrendered to the Spaniards; and next year, when Seville fell into the hands of the French, Cadiz became the first seat of the central Junta, and of the Cortes. It now sustained the long French blockade, from which it was not relieved until the battle of Salamanca. The civil government of Cadiz is in the hands of a king's lieutenant and commandant; and a mayor and two alcaides. It is a bishop's suffragan of Seville, and contains

twenty-eight parishes, and is the seat of a captain, general, and other officers of marine. The population has fluctuated of late years from 60,000 to 20,000. It is forty-five miles north-west of Gibraltar, and sixty south-west of Seville.

CADIZADELITES, a sect of Mahomedaus, very like the ancient Stoics. They shun feasts and diversions, and affect an extraordinary gravity in all their actions; they are continually talking of God, and some of them make a jumble of Christianity and Mahomedanism.

CADMEAN LETTERS, the ancient Greek or Ionic characters, such as they were first brought by Cadmus from Phœnicia; whence Herodotus also calls them Phœnician letters. Some say, that Cadmus was not the inventor, nor even the importer of the Greek letters, but only the modeller and reformer of the alphabet; and hence they acquired the appellation of Cadmean or Phœnician letters; whereas before that time they had been called Pelagian.

CADMI, in pharmacy, a name which has been variously applied; but it usually denotes a mineral substance, whereof there are two kinds, natural and artificial.

CADMI **ARTIFICIAL**, **CADMI** **FORNACUM**, or **CADMI** **OF THE FURNACES**, is a matter sublimed when ores containing zinc, like those of Rammelsberg, are smelted. This cadmia consists of the flowers of the semi-metal sublimed during the fusion, and adhering to the inner surfaces of the walls of furnaces, where they suffer a semi-fusion, and therefore acquire more solidity. So great a quantity of these are collected, that they form very thick incrustations, which must be frequently taken off. The name has also been given to all the soots and metallic sublimates formed by smelting in the grate, although there is certainly a difference in these matters. Ancient chemists distinguished five kinds of cadmia fornacum, viz. *C. botrytis*, resembling a bunch of grapes, which is found in the middle of the furnace. *C. calamitis*, found hanging round the iron rods, with which the matter is stirred in the furnace, and generally in the form of quills; whence the name from *calamus* a quill. It is reckoned desiccative and detersive, and is used to cicatrize ulcers. *C. capnitis*, found at the mouth of the furnace. It is used by some in diseases of the eyes. *C. ostracitis*, found at the bottom of the furnace in the form of a sea shell. *C. flacitis*, found at the top of the furnace, in the form of a crust. It is also used by some in diseases of the eyes.

CADMI, **NATURAL**, is of two sorts; the one containing arsenic, and called *cadmia fossilis*, or *cobalt*; the other containing zinc, called *calamine*, or *lapis calaminaris*. See **CALAMINE**. Cadmia is also used by Pliny for copper ore, or the stone of which copper is made.

CADMITES, in natural history, a kind of gem, nearly resembling the ostracites; from which it only differs in that the latter is sometimes girt with blue spots.

CADMIUM, in mineralogy, a new metal first discovered at Hanover in 1817, by Mr. Stromeyer, in carbonate of zinc. He obtains it in the following manner:—Dissolve the substance which contains cadmium in sulphuric acid, and pass through

the acidulous solution a current of sulphuretted hydrogen. Wash this precipitate, dissolve it in concentrated muriatic acid, and expel the excess of acid by evaporation. The residue is then to be dissolved in water, and precipitated by carbonate of ammonia, of which an excess must be added, to redissolve the zinc and the copper that may have been precipitated by the sulphuretted hydrogen. This carbonate of cadmium, being well washed, is heated, to drive off the carbonic acid, and the remaining oxide reduced by mixing it with lamp-black, and exposing it to a moderate red heat in a glass or earthen retort. Dr. Wollaston's process is preferred for its precision and the facility with which it yields the metal; we subjoin it from Dr. Ure. 'From the solution of the salt of zinc supposed to contain cadmium, precipitate all the other metallic impurities by iron; filter and immerse a cylinder of zinc into the clear solution. If cadmium be present it will be thrown down in the metallic state, and, when redissolved in muriatic acid, will exhibit its peculiar character on the application of the proper tests.' Mr. W. Herapath states that he has obtained it in quantities from the soot collected in the zinc works at Bristol. The metal is obtained by dissolving this substance in muriatic acid, filtering, evaporating to dryness, redissolving and filtering, then precipitating by a plate of zinc. The cadmium thrown down is to be mixed with a little lamp-black or wax, put into a black or green glass tube, and placed in the red heat of a common fire, until the cadmium has sublimed into the cool part of the tube; then the residuum is to be shaken out, which is easily done without loss of cadmium. A little wax introduced into the tube, and a gentle heat applied, the metal melts, and by agitation forms a button.

The color of cadmium is a fine white, with a slight shade of bluish-gray, very similar to that of tin; which metal it also resembles in lustre and susceptibility of polish. Its texture is compact, and its fracture hackly. It crystallises in octohedrons, and presents when cooling the appearance of leaves of fern. It is flexible, and yields readily to the knife; but is harder and more tenacious than tin; and, like it, stains paper. It is ductile and malleable, but when long hammered it seales off in different places. Its specific gravity is 8.6040. It melts, and is volatilised under a red heat. Its vapor, which has no smell, may be condensed in drops, which, on congealing, present distinct traces of crystallisation. When heated in the open air, it burns like tin, passing into a smoke, which falls and forms a very fixed oxide, of a brownish-yellow color. Nitric acid readily dissolves it cold; dilute sulphuric, muriatic, and even acetic acids, act feebly on it with the disengagement of hydrogen.

Cadmium forms a single oxide, in which 100 parts of the metal are combined with 14.352 of oxygen. The prime equivalent of cadmium deduced from this compound seems to be very nearly 7, and that of the oxide 8. This oxide varies in its appearance according to the circumstances, from a brownish-yellow to a dark brown, and even a blackish colour. With charcoal it is reduced with rapidity below a red heat. It gives a transparent colorless glass bead with borax.

The fixed alkalies do not dissolve the oxide of cadmium in a sensible degree; but liquid ammonia readily dissolves it. On evaporating the solution, the oxide falls in a dense gelatinous hydrate. With the acids it forms salts, which are almost all colorless, have a sharp metallic taste, and are generally soluble in water. Cadmium also unites easily with most of the metals, when heated with them out of contact of air. Most of its alloys are brittle and colorless.

CADMUS, in fabulous history, king of Thebes, the son of Agenor, king of Phœnicia, and the brother of Phœnix, Cilix, and Europa. He carried into Greece the sixteen simple letters of the Greek alphabet; and there built Thebes, in Beotia. The poets say, that he left his native country in search of his sister Europa, whom Jupiter had carried away in the form of a bull; and that, enquiring of the Delphic oracle for a settlement, he was answered, that he should follow the direction of a cow, and build a city where she lay down. Having arrived among the Phœcenses, he was met by a cow, who conducted him through Beotia to the place where Thebes was afterwards built: but as he was about to sacrifice his guide to Pallas, he sent two of his company to the fountain of Dirce for water. The waters were sacred to Mars, and guarded by a dragon, which devoured all the Phœnician attendants. Cadmus tired of their seeming delay, went to the place, and saw the monster still feeding on their flesh. He attacked the dragon, and overcame it by the assistance of Minerva, and sowed the teeth in a plain, upon which armed men suddenly rose up from the ground. He threw a stone in the midst of them, and they instantly turned their arms one against the other, till all perished except five, who assisted him in building his city. Soon after, he married Hermione the daughter of Venus, with whom he lived in the greatest cordiality, and by whom he had a son, Polydorus, and four daughters, Ino, Agave, Autonoe, and Semele. Juno persecuted these children; and their well-known misfortunes so distracted Cadmus and Hermione, that they retired to Illyricum, loaded with grief, and infirm with age. They entreated the gods to remove them from the misfortunes of life, and they were immediately changed into serpents. Some explain the dragon's fable, by supposing that it was a king of the country whom Cadmus conquered by war; and the armed men rising from the field, is no more than men armed with brass, according to the ambiguous signification of the Phœnician word. Cadmus was the first who introduced the use of letters into Greece; but some maintain, that the alphabet which he brought from Phœnicia, was only different from that which was used by the ancient inhabitants of Greece. This alphabet consisted only of sixteen letters, to which Palamedes afterwards added four, and Simonides of Melos the same number. The worship of many of the Egyptian and Phœnician deities was also introduced by Cadmus, who is supposed to have come into Greece 1493 years before the Christian era, and to have died sixty-one years after. According to those who believe that Thebes was built at the sound of Amphiion's lyre, Cadmus built only a

small citadel, which he called Cadmea, and laid the foundation of a city which was finished by one of his successors.

CADOGAN (William Bromley), M.A. was the second son of the first earl Cadogan, and born in 1751. He was educated at Westminster-school, whence he removed to Christ-Church, Oxford, where he took the degree of B.A. and entered into orders. In 1774 lord chancellor Bathurst gave him the vicarage of St. Giles, Reading; soon after which he was presented to the rectory of Chelsea. He was a most indefatigable parish minister and priest, and died much esteemed in 1797. He published some single sermons; and after his death his Discourses, Letters, and Memoirs were collected by Mr. Cecil. See *Cecil's Life of Cadogan*.

CADOGAN (William), M.D. was educated at Oriel College, Oxford, where he took his degree of M.A. in 1755; and the same year was made doctor of physic. He became a fellow of the college, before which he delivered two Harveian orations. Dr. Cadogan became famous for prescribing an abstemious regimen in the gout, in Dissertations on that disorder, 8vo. 1764. He also published a treatise on the Management of Children, and died in 1797, aged eighty-six.

CADORE, a town of the Venetian territory, in the district of the Cadurin, on the frontier of the Tyrol, near the Piave. It carries on a traffic in iron and the timber of the district, which is abundant in those productions. The Austrians were defeated here by the French in 1797. In 1806 Bonaparte created Cadore into a duchy, whose possessor had a revenue of 60,000 francs, or £2,500 sterling. It was bestowed, in 1809, on his minister Champagny. Titian was a native of this place. It is fifteen miles north of Belluno, forty-two north-east of Trent, and fifty-three west of Friuli, the district is said to contain 22,000 inhabitants.

CADSAND, a small town and insulated tract of Flanders, formed by the sea, the Wester Scheldt, and other rivers and canals. It belongs to the district or 'free land' of Sluys, consisting of drained marshes: it is very fruitful in corn, and the pasture is excellent. High embankments, constructed at a vast expense, defend it generally from the sea, but hardly sufficient in north-west winds. The Dutch by means of possessing this island command the navigation of the Scheldt. It was taken by the French on the 29th July, 1794; and occupied for a while by our army in the unfortunate Walcheren expedition. The town is two miles north-west of Sluys.

CADUCEUS, in ancient mythology, Mercury's rod, a wand entwisted by two serpents, and furnished with wings, as in the annexed figure. It was given to him by Apollo, for his seven-stringed harp. The caduceus afforded him the power of bringing souls out of hell, and also to cast any one into sleep. In Roman antiquity it was used as a symbol of peace and concord. The Romans sent the Carthaginians a javelin and a caduceus, offering them their choice either of war or peace. Those who de-

nounced war were called *feciales*; and those who went to demand peace *caduceatores*, because they bore a caduceus in their hand. The caduceus on medals is a common symbol, signifying good conduct, peace, and prosperity. The rod expresses power, the two serpents prudence, and the two wings diligence.

CADUCI, in botany, to fall, the name of a class in Linneus's *Calycina*, consisting of plants whose calyx is a simple perianthium, supporting a single flower or fructification, and falling off either before or with the petals. It stands opposed to the classes *persistentes*, and is exemplified in mustard and ranunculus.

CADURCUM, **CADURCUS**, or **CADURX**, in ancient geography, a town of Aquitania; situated between the river Oldus, running from the north, and the Tarnis from the south, and falling into the Garumna; now called Cahors.

CADUS, in antiquity, a wine-vessel, containing eighty amphoræ or firkins; each of which, according to the best accounts, held nine gallons, though some make them only seven. See **AMPHORA**.

CÆCILIA, in zoology, a genus of serpents belonging to the amphibia class. The *cæcilia* has no scales; it is smooth, and moves by means of lateral rugæ or prickles. The upper lip is prominent, and furnished with two tentacula. It has no tail. There are only two species, viz. 1. *C. glutinosa*, with 340 rugæ or prickles above, and ten below, the anus. It is of a brownish color, with a white line on the side, and is a native of the Indies, and South America. 2. *C. tentaculata*, with 135 rugæ. It is about a foot long, and an inch in circumference, preserving a uniform cylindrical shape from the one end to the other. The teeth are very small. It has such a resemblance to an eel that it may easily be mistaken for one; but, as it has neither fins nor gills, it cannot be classed with the fishes. It is a native of America, and its bite is not poisonous.

CÆCULUS, a son of Vulcan, conceived, as some say, by his mother, when a spark of fire fell into her bosom. He was called *Cæculus*, because his eyes were small. After a life spent in plundering and rapine, he built *Præneste*: but being unable to find inhabitants, he implored Vulcan to show whether he really was his father. Upon this a flame suddenly shone among the multitude who were assembled to see some spectacle, and they were immediately persuaded to become the subjects of *Cæculus*. Virg. *Æn.* 7, v. 680, says that he was found in fire by shepherds, and on that account called son of Vulcan, who is the god of fire.

CÆCUM, or **CÆCUM**, the blind gut, so called from its being perforated at one end only. The first portion of the large intestines, placed in the right iliac region, about four fingers' breadth in length. It is in this intestine that the ileum terminates by a valve, called the valve of the cæcum, and the *appendicula cæci vermiciformis* is also attached to it. See **ANATOMY**.

CÆLEBS, in entomology, a species of *cimex*, of brownish gray color, with three points on the scutellum, and a yellowish apex. First found in New Holland.

CÆLUS, in the Pagan mythology, the god

of the heavens, was represented as the son of *Æther* and *Dies*, the father of *Saturn* and *Ops*, and progenitor of all the gods.

CÆMENT. See **CEMENT**.

CÆMENTUM, in oryctology, a genus of argillaceous earths, consisting of iron, alumine, a large quantity of silica, and generally a small portion of carbonate of lime; hardish, lightish, and porous; of an earthy texture; imbibing water with a hissing noise; crackling when dried, rough; without lustre: when powdered and beaten up with water and quicklime, becoming so hard as not to be penetrated by water; easily melting in the fire into a black scoria. Three species. 1. *C. tufa*. *Tufa*, *Tuffwacke*. Collected into entire cliffs, and vast strata about volcanic mountains. Found particularly about Naples and Rome. It is commonly magnetic, of an earthy fracture, and not easily decomposed by the action of the air. 2. *C. tarras*. *Trass*. Forming large strata under the surface of the common soil. Found on the banks of the Rhine; principally near Andernach, and on mount Vogelberg, some feet under the surface, where streams of water have not had access; dull, gray or blackish, rarely variegated. When pounded, it makes the best cement for buildings under water. 3. *C. columnare*. Prismatic cement. There are two varieties; the prisms being sometimes five and sometimes six-sided. Found on the banks of the Rhine, and sometimes near the base of mount Etna, in columnar masses of a gray color, close to each other, and forming internally the common mass.

CAEN, a considerable town in France, in the department of the Calvados, and *ci-devant* province of Lower Normandy, of which it was the capital. It has a celebrated university, founded in 1431, by our Henry VI., and an academy of literature; and contains twelve parish churches, and about 40,000 citizens. It has also a castle which was built by the English. The town is built chiefly of a white stone, which, though not durable, is of beautiful appearance, and the streets are wider than those of most French towns. The principal squares are the *Place Royal*, and the *Place St. Sauveur*. In the former is the *Hotel de Ville*, a public library, and the *Musée des Arts*. Our William the conqueror, who was buried here, built the *Abbaye aux Hommes*; which is a noble, though rather plain structure. The *Palais de Justice* is a handsome modern building. Malherbe was born here, and Iluet, bishop of Avranches. There is a considerable trade carried on at Caen in linen, lace, stockings, caps, and serges, of home manufacture, as well as in cattle, horses, dye stuffs, cider, and skins. The town is but eight miles from the sea, and has a good communication with it by the river Orne, which vessels of 160 tons burden can ascend with the tide. The neighbourhood is pleasant and fertile, but flat. Edward III. was stoutly resisted here in 1346; but the English took Caen in 1417, and retained it thirty-one years. It is sixty-two miles west by south of Rouen, and 132 west by north of Paris. Long. 0° 27' W., lat. 49° 11' N.

CÆRE, in ancient geography, a town of Etruria, the royal residence of Mezentius. Its an-

cient name was *Argyllæ*. In Strabo's time not the least vestige of it remained, except the baths called *Caritana*.

CERITES TABLE. the tables of the Roman censors. In these were entered the names of such as for some misdemeanor forfeited their right of suffrage, or were degraded from a higher to a less honorable tribe. They were so named from the people of *Cære*, who hospitably receiving the Romans after the taking of Rome by the Gauls, were, on the Romans recovering their city, honored with all the privileges of citizens, except the right of voting.

CAERMARTHEN. See **CARMARTHEN**.

CAERNARVON. See **CARNARVON**.

CAERLEON, an ancient market town of Monmouthshire, on the *Usk*, over which is a handsome stone bridge, is said to have been a residence of one of the British kings, and was at a very early period distinguished for its ecclesiastical and literary foundations. Its name signifies the fort or town of *Leon*. By the Romans it was called *Isca*, *Isca Colonia*, and *Civitas Legionis II. Augustæ*. In order to distinguish it from *Exeter*, which was likewise called *Isca*, it was also denominated *Isca Silurum*. Here the Roman prætor resided, and had his *Palatium*, which, in all probability, was where the old mansion called the lodge now stands. Here also the courts were held for *Britannia Secunda*, and the imperial edicts were promulgated. Mr. Cox, the tourist, endeavoured to take a survey of the ancient city, which appeared to him to be oblong, inclining to a square, enclosing a circumference of 1800 yards, but the Roman city must have had extensive suburbs.

Giraldus Cambrensis visited *Caerleon*, in making the tour of Wales with archbishop Baldwin, in the year 1180. At that time it was hastening to decay; but to the learned arch-deacon it continued to display evident marks of former magnificence. He speaks of 'its splendid palaces, which once emulated with their gilded roofs the grandeur of Rome, for it was originally built by the Roman princes, and adorned with stately edifices; a gigantic tower, numerous baths, ruins of a temple, and a theatre, the walls of which are partly standing. Here we still see,' he adds, 'both within and without the walls, subterraneous buildings, aqueducts and vaulted caverns, and stoves so excellently contrived, as to convey their heat through secret and imperceptible pores.' Of its Christian antiquities he says, 'Here lie two illustrious, and next to Alban and Amphibalus, the two most celebrated proto-martyrs of Britain, Julius and Aaron, of whom both had a church within the city, dedicated to their memory; for, in former ages, it contained three fine churches; the first was that of Julius, adorned with a convent of Franciscan friars,

devoted to the virgin deity; the second, that of his holy associate Aaron, and illustrious for its order of regular canons; the third was at one time the metropolitan church of all *Cambria*.' Part of an ancient castle is still remaining; it appears to have been 300 yards in circumference; and from the eminence on which it was situated, commanded one of the most beautiful and extensive views in England. There is an amphitheatre on the banks of the *Usk*, of an oval concavity, measuring seventy-four yards by sixty-four, and six in depth: the natives call it king Arthur's round table. The present church, a good specimen of the Norman era, is kept in good repair by the testamentary benefaction of the late Charles Williams, Esq. a native of the place. He also founded a charity-school for thirty boys and twenty girls. The town now consists only of two or three small streets. In the vicinity are extensive iron and tin works. The market is on Thursday, and well supplied. There is also a smaller market on Saturday.

CERULATA, in entomology, a species of *phalana geometra*, the wings of which are banded with two ceruleous bands.

CERULEA, sky blue, the specific name of a *chrysomela*, *pinelia cicindelia*, and *neocydalis*, so called from their shining blue color.

CERULA, in ichthyology, a species of *coryphæna*, found in the American Ocean.

CARULEA, in ornithology, an American species of *ardea*; the blue heron of Latham; the blue bittern of Catesby. The color of the body is blue, whence its name. Also, an Indian species of *alcedo*; the *ispida indica torquata* of Brisson; and the white collared king's fisher of Latham. Also, a species of *procellaria*; the blue petrel of Latham. Also, a fine species of *certhia* or creeper, from Cayenne. Also, a South American *columba*; the *tlacapoilotl* of Ray; and blue pigeon of Latham. And, lastly, a species of *muscipapa*, or fly-catcher, found in the Philippine isles. This is the azure fly-catcher of Latham.

CERULEOCEPHALIA, in entomology, a species of *cantharis* with a red thorax, fuscous wing cases, and the posterior part of the head blue black. Also, a species of *bombyx*, commonly called the figure of eight moth.

CERULEOCEPHALA, in ornithology, a species of *alcedo*. Buffon calls it *martin-pêcheur* à tete bleue, and *petit-martin-pêcheur* du Sénégal; and it is the blue-headed king's fisher of Latham.

CERULEOCEPHALUS, in entomology, a species of *curculio*, of a violet color, with testaceous thorax and elytre. Found in Germany.

CERULOCEPHALUS, in ornithology, a species of *psittacus*; the red and blue parrot of Willoughby and Latham. Found in Guiana and Cayenne.
